PROFESSIONAL GEOLOGIST CERTIFICATION

"I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer/professional geologist who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

CERTIFICATION OF COMPLIANCE

I certify that this CSR report and all attachments were prepared under my direction in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Based on my review of the findings of this report with respect to the Risk Reduction Standards (RRSs) under the Rules for Hazardous Site Response, Rule 391-3-19-.07 and the Voluntary Remediation Program Act, O.C.G.A 12-8-108, I have determined that the following tax parcels related to the Site (HSI Number 10228) are in compliance with RRSs as follows:

Tax Parcel 040 031(a.k.a. Drexel Facility): Type 5 RRSs for soil and groundwater

Tax Parcel 040 028 A-J (a.k.a. Drexel Additional Property): Type 1 RRSs for soil, Type 5 RRSs for groundwater

CSX Property (no tax parcel ID number): Type 5 RRSs for soil

Certified by: _____ Date: June 2, 2016

Drexel Chemical Company
Leigh Shockey
CEO

1 INTRODUCTION

1.1 VRP Properties

Drexel Chemical Company (Drexel) submitted a Voluntary Remediation Program (VRP) Application (which the EPD refers to as the Voluntary Investigation and Remediation Plan, (VIRP) in February 2011 (EPS, 2011). In a letter dated April 28, 2011, the Georgia Environmental Protection Division (EPD) accepted Drexel as a participant into the VRP. Pursuant to the conditions of the acceptance letter, this document is the Compliance Status Report (CSR) for the Drexel Site. This CSR includes certification by the Professional Geologist (Kirk Kessler) specified in the VIRP. Appendix A contains a monthly summary of hours invoiced since the last progress report and description of services provided.

The Drexel facility is located at 120 Cape Road, Cordele, Crisp County, Georgia (Facility). The Facility is a Pesticide Blending Facility, which is located approximately four miles east of downtown Cordele in a primarily agricultural and wooded area. Figure 1 shows the location of the Drexel Facility on a topographic map. The Drexel Facility (as originally accepted into the VRP) is approximately 6.89 acres, which consists of two parcels owned by Drexel. With the Second Progress Report (EPS, 2012A), Drexel requested that other property bordering the facility and owned by Drexel be added to the VRP. Additionally, on August 29, 2012 Drexel and CSX Transportation (CSX) submitted a request to include the CSX property bordering the facility to the north, to be added as an eligible property in the VRP. In a letter dated December 5, 2012, the EPD accepted the CSX and additional Drexel parcels into the VRP. For discussion purposes, these properties will be referred to as "Facility," "CSX," and "Drexel Additional Property" and are jointly referred to as the "Site." Figure 2 shows the locations of these properties on an aerial photograph.

1.2 Site History

In 1985 Drexel purchased the property from Gold Kist and purchased an adjacent 3 acre agricultural parcel south of the Gold Kist property, bringing the Facility to its current size of 6.89 acres. Gold Kist reportedly began fertilizer production in the early 1960's and pesticide production followed thereafter. Records and aerial photography indicate that by 1962 the facility consisted of a production building, office, rail spur, at least six subgrade surface impoundments, and a 235-foot deep water well (PW-1) reportedly used for both potable water and industrial purposes. Aerial photography indicates that by 1968 an additional production (liquid production) building, attached warehouse, and bulk storage tanks had been constructed. By 1968 (see aerial photograph, Figure 3), eight surface impoundments were located at the facility. It is unknown exactly when and/or how the first four of the eight surface impoundments were removed from service, or exactly how any were closed out. However, it appears from historical Georgia Environmental Protection Division (EPD) inspection reports that, of the eight noted in aerial photography, only four

remained in operation by 1982, and none remained in operation by March 1984. It is believed the four western-most impoundments were filled with soil and graded in 1983 (USEPA, 1985). Drexel purchased the Facility in 1985. In 1986, Drexel constructed a 40,000 square foot warehouse (referred to as the Mill or New Warehouse) and attached production building over the location of the former (westernmost) surface impoundments. For more information about the operational history, please see the Revised 3013 Site Assessment Report (EPS, 2008).

Figure 4 shows the historical site features. The facility is served by a side track rail spur, owned by CSX and leased to Drexel, and located on the northern part of the Facility within the Facility's fence line. A chain link fence surrounds the facility. There were two on-site water supply wells, PW-1 and PW-2, which were used during most of the operational period of the facility. These wells were taken offline in 2003 due to the detection of 1,2-dibromoethane (also referred to as ethylene dibromide, EDB) in the water.

1.3 Media and Constituents of Interest

The media of interest are soil and groundwater. Numerous soil investigations have taken place at the Facility since 1984. A wide variety of constituents have been detected in the soil, but the primary constituents of interest at the Facility are pesticides. Drexel worked with the EPD to develop Risk Reduction Standards (RRSs) for the Site. The methodology used to determine RRSs is presented in a technical memorandum to the EPD (EPS, 2010). The RRSs were revised according to EPD's comments in a letter dated December 2, 2010 and presented in the VIRP. These RRSs were approved by the EPD in a letter dated April 28, 2011. The approved soil and groundwater RRSs are shown in Table 1 and Table 2, respectively. The predominant constituents of interest in soil include EDB, chlordane, dimethoate, disulfoton, endosulfan II, endosulfan sulfate, ethyl benzene, methyl parathion, o-xylene, and toxaphene.

Groundwater monitoring began in 2005. Analysis of water from the Drexel monitoring wells has indicated that the only constituent that exceeds the Residential RRS is EDB. The groundwater potentiometric surface from February 2014 is shown on Figure 5. According to the VRP regulations, the Point of Exposure (POE) for groundwater is the nearest of the following: the closest existing downgradient drinking water well, the likely nearest future downgradient drinking water well, or at a hypothetical point of exposure 1000 feet downgradient of the plume edge. The closest downgradient water well is Well D[1], which is approximately 450 feet southeast of the Site's fence line. Thus, this well will serve as the Point of Exposure. Drexel purchased additional property to the south and east of the facility in 2009, which includes this well. The well is currently being used by the facility as a non-potable water source.

[1] Note, at the time of the VIRP submission it was thought that groundwater flow was to the south and that well PW-Aiken was the closest down-gradient well. Continued sampling events indicated that the groundwater flow is in a south-easterly direction making Well D the closest down-gradient well.

1.4 Activities Conducted under the VRP

Since the Site was accepted into the VRP in 2011, Drexel has completed the following major activities:

- Submitted nine semi-annual progress reports
- Abandoned two unused production wells (PW-1 and PW-2) in August 2012
- Installed two monitoring wells
  - BW-5 installed east of the facility to aid in horizontal delineation in groundwater in January 2013
  - BW-6 installed with multi-level sampling ports for vertical delineation in the area of highest concentrations in 2013
- Conducted six groundwater sampling events
- Conducted multiple soil investigations for chemical and geotechnical testing
- Completed soil remediation (Phase 1) of four former surface impoundments (see Section 5)
- Completed soil remediation (Phase 2) along the former railcar unloading area and drainage swale (see Section 6)
- Installed a groundwater pump-and-treat system (Phase 3) and began groundwater monitoring (Section 7)
- Developed a draft environmental covenant (see Section 8).

1.5 Compliance

Shallow soils (from 0-15 ft below the surface, (bgs)) are in compliance with Residential RRS. Additionally, the deep soils (deeper than 15 ft) for all constituents except EDB are in compliance with Residential RRSs. EDB in deep soils are in compliance with the direct-contact Residential RRS for EDB, but not for the leaching-based RRS. Although the soils meet the Residential RRSs, Drexel is certifying the soils to Type 5 due to the use of area averaging and the presence of EDB in the deep soils above the leaching criterion. Groundwater is in compliance with Residential RRSs with controls (groundwater pump-and-treat and environmental covenant). Due to the use of the controls, Drexel is certifying groundwater to Type 5.

2 CONCEPTUAL SITE MODEL

2.1 Introduction

The conceptual site model (CSM) is intended to establish a common knowledge base about the Site (which includes all the VRP properties) and its environmental condition, to facilitate the development of basic remedial action objectives, and to allow an informed decision regarding possible remedial action measures. This section describes the surface and subsurface features at the Site and discusses the potential receptors and exposure pathways. Section 3 discusses the extent of contamination at the Site prior to remedial action.

2.2 Ground Surface Features

The majority of the Facility is flat (0-2% slopes) with a small rise in elevation on the southeast part of the Facility. Drainage features on the Site are indicated on Figure 6. Drainage in the surrounding area, the majority of which is in agricultural use, is primarily to the east, parallel to the CSX rail line along two drainage features, one on each side of the tracks. The north drainage ditch is about 40 feet (ft) wide, and has generally wet soils with areas of standing water. The south drainage is a shallower swale that is also about 40 ft wide, but has generally dry soils. The railroad manages vegetation along its operating corridor using intermittent applications of herbicides. During wet periods, surface water in the south swale flows to the northeast until it reaches a culvert beneath the rail line approximately 800 ft to the east of the Drexel Facility where it runs under a small culvert and joins with the north ditch. The north ditch continues to flow in a southeasterly direction to join with other intermittent stream flowing from the forested area to the north, at which point it turns south through a box culvert under the rail line approximately 3,000 ft to the east of the Drexel Facility. The ditch continues in a southeasterly direction and merges with several other drainage features to become Deep Creek.

The drainage swale that runs along the southern side of the rail is predominantly a dry ditch except during rainfall events (Photograph 1). In contrast, the swale along the north side of the rail line becomes comingled with an intermittent stream and wetlands feature eastward of the Facility. The National Wetlands Inventory classifies this area as a “freshwater forested/shrub wetland.” The intermittent stream is a part of this low relief wetland and is not a discrete, incised channel. Photograph 2 shows where the intermittent stream flows underneath the rail line (approximately 3,000 ft east of the Facility). Irrigation ponds are common in the area and there is one located approximately 100 ft to the north of the Facility and another is located just under 450 ft to the east of the Facility.

Photograph 1 Drainage Swale on Southern Side of Rail Line
(Facility is on the left; photograph taken facing northwest)

Photograph 2 Intermittent Stream on the North Side of the Rail Line East of the Facility (photograph taken facing west-northwest back toward the Facility)

The majority of the facility is covered with a concrete apron. A concrete culvert runs underneath the Liquid Production building to the northeast corner of the Facility. Drexel operates under a National Pollution Discharge Elimination System (NPDES) permit to discharge stormwater runoff at multiple permitted discharge locations. The locations of the outfalls are shown on Figure 6.

Drexel's NPDES permit authorizes discharge non-contact cooling water or other permitted process water through Outfall 001, which is located on the north side of the facility and travels to S01 on the northeast side of the facility. Drexel submitted a permit renewal application in 2015 to include discharges from the pump-and-treat system.

2.3 Subsurface Features

2.3.1 Geological Setting

2.3.1.1 Regional Geological Setting

Crisp County is located on the western flank of the Coastal Plain Physiographic Province. This province is bounded to the north by the Fall Line separating the Coastal Plain and Piedmont Physiographic Provinces. The coastal plain contains unconsolidated sediments (sands, silts and clays) and consolidated sediments (cemented sands and limestones) dating from Late Cretaceous to Recent age. These sedimentary sequences crop out at progressively younger ages away from the Fall Line to the Atlantic coast. The sedimentary formations dip gently to the south-southeast while thickening in the downdip direction forming wedge-shaped stratigraphic layers (Wait, 1960).

The Coastal Plain Physiographic Province in Crisp County is further divided into three districts. The Fall Line Hills District is exposed in the northwestern portion of the county. The central-southwestern portion of the county contains the Dougherty Plain District, a northeast-trending, wedge-shaped feature characterized by gently rolling low land. The Tifton District occurs in eastern Crisp County characterized by well-developed dendritic drainage patterns. The Tifton District slopes in elevation from 480 ft above mean sea level (amsl) in the north to 150 ft amsl in the southeast (Clarke and Zisa, 1976). The city of Cordele is located along the boundary between the Fall Line Hills and Tifton Districts.

The Ocala Limestone of upper Eocene age crops out along the western margin of the county and dips to the south-southeast, underlying the Flint River Formation. The Oligocene-age Flint River Formation is exposed from the western portion of the county to a line (north-south) approximately immediately west of Cordele. The Flint River Formation is also described in the scientific literature as the Suwannee Limestone and residuum. The Flint River Formation underlies the younger Hawthorne Formation of Miocene age from Cordele to the eastern margin of the county (Figure 7). The Hawthorne Formation is also described in the scientific literature as undifferentiated Neogene sediments. Chemical weathering of underlying rocks (especially limestones) creates a thick mantle of sandy clay or residuum. This residuum may be 50 ft or more in thickness.

The Hawthorne Formation is a pale to dark green phosphatic sandy clay with lesser amounts of sand and sandy limestone. The Flint River Formation is a siliceous limestone, sandy limestone and recrystalized limestone. The Ocala Limestone is a white to yellowish-white pure fossiliferous limestone. The Ocala thickens up to 130 ft in the southeastern corner of the county. Beneath the Ocala Limestone exists the Claiborne Group, a sandy limestone and sand with some clay beds. The Claiborne Group is 120 ft thick in the northwest portion of the county, thickening to 320 ft in the southeastern portion of the county. Underlying the Claiborne is the Wilcox Group, a gray sandy clay and fine sand. The Wilcox Group is nearly uniform in thickness within the county, varying from 120 to 140 ft.

2.3.1.2 Site Geology – Residuum (overburden)

Numerous soil borings have been advanced across the Site (see Appendix B for more information about the different site investigations conducted since 1984). Boring logs from soil borings conducted since 2005 are presented in Appendix F of the VIRP. Similarly, well construction diagrams for wells constructed from 2005 - 2012 are presented in Appendix G of the VIRP and the wells constructed in 2013 are presented in Appendix C of the 5th Progress Report (EPS, 2013). Hydrologic cross-sections are shown on Figure 8A and 8B.

The investigations revealed that beneath the topsoil layer, residuum is characterized by a predominantly clay soil texture with pockets of coarser-grained soil. Soil density and clay content increase with depth, with gradational changes in texture beginning at approximately 60-70 ft bgs to a weathered rock (limestone) condition. As the degree of weathering decreases with further depth, the weathered rock transitions into competent limestone around 100 ft bgs or more.

2.3.2 Hydrogeological Setting

2.3.2.1 Regional Hydrogeological Setting

The Hawthorne and Flint River Formations supply modest yield of water to dug and shallow wells drilled in the eastern half of the county. These formations are not significant in terms of a regional water supply, and are considered as a semi-confining unit to the underlying Floridian aquifer (Ocala Limestone). The clay layer of chemically-weathered residuum of the Ocala is laterally continuous and of substantial thickness in places to create a hydraulic barrier to vertical flow of water, causing perched groundwater conditions.

The Ocala is the uppermost regional water supply of significant yield potential. In the area of the Site, water supply wells may yield up to 400 to 500 gallons per minute (gpm). Structure contour and isopach maps of the Ocala limestone in northeastern Crisp County show the top of the unit occurs as an approximate elevation of 290 ft amsl and the base at about 60 ft amsl (Arora, 1984). The depth to water in the Ocala varies across the county and may be as much as 150 ft bgs in eastern Crisp County.

The Claiborne Group is the principal regional water supply, capable of yields of 1200 gpm. The four City of Cordele water supply wells obtain their supply primarily from the Claiborne and to a lesser extent the underlying Wilcox Group (well numbers 1 and 2 were previously decommissioned; presently the city is served by well numbers 3, 4, 5, and 6). These water supply wells are dispersed and as far as three miles east of the city in the direction of the Drexel Facility. The nearest of the city water supply wells (well number 6) is approximately 4,000 ft northwest of the Facility; well number 6 is cased to a depth of 364 ft bgs with multiple screened intervals extending to a total depth of 600 ft bgs. Structure contour and isopach maps of the Claiborne Group in northeastern Crisp County show the top of the unit occurs as an approximate elevation of 40 to 80 ft amsl and the base at about 245 to 280 ft below mean sea level (bmsl) (Arora, 1984).

Based upon a regional hydrologic study of the aquifer (Hydrologic Atlas 22), the groundwater flow direction is to the east-southeast (Peck et al., 1999).

2.3.2.2 Site Hydrogeology: Perched Water in Residuum

As mentioned above, perched groundwater conditions are often found in the residuum of the Ocala. Fifteen shallow perched water zone monitoring wells and one deeper perched water zone well offset were installed during the Peachtree Environmental Inc. (Peachtree) Compliance Status Report investigation (Peachtree, 1999 and 2001). Water was reported to occur in each of the well installations, although the depth-to-water varied greatly from 1.3 ft below top of casing to as much as 35.4 ft below top of casing. At the well cluster location (MW-15), the depth-to-water varied from 3.3 ft below top of casing in the shallow well to 27.2 ft below top of casing in the deeper overburden well. In 2004, GeoSyntec Consultants (GeoSyntec) advanced 19 soil borings and direct-push well points (at some locations in excess of 40 ft bgs) across the Site to better understand the Site hydrogeology of the overburden; groundwater was not encountered in any of these borings or well points. Based on this, GeoSyntec concluded at that time that the shallow groundwater is either a localized perched water table condition, or the soils have such low permeabilities in places that water is extremely slow to release from the formation into the borehole/well point. Subsequent studies performed during the RCRA 3013 site assessment (EPS, 2008) proved the hypothesis that the water in the overburden (i.e., subsurface soils overlying the bedrock) is perched water (further detail is provided in Appendix E of the VIRP).

2.3.2.3 Site Hydrogeology: Ocala Limestone Aquifer

The Ocala Limestone underlies the overburden. Two former water supply wells (PW-1 and -2) were installed within the Ocala. PW-1 was approximately 235 ft deep while PW-2 was approximately 270 ft deep. These former water supply wells were cased through the overburden (to prevent soil from collapsing into the well) and partially into the limestone (likely where the rock is loosely cemented and easily friable), and were open-hole installations to their termination depth. These wells were abandoned in 2012. Groundwater at the Site is encountered at approximately 150 ft bgs.

In 2005 three groundwater wells were installed at and near the Site (see Figure 5). Well BW-1 was installed to a depth of 170 ft between Tank Farm #1 and the rail unloading area. Well BW-2 is 179 ft deep and is located at the southeastern corner of the Drexel Facility. Well BW-3, which is 175 ft deep, is located just over 300 ft from the northwest corner of the Drexel Facility. The first approximation of the potentiometric surface at the Site (based on these three wells) was presented in the RCRA 3013 Report (EPS, 2008). The groundwater flow direction based on these wells was determined to be to the south-southeast. Based on this direction of groundwater flow, a more ideally situated well downgradient from the area of greatest contamination was needed. Therefore, in 2010 another well (BW-4) was installed. The total depth of the well is 180 ft and is located near the middle of the Drexel Facility's southern fence line. Groundwater depths from BW-1, BW-2, BW-3, and BW-4 were measured in August 2012, which indicated a groundwater flow direction with a more easterly component. Thus, for the purposes of delineation, EPS installed two additional wells in 2013. EPS installed BW-5 with a total well depth of 170 ft east of the Drexel Facility for horizontal delineation. EPS installed BW-5 near former well PW-1 for vertical delineation. BW-6 is a multi-level sampling well (specifically a FLUTe^{TM} well) with sample ports screened at 180-190ft, 280-290ft, and 380-390ft. The potentiometric surface from February 2014 is shown on Figure 5.

2.4 Chemical Fate and Transport

2.4.1 Constituent of Concern

The primary constituent of concern in groundwater (the only constituent that consistently exceeds its RRS) is EDB. This section provides a description of the potential fate and transport mechanisms for EDB and an empirical model for its fate and transport at the Site.

2.4.2 General Physical/Chemical Properties of EDB

EDB is a low-molecular-weight (187.88 g/mol) halogenated hydrocarbon that is more dense than water (specific gravity of 2.172 at 25° C; Windholz, 1983). The fate and transport of EDB through the overburden (soil) to the groundwater table depends on the soil adsorption properties and bioavailability for microbial degradation. The log Koc (soil organic carbon/water partition coefficient) value for EDB is 1.45 (USEPA, 1998), which indicates that EDB has low to moderate soil adsorption and a high mobility in soil. The vapor pressure is 11 mm Hg at 25° C (ATSDR, 1992) and the dimensionless Henry's Law Constant is 0.0133 (USEPA, 1998) indicating that EDB readily volatilizes from dry or moist surfaces. Aerobic biodegradation of EDB in surface soil occurs readily (USEPA, 2004A) and EDB is moderately persistent in deeper soil with a representative half-life of 100 days (Extension Toxicology Network, 2004). Anaerobic biodegradation and abiotic degradation in soil are limited (USEPA, 2004B).

The fate and transport mechanisms of EDB in the groundwater include advection, dispersion, sorption to native organic matter, biodegradation, neutral hydrolysis, and non-biological reactions with sulfide. Adsorption of EDB to suspended solids in the groundwater table is not expected based on its log Koc. The range of retardation ratios (rate of movement of water divided by the rate of movement of EDB) that is expected from sorption of EDB to native organic carbon in aquifers is 1 to 4.1, which corresponds to fraction of organic carbon range of 0.01% to 1% (USEPA, 2008). This indicates very little retardation due to sorption would be expected unless there is a significant amount of organic carbon (which is not characteristic of a limestone aquifer matrix). EDB is resistant to abiotic hydrolysis, with a hydrolytic half-life ranging from 6 to 13.2 years (USEPA, 2004A and 2004B). However, at higher concentrations (above 0.2 mg/L), EDB can be abiotically transformed through a reaction with sulfide (USEPA, 2008). The biodegradation half-life under anaerobic conditions (which is the state of the groundwater at the Site) is 15 to 50 days (USEPA, 2006). The range of first order rate constants for anaerobic degradation of EDB in aquifer sediments is 0.03 to 17 per year (USEPA, 2008). Using these decay rates and the following reaction equation:

$C_t / C_o = e^{kt}$, where

C_t = concentration at some time t; use the RRS of 0.00009 mg/L

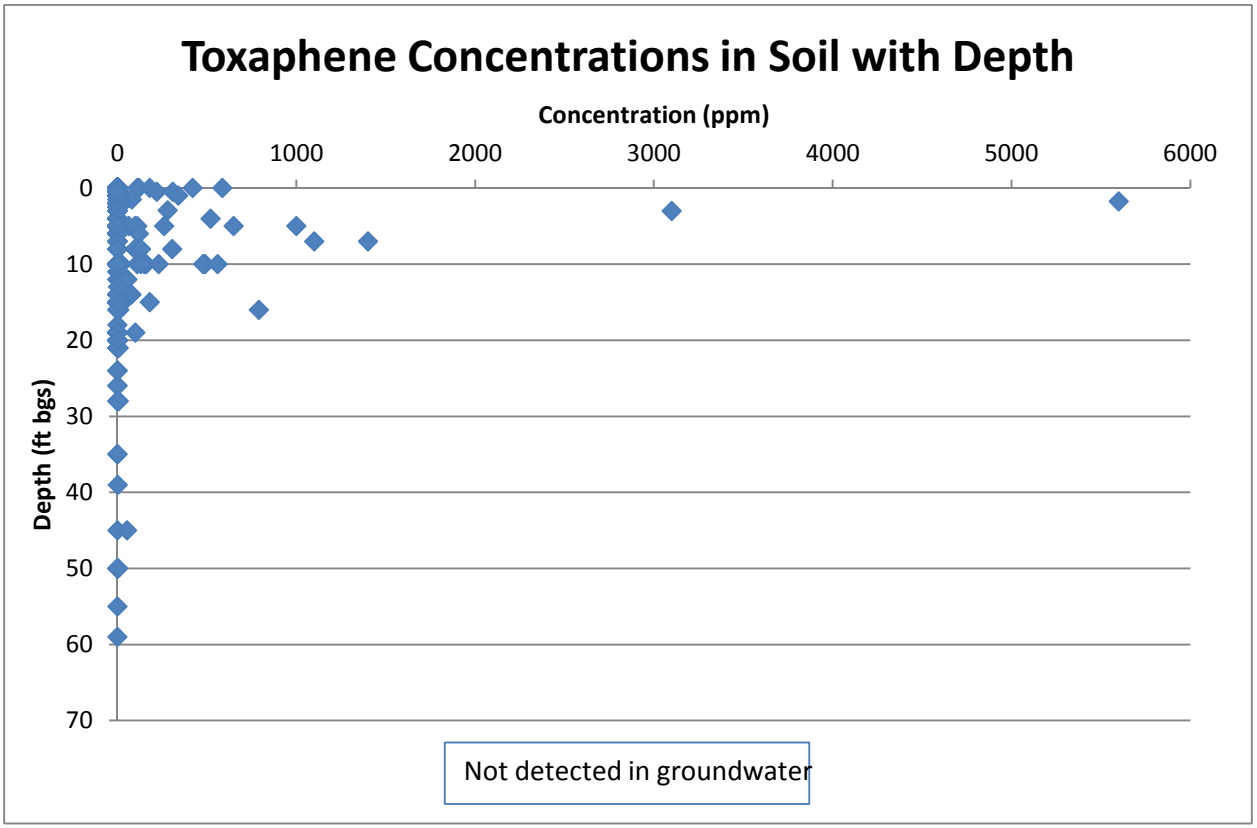
C_o = initial concentration; use March 2013 result of 0.00042 mg/L from BW-1

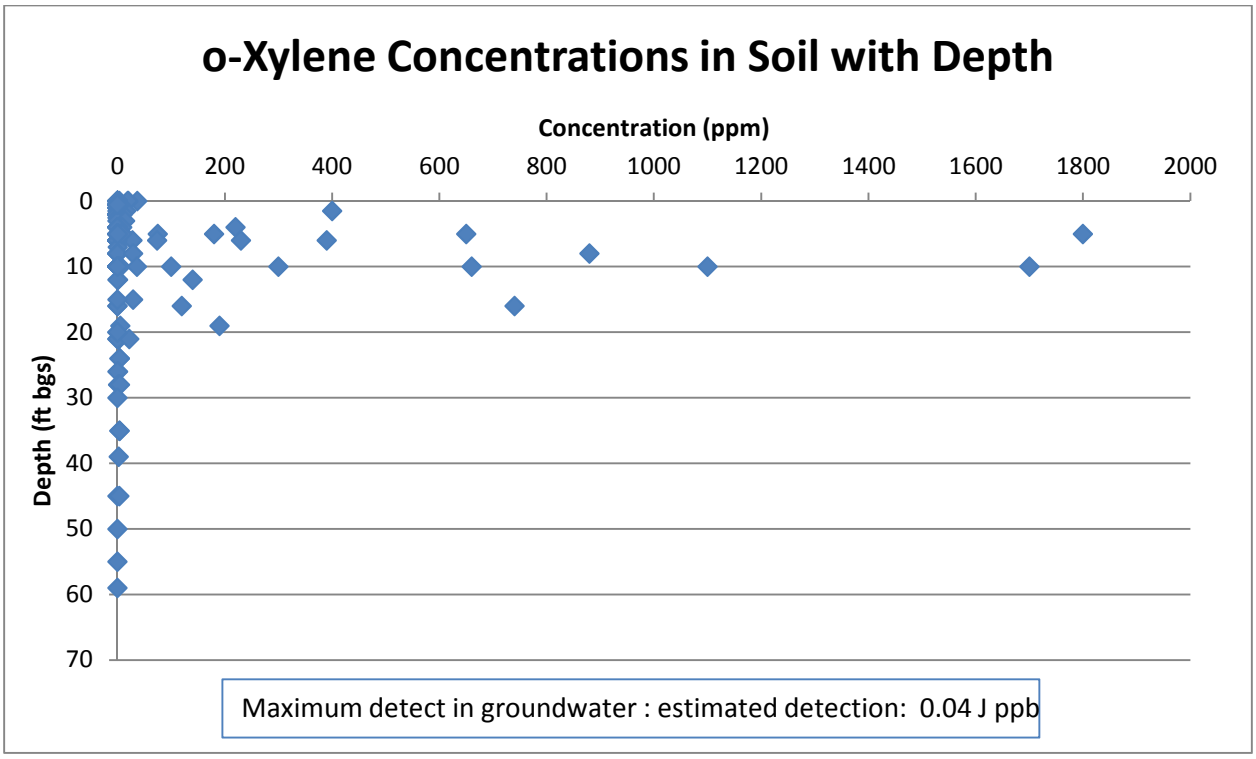
k = first order rate constant; to be conservative, use 0.1 per year,

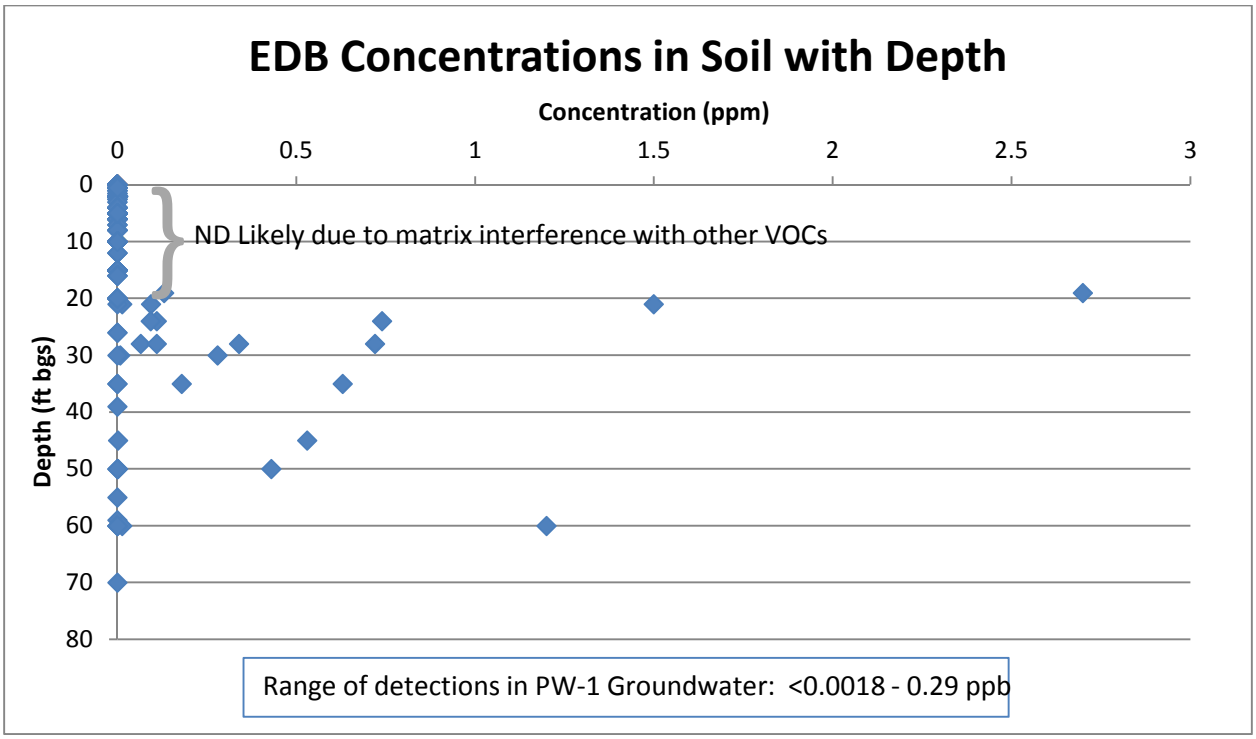
the resulting time until the RRS is reached (using a conservative rate constant) is modeled to be 15.4 years.

2.4.3 Empirical On-Site Model

The empirical evidence indicates that the leaching of constituents to groundwater is either not occurring or is not significant. The concentrations of constituents in the overburden decrease with depth. The graphs below for three of the primary soil constituents of interest demonstrate this decreasing concentration with depth below the ground surface. Despite the age of the facility (in operation since the 1960s) and the high concentrations seen in the overburden, only one constituent has been consistently detected above its RRS in groundwater. And this constituent (EDB) has only been above its RRS consistently in three existing wells (BW-1, BW-5, and BW-6) and one abandoned well (PW-1) and at low concentrations.







The highest concentrations of toxaphene and o-xylene in soil (along with other constituents) occur in the 0-20 ft bgs range. EDB is not detected at these shallow depths in soil, but is detected below 20 ft bgs. It is believed that the high concentrations of VOCs and pesticides in the 0-20 ft bgs range are causing matrix interferences during the analysis of EDB in these samples.

The model described below and shown on Figure 9 provides an explanation as to how EDB may be found in the groundwater when leaching is not a significant factor at the Site. The groundwater aquifer, which is located in the limestone has very low concentrations of EDB. Considerably higher concentrations of EDB have been reported in perched water found in the overburden. Samples of the perched water have been collected in the area of high soil contamination (DC-14N) and near this area (MW-15, MW-15D). In 2000, a high concentration (3,200 µg/L) of EDB was found in perched water that was sampled while collecting a soil sample at location DC-14N. Nearby monitoring wells placed in the overburden (MW-15 and associated deeper overburden well MW-15D) had a concentration of 53 µg/L in 2000 and 80 µg/L in July of 2003[2]. During the same time period (2000-2003) PW-1 (which was located in the limestone aquifer downgradient of the area of high soil concentrations) had concentrations of <0.0021 to 0.21 µg/L. Well BW-1 (located near DC-14N in the area of higher soil contamination) was constructed in 2005 in the limestone aquifer. Concentrations in this well have ranged from non-detect to 0.42 µg/L.

The former production wells had an open borehole construction in the limestone bedrock. In 2005 downhole geophysical logging was performed on PW-1 and PW-2 (see Appendix B for more information). It was determined that the casings for these wells were not sealed. It is likely that the contaminated perched water migrated downward through the overburden then migrated vertically downward through the unsealed casings of PW-1, resulting in the presence of constituents in the limestone aquifer.

2.5 Potential Receptors and Exposure Pathways

The Drexel plant is an isolated industrial facility that is set in a primarily agricultural area. The facility is not connected to city water or city sewer. The Facility is approximately 6.89 acres bounded on the west by Cape Road, to the north by a railroad, and to the south and east by private agricultural land. All of the facility's pesticide blending operations take place on the northern half of the Facility; the southern half was purchased for future expansion and is presently used primarily for employee and visitor parking. A septic drain field is also present on the southern half of the Facility. The Facility is completely enclosed with an 8-foot chain link fence.

Drexel currently employs approximately 30-40 people at the Cordele facility. Potable water for employee use has been delivered to the facility from an outside vendor since Drexel ceased operations of the facility water supply wells. A literature-based well survey (Peachtree, 2001), identified three public water supply wells within a three mile radius of the Facility. These wells were determined to be located approximately 11,000 ft northwest, 4,000 ft northwest, 8,500 ft northeast of the Facility, with depths upwards of 600 ft bgs. Nine private domestic-supply wells have been identified within a one half-mile radius of the Facility. The nearest private well down/sidegradient of the Facility is at the Akin residence (100 Cape Rd.), approximately 383 ft south of the Facility's fence line. However, this well is not currently in operation and the power supply has been shut-off. There is an abandoned residential well (Well D) that is approximately 460 ft southeast of the Facility's fenceline, which is currently used by the Facility as a non-potable

[2] Samples collected in 2000 were labeled MW-15 and DW-1. Samples collected in 2000 by the EPD were labeled as MW-7 and MW-7D.

water source. There is also a private well approximately 110 ft north of the Facility's fence line at the Stewart residence (140 Cape Rd.); this well is upgradient of the groundwater flow direction.

The adjoining properties are used for residential or agricultural purposes or are currently vacant. In October 2009, Drexel purchased additional parcels of land comprising approximately 35.2 acres. Several of these are contiguous parcels, totaling 32.2 acres, which border the southern and eastern boundaries of the Facility. These additional parcels owned by Drexel are currently vacant.

The areas of soil contamination on the Facility included the former Surface Impoundments and along the rail line and spur. These areas have now been remediated to meet Residential RRSs (see Section 5 and Section 6). Note also that most areas are covered by buildings, pavement, or rock ballast that further limit any potential exposure of humans to the subsurface. All previous progress reports included a discussion of the current and/or potential future human and ecological receptors prior to the remedial action. With the conclusion of the soil remedial action, the potential risk to humans and ecological receptors has been virtually eliminated. The remaining potential risk scenario is the use of groundwater.

The groundwater at the Facility has been found to have concentrations of EDB above its Residential RRS. However, the groundwater sampled outside the Facility has not had exceedances of the residential RRSs. Therefore, the use of the groundwater at the Facility by any potential receptor (resident or worker) could pose a potential hazard to humans. Accordingly, Drexel is implementing an environmental covenant (see Section 8) that prohibits the extraction of groundwater for non-remedial purposes.

3 CONDITION PRIOR TO REMEDIATION

3.1 Site Investigations

The Site has been investigated on numerous occasions over the years by a number of different parties. EPS has compiled all of these environmental data records into a relational database library. Throughout these investigations, the primary focus has been characterization of soil at the Drexel Facility and rail spur, and soil/sediment along drainage areas off the Facility. Groundwater has also been investigated. Hundreds of surficial and subsurface soil samples have been characterized for pesticides, herbicides, metals, volatile organic compounds (VOCs), and semi-VOCs (SVOCs). Appendix B contains a summary of the previous site characterization and response actions. Appendix B also contains data summary tables for soil and groundwater sampling conducted at the Site.

3.2 Risk Reduction Standards

Drexel has worked with the EPD to develop RRSs for the Site. The methodology used to determine the RRS is presented in a technical memorandum to the EPD (EPS, 2010). The RRSs were revised according to EPD's comments in a letter dated December 2, 2010 and presented in the VIRP. These RRSs were approved by the EPD in a letter dated April 28, 2011. The approved soil and groundwater RRSs are shown in Table 1 and Table 2, respectively.

Based on section 12-8-108 of the Georgia Voluntary Remediation Program Act, the soil and groundwater was to be delineated to default residential cleanup standards. Type 1 RRSs were used as the delineation standards and are shown in Tables 1 and 2 for soil and groundwater, respectively.

3.3 Delineation

3.3.1 Groundwater Delineation

Analytical results for organic constituents detected in groundwater are shown in Table 3. The only constituent that was detected above its delineation standard was EDB. Horizontal delineation of groundwater is shown on Figure 10. Wells PW-Stewart, PW-Scoggins and BW-4 provide horizontal delineation to the north, west, and south, respectively. BW-5 provides a practical horizontal delineation of groundwater to the east as results in BW-5 have ranged from 0.06 to 0.11 µg/L, compared to the Residential RRS of 0.09 µg/L. A sample from BW-5 was recently collected for EDB analysis. The result (0.11 µg/L) is included in Table 3 and the laboratory report is presented in Appendix C. Well BW-6 provides vertical delineation of groundwater. EDB is detected above the delineation standard in the shallowest screened interval (BW-6-1), but was non-detect in the two lower screened intervals (BW-6-2 and BW-6-3). In the letter dated June 19, 2014, the EPD concurred that vertical delineation of groundwater is complete. EPD also stated

that horizontal delineation of groundwater is incomplete due to the EDB concentration in BW-5. However, the EPD is not requiring the installation of an additional delineation well at this time. Instead, Drexel will to continue monitoring groundwater at BW-5 as part of the post-remediation groundwater monitoring program.

3.3.2 Soil Delineation

According to the VRP schedule, horizontal delineation was to be demonstrated in the Second Progress Report. The only property in the VRP at the time of the second Progress Report was the Drexel Facility. Thus, in the Second Progress Report (EPS, 2012A) delineation was demonstrated on the Drexel Facility property. The EPD concurred with soil and groundwater delineation of constituents on the Drexel Facility parcel in a letter dated December 5, 2012. Delineation outside the Drexel Facility was presented in the Fourth Progress Report (EPS, 2013A). In the June 19th, 2014 letter, the EPD concurred that the soil has been horizontally and vertically delineated. The portions of the Second and Fourth Progress Reports pertaining to delineation are included in Appendix D. Figure 11 gives an overview of the delineation of soil at the Site. This figure shows in purple where there was at least one exceedance of a delineation criteria at a given location (at any depth). The green circles are locations where every constituent sampled at every depth was below the delineation criteria.

4 REMEDIAL ACTION PLAN

4.1 Overview

The final remediation plan was presented in the Fifth Progress Report (EPS, 2013B) and consisted of four phases: 1) former surface impoundment remediation, 2) rail line and drainage swale remediation, 3) groundwater remediation and monitoring, and 4) environmental covenant. Phase 1 and Phase 2 have been completed. The remediation component of Phase 3 (groundwater remediation and monitoring) has started and monitoring will be ongoing. The environmental covenant (Phase 4) is in a draft form.

4.2 Basis for Phase 1 and Phase 2 Soil Excavations

4.2.1 Introduction

Drexel elected to remediate the Site to meet Residential RRSs. Figure 12 shows in orange where there is at least one exceedance of a soil Residential RRS at a given location. The VRP approach allows for the use of engineering controls (such as concrete or asphalt covered soils) or institutional controls to interrupt exposure pathways. The majority of this Site is covered with some form of exposure barrier (buildings on concrete slab, concrete apron surrounding buildings, and rock ballast and rail along the spur area) that makes current exposure to the soils an incomplete pathway. Nevertheless, Drexel decided to address impacted soil without the use of either engineering or institutional controls. Even though the facility is industrial with no plans to be converted to residential use, Drexel decided to perform remediation in order to meet Residential RRSs.

4.2.2 Area Averaging

The VRP Program does not require a point-by-point remediation, but instead allows remedial action decisions on area-average concentrations (e.g., 95% upper confidence limit (UCL) on the average concentration). The VRP incorporates the concept of exposure domains within which representative concentrations of constituents can be derived from the site characterization data. The Site was divided into five exposure domains (see Figure 12) to encompass the areas where the soil condition exceeded the Residential RRSs. The approximate 1-1.5-acre dimension of the exposure domains is appropriate for potential future use scenarios for the Facility including the potential for residential use (residences in this agricultural area are commonly on one or more acres of land).

Area-averaging was conducted by first performing spatial interpolation to estimate the concentration gradients across the domains. Second, the representative concentration (95% UCL) was calculated using the robust statistical model Pro UCL (USEPA, 2007) for each constituent of interest in each domain at different depth intervals. The representative concentrations were then compared to the Residential RRSs.

Because the former surface impoundments (SIs) were defined units generally confined within concrete, the soil results obtained within the former SIs were not included in the area-averaging analysis. The plan for the Phase 1 soil remediation of the SIs was based on the physical dimensions/locations of the SIs (see Section 4.2.3). The plan for the Phase 2 soil remediation was developed based on an area-averaging analysis, as described in Section 4.2.4. Figure 13 shows the Phase 1 and Phase 2 remediation plan.

4.2.3 Phase 1: Surface Impoundments

The majority of the Site was evaluated based on an area-averaging approach (see Section 4.2.4). Although averaging techniques (allowed under the VRP) would likely indicate that very little (if any) of the former SIs would need to be remediated, Drexel decided to remove former SIs where the environmental condition of the materials in the SIs were in excess of the Residential RRSs. Table 4 shows the analytical results related to the former SIs for constituents for which at least one result exceeded the Residential RRS. More complete information is included in Appendix B and Appendix E.

EPS sent a memo on November 11, 2013 to notify the EPD of the intended remedial action (included as Appendix E) to allow an opportunity for the EPD to comment on the action prior to it being implemented. In response, the EPD requested that six confirmation samples be taken at each SI (where existing data was not already available): three at the base of the excavation and three along the side-walls. EPD further specified that the samples should be analyzed for metals and pesticides.

The proposed remedial action consisted of removal of four surface impoundments (see Figure 13) per the following:

- Surface impoundment #5: Removal of the concrete surface impoundment structure, excavation of soils contained within the structure, and soils beneath the structure to a preliminary total depth of 15 ft.
- Surface impoundment #9: Excavation of the soils in the former surface impoundment area and soils below the former impoundment to a preliminary total depth of 10 ft. The surface impoundment structure was removed in earlier remedial action at the site.
- Surface impoundment #15: Removal of the concrete surface impoundment structure and excavation of soils contained within the structure to a preliminary depth of 7 ft.
- Surface impoundment #20: Removal of the concrete surface impoundment structure and excavation of soils contained within the structure to a preliminary depth of 7 ft.

Note, the remediation was not a “point-by-point” cleanup where every point above the Residential RRS would be excavated. Instead, it was designed to remove specific SIs and surrounding soil with elevated concentrations. The confirmation samples were then used in the area-averaging analysis for the facility.

4.2.4 Phase 2 – Rail Line and Drainage Swale

The basis for remedial action was presented in the Fifth Progress Report (EPS, 2013B). The relevant sections of that report are included in Appendix F. The remedial action was selected based on human health and ecological evaluations. A brief summary of the basis for determining the remedial action areas for protection of human health presented in this section; please refer to Appendix F for more information.

The data used for the area-averaging is shown in tables 5A through 5D, which show the analytical results (by exposure domain and depth interval) for constituents that had at least one result above the Residential RRS. Data is not shown on these tables for the North Swale domain as the results were below the Residential RRS. (Note, Appendix B and Appendix F contain more detailed information.) The representative concentrations were developed by computing the 95% UCL on the interpolated data for each constituent of interest in each domain at different depth intervals. These representative concentrations were compared to the Residential RRSs. The exposure domains that had representative concentrations above the Residential RRSs were evaluated further to determine where remedial action was warranted in order to meet the Residential RRSs.

An iterative process was used to determine areas of the Site that required further action using a small-sized grid approach. For the primary constituents, various model runs were conducted to determine the specific dimensions of areas of the Site that needed to be addressed. In other words, if certain areas of the site were addressed (i.e., soil excavation), the resulting post-remediation condition (i.e., 95% UCL) would be below the Residential RRS.

The results of this analysis indicated that removal actions along either side of the rail line and rail spur and along the southern drainage swale (see Figure 13) would be sufficient to meet the Residential RRSs.

5 PHASE 1: EXCAVATION OF FORMER SURFACE IMPOUNDMENTS

5.1 Background on the Former Surface Impoundments

There were eight former Surface impoundments (SIs) at the facility (see Figure 3 and Figure 12). Based on aerial photography, the units were constructed at least by 1968. According to the 2001 Compliance Status Report (prepared by Peachtree Environmental for the former site owner, Gold Kist):

> Prior to the pesticide operation, the liquid fertilizer operation was designed to use eight SIs as part of the production process. However, USEPA recorded in its February 1985 Site Inspection that the Gold Kist Plant Manger reported that the basins were used to collect rainwater, but did also receive "floor sweepings" and pesticide residues and waste containers. This practice dates back until at least 1973 when an EPD inspector noted the impoundments were used for this purpose, and that sodium hydroxide was being used to "break down the pesticides." For a period of time in the late 1970's, and possibly into the early 1980's dust from air pollution control systems was placed in at least one impoundment. The quantity has been described by the former Gold Kist Plant Manger as "a few wheelbarrow loads per year" and reportedly consisted mainly of inert clays (Pyrax dust) which were carriers for liquid pesticides.

The SIs were constructed of poured concrete, each approximately 45 ft in diameter at the surface and sloping down (in a bell-like shape) to the bottoms, which are at approximately 7-8ft bgs in the center.

In approximately 1985, some of the contents in each SI were removed and the SIs were backfilled and graded. The majority of the concrete structure from SI 9 was also removed at some unknown date. The remaining seven SIs still had the entire concrete structure underground. Each SI was buried beneath a concrete surface, either outside in a paved area or inside under a floor slab.

5.2 Implementation of Remediation Plan

5.2.1 Introduction

The selected contractor (A&D Environmental) mobilized to the Site on November 18, 2013 to begin this remedial action. A summary of the actual amounts excavated is shown below and details for each SI are provided in the following section. The equipment was decontaminated between each SI excavation. The excavated material was temporarily stockpiled on-site in approximately 500 cubic yard (CY) piles. Representative samples of the material were collected and analyzed for constituents using the toxicity characteristic leaching procedure (TCLP) to determine whether the material could be disposed of as hazardous or non-hazardous. The material was then

transported to the appropriate disposal facility. The results of the confirmation sampling are shown on Table 4. The excavation areas were backfilled with stone and the concrete slab was replaced. The transportation and disposal documentation is included in Appendix G and laboratory data reports are included in Appendix H. A photolog is included as Appendix I.

The table below shows the summary information for each SI excavation. The actual depth of excavation exceeded the planned depth in some SIs based on initial post-excavation sampling results. Figure 14 shows the actual extents of excavation and the locations where confirmation samples were collected.

Summary of Surface Impoundment Remediation

SI #	Concrete Bottom	Planned Depth of Excavation	Actual Depth of Excavation	Soil and Concrete Debris Excavated
5	7.5 ft	15 ft	15 ft	895 tons
9	Partial 7.5 ft	11 ft	15 ft	907 tons
15	7.5 ft	7 ft	9 ft	438 tons
20	7.5 ft	7 ft	11-15 ft	613 tons
TOTAL				2,853 tons

5.2.2 SI-20

SI-20 was the first SI addressed. The surface concrete was removed and then the concrete SI structure along with the soil contained within and just outside it was excavated. The SI structure was found to be a bowl-shaped concrete structure approximately 45 ft in diameter and 7.5 ft in depth. The SI was initially excavated to a depth of 9 ft. Initial confirmation samples were collected. The three sidewall samples (CS1 through CS3) were collected at a depth of 5 ft from the surface. The results were all low (see tables in Appendix E). Three base of excavation samples (CS4 through CS6) were collected at 9ft. One of the base of excavation samples (CS4) was low, but the other two had elevated concentrations for toxaphene. Therefore, Drexel decided to extend the excavation an additional two feet, to 11 ft. Three additional base of excavation samples were collected (CS7 through CS9). One of these samples (CS7) had elevated concentrations DDT, chlordane and toxaphene. Thus, Drexel extended the excavation in the area of CS7 an additional two feet, and a subsequent confirmation sample (CS10-13) was still elevated. After an additional two feet of excavation (to a total depth of 15ft in the southeast corner of the SI excavation), the confirmation sample (CS10-15) had low concentrations. Thus, approximately two-thirds of the SI-20 excavation area was to a depth of 11ft, while the remaining third was to a depth of 15ft. The locations of the confirmation samples are shown on Figure 14.

During the excavation, a few remnant structures were discovered underground. A pipe ("pipe 1") was found approximately two feet below ground on the north side of the SI. Additionally, what appears to be a French drain was uncovered around the south side of the SI. Initially it was thought that there were two pipes: "pipe 2" on the southwest side of the SI and "pipe 3" on the southeast side of the SI. However, after additional excavation it was discovered that they were part of the

same structure, what appears to be a French drain that may have run alongside the SI when it was in use. As a precaution, EPS collected samples of the soil at each of the locations analyzed for metals, pesticides and VOCs. All results had low concentrations.

The excavated material was stockpiled and TCLP testing indicated that the soil was non-hazardous. A total of 612.54 tons of soil from SI-20 was transported off-site and disposed of at the Crisp County Landfill.

5.2.3 SI-15

SI-15 was the second SI addressed. The surface concrete was removed and then the concrete SI structure along with the soil contained within and just outside of it were excavated. The SI structure was found to be a bowl-shaped concrete structure approximately 45 ft in diameter and 7.5 ft in depth. The SI was excavated to a depth of 9ft. Initial confirmation samples were collected. The three base of excavation samples (CS4 through CS6) were collected at 9ft. All three base of excavation samples had low concentrations. The three sidewall samples (CS1 through CS3) were collected at a depth of 5 ft bgs. The results for two of the sidewall samples (CS2 and CS3) were low; however, the third sidewall sample (CS1) had an elevated concentration of toxaphene. Therefore, Drexel decided to extend the excavation laterally in the direction of CS1 (to the northeast). A subsequent confirmation sample (CS1R) was collected along the newly cut sidewall. This sample had low concentrations. In summary, SI-15 was excavated to 9ft and additional lateral excavation was conducted on the northeast side.

During the excavation, a terracotta pipe was discovered approximately 8ft underground on the north/northeast side of the excavation. As a precaution EPS collected samples of sediment residue contained within the pipe (Pipe1Content), and soil located outside of the pipe (Pipe1) and had them analyzed for metals, pesticides and VOCs. Some of the metal (arsenic, cadmium and copper) results were elevated. When the excavation was extended in the direction of CS1 (mentioned above), this also included additional excavation of the pipe. Therefore, additional samples (Pipe1R and Pipe1ContentR) were collected. The soil sample outside the pipe (Pipe1R) had results that were all low. However, the contents inside the pipe were still elevated for several metals. After the pipe was flushed with water, an additional sample of the sediment in the pipe was sampled (Pipe1ContentRs). This sample was factored into an updated area-averaging analysis, showing that condition to be below remedial goals. At this point, the pipe was sealed with concrete.

The excavated material was stockpiled and TCLP testing demonstrated that the soil was non-hazardous. A total of 438.34 tons of soil from SI-15 was transported off-site and disposed of at the Crisp County Landfill.

5.2.4 SI-5

SI-5 was the third SI addressed. As this SI was located inside an active building, shoring was put into place to retain the building's integrity after the surface concrete was removed. Next the concrete SI structure along with the soil contained within and just outside of it were excavated. The SI structure was found to be a bowl-shaped concrete structure approximately 45 ft in diameter and 7.5 ft in depth. The soil underneath the SI was excavated to a depth of 15ft and confirmation

samples were collected at the base of excavation (CS4 through CS6). Three sidewall samples (CS1 through CS3) were also collected at a depth of 7ft. All six confirmation samples had low concentrations. Therefore, the excavation area was backfilled and resurfaced.

The excavated material was stockpiled and the TCLP results exceeded the threshold concentration for chlordane. Exotech conducted a treatability test on the soil to determine the feasibility of treating the soil such that it could be disposed of as non-hazardous. Five different chemical combinations (persulfate with iron activator, persulfate with sodium hydroxide activator, zero valent iron, calcium polysulfide, dithianite and zero valent iron with surfactant) were evaluated. Nearly all approaches resulted in a decrease in chlordane concentrations, with sodium persulfate and calcium polysulfide providing the greatest decreases (77-84% reduction). However, TCLP test results at the conclusion of the treatability test still failed for chlordane. Accordingly, the material (895.44 tons) was transported to Heritage Environmental Services for incineration.

5.2.5 SI-9

SI-9 was the last SI addressed. As this SI was located inside an active building, shoring was put into place to retain the building's integrity after the surface concrete was removed. It was believed that the concrete SI had been removed at some point in the past. However, during some exploratory trenching, the concrete bottom of the SI was discovered at a depth of 7-8ft and part of the eastern side of the SI was discovered. What was left of the concrete SI structure along with the soil contained in a 45 ft diameter area was excavated. The middle part of the excavation (where the concrete bottom was located) was excavated an additional 3 ft beyond the concrete, to a total depth of 10ft. Confirmation samples were then collected. Three sidewall samples (CS1 through CS3) were collected at a depth of 6ft and the three base of excavation samples (CS4 through CS6) were collected at 10ft. All six confirmation samples had elevated concentrations of at least one constituent. Therefore, the excavation area was extended both laterally and vertically to a total depth of 15ft in the middle. The lateral excavation extended to where the shoring was in place and extended vertically down to a depth of 7ft. Three new sidewall confirmation samples (CS7 through CS9) were collected, and all had low concentrations. Three new base of excavation confirmation samples (CS6, CS10 and CS11) were collected at a depth of 15ft. CS6 was analyzed for pesticides and metals. However, CS10 and CS11 were only analyzed for metals as two historical borings (BHS1C-9-1 and BHS1C-9-2, both at a depth of 13-15ft) serve as confirmation samples for pesticides. All six confirmation samples but one had concentrations below the RRS. The one sample will concentrations above the RRS were not sufficiently high to warrant further excavation as the samples were factored into an updated area-averaging analysis, showing that condition to be below remedial goals. Therefore, the excavation area was backfilled and resurfaced.

The excavated material was stockpiled and TCLP testing demonstrated that the soil was nonhazardous. A total of 907.27 tons of soil from SI-9 was transported off-site and disposed of at the Crisp County Landfill.

5.3 Post-Remedial Action Condition

The final confirmation samples from the Phase 1 remediation (shown on Table 4) were incorporated into the area-averaging model (described in Section 4.2.3) for the exposure domain in which the SIs reside ("Drexel West"). The results were presented in the Sixth Progress Report (EPS, 2014). The applicable pages are included in Appendix E. The outcome is also summarized in Section 6.3 (see also Table 5A and Table 6). In summary, the resulting condition meets Residential RRSs.

6 PHASE 2: SOIL EXCAVATION ALONG THE RAIL LINE AND DRAINAGE SWALE

6.1 Proposed Action

The selected remedial option for soils in the rail line and drainage swales was excavation. The excavation plan was organized into nine distinct "Areas" in order to facilitate the work, as shown in Figure 15. The plan specified each Area to be excavated down to the depth indicated by the color of the polygon on Figure 15.

Excavation Area	Description	Approximate Area (ft^2)	Planned Excavation Depth (ft)	Actual Excavation Depth (ft)
1	Drainage swale	8,500	2 ft	3-3.5 ft
2	South Rail line/spur	5,300	5 ft	5 ft
3	South Rail line/spur and former AST area	4,000	15 ft	15 ft
4	South Rail line/spur	500	5 ft	5 ft
5	South Rail line/spur	700	2 ft	2 ft
6	Former AST area	900	5 ft	5 ft
7	North Rail line/spur	700	15 ft	15.5 ft
8	North Rail line/spur	400	2 ft	2.5 ft
9	North Rail line/spur	3,000	2 ft	2 ft

No post-remediation confirmation samples were to be collected as the remediation was based upon area-averaging of interpolated concentrations across the domains, which included some pre-remediation confirmation sampling.

6.2 Implementation of Remedial Action Plan

6.2.1 Overview

The remedial action plan called for excavation of a significant amount of soil on either side of an active CSX rail line to a maximum depth of 15 ft. Accordingly, Drexel consulted CSX at every

step of the process to ensure the activities met with CSX approval. Due to the deep excavation work, shoring was required on either side of the rail line and along one corner of a building on the Drexel facility. HEPACO, Inc. (HEPACO) was selected to perform the remediation work and Hayward Baker Inc. (HBI) was contracted to perform the shoring design and implementation.

Phase 2 activities commenced August 24, 2015 and were completed by January 14, 2016. A total of 11,426 tons of soil and concrete debris were removed and transported off-site for disposal.

Documentation of the soil disposal off-site is provided in Appendix J. A photolog documenting the project is included in Appendix I. Laboratory data reports are included in Appendix K.

6.2.2 Pre-Excavation Activities

Part of the excavation area was located in wetlands. Accordingly, prior to mobilization to the Site, Drexel submitted a Pre-Construction Notification (PCN) to the Army Corps of Engineers (COE). The COE determined that the work was authorized under Nationwide Permit 38. Drexel purchased mitigation credits as required by the COE.

A CSX flagman was present throughout the project to ensure the safety of all parties.

Prior to mobilization of HEPACO and HBI, a licensed surveyor marked: the corners and turn points for all the excavation areas, where the shoring would be placed, and corners and turn points based on a 2 horizontal to 1 vertical slope (2:1 slope) in the areas that would not be shored. Utility locating services were employed to verify that there were no underground utilities in the excavation areas.

HEPACO installed an access road north of the rail line so that the northern excavation area could be accessed. They also installed the appropriate erosion and sediment control across the Site. HEPACO performed a significant amount of concrete demolition and clearing and grubbing to prepare the Site for the excavations. HEPACO also removed the rail spur that serviced the Drexel facility to facilitate the deep soil excavation in this area.

6.2.3 Shoring

Shoring was required to accommodate the vertical excavations along the CSX rail line and in the corner of the middle warehouse. Elsewhere, a 2:1 sloped excavation was used to maintain sidewall stability. The soil excavated as a part of the sloping was transported offsite for disposal along with the other excavated soil.

Shoring along the rail line was constructed 12 ft from the centerline of the rail line. The shoring consisted of lagging walls, which were constructed by driving soldier piles vertically into the ground every 6 ft and installing timbers between the piles. The procedure involved a sequence of excavation followed by lag wall installation until the target terminal depth of the excavation was reached.

Initially the areas for shoring were excavated to a depth of 5-6 ft. After the lagging timbers were installed to 5 ft along both sides of the rail line, in Areas 3 and 7 (where soils were removed down to 15 ft bgs) tiebacks were installed horizontally between the two lagging walls on either side of

the rail line to provide additional structural support. In Areas 3 and 7, excavation and installation of lagging continued in approximately 5-ft increments until the total depth of 15 ft was reached.

Shoring of the middle warehouse involved installing push piers at the base of the foundation and constructing a shotcrete wall on the adjacent excavation cut face.

6.2.4 Soil Excavation

The removal action utilized at the Site was completed using conventional excavation equipment, including hydraulic excavators, a skid-steer and front end loader for transportation of soils to stockpile areas, and a bulldozer for pushing backfill into excavated areas. Below is an overview of excavation activities performed in each Area to remove impacted soils.

Area 1- Initial excavation began September 16, 2015. The planned excavation depth for Area 1 was 2 ft; however, Area 1 was over excavated to approximately 3-3.5 ft bgs due to wet soil conditions at the time of excavation. Soils removed from Area 1 were stockpiled in the work area prior to transportation to Crisp County Landfill. Area 1 was ready for backfill on September 21, 2015. Perched water observed at the bottom of the finished excavation was pumped out to a frac tank for off-site disposal.

Area 2- Initial excavation began September 21, 2015. Area 2 was excavated down to 5 ft bgs while lagging supports were installed along the soil cut face adjacent to the rail line. Soils removed from Area 2 were transported to Crisp County Landfill for disposal. Area 2 was ready for backfill on October 15, 2015.

Area 3- Soil removal activities in Area 3 were organized into two "runs" to facilitate the work. "Run 1" involved soil removal and shoring installation along the rail line. "Run 2" involved shoring the middle warehouse foundation and excavating the remaining area to 15 ft bgs. Soil removal and shoring activities in both "runs" were conducted in 5-ft lifts. "Run 1" began October 13, 2015 and was completed November 30, 2015. "Run 2" began on October 15, 2015 and was completed December 1, 2015. All soil removed from Area 3 was transported to Crisp County Landfill for disposal. Perched water observed at the bottom of the excavation prior to the completion of soil removal activities was captured in frac tanks for off-site treatment. Area 3 was ready for backfill December 1, 2015.

Area 4- Initial excavation began October 13, 2015. Area 4 was excavated down to 5 ft bgs while lagging supports were installed along the soil cut face adjacent to the rail line. Soil removed from Area 4 was loaded directly into dump trucks and transported to Crisp County Landfill for disposal. Area 4 was ready for backfill October 13, 2015.

Area 5- Initial excavation began October 10, 2015. Area 5 was excavated down to 2 ft bgs and was ready for backfill on October 10, 2015. Soil removed from Area 5 was loaded directly into dump trucks for transportation to Crisp County Landfill.

Area 6- Initial excavation began October 21, 2015. Area 6 was excavated down to 5 ft bgs and ready for backfill on October 21, 2015. Soil removed from Area 6 was loaded directly into dump trucks for transportation to Crisp County Landfill.

Area 7- Initial excavation began on October 13, 2015. Area 7 was excavated down to 15 ft bgs in 5-ft lifts while lagging supports were installed along the soil cut face adjacent to the rail line. Two significant rainfall events delayed production in Area 7. The first event, which occurred on November 1st, resulted in approximately 3.27" of rain in a two-day period. The second event, which occurred on November 7th, resulted in approximately 4.35" of rain in a three-day period. The excavated areas were inundated with rain water, which was pumped out to frac tanks for offsite disposal and an additional 6" of soil was scraped from the bottom of the excavation prior to resuming work. Soil removed from Area 7 was stockpiled in Area 3 due to poor conditions at Crisp County Landfill as a result of the rain. Area 7 soils were eventually transported to the landfill during the week of November 16th. Area 7 was ready for backfill November 12, 2015.

Area 8- Initial excavation began November 12, 2015. Area 8 was excavated down to 2 ft bgs and ready for backfill on November 13, 2015. Perched water from the rainfall events described above was pumped to frac tanks and transported off-site for disposal. As in Area 7, the remediation contractors over-excavated approximately 6" of soil from the bottom of the excavation following dewatering activities. Soil from Area 8 was stockpiled in Area 3 due to the rainfall events described and transported to Crisp County Landfill the week of November 16th.

Area 9- Initial excavation began September 24, 2015. Area 9 was excavated down to 2 ft bgs and ready for backfill on October 15, 2015. All soil removed from Area 9 was directly loaded into dump trucks and transported to Crisp County Landfill for disposal.

6.2.5 Water Management

HEPACO captured approximately 219,790 gallons of water from the excavation areas. The majority was transported off-site to the HEPACO water treatment facility in Doraville, Georgia. Approximately 28,400 gallons was transported to the City of Cordele's Wastewater Treatment Plant.

6.2.6 Soil Disposal

In advance of starting the project, Drexel interacted with the Crisp County Landfill (a local Subtitle D Landfill) to develop a soil characterization plan. The purpose of the plan was to pre-characterize the soil so that all pre-characterized non-hazardous soil could be direct loaded during excavation activities for transport to the landfill. The pre-characterization sampling involved collecting composite soil samples for TCLP-pesticides analysis. Copies of the TCLP laboratory report are included in Appendix K. One sample was collected per every approximately 250 CY of soil to be excavated. The pre-characterization identified one 250 CY area as potentially being RCRA hazardous. This area is referred to as "Area A," which is located within excavation area 7 and 9 as shown on Figure 15. The pre-characterization results were shared with Crisp County Landfill, who then accepted that all soil (except from Area A) was non-hazardous. Accordingly, soil from all areas except Area A was transported directly to Crisp County Landfill without additional stockpiling or testing. During excavation activities, the soil from Area A was stockpiled for additional characterization prior to disposal.

Area A was excavated on October 15, 2015 and stockpiled at a temporary location on the south side of the Drexel facility. The stockpile was placed on top of a double layer of 6-mil polyethylene sheeting, bermed with straw bales, and covered with 6-mil polyethylene sheeting to prevent soil from being unintentionally transported from the pile due to wind or rain. On November 11, 2015, HEPACO physically separated the stockpile into four distinct quadrants (Quadrant 1, 2, 3, and 4). EPS collected a composite soil sample from each quadrant for total alpha/gamma chlordane and pesticide TCLP analysis. Alpha and gamma chlordane were analyzed to determine whether hazardous landfilling or incineration was appropriate. The results are summarized in the tables below:

Area A Pesticide TCLP results

TCLP		Criteria	Quadrant 1	Quadrant 2	Quadrant 3	Quadrant 4
Chlordane	mg/L	0.03	0.11	0.061	0.15	<0.005
Heptachlor	mg/L	0.008	0.0008	<0.0005	0.00079	<0.0005
Toxaphene	mg/L	0.5	0.1	0.08	0.15	<0.05

Area A Total Alpha/Gamma Chlordane Results

TCLP		Criteria*	Quadrant 1	Quadrant 2	Quadrant 3	Quadrant 4
Alpha chlordane	mg/kg	2.6	1	0.2	0.56	0.37
Gamma chlordane	mg/kg	2.6	1.2	0.25	0.67	0.44

*10 times the universal treatment standard

Quadrant 4 results met the criteria for non-hazardous waste disposal. Accordingly, the soil from Quadrant 4 was transported to Crisp County Landfill on December 4, 2015. TCLP results for Quadrants 1, 2, and 3 exceeded the TCLP criteria for non-hazardous disposal for chlordane. The alpha- and gamma-chlordane results were below 10 times the universal treatment standard for chlordane. Thus, soil from Quadrants 1, 2, and 3 qualified for disposal at a hazardous waste landfill without pre-treatment. This soil was loaded into specially prepared roll-offs for transport and disposal to Waste Management's Emelle Treatment Facility in Alabama.

HEPACO transported a total of approximately 11,249 tons of non-hazardous soil and debris to Crisp County Landfill for disposal. Waste Management transported a total of approximately 177 tons of hazardous soil to their Emelle facility for disposal.

6.2.7 Backfilling and Restoration

The excavations were backfilled to grade with clean backfill soil. A state-approved borrow source (Folsom Borrow Source) was selected as the source for fill material. The fill was sampled at the time of selection of the borrow source and the soil brought to the Site was also sampled. Borrow fill analytical results are included in Appendix K. The only constituents that were detected were barium and chromium, which were both at levels well below the Type 1 RRSs.

The fill was transported to open excavations using dump trucks and a front-end loader and pushed into excavated areas and compacted with a bulldozer. The fill was compacted in 6 inch lifts. Field compaction testing was conducted to ensure that the fill material was compacted to at least 95% of its maximum density with a moisture content no more than 1% greater than or 2% less than the optimum moisture determined in accordance with ASTM Designation D-1557 (Modified Proctor). In areas where ballast was required for CSX, the fill material within 3 feet of the subgrade elevation was compacted to at least 98%.

Restoration work began once backfill was graded to pre-excavation elevations. In excavation areas where concrete was removed prior to soil removal activities, the remediation contractor backfilled 12 inches of gravel and constructed a 5,000 psi concrete slab reinforced with rebar over the gravel layer. Areas previously vegetated were seeded with Georgia Department of Transportation seasonal mix and all fencing removed prior to the commencement of soil removal activities was replaced. Additionally, ballast was placed along the rail line where necessary and the rail spur at the Drexel facility was replaced according to CSX specifications.

6.3 Post-Remedial Action Condition

The post-remedial action condition was determined to meet Residential RRSs prior to beginning the remediation. The analysis of the post-remedial action condition was presented in the Fifth Progress Report (EPS, 2013B) and the relevant pages are included in Appendix F. Confirmation samples were collected during the Phase 1 remediation. The post-remedial action condition was re-evaluated by incorporating the confirmation sampling results into the area-averaging analysis. The revised area-averaging analysis for the Drexel West domain was presented in the Sixth Progress Report (EPS, 2014). The relevant pages are included in Appendix E.

Table 6 shows a summary of the post-remedial action condition based on the area-averaging analyses. Table 6 shows for the constituents of interest for each domain and depth interval, the maximum concentration prior to remedial action, the maximum concentration after remediation, and the representative concentration (95% UCL on the average based on interpolation) after remediation. This table shows that for shallow soils (< 15 ft bgs), the representative concentration meets the Residential RRSs. For deep soils (> 15 ft bgs), all constituents except EDB meet the Residential RRSs. As described more fully in Appendix I, despite the EDB concentrations being higher than the Residential RRS, the concentrations at depth are still protective of human health. One component of the RRS determination is direct-contact and another is protection of groundwater. Although the EDB concentrations are higher than the protection of groundwater component, they are well below the direct-contact component. Thus, the concentrations of EDB in soil are protective of human health based on the residential scenario. However, it is unlikely that any residents (or industrial/construction workers for that matter) would ever reasonably come into contact with the soils at these depths (15-60 ft). Thus, the deep soils (> 15ft) can be certified for Residential RRS based on direct-contact.

The only remaining consideration for deep soils is protection of groundwater, which is being addressed by implementation of a groundwater pump-and-treat system at the Facility (see Section 7) and an environmental covenant restricting groundwater usage until the groundwater RRS

criteria is met (see Section 8). The pump-and-treat system will aid in capturing whatever may be leaching. Once groundwater meets applicable RRS, the deep soils can be certified for protection of groundwater on the basis of an empirical site-specific demonstration of soil leaching, i.e., the site groundwater underlying the soil meets the RRS (from which the leaching-based RRS is derived).

7 PHASE 3: GROUNDWATER REMEDIATION AND MONITORING

7.1 Groundwater Remediation

7.1.1 Treatability Study

In July 2013, EPS performed a treatability study to assess the performance of granular activated carbon (GAC) for the removal of dissolved EDB for a proposed groundwater pump-and-treat system. GAC was selected for evaluation based on a review of available EDB remediation technologies for groundwater. Virgin coconut carbon was selected as coconut carbon tends to report better adsorption efficiency for low molecular weight, low volatility compounds at low concentrations (characteristic of the groundwater EDB condition at the Facility).

GAC is an absorption-based technology with the primary design parameters being the groundwater residence time within the GAC vessel (empty-bed contact time, or EBCT) and maximum carbon loading rate. The theoretical EBCT for EDB is 15 minutes and the carbon loading rate is 0.64 pounds (lbs) EDB per 100 lbs GAC. The EBCT evaluated during the treatability study ranged from 19 to 24 minutes based on the maximum groundwater flow rate attainable from monitoring well BW-1. The flow rate was limited to approximately 1 to 1.3 gallons per minute (gpm) by pump capacity. The treatability test showed that this was effective in removing EDB from groundwater, as all the effluent samples were below the detection limit.

7.1.2 Extraction Well Installation

The groundwater extraction well was installed the week of March 14, 2016 using mud/air rotary drilling equipment. The well construction diagram is included in Appendix L. The well was installed between BW-1 and PW-1 as shown on Figure 16. The extraction well is constructed of a 4" Schedule 40 PVC and extends to a depth of 200 ft bgs. The total depth of the extraction well is based on the vertical delineation data obtained from BW-6, which reported EDB at 180-190 ft-bgs, with two deeper intervals at BW-6 reporting non-detect. The screened portion of the extraction well spans an interval from 140-200 ft-bgs. This interval was selected to bracket the current screen intervals of both BW-1 (140-170 ft-bgs) and BW-6.

An 8" outer steel casing was installed to 140 ft bgs. The annular spaces were filled with grout and cement and allowed to settle overnight. The well was completed as a flush mount well with a locking vault. After the well was set, the well was developed. The extraction well is outfitted with a submersible Grundfos 5SQ-230 pump, capable of 5 gallons per minute.

7.1.3 Treatment System Configuration

The treatment system began operation on April 13, 2016. The treatment system consists of two carbon steel tanks in series containing 500 lb of virgin coconut shell carbon in each tank. Influent sampling ports are available to test the influent from the well and effluent after the carbon vessels. The treated water is stored in a 30,000 gallon storage tank for on-demand non-potable use by the facility. Excess water will be discharged through the facility's permitted NPDES outfall.

7.2 Monitoring and Reporting

7.2.1 Introduction and Reporting

The treatment system (influent/effluent) and the groundwater at the Site will be monitored per the Monitoring and Maintenance Plan (Appendix M). This monitoring will continue as long as the pump-and-treat system is in operation. Annually, Drexel will submit the monitoring results to the EPD. This annual report will assess the groundwater condition compared to applicable RRS and/or other relevant risk-based criteria. As described further in the Monitoring and Maintenance Plan, Drexel will annually evaluate the effectiveness of the system to determine whether it should continue.

7.2.2 Treatment System Monitoring

The Monitoring and Maintenance Plan specifies a schedule for monitoring the groundwater EDB concentrations from the extraction well and the effluent of the treatment system. The treatment system monitoring began on April 13, 2016. The table below shows the results of influent and effluent testing received to date. The laboratory reports are included in Appendix C. The influent concentration (water pumped directly from EW-1) has ranged from 0.15 to 0.17 µg/L and the effluent concentration has consistently been non-detect (<0.003 µg/L). This indicates that the treatment system is effectively removing EDB from the extracted water. Treatment system monitoring will continue as long as the system is in operation.

Treatment System Monitoring Results

Date	Influent (µg/L)	Effluent (µg/L)
4/13/2016	0.17	<0.003
4/20/2016	0.11	<0.003
4/27/2016	0.15	<0.003
5/5/2016	0.15	<0.003

7.2.3 Groundwater Monitoring

The groundwater monitoring program will consist of the following:

- Semi-annual monitoring:
    - Extraction well (EW-1)
    - Analyzed for EDB.
- Annual monitoring:
    - BW-1, BW-2, BW-5, BW-6-1, and Well D.
    - Analyzed for EDB.

The first semi-annual monitoring event was conducted on April 13, 2016. As described above the EDB concentrations in EW-1 (the influent to the treatment system) was 0.17 µg/L. The first annual monitoring event will be conducted before the end of December, 2016.

8 SITE COMPLIANCE AND DELISTING

Three parcels (Drexel Facility, CSX, and Drexel Additional Property) are included as part of the VRP program for this Site. An explanation of the certifications for each parcel is provided below.

Drexel Facility

The shallow soils (from 0-15 ft below the surface) meet the Residential (Type 1/2) RRSs. Additionally, the deep soils (deeper than 15 ft) for all constituents except EDB meet the Residential RRSs. EDB in deep soils meet the direct-contact Residential RRS for EDB with controls (environmental covenant) for protection of groundwater. Although the soil meets Residential RRSs, the Drexel Facility parcel is being certified to Type 5 as area-averaging was used to demonstrate compliance.

The Point of Exposure (POE) well for the Site (Well D) does not have any RRS exceedances. However, wells at the Drexel Facility have exceedances of EDB that are being addressed by a pump-and-treat system and environmental covenant. Thus, groundwater on the Drexel Facility parcel is being certified to the Type 5 RRS until such time as the groundwater meets applicable RRS.

The draft Environmental Covenant for the Drexel Facility parcel is included in Appendix N. The principle conditions of the covenant are the following:

- Restriction of groundwater extraction for non-potable use until the groundwater meets applicable RRSs
- Groundwater monitoring per the Monitoring and Maintenance Plan.
- Restriction on use of soil below fifteen feet in the area with EDB concentrations above the leaching-based RRS.

Upon finalization of the language of the covenant, it will be sent to the parties with interest in the property. Once the EPD and Drexel have executed the document it will be recorded with the Facility's deed in Crisp County.

CSX

The shallow soils (from 0-15 ft below the surface) meet the Residential (Type 1/2) RRSs. Additionally, the deep soils (deeper than 15 ft) for all constituents except EDB meet the Residential RRSs. EDB in deep soils meet the direct-contact Residential RRS for EDB with controls (environmental covenant) for protection of groundwater. Although the soil meets Residential RRSs, the CSX parcel is being certified to Type 5 as area-averaging was used to demonstrate compliance.

Groundwater has not been sampled on the CSX property and it is up- and/or side-gradient of groundwater at the Drexel Facility. Accordingly, groundwater on the CSX property is not being certified.

Drexel Additional Property

Soil on the Drexel Additional Property is in compliance with Type 1 RRSs as shown on Figure 11. Accordingly, this parcel is being certified to Type 1 RRSs for soil.

Two wells are located on the Drexel Additional Property. Well D is the POE well and is in compliance with Type 1 RRSs. Well BW-5 has had results that straddle the Residential RRS for EDB. Well BW-5 will continue to be sampled for EDB. If after a year from the submittal of this report concentrations at this well have not fallen below the Residential RRS, an environmental covenant will be placed on this parcel to prohibit the extraction of groundwater from the site for potable uses. For the time being, this parcel is being certified to Type 5 RRSs for groundwater until such time as the groundwater meets Residential RRSs.

As the Site (HSI ID No 10228) is in compliance with RRSs and remedial action has been completed, we respectfully request EPD's concurrence and delisting of the Site from the Hazardous Site Inventory.

Dup - duplicate sample

* RRS not calculated, HSRA Type 1 Groundwater criteria value shown.

NA - not analyzed

NA** - not analyzed due to laboratory error

Bold: Above Residential RRS

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

Excavated during Phase 1 Remedial Action

Bold: Exceeds residential RRS

Qualifiers:

J	The associated numerical value is an estimated quantity.
B	Analyte present in the blank and the sample.
*	Spike recovery is equal to or outside the control criteria used.
P	> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D	Analytes analyzed at a secondary dilution.
E	Reported value is estimated because of the presence of interference.

Excavated during Phase 2 Remedial Action

Bold: Exceeds residential RRS

Qualifiers:

J	The associated numerical value is an estimated quantity.
B	Analyte present in the blank and the sample.
*	Spike recovery is equal to or outside the control criteria used.
P	> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D	Analytes analyzed at a secondary dilution.
E	Reported value is estimated because of the presence of interference.

Excaveted during Phase 2 Remedial Action

Bold: Exceeds residential RRS

Qualifiers:

J	The associated numerical value is an estimated quantity.
B	Analyte present in the blank and the sample.
*	Spike recovery is equal to or outside the control criteria used.
P	> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D	Analytes analyzed at a secondary dilution.
E	Reported value is estimated because of the presence of interference.

Excaved during Phase 2 Remedial Action

Bold: Exceeds residential RRS

Qualifiers:

J	The associated numerical value is an estimated quantity.
B	Analyte present in the blank and the sample.
*	Spike recovery is equal to or outside the control criteria used.
P	> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D	Analytes analyzed at a secondary dilution.
E	Reported value is estimated because of the presence of interference.

B1 SITE CHARACTERIZATION AND HISTORICAL RESPONSE ACTIONS

B1.1 Toxaphene Clean-up Action - 1984

As part of a clean up response to an April 6, 1984 Notice of Violation by EPD, on May 15, 1984 five samples were taken by Gold Kist in the area of Tank Farm #1. These samples indicated elevated levels of toxaphene in the immediate area surrounding the toxaphene bulk storage tank. A soil removal action was later conducted by Gold Kist, and on July 2, 1984, 20 cubic yards of soil was removed an average of two to three ft (up to a maximum depth of five ft). Twelve post-excavation samples were analyzed for toxaphene in an EP toxicity extract in order to verify the clean-up met the goal of 0.5 mg/L in the extract[1].

B1.1.1 USEPA Characterizations - 1985

Portions of the site were re-characterized on February 19-20, 1985 by USEPA. Samples were taken with the objective of characterizing possible contamination in the surface impoundments and a concrete underground holding tank, prior remediated soils, and to determine levels of possible contamination of soil, surface water and groundwater at the Site. Two groundwater, one surface water, and six soil/sediment samples were collected. Surface water and sediment samples were taken in an off-Site drainage ditch along Cape Road near the northwest corner of the Site. Composite shallow surface soil and sediment samples were taken from the bulk unloading area, the southern railroad ditch, the drainage outfall near the northeast corner of the Site, one of the surface impoundments, and a swampy area between the rail line and a pond to the north. Groundwater samples were collected from a nearby private water well (the Stewart residence) and from the on-Site industrial well PW-01. The Stewart well is located about 400 ft northwest of the site and is 200 to 240 ft deep.

Upon arrival at the Site, the USEPA sampling team noted that the four surface impoundments they were aware of had been filled in with soil and graded level. An auger was used to sample what was believed to be the northeast impoundment. The concrete underground holding tank was not sampled at this time due to difficulties removing the tank's concrete lid.

Further characterization was performed on July 22-23, 1985 by NUS Corporation Field Investigation Team (FIT) under contract to USEPA. A total of fourteen samples were taken. Soil/sediment samples were collected at the four known (westernmost) surface impoundments after augering through backfill material at the approximate center of each surface impoundment. A total of five on-Site surface samples were collected from two drainage areas and two composite

[1] EP Toxicity (EP Tox) was a test method typically used to characterize media for RCRA waste (disposal) classification. It does not measure the total compositional makeup of the media tested and therefore would not be applicable to current standard practices for environmental restoration verification.

samples along the rail spur. Three off-Site samples were collected from two locations. A background sample was taken in the wooded area west of the property and two samples were collected from a swampy area north of the facility between the rail line and the pond. Groundwater samples were again collected from the Stewart well and from PW-01.

B1.2 Law Report of Limited Soil Assessment - 1995

In response to a 1994 EPD Hazardous Site Inventory (HSI) listing of the site, Gold Kist consultant Law Environmental, Inc. (Law) conducted an investigation of the Site in 1995 in order to assess site conditions. Law's investigation was similar to prior studies by USEPA and focused primarily on the south side of the rail line. Results of grab samples were similar to both earlier USEPA investigations.

B1.3 Kiber Field Sampling - 1996

In further response to the 1994 HSI listing of the site, Gold Kist consultant Kiber Environmental Services (Kiber) visited the facility in August 29, 1996 to assess the effectiveness of Gold Kist's 1986 clean-up of the bulk unloading area. Kiber collected six background/upgradient samples and three samples in areas previously excavated for removal of contaminated soils. Samples were analyzed using USEPA SW-846 methods for pesticides (3550A and 8081) and arsenic (3005A and 6010A).

B1.4 Compliance Status Reporting Under HSRA (1998-2001)

On behalf of Gold Kist, Peachtree Environmental, Inc. (Peachtree) performed two field investigations of the Site and vicinity under HSRA requirements for a CSR [Peachtree, 1999 & 2001]. The objective of the CSR was to define the vertical and horizontal extent of constituents in soil, drainage way sediments, and surficial groundwater.

The 1999 CSR investigation focused on six areas of the Site identified in the CSR scoping phase as being potential source areas:

1. 1,000 gallon concrete underground "septic"/holding tank located off northwest corner of Liquid Production Building.
2. Rail car unloading area located north of Middle Warehouse.
3. Liquid Plant located on the eastern end of the property.
4. Tank Farm No. 1 located south of the rail car unloading area and in between the Liquid Plant and Middle Warehouse.
5. Four formerly used surface impoundments located on the western side of the property.
6. Former baghouse previously located on the eastern end of the Liquid Plant.

The 2001 CSR (Addendum) investigation and report expanded to eleven the number of areas at the Site identified as being potential source areas:

1. 1,000 gallon concrete underground "septic"/ holding tank located off northwest corner of Liquid Production Building.
2. Rail car unloading area located north of Middle Warehouse.
3. Liquid Plant located on the eastern end of the property.
4. Tank Farm No. 1 located south of the rail car unloading area and in between the Liquid Plant and Middle Warehouse.
5. Eight formerly used surface impoundments located on the western side of the property.
6. Former baghouse previously located on the eastern end of the Liquid Plant.
7. Former drum storage area along the northern fence line
8. Septic tank and associated drain field located south of easternmost building
9. Drum storage area near the south end of the Middle Warehouse.
10. Two alleged debris disposal areas, one along the western side of the property along Cape Road and another on the east side of the property, south of the easternmost building.
11. Tank farm No. 3 located near the southern end of the Liquid Production Building.

Approximately 162 soil borings and greater than 500 individual soil and/or water samples were collected from these focus areas as well as from off-Site areas, including a swampy area between the rail line and a pond to the north, and the northern and southern railroad ditches. Samples collected were analyzed for a broad range of constituent classes using USEPA SW-846 methods (i.e. – Methods 8081 and 8141 for organo-chlorine and organo-phosphorus pesticides, Method 8151 for herbicides, Method 8260 for volatile organics, Method 8270 for semi-volatile organics, and Method 6010 for a select list of inorganics).

Sampling was roughly evenly divided between two field investigations. The first field investigation, consisting of approximately eighty-four borings, was performed from October 1998 to March 1999. The second field investigation, consisting of approximately seventy-eight borings, was conducted from October 2000 to March 2001.

Soils were investigated at depth increments of five ft (up to 20 ft in some places) using direct-push technology (DPT – GeoProbe®). Where DPT was not feasible, soil samples were collected either by split-spoon samples used in conjunction with hollow-stem augering (HSA) techniques or with stainless steel hand augers [Peachtree 2001].

In addition to the soils investigation, Peachtree conducted a literature-based well survey, identifying three public water supply wells within a three mile radius of the property. These wells were determined to be located approximately 11,000 ft northwest, 4,000 ft northwest, 8,500 ft northeast of the Property, with depths upwards of 600 ft below ground surface (bgs).

Peachtree also identified nine private domestic-supply wells within a one half-mile radius of the property. The nearest private well is the Stewart residence, located approximately 400 ft northwest of the property. Access for sampling was granted for seven of these wells.

Peachtree also installed 15 shallow monitoring wells (and one temporary deeper well offset) in the overburden. Water samples were collected from each of the wells, representing what is now known to be perched water above the regional water table. Of these wells, MW-15, which is located in

the rail car unloading area, contained the greatest number and highest concentration of constituents.

During this same period, Drexel consultant Rindt-McDuff & Associates sampled Drexel's two on-Site wells. This water well sampling event used the standard USEPA RCRA analytical test methods. Results did not indicate the presence of EDB, however the RCRA method detection limits were above the drinking water standard for EDB. Subsequent testing of these water sampling wells, in addition to the off-Site residential wells, have used the more sensitive USEPA drinking water analytical methods.

B1.5 Georgia EPD Sampling – July 2003

On July 21-22, 2003 EPD, acting as contractor for USEPA, performed additional Site sampling as part of a CERCLIS site re-assessment effort. EPD took seventeen samples. Four water samples were taken from the shallow monitoring wells installed by Peachtree. Drexel's on-Site water supply well PW-1 was also sampled at this time. Soil, sediment, and surface water samples were taken from outfall #1 near the northeast corner of the property, north of the concrete spillway and at outfall #2 near the rail spur. Additional soil samples were collected from the north side of the rail spur north of the liquid plant and in the southwest corner of the property. Sediment and surface water samples were collected from the swampy area between the railroad tracks and the nearby pond, along with a background sample taken northwest of the property. The samples were analyzed for a broad range of constituent classes using USEPA SW-846 methods (i.e. – Methods 8081, 8082, and 8141 for organo-chlorine and organo-phosphorus pesticides, Method 8151 for herbicides, Method 8260 for volatile organics, Method 8270 for semi-volatile organics, and Method 6010 and Method 6020 for a select list of inorganics).

The sample taken by EPD from PW-1 was analyzed using USEPA SW-8461 drinking water Method 504.1, which has a lower detection limit for EDB. This was the first time a sample from the Site groundwater was analyzed using this method. EDB was detected in PW-1, prompting Drexel to immediately suspend use of this well. At this time, Drexel began supplying the facility with bottled water for worker use and/or consumption. Thereafter, Drexel ceased using PW-2, which had been used to provide non-contact cooling water.

B1.6 Ethylene Dibromide in Groundwater Supply

After EPD reported the detection of EDB in PW-1 from the July 2003 sampling, Drexel immediately re-sampled (samples were also split by EPD) both PW-1 and PW-2 in order to confirm prior results. Samples were also taken from nearby private domestic supply wells by Peachtree (and split by the EPD) in August 2003. Samples were collected from three nearby residences: the Stewart well, located approximately 400 ft northwest of the facility; the Aiken well, located approximated 800 ft south of the facility; and Sanders well, located approximated 2000 ft north of the facility. These samples were analyzed for a full drinking water scan using USEPA SW-846 drinking water methods, including Method 524.2 and 525.2 for Organics, Method 200.8

for Metals, Method 504.1 for EDB (high resolution trace level method), and Method 508.1 for Pesticides. None of the detected constituents was detected above drinking water standards.

Additional sampling of the PW-1 and PW-2 water supply systems was conducted on behalf of Drexel by GeoSyntec on October 30, 2003 (upon approval from EPD of its sampling plan/procedure). The purpose of GeoSyntec's sampling was to measure the concentration of EDB from the well head to key points of potential exposure. Samples were collected from the PW-1 supply line from four locations: the well head tap, the drinking water fountain, and two of the hand wash sink taps in the locker room (one with aerator in place, one without). Upon completion of the PW-1 supply system sampling, the PW-2 supply system was sampled. Samples were collected at the well head, the discharge point, and the outfall at the fence line from the property. Samples were analyzed using USEPA Method 504.1. Drexel then provided notice to EPD of its intention to discontinue its permitted NPDES discharge of non-contact cooling water, which was discontinued shortly thereafter.

B1.7 Drexel Septic System Drainfield Sampling - 2003

Because of EPD's questioning regarding washing of employee coveralls on Site, on October 6, 2003 Drexel personnel voluntarily collected three shallow soil samples from near the distribution box centralized in the septic system drain field located near the fence line south of the Locker/Break Room. Samples were analyzed using USEPA SW-846 methods (i.e. – Methods 8081 and 8141 for organo-chlorine and organo-phosphorus pesticides, Method 8151 for herbicides, Method 8260 for volatile organics, and Method 8270 for semi-volatile organics).

B1.8 Supplemental Septic System Drainfield and Post-Fire Response Action Sampling - 2004

A fire occurred on March 8, 2004 in the facility's Liquid Production Building. As a result of the fire, the majority of the building was demolished. The fire likely resulted in the release of products from their storage containers (much of which likely was consumed in the fire) and into water used by the Crisp County Fire Department to suppress the fire. The concrete culvert in the northeast corner of the property was bermed, as was the area immediately before that NPDES outfall, to retain the fire suppression runoff water. The water that was captured was pumped to 250-gallon totes and bulk tanks for storage prior to sampling, and was then disposed of properly. In the immediate vicinity of the building, surface soil and gravel were scraped (at the direction of EPD), staged in roll-off boxes, sampled and disposed of off-Site.

On March 10, 2004 Region 4 USEPA and EPD conducted an investigation and took thirteen samples that were split with GeoSyntec. The original purpose of this investigation was to investigate the septic tank drainfield area located south of the Locker/Break Room. This scope was expanded to include post-fire response characterization. Six air samples were also taken to assess ambient air quality after the fire. All samples taken were analyzed for a full suite of pesticides, herbicides, VOCs and SVOCs and metals.

Additional post-fire response sampling was conducted by GeoSyntec on April 15-16, 2004 to assess the nature and extent of potential contamination from the fire suppression water runoff. The primary focus of this investigation was to characterize the southern railroad ditch where a portion of the fire suppression water had drained. Twelve samples were taken by GeoSyntec. Samples were analyzed for metals, chlorinated pesticides, organophosphate pesticides, volatile organics, and carbaryl. Two of the samples taken at the northwest corner of the Liquid Production Building were also analyzed for sulfur (owing to a yellowish coloration).

B1.9 Supplemental Site Characterization - 2004

A supplemental site characterization was performed by GeoSyntec on June 2-4, 2004. The purpose of this investigation was to evaluate potential sources of the EDB that had been detected in the on-Site water supply wells, as well as to address certain data gaps from the CSR site-wide characterizations.

A total of fifty-two samples were taken at twenty locations by GeoSyntec. Soils were investigated at depth increments of five ft (up to 10 ft in most places) using direct-push technology (DPT – GeoProbe®). Samples were taken from the former concrete underground holding tank area near the bulk unloading area north of the liquid production building, the alleyway between tank farm #1 and the liquid production building, the former bag house, the liquid production building, the middle warehouse, the septic tank near the laboratory/office, and from some of the surface impoundments. As part of an effort to characterize the former surface impoundments, GeoSyntec profiled the southeastern surface impoundment located across from the lab/office by advancing borings to refusal depth along a transect and recording the depth to refusal at each boring location. A soil sample was collected at six ft bgs from this surface impoundment (at refusal). This soil sample was stained black and exhibited a pungent and sweet odor. Samples collected were analyzed using USEPA SW-846 methods (i.e. – Methods 8081 and 8141 for organo-chlorine and organo-phosphorus pesticides, Method 8151 for herbicides, Method 8260 for volatile organics). Selected samples were also analyzed for arsenic.

GeoSyntec also advanced several DPT borings and temporary well points at multiple locations on Site to further investigate groundwater in the overburden. No groundwater was found in any of the borehole locations – all borings were dry and were comprised of clay.

B2 RCRA SECTION 3013 SITE ASSESSMENT 2005-2009

In 2005 and 2006 a significant effort was made to assess the Site, which is summarized in this section. Details of this assessment can be found in the 3013 Report (EPS, 2008).

B2.1 Phase One – Spring 2005

B2.1.1 Off-Site Residential Wells and On-Site Water Supply Wells

In May 2005, of the nearby off-Site wells, six residential water wells were sampled. The Scoggins and Sanders wells were sampled at the wellhead. The samples from the Farrow #1 well and the Stewart well were collected from a spigot about two ft beyond the pressure tank. The Farrow #2 well and the Aiken well were both sampled from a spigot located about 50 ft from the wells. The samples were analyzed for USEPA drinking water methods 524.2 for VOCs, 525.2 for SVOCs, 200.8 for metals, 504.1 for EDB, 515.1 for herbicides and chlorinated acids, 531.1 for HPLC and endothall, and 8141 for organo-phosphorous pesticides.

B2.1.2 Downhole Geophysical Survey of On-Site Water Supply Wells

Downhole geophysical logging was performed on the two on-Site production wells PW-1 and PW-2 to gain a better understanding of the well construction and characteristics of the Ocala Limestone. The logging was performed on May 2-6, 2005.

The logs selected for this investigation included fluid temperature, fluid resistivity, three-arm summation caliper, natural gamma, borehole acoustic televiewer (ATV), borehole optical televiewer (OBI), and heat pulse flowmeter. In addition, a sonic log was run on PW-2.

PW-1 was determined to have a steel casing to a depth of 133 ft below the top-of-casing (bTOC), and the remainder of the well is open-hole to a total depth of 235 ft bTOC. Groundwater was approximately 146 ft deep bTOC. The OBI data through the cased portion of the well did not show any obvious casing defects. Because the casing did not extend into groundwater, the sonic log could not be run to determine the presence of grout outside of the casing.

PW-2 has 181 ft of steel casing with open hole below that to a total depth of 267 ft bTOC. Groundwater was approximately 146 ft bTOC. The OBI data through the cased portion of the well did not show any obvious casing defects. A sonic log was run through the portion (about 35 ft) of the casing that was below the water table. The sonic data indicated that there is no grout between the casing and the formation around it.

Additional information (discussed under Section 4.2.2 of the RCRA 3013 Report) was gained from geotechnical borings and well installation borings relevant to the PW wells, indicating that weathered rock exists around 60 to 65 ft bgs and competent bedrock is about 75 to 85 ft bgs.

Therefore, the depth of the casings in PW-1 and PW-2 is sufficient for sealing off the overburden; however, assuming the wells were installed in a similar manner, the limited sonic log data suggest that the well annuli were not sealed according to current environmental practices. Downward vertical migration of contaminated perched water in the soil (overburden) might occur through these poorly sealed casings, perhaps accounting for the EDB detections in PW-1 and PW-2.

Transmissive zones were indicated in PW-1 at 151 ft, 159 ft, 167 ft, 182 ft, 208 ft, and 228 ft bTOC. Heat pulse data indicated low ambient flow entered PW-1 at the bottom of the well and above exited at 208 ft bTOC.

Transmissive zones were indicated in PW-2 at depths of 201 ft, 202 ft, 217 ft, 223 ft, 226 ft and 241 ft bTOC. Heat pulse data was inconclusive over the open hole portion of the well, but it did indicate that the casing might be leaking above 175 ft bTOC.

In general, the lithology below the casing in PW-1 and PW-2 consists of fractured limestone. Transmissive zones occur in the wells; however, the limestone is "soft" and groundwater is able to enter the wells throughout the open-hole intervals. A detailed report of the geophysical surveys was previously provided to the USEPA [Geophex, Ltd, May 2005].

The results of the geophysical logging were evaluated in the field to select transmissive zones for discrete-zone groundwater sampling, from the on-Site production wells PW-1 and PW-2. These wells were sampled using a grab sampler which was lowered to the desired depth and opened to allow water to fill the chamber. The discrete groundwater sample was brought to the surface and transferred into the proper sample containers.

Well PW-1 was sampled at 150 ft bgs and 190 ft bgs, and PW-2 was sampled at 190 ft bgs and 235 ft bgs. The samples were analyzed for EDB by USEPA Method 504.1. This sampling design was considered as a qualitative test to determine where, within the vertical span of the open-hole portion of the on-Site production wells, a more concentrated zone of EDB might be located[2]. The objective of this sampling was to establish the appropriate depth (and screened interval) for monitoring well installation (to also be installed in the Ocala Limestone).

EDB was detected at 0.0082 µg/L in the sample collected from PW-1 at 150 ft bTOC. None of the other three discrete samples contained detectable EDB. The test was deemed inconclusive and ultimately did not factor into the design for the monitoring wells.

B2.2 Phase 2 - Fall 2005

B2.2.1 On-Site Soils

Site-wide sampling of surface (0-2 ft bgs) and subsurface soils was a major component of the Phase II Site Assessment. The scope of work involved areas of the site that either had not been previously assessed, or areas where previous assessments indicated the presence of site-related

[2] Past sampling in 2003, when EDB was first discovered in PW-1 and PW-2, was done under continuous pumping conditions. Sampling under a continuous pumping in an open hole well provides a vertically-integrated (i.e., non discrete) sample that might serve to dilute the true EDB concentration in a specific transmissive zone within the limestone.

chemicals requiring further delineation of their extent. Soil cores were extracted from the subsurface using direct-push drilling (unless otherwise noted), and cores were visually examined and screened with a photoionization detector (PID) for the presence of volatile organics. Samples that contained visual staining or exhibited PID readings above the ambient background "noise" are noted in the subsequent description of the work.

2.2.1.1 SE Debris Disposal Area

This is one of two areas indicated as a possible debris disposal site in the CSR [Peachtree, 2001]. Borings S-1 through S-6 were advanced in the southeastern portion of the site to visually inspect the subsurface for debris and to obtain environmental samples for analysis. Continuous soil samples were collected with the direct push rig to a total depth of 12 ft in each of the borings. The 0 to 2-foot, 4 to 6-foot, and 8 to 10-foot sample from each boring was collected for laboratory analysis. In general, the soils included poorly sorted sand from 0 to 2 ft bgs, lean sandy clay from 2 to 8 ft bgs, and fat clay from 8 to 12 ft bgs. No odors or staining were observed in the soils from these borings. No debris or other indicators of non-native material were observed.

2.2.1.2 NW Debris Disposal Area

This is the second area indicated in the CSR as a possible debris disposal site. Soil borings S-7 through S-12 were installed in the northwestern portion of the site, four borings in the warehouse building, and two borings in the grass. Continuous soil samples were collected with the direct push rig to a total depth of 12 ft in each of the borings. The soil cores were logged using the USCS. The 0 to 2-foot, 4 to 6-foot, and 8 to 10-foot sample from each boring was collected for laboratory analysis. Soils from these borings were typically lean sandy clays from 0 to 2 ft bgs, poorly sorted sands from 2 to 4 ft bgs, lean sandy clays from 4 to 8 ft bgs, and fat to lean clays from 8 to 12 ft. No odors or staining were observed in the soils from these borings. No debris or other indicators of non-native material were observed.

2.2.1.3 Railcar Unloading Area / Liquid Production Building

Three borings, S-13, S-14, and S-15, were completed on the rail spur, and one boring, S-16, was completed just south of the rail spur. Two borings (S-17 and S-18) were drilled immediately south of the spur, atop the northern edge of the liquid production building concrete slab.

Borings S-13 to S-15 were drilled in the area of the rail spur where a shallow soil removal action had occurred in 1985-86 (upper few ft was removed and backfilled). Visual observations during the Phase II RCRA 3013 Site Assessment showed the upper soil (soils immediately below the ballast rock) was visually clean, then underlain by a zone of stained soil. The zone of staining diminished with greater depth, although the soil remained odoriferous beyond the stained depth.

As shown in the boring logs, soils from the railcar unloading area were mostly lean sandy clays with poorly sorted sand from 6 to 10 ft bgs in S-14, S-15, and S-16 and fat clays from 20 to 26 ft bgs in borings S-13 and S-14 and 10 to 16 ft bgs in boring S-15.

At S-13, staining was observed in the soils from 2 to 4 ft bgs. Odors were apparent in soils to its total depth at 28 ft. Soil samples for laboratory analysis were collected from 14 to 16 ft, 19 to 21 ft, 22 to 24 ft, and 26 to 28 ft bgs. Staining was observed in boring S-14 at 2 to 4 ft bgs. A faint

odor was apparent in the 24 to 28-foot soil core. Soil sample intervals were from 14 to 16 ft, 19 to 21 ft, and 24 to 26 ft. The conditions at boring location S-15 were similar. Soil samples were collected from the same depth intervals as for S-14. Boring S-16 was advanced to 28 ft, and odors were apparent throughout. Soil intervals from 14 to 16 ft, 19 to 21 ft, and 26 to 28 ft were collected for laboratory analysis from S-16.

Direct push borings S-17 and S-18 were drilled along the northern edge of the liquid production building slab. The slab is raised approximately 4 ft above the surrounding ground surface. All depths described for borings on the slab are depths below the slab. Each of these borings was pushed to total depths of 28 ft. Sample depths for laboratory analysis for both of these borings were from 17 to 19 ft, 22 to 24 ft, and 26 to 28 ft.

2.2.1.4 Tank Farm No. 1

Tank Farm No. 1 is enclosed with a secondary containment basin. On September 23, 2005, in order to collect soil samples below the tank farm without puncturing the containment structure, angle borings (AB-1, AB-2, and AB-3) at approximately 45˚ were completed. Soil samples were collected from 2 to 4 ft, 6 to 8 ft, and 10 to 12 ft of rod length bgs. Lean sandy clays were present in all three borings to the boring termination depths. In addition, poorly sorted sand was present around 1 to 4 ft of rod length bgs in boring AB-2.

Odors were present throughout the boring interval in AB-1, located at the southeastern corner of the tank farm. Odors and black staining were noticeable around 4 to 8 ft of rod length bgs in AB-2, located at the northeastern corner of the tank farm adjacent to the railcar unloading area. This was similar to the soils seen in other borings in the railcar unloading area. No odors or staining were present in the soils in AB-3, located at the southwest corner of the tank farm.

2.2.1.5 Septic Tank Areas

Three borings, S-19, S-20, and S-21 were installed in the current septic drainfield area. Two additional borings, S-22 and S-23 were installed in an area possibly associated with a former septic system. Each of these borings was advanced to 10 ft bgs and sample depths included 0 to 2 ft, 4 to 6 ft, and 8 to 10 ft. Soils from these borings were typically poorly sorted sands from 0 to 4 ft bgs and lean sandy clays from 4 to 12 ft bgs. No odors or staining were observed in the soils from these borings.

2.2.1.6 Surface Impoundments

In September 2005, multiple direct-push borings were completed in each of the eight surface impoundments to characterize the material contained within these buried concrete structures. Since there are no existing surface features marking the locations of the impoundments, the impoundment locations were estimated using existing site features and historical aerial photographs. Each of the impoundment lies beneath concrete, either outside in a paved area or inside under a floor slab.

For each boring, a direct-push rig was used to penetrate the surface concrete (i.e., floor slab or pavement above the impoundment). Multiple borings were drilled along a linear transect across each surface impoundment to verify its location and configuration. Soil cores were then obtained

continuously to the bottom of the impoundment with a 4-foot macro-core sampler and an acetate liner. The bottom of the impoundments was approximately 7 ft bgs in the center. Soils encountered in the surface impoundment borings were fine sands, sandy clays, and clays. A representative sample from 2-foot sections was placed in a baggie and the headspace was screened with a PID. Significant PID measurements (>100 ppm) and staining were noted in SI #5, SI #14, SI #19, and SI #20.

Typically, two soil samples were collected from each boring at depths exhibiting the highest likelihood of potential impact based on visual observations and PID readings.

The first few borings in SI-9 reached 12 ft without hitting a concrete bottom. After multiple offsets, which also reached 12 ft without hitting bottom, it was determined that the concrete structure for this surface impoundment had been removed in the past.

2.2.1.7 Off-Site Background Soil Sampling

Three locations (HA-1, HA-2, and HA-3) were selected to determine background concentrations in the vicinity of the Site. HA-1 was located in a wooded area across Cape Road from the facility. HA-2 was located in a drainage swale along the north side of the train tracks and west (upslope) of the Drexel facility. HA-3 was collected between crops on the farm property to the north of the facility. At each location a hand auger was used to collect three random samples. The samples at location HA-1 were designated HA-1-1, HA-1-2, and HA-1-3. Samples at HA-2 and HA-3 were designated similarly.

B2.2.2 Groundwater

2.2.2.1 Monitoring Well and Piezometer Installation

In the fall of 2005, three monitoring wells (BW-1, BW-2, and BW-3) and two shallower piezometers (GTB-1 and GTB-2) were installed. These monitoring wells are referred to as “deep” to differentiate them from shallow monitoring well installations from the CSR, that were screened in perched water zones. All three of the monitoring wells were installed into the local drinking water aquifer. Based on previous data collected at the site, rock was anticipated to be encountered around 70 ft bgs and groundwater at approximately 140 ft bgs. Therefore, each monitoring well was designed with an outer casing to seal off the overburden from the rock. BW-1 was installed in the railcar unloading area. Since this area was known to have chemicals-of-concern in the upper 28 ft of the soil horizon and there are tight clays at depths below that, BW-1 was installed with one outer casing to seal the borehole in the tight clay and a second (inner) casing to seal the remainder of the borehole into rock.

Well BW-1 was constructed with an 8-inch outer casing down to 53 ft, a 5-inch inner casing down to 82 ft, and a 2-inch diameter PVC well casing with a screen set to 170 ft bgs. Odors were present in the sandier soils in the 40- to 42-foot sample. The 45- to 47-foot and the 50- to 52-foot samples had only a slightly noticeable odor and consisted of fat clay. Some chert was encountered between 62 and 65 ft, and limestone was encountered at 65 ft. The borehole was advanced to 82 ft where it reached competent rock. The borehole was advanced and sand size bits of limestone and occasional pebble size chert were observed in the drill mud return. Beginning at 115 ft bgs, some

mud circulation was lost due to voids in the limestone. At 150 ft bgs, mud circulation was completely lost. Loss of circulation is common when drilling in limestone formations The borehole was advanced to a termination depth of 185 ft. A 2-inch Schedule 40 PVC well, with of 30 ft of 0.010-inch slotted screen, was lowered down the BW-1 borehole. The well casing and screen could not be advanced beyond 170 ft due to some cave-in of the formation in the borehole. A 12-inch diameter, flush mounted well vault was set in a 3-foot by 3-foot by 4-inch deep concrete well pad, and a locking well cap was placed on the 2-inch well.

Monitoring well BW-2, located in the southeast corner of the facility, was first drilled with 4¼-inch hollow stem augers. The augers drilled through rock at 60 to 62 ft. The borehole was advanced with augers to 80 ft. When the augers were removed, weathered limestone was observed on the lead auger. The boring was then drilled with 10¼-inch OD augers, and the 5-inch casing was set inside the auger. The mud rotary bit was advanced to 105 ft where the borehole began losing circulation. The drill cuttings down to 120 ft were sand size bits of white limestone. After 120 ft, green and brown clayey cutting were observed. Circulation was completely lost at 130 ft. A 3-foot void was hit at 140 ft. BW-2 was drilled to 182 ft. Static water level was measured at 149 ft, and a 2-inch Schedule 40 PVC well with 30 ft of 0.010 slotted PVC screen was set at a depth of 179 ft.

Well BW-3, located off-Site to the northwest of the facility, was installed in a similar manner as BW-2. Auger refusal was reached at 77 ft bgs, and the 5-inch casing was set at 76 ft bgs. Mud rotary cuttings showed white limestone chips and some green chert chips around 77 to 78 ft and then only limestone below that alternating between harder and softer material. Mud circulation was lost at 100 ft. The borehole was drilled to 190 ft bgs to allow for borehole cave-in. The 2-inch well was set at 175 ft with 30 ft of screen.

Wells GTB-1 and GTB-2 were installed in the Fall of 2005 to collect geotechnical data and to evaluate whether water encountered in the overburden (soil) was perched water, or was it groundwater (i.e., a continuous water table aquifer). GTB-1 was installed adjacent to BW-2 in the southeast corner of the property. Beginning with the 5- to 7-foot depth interval, a 2-foot split spoon soil sample was collected for every 5 ft of drilling. Standard penetration tests (SPTs) were performed and blow counts were collected for each 6 inches of sample. The N value, or blows per foot, is used to determine consistency of soils. Generally in GTB-1, N values were between 10 and 15 (stiff soils) until a depth of 70 ft where they increased to between 29 and 36 (very stiff to hard). Each section of soil sample was logged using the USCS. Lean sandy clay was observed from the ground surface to a depth of approximately 40 ft. Fat clay was present between 40 ft and 66 ft. Below that, lean clay and poorly sorted sands grade into limestone between 70 and 80 ft. Split spoon samples indicated the clayey soil had nominal water content until about 20 ft bgs. Split spoon soil samples from 20 ft bgs to the termination depth of the boring showed a wide range of water content, from prior saturation to moist conditions, indicated the boring had not encountered a water-table aquifer condition. The lower portion of the overburden soils, in the zone of weathered limestone, appears to have the higher degree of saturation, and a piezometer was installed to screen this interval to measure the true static water level. Boring GTB-1 was terminated at a depth of 75 ft bgs and completed as a piezometer with 15 ft of screen.

The piezometer at GTB-2 was installed adjacent to BW-3 to the northwest of the facility. Standard penetration test results showed N values of 10 to 15 blows per foot (stiff soils) down to the 60 to 62-foot sample where split spoon refusal was reached. The soils were lean clays down to 25 ft bgs and fat clays between 25 and 60 ft bgs. Some limestone remnants were present at 46 to 46½ ft, and chert and limestone fragments were present between 55 and 60 ft. The 60 to 62 foot sample consisted of weathered limestone. Similar conditions regarding the soil moisture characteristics of the overburden were observed at GTB-2 and again the interval of weathered limestone exhibited the greatest amount of water in the soil. The piezometer was set at 61 ft bgs with 10 ft of screen.

Both piezometers were installed in a similar manner. The screen and casings were set inside the 4¼-inch ID (7¼-inch OD) hollow stem augers. Sand was poured down the augers as the augers were slowly pulled up until the sand was a minimum of 2 ft above the top of the screen. Then, a minimum of 2 ft of bentonite chips were poured down the augers and hydrated, and a bentonite grout was pumped down the augers up to the ground surface.

Depth to water was measured in piezometers over the next few days. Both piezometers were intentionally screened at the base of the overburden, and in both cases approximately 25 to 35 ft deeper than where saturated soil was first encountered. After the wells were left to equilibrate for more than a week, depth to water was measured in GTB-1 at 62.5 ft bgs and GTB-2 at 59 ft bgs. The fact that the water level occurs at the elevations of the well screen, as opposed to a much higher elevation where water was first encountered, proves the point of a perched water condition.

A wide range of water levels is exhibited in the shallow monitoring wells installed for the CSR, with depth to water varying between 5 to 20 ft bgs, confirming the interpretation of a perched water condition.

2.2.2.2 Deep Monitoring Well Sampling

Wells BW-1, BW-2, and BW-3 were developed on November 15, 2005 and sampled on November 16, 2006. The samples were analyzed for USEPA drinking water methods 524.2 for VOCs, 525.2 for SVOCs, 200.8 for metals, 504.1 for EDB, 515.1 for herbicides and chlorinated acids, 531.1 for HPLC and endothall, 508.1 for chlorinated pesticides, and 8141 for organo-phosphorous pesticides.

Also in November 2005, discrete groundwater samples were collected using an inflatable packer to isolate the upper portion of the open hole, in the two on-Site former production wells PW-1 and PW-2. Geophysical data, previously obtained from PW-1 and PW-2, did not indicate discrete fracturing in the formation but rather a generally overall porous formation. These water supply wells had been constructed with 6-inch steel casing to 133 ft in depth for PW-1 and to 182 ft in depth for PW-2, and are open hole wells below that. Much of the open hole portion in the wells has widened over time. The packer was capable of a maximum expansion of 7½ inches. Therefore, the packer depths, and the sampling depths, were determined based on the shallowest depth below the casings and below the groundwater table where the boreholes were no more than 7½ inches in width.

In both PW-1 and PW-2, the packers were set at 190 ft below the top of casing (bTOC) and the samples were obtained from 187 ft bTOC. The samples were analyzed for the full suite of drinking water parameters, as was done for the deep monitoring wells.

B2.3 Phase 3

B2.3.1 Groundwater Sampling – Spring 2006

An additional round of sampling was performed in April 2006 for monitoring wells BW-1, BW-2, and BW-3 and off-Site residential water wells C, E, F, and K. The wells were purged and sampled. Groundwater samples were analyzed for the full suite of drinking water parameters by USEPA methods 524.2 for VOCs, 525.2 for SVOCs, 200.8 for metals, 504.1 for EDB, 508 for PCB and multi-component pesticides, 515.1 for herbicides and chlorinated acids, 531.1 for HPLC and endothall, and 8141 for organo-phosphorous pesticides.

B2.3.2 Sewer Video Tracing

A sewer video inspection was performed on the on-Site sanitary sewer lines. While the camera was in the lines, the sewer video contractor was able to locate and mark the lines on the ground surface.

One sewer drain line exits the office restroom and drains into a septic tank located off of the southwest corner of the office building. Liquids are then pumped via a 1-inch flexible hose into the sump located across the driveway from the locker/break room building. Two additional sewer drain lines exit the south side of the locker/break room. These lines drain into a septic tank across the driveway and west of the sump. The liquids are then gravity fed into the sump. A float switch in the sump activates a pump which forces the liquids via a two-inch PVC pipe to the distribution box near the central portion of the southern property boundary. Septic drain lines extend from the distribution box to the east and west.

Septic lines were traced with a video camera. No breeches or pipe branches were recognizable in the video. The lines exiting the office leading to the septic tank and those exiting the locker/break room building leading into the septic tank were coated with precipitates and had large volumes of water in them. The video in these lines was not recognizable and was not recorded. Videos were not able to be taken inside septic tanks, the distribution box, or the septic drain lines.

The former liquid production floor slab was inspected for sewer drain locations. One drain was located at the northwest corner of the floor slab and once led to a septic tank just outside of the northwest corner of the building. This tank was previously removed and the line was plugged. The other drains encountered were located in the former restroom area. These drains included sink, shower, and toilet drains. The shower and toilet drains were the only drains large enough for the camera; however, these lines were filled with gravel and could not be accessed. It is unknown if these drains fed into the same sump as the other site drains or if they ran to another distribution box.

B2.3.3 Additional Soils Delineation Sampling – Summer 2006

Additional soils sampling was performed in three areas of the site during Phase III, to better delineate the horizontal or vertical extent of contamination.

2.3.3.1 Railcar Unloading Area / Liquid Production Building

Three additional, deep soil borings were drilled in the area of the railcar unloading/liquid production building. Boring S-24 was installed at the northern edge of the liquid production building foundation to vertically delineate compounds previously detected in borings S-17 and S-18. Samples were collected at 37 to 39 ft and 48 to 50 ft, and direct push refusal was reached at 51 ft. These samples were analyzed for VOCs by 8260B and organo-chlorine pesticides by 8081. Poorly sorted sands were present from 0 to 8 ft bgs, and the remainder of the boring was lean clay down to total depth.

Two additional borings, S-25 and S-26, were completed along the rail spur. For both S-25 and S-26, the direct push rods were pushed to 32 ft bgs, and then continuous soil samples were collected for the remainder of the borehole until refusal was reached at 56 ft and 59 ft, respectively. Samples collected for analysis from S-25 included the 33 to 35-foot sample, the 43 to 45-foot sample, and the 53 to 55 foot sample. Samples collected for analysis from S-26 included the 33 to 35-foot sample, the 43 to 45-foot sample, and the 57 to 59-foot sample. The sampled intervals from S-25 and S-26 consisted of lean clays. These samples were analyzed for VOCs by 8260B and organo-chlorine pesticides by 8081.

2.3.3.2 Off-Site Drainways Soil Sampling

Two off-Site areas were sampled during the Phase III work: (1) a general low-lying area north of the main CSX rail, and (2) the drainway south of the CSX railroad and east of the facility. The drainage way south of the CSX rail was sampled at two locations, S-27 and S-28 east of the site. These borings were installed to horizontally delineate compounds detected in the soil believed to be in the drainage feature. S-17 was located just outside of the site fence, and S-18 was located approximately 670 ft east southeast of the northeast corner of the property. Samples were collected for laboratory analysis from depths of 0 to 2 ft and 3 to 5 ft. These samples were analyzed for organo-chlorine pesticides by 8081 and arsenic by 6010B. Both S-27 and S-28 consisted of poorly sorted sand from 0 to 2.5 ft bgs and lean sandy clay from 2.5 to 5 ft bgs.

Two locations, S-29 and S-30, were sampled in areas north of the facility. S-29 was located to the north of the rail spur area and between the main CSX tracks and the drainage feature north of the tracks. Here samples were collected at 0 to 2 ft, 3 to 5 ft, 8 to 10 ft, and 13 to 15 ft. Boring S-30 was located north of the rail spur area, north of the drainage feature, on a berm south of the pond. Water was encountered in S-30 at 5 ft bgs, which was approximately the same elevation as the pond water. Samples were collected at this location at 0 to 2 ft, 3 to 5 ft, and 8 to 10 ft. Poorly sorted sands were observed in the 0 to 2 foot interval from each of these borings with lean sandy clay below that.

PID readings of 572 ppm and 475 ppm were measured in S-29 at 3 to 5 ft and 13 to 15 ft, respectively. No PID detections were measured in S-30. Samples were analyzed for VOCs by USEPA Method 8260B and for organo-chlorine pesticides by Method 8081A.

2.3.3.3 Former Surface Impoundments

Five of the eight surface impoundments (SI #5, 9, 10, 15, and 20) were selected for additional investigation in the Phase III work scope, to assess the conditions beneath the base of the

impoundment structures. In order to avoid cross contamination, outer casings were installed within a boring drilled to the concrete base of the structure, and grouted to seal the casing to the concrete. Two such casings were installed in each impoundment. The surface impoundment casings were designated SIC-5-1, SIC-5-2, SIC-9-1, SIC-9-2, SIC-10-1, SIC-10-2, SIC-15-1, SIC-15-2, SIC-20-1, and SIC-20-2.

The locations of the casings were selected based on the estimated impoundment locations and previous depth-to-bottom of impoundment data collected. Continuous soil samples were collected beneath each of the impoundments to a depth of 20 ft bgs using direct push rig with 5-foot macro core samplers and acetate liners. Samples were collected at depths of 8 to 10 ft, 13 to 15 ft, and 18 to 20.

Soils from SIC-5-1, SIC-5-2, SIC-10-1, SIC-10-2, SIC-15-1, and SIC-15-2 were lean and fat clays down to 15 ft and fat clays down to boring termination at 20 ft. PID readings were minimal throughout the borings; however, odors were noticeable down to 15 ft and only minimal odors were noticeable in the fat clays below 15 ft.

Soils from SIC-9-1 and SIC-9-2 consisted of well sorted sand at the surface, lean sandy clays down to 10 ft, a layer of gravel at 10 ft (may be bottom of impoundment removal excavation), and lean clays down to boring termination. The concrete bottom of SI #9 must have been removed during the 1985 removal action (performed only on this impoundment). PID readings were around 100 ppm in SIC-9-1 down to total depth. The highest PID reading from these borings was 366 ppm in a thin layer of sand around 16 ft in SIC-9-2.

After drilling to the base of SI-20 at locations SI-20-1 and SI-20-2, the boreholes filled with water. It was determined that by coring through the bottom of SIC-20, there was a high risk of soils below the impoundment becoming cross-contaminated due to the large volume of water in the impoundment. Both boreholes were abandoned by filling them with sand and concreting the top 4 inches flush with the pavement.

Samples collected from underneath the surface impoundments were analyzed for organo-chlorine pesticides. The samples collected below SI-15 were also analyzed for arsenic.

B3 2010 INVESTIGATIONS

B3.1 Groundwater Sampling and Monitoring Well Installation – 2010

An additional monitoring well (BW-4) was installed in the upper limestone aquifer beneath the site per an EPD-approved Work Plan (EPS, 2010). This well is of the same installation design as the other limestone aquifer wells (wells BW-1 to -3) installed during the RCRA 3013 Site Assessment. BW-4 was installed in a direct down gradient direction from BW-2 at the edge of the facility fence line.

Well BW-4 was constructed using a sonic rig with a 6 inch bit. A temporary 6-inch override casing was advanced to 183 ft and a 2-inch diameter PVC well casing with a screen was set inside the temporary casing from 150 to 180 ft bgs.

Continuous soil cores were collected during the borehole advancement. A mix of sand and clay with occasional fine weathered rock was observed in the soil cores from the ground surface to approximately 62 ft bgs. Primarily weathered rock and chert was observed from 62 to 110 ft bgs. Another layer of clay and sand was observed between 110 and 148 ft bgs. Marl was noted from 148 ft to 178 ft where soil cores were terminated. Groundwater was noted at approximately 148 ft bgs. The six inch borehole and temporary casing was advanced to a termination depth of 183 ft. The borehole was then cleaned out using 1,250 gallons of water.

A 2-inch Schedule 40 PVC well, with 30 ft of 0.010-inch slotted screen, was lowered down the BW-4 borehole. The well casing and screen could not be advanced beyond 180 ft due to some cave-in of the formation in the borehole. A total of seventeen 50-pound bags of sand were used to bring the filter pack up to 145 ft. The sand was periodically flushed down the borehole using water to limit the chance of bridging. As the sand was added, the casing was pulled up and removed. Three bags of bentonite chips were added using water to prevent bridging. Bentonite was poured from 145 ft to 134 ft. The bentonite was allowed to hydrate overnight. The next day, the well was developed using a Grundfos pump. A total of 250 gallons of water was collected during the development of the well. After development, the remainder of the 2-inch well casing was pressure grouted using a tremmie pipe from the top of bentonite to approximately 80 ft bgs using a mix of Portland cement and high yield bentonite. A total of 35 bags of cement and four bags of bentonite were used for grouting. The remaining 80 ft of borehole was filled using sixteen bags of bentonite and 9 bags of sand. A 8-inch diameter, flush mounted well vault was set in a 2-foot by 2-foot by 4-inch deep concrete well pad, and a locking well cap was placed on the 2-inch well.

On June 30 and July 1, 2010, groundwater was sampled from all of the limestone aquifer wells at the Site (BW-1, BW-2, BW-3, BW-4, PW-1 and PW-2). In addition, nearby off-Site residential wells (C, E, F, and K) were sampled. Residential well sampling was limited to those wells that are down gradient or side gradient of the Site.

The groundwater samples were analyzed using SW-846 methods for drinking water supply testing: 200.7, 200.8 and 245.1 for metals, 504.1 for EDB and DBCP, 508.1 for PCB and multi-component pesticides, 515.1 for herbicides and chlorinated acids, 524.2 for volatiles, 525.2 and 8270C for semi-volatiles, and 531.1 for carbamate pesticides. The results are shown in Table E-16 through E-20.

B3.2 Off-Site Sediment and Surface Water Sampling – 2010

The EPD requested that the irrigation pond located east of the facility be characterized. Five surface sediment samples (SD-101 through SD-105) and one surface water sample (SW-101) were collected from this pond. The results are presented in Tables E-6 through E-15.

In addition, sampling was conducted at background locations (pond and stream settings) outside the potential influence from the Drexel facility. Appropriate locations for the background sampling was established by interpreting the topographic divides and surface water runoff directions from topography depicted on USGS quandrangle maps. Samples were collected from two separate streams upgradient of the Site, and from one pond upgradient of the Site. Five sediment samples (SD-106 through SD-110) and one surface water sample (SW-102) were collected in the upgradient pond. Five sediment samples (SD-111 through SD-115) and one surface water sample (SW-103) were collected in the western branch of the stream. Four sediment samples (SD-116 through SD-119) and one surface water sample (SW-104) were collected in the eastern branch stream. And one sediment sample (SD-120) was collected after the confluence of the eastern and western branches.

The surface sediment samples were collected from the upper 6 inches. The sediment and surface water samples were analyzed for a broad range of constituent classes using USEPA SW-846 methods (i.e. – Method 8081 for organo-chlorine pesticides, Method 8151 for herbicides, Method 8260 for volatile organics, Method 8270 for semi-volatile organics, and Method 6010 and Methods 7470/7471 for inorganics). The results are shown in Tables E-6 through E-15.

Surface water and sediment background values were determined based on the results from these background samples. For constituents that were detected, the background value was set as twice the arithmetic mean. For the statistical calculations, non-detect values were substituted with one-half the detection limit. For constituents that were not detected, background was set as the detection limit. Tables E-21 and E-22 display the results of the background determination for sediment and surface water, respectively.

B4 VRP INVESTIGATIONS

B4.1 Soil Delineation Sampling - February 2012

In February 2012, soil samples from four locations were collected using hand augers to complete delineation of a few compounds on the southern half of Drexel's facility. HA-10 is located along the eastern fenceline, with HA-13 being collected just on the other side of the fenceline. HA-11 is located along the southern fenceline and HA-12 is located along the eastern fenceline.

B4.1.1 Delineation and Geotechnical Sampling – November 2012-January 2013

EPS conducted an additional soil characterization sampling in November 2012 through January 2013 for the purposes of finalizing soil delineation and for geotechnical properties testing. The first phase of this work consisted of the advancement of 6 soil borings (DB-1 through DB-6) and the second phase consisted of the advancement of one additional boring (DB-7). The scope of work for the first phase included advancing five soil borings along the rail line and one on the Drexel facility. EPS subcontracted a geotechnical firm (Universal Engineering Sciences, Universal) to advance the soil borings, collect samples from three of the borings for geotechnical analysis and prepare a geotechnical slope stability evaluation. EPS collected samples from all soil borings for chemical analysis. EPS and Universal conducted the first phase of this work November 27 through December 1, 2012. Evaluation of the results from the chemical analysis indicated that one additional soil boring for horizontal delineation was needed to the north. Thus, on January 23, 2013 EPS conducted the second phase of this work during the same field event as the installation of BW-5. The driller (Southern Sonic Solutions) used for the well installation was also used for the advancement of the additional soil boring.

4.1.1.1 Boring Summary

Universal advanced borings DB-1, DB-3, DB-4, DB-5 and DB-6 using an off-road CME-50 drill rig advancing a 6.25-inch inside diameter hollow-stem auger in 5-foot intervals. Soil samples were collected every 5-feet using a split spoon sampler and soil lithology was recorded. Soil samples were collected from the split spoon sampler, placed into Ziploc bags, sealed, and placed in the sun for several minutes. A photoionization detector (PID) was inserted into the bag and the volatile organic compound (VOC) measurements were observed and recorded. These boreholes were completed by tremmie grouting using "neat" grout. The drill rig was unable to access the B-2 location; thus, EPS advanced B-2 using a hand auger. Southern Sonic Solutions advanced boring B-7 using sonic drilling techniques.

The drill rigs and drilling tools and accessories were decontaminated prior to starting the work and between borings. The split spoons were decontaminated between borings by brush washing in a phosphate-free detergent wash and rinsing with distilled water. Augers were decontaminated between borings by washing with a phosphate-free detergent and a steam pressure washer.

Disposable gloves were worn during sampling and discarded after each sample was collected to minimize the potential of cross-contamination.

A summary of the conditions noted in each boring is as follows:

- DB-1: Advanced to 30 ft bgs. No staining, no significant odors or PID readings noted.
- DB-2: Advanced to 12ft bgs. No staining observed. Degrading organic odors noted. Wet (perched water) at approximately 8ft bgs.
- DB-3: Advanced to 60 ft bgs, where auger refusal occurred. Staining observed from 0-6ft bgs. No significant odors or PID readings noted.
- DB-4: Advanced to 60 ft bgs, where auger refusal occurred. Staining observed from 0-5ft bgs. Odors and elevated PID readings were noted throughout the depth of the boring.
- DB-5: Advanced to 70 ft bgs. Staining observed from 0-3ft bgs. Odors and elevated PID readings were noted at 10 and 20ft bgs. Soil appeared wet in the 10-20ft bgs zone.
- DB-6: Advanced to 60ft bgs. Staining observed 3.5-10 ft and slight staining from 13.5-15ft bgs. Odors and moderate PID readings were noted from 3.5 to 50 ft bgs.
- DB-7: Advanced to 85ft bgs. No staining or odors noted.

4.1.1.2 Geotechnical Analysis

Universal used samples collected from three of the borings (DB-3, DB-4 and DB-5) for geotechnical analysis. Universal's report, which includes soil boring logs, was included in the Fourth Progress Report (EPS, 2013). Universal collected samples from each soil horizon for geotechnical examination, laboratory analysis and classification. Laboratory testing included Atterberg Limits, grain size distribution, natural moisture content, and triaxial strength testing. The soils consist of interbedded layers of clays, sandy clays, and clayey sands. Auger refusal was encountered at 60ft below ground surface (bgs) at DB-3 and DB-4.

Universal performed a slope stability analysis using STEDwin and assumed a surcharge load equivalent to a Cooper E80 train. The results indicated that a 15 foot depth excavation using a 2 horizontal to 1 vertical slope would be stable against rotational failure and allow for safe construction. Universal recommends that if a deeper or steeper excavation is needed, that a braced excavation would be required. This information will be used to design the deep soils remediation anticipated along the northern end of the facility and potentially extending into the CSX rail line right-of-way.

4.1.1.3 Soil Chemical Analysis

Specific depth intervals were sampled and analyzed for specific constituents based on where delineation was needed for specific constituents. EPS collected soil samples for chemical analysis from the split spoon sampler. Samples were collected in unpreserved glass jars for organophosphorus pesticides and chlorinated pesticides. EPS collected samples for VOC analysis using EPA Method 5035 by using a syringe to place similar portions into three, 40-millileter glass vials: one preserved with methanol and two preserved with sodium bisulfate. EPS placed the samples in appropriate sample containers provided by the analytical laboratory, placed them on

ice in a cooler, logged them under standard chain-of-custody procedures, and delivered or shipped the samples to Analytical Environmental Services, Inc. in Norcross, Georgia for analysis.

All of the results from borings DB-1, DB-2, DB-3, DB-6, and DB-7 were below the delineation criteria, and most of the results were below the detection limit. An additional deep soil boring was needed to the north to finalize delineation. Due to access limitations north of the rail line, the northern soil boring (DB-7) was advanced just north of an irrigation pond. The results from this boring were non-detect.

B4.1.2 Railroad Sampling – August 2013

At the request of CSX, EPS conducted an additional soil characterization sampling event for the purposes of assessing the conditions directly under the CSX rail line.

4.1.2.1 Boring Summary

EM Services advanced borings DB-8, DB-9, DB-10, DB-11, DB-12, DB-13 and DB-14 using a track mounted GeoProbe direct push drill rig. Soil samples were collected every 4-ft using a Macro-Core MC5 soil sampler with single-use disposable liners and soil lithology was recorded. These boreholes were completed by tremmie grouting using "neat" grout.

The drill rigs and drilling tools and accessories were decontaminated prior to starting the work and between borings. The sampler drive shoe was decontaminated between borings by brush washing in a phosphate-free detergent wash and rinsing with distilled water. Augers were decontaminated between borings by washing with a phosphate-free detergent and a steam pressure washer. Disposable gloves were worn during sampling and discarded after each sample was collected to minimize the potential of cross-contamination.

A summary of the conditions noted in each boring is as follows:

- DB-8: Advanced to 47 ft bgs, where auger refusal occurred. No staining and no significant odors noted.
- DB-9: Advanced to 60 ft bgs, where auger refusal occurred. No staining and no significant odors noted.
- DB-10: Advanced to 52 ft bgs, where auger refusal occurred. No staining and no significant odors noted.
- DB-11: Advanced to 10 ft bgs. No staining and no significant odors noted.
- DB-12: Advanced to 10 ft bgs. No staining and no significant odors noted.
- DB-13: Advanced to 60ft bgs. No staining and no significant odors noted.
- DB-14: Advanced to 10ft bgs. No staining or odors noted.

4.1.2.2 Results

Specific depth intervals were sampled and analyzed for specific constituents. EPS collected soil samples for chemical analysis from the liner. Samples were collected in unpreserved glass jars for organophosphorus pesticides and chlorinated pesticides. EPS collected samples for VOC analysis

using EPA Method 5035 by using a syringe to place similar portions into three, 40-millileter glass vials: one preserved with methanol and two preserved with sodium bisulfate. EPS placed the samples in appropriate sample containers provided by the analytical laboratory, placed them on ice in a cooler, logged them under standard chain-of-custody procedures, and delivered the samples to Analytical Environmental Services, Inc. in Norcross, Georgia for analysis.

B4.1.3 Surface Impoundment Confirmation Sampling – November 2013 – January 2014

At the request of the EPD, six confirmation samples were to be collected at each of the SIs being remediated, where existing data were not already available. Three of the confirmation samples were to be collected at the base of the excavation. The remaining three confirmation samples were to be collected along the side-wall of the excavation approximately half way down the slope of excavation. All confirmation samples were to be analyzed for metals and pesticides. Some of the samples had elevated concentrations so Drexel elected to conduct additional excavation work followed by more confirmation sampling. More information about the confirmation sampling is detailed in the main body of the CSR and in the Sixth Progress Report (EPS, 2014).

B4.1.4 Rail Confirmation Sampling – July 2014

EPD approved of the remedial plan for the remainder of the Site, but requested that confirmation samples be collected. A memorandum was submitted by EPS to the EPD on July 2, 2014 with the proposed sampling plan and how the data would be evaluated. Sampling was conducted on July 23, 2014 in accordance with the plan. A Geoprobe rig was used to advance the two boring locations to a depth of 10 feet (ft). Samples from each location were collected at 1ft below ground surface (bgs) and 10ft bgs. All samples were analyzed for pesticides (SW8081B) and RCRA metals (SW6010C and SW7471B). Samples were placed in laboratory-supplied containers, packed on ice and delivered to the laboratory for analysis.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

EPS

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

EPS

Table B-4 Soil Analytical Results: Semi-Volatile Organic Compounds

Location	Date Sampled	Depth	1,1-Biphenyl mg/kg	1,2,3-Trichlorobenzene mg/kg	1,2,4,5-Tetrachlorobenzene mg/kg	1,2,4-Trichlorobenzene mg/kg	1,2-Dichlorobenzene mg/kg	1,2-Diphenylhydrazine mg/kg	1,3-Dichlorobenzene mg/kg	1,4-Dichlorobenzene mg/kg	1-Chloronaphthalene mg/kg	1-Methylnaphthalene mg/kg	1-Naphthylamine mg/kg	2,2'-Oxybis(1-Chloropropane) mg/kg	2,2'-Oxybis(2-Chloropropane) mg/kg	2,3,4,6-Tetrachlorophenol mg/kg	2,4,5-Trichlorophenol mg/kg	2,4,6-Trichlorophenol mg/kg	2,4-Dichlorophenol mg/kg	2,4-Dimethylphenol mg/kg	2,4-Dinitrophenol mg/kg	2,4-Dinitrotoluene mg/kg	2,6-Dichlorophenol mg/kg	2,6-Dinitrotoluene mg/kg	2-Chloronaphthalene mg/kg	2-Chlorophenol mg/kg	2-Methylnaphthalene mg/kg	2-Methylphenol mg/kg

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not av
Dup - duplicate sample
J-Associated numerical value is an estimated quar
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not av
Dup - duplicate sample
J-Associated numerical value is an estimated quar
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

Table B-4 Soil Analytical Results: Semi-Volatile Organic Compounds

Location	Date Sampled	Depth	Dibenz(a,j)acridine mg/kg	Dibenzo(a,h)anthracene mg/kg	Dibenzofuran mg/kg	Dichlorvos (DVPP) mg/kg	Dicrotophos mg/kg	Diethylphthalate mg/kg	Dimethoate mg/kg	Dimethylaminoazobenzene mg/kg	Dimethylphthalate mg/kg	Di-n-butylphthalate mg/kg	Di-n-octylphthalate mg/kg	Diphenylamine mg/kg	Disulfoton mg/kg	Endosulfane Lactone mg/kg	EPN mg/kg	Ethion mg/kg	Ethyl methanesulfonate mg/kg	Famphur mg/kg	Fenitrothion mg/kg	Fensulfothion mg/kg	Fenthion mg/kg	Fluoranthene mg/kg	Fluorene mg/kg	Heptadecanol mg/kg

BDL - below detection limit; detection limit not av
Dup - duplicate sample
J-Associated numerical value is an estimated quar
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not av
Dup - duplicate sample
J-Associated numerical value is an estimated quar
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not av
Dup - duplicate sample
J-Associated numerical value is an estimated quar
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

Table B-5 Soil Analytical Results: Volatile Organic Compounds

BDL - below detection limit; detection limit not available

Dup - duplicate sample

J-Associated numerical value is an estimated quantity.

B-Analyte present in the blank and the sample.

*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D-Analytes analyzed at a secondary dilution.

E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

J-Associated numerical value is an estimated quantity.

B-Analyte present in the blank and the sample.

*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D-Analytes analyzed at a secondary dilution.

E-Reported value is estimated because of the presence of interference.

EPS

BDL - below detection limit; detection limit not available

Dup - duplicate sample

J-Associated numerical value is an estimated quantity.

B-Analyte present in the blank and the sample.

*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D-Analytes analyzed at a secondary dilution.

E-Reported value is estimated because of the presence of interference.

Table B-5 Soil Analytical Results: Volatile Organic Compounds

BDL - below detection limit; detection limit not available

Dup - duplicate sample

J-Associated numerical value is an estimated quantity.

B-Analyte present in the blank and the sample.

*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D-Analytes analyzed at a secondary dilution.

E-Reported value is estimated because of the presence of interference.

EPS

BDL - below detection limit; detection limit not available

Dup - duplicate sample

J-Associated numerical value is an estimated quantity.

B-Analyte present in the blank and the sample.

*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D-Analytes analyzed at a secondary dilution.

E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

Table B-9 Sediment Analytical Results: Semi-Volatile Organic Compounds

BDL - below detection limit; detection limit not availal
Dup - duplicate sample
J-Associated numerical value is an estimated quantity
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

Table B-10 Sediment Analytical Results: Volatile Organic Compounds

Location	Date Sampled	Depth	cis-1,2-Dichloroethene mg/kg	cis-1,3-Dichloropropene mg/kg	Cyclohexane mg/kg	Dibromochloromethane mg/kg	Dibromofluoromethane mg/kg	Dibromomethane mg/kg	Dichlorobromomethane mg/kg	Dichloromethane (Methylene chloride) mg/kg	Diisopropyl ether mg/kg	Ethyl benzene mg/kg	Freon-11 mg/kg	Freon-113 mg/kg	Freon-12 mg/kg	Hexanal mg/kg	Isopropyl Alcohol mg/kg	Isopropylbenzene mg/kg	m&p-Xylene mg/kg	Methyl acetate mg/kg	Methyl iodide mg/kg

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not ava
Dup - duplicate sample
J-Associated numerical value is an estimated quant
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

Table B-13 Surface Water Analytical Results: Pesticides

Location	Date Sampled	gamma-Chlordane mg/L	gamma-Chlordene mg/L	Heptachlor mg/L	Heptachlor epoxide mg/L	Malathion mg/L	Merphos mg/L	Methoxychlor mg/L	Methyl parathion mg/L	Mevinphos mg/L	Mirex mg/L	Parathion mg/L	Ronnel mg/L	Stirophos mg/L	TEPP mg/L	Tetraethyl Dithiopyrophosphate mg/L	Tokuthion mg/L	Toxaphene mg/L	Trichloronate mg/L	Trifluralin mg/L

BDL - below detection limit; detection limit not avai
Dup - duplicate sample
J-Associated numerical value is an estimated quanti
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

EPS

BDL - below detection limit; detection limit not available

Dup - duplicate sample

J-Associated numerical value is an estimated quantity.

B-Analyte present in the blank and the sample.

*Spike recovery is equal to or outside the control criteria used.

P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D-Analytes analyzed at a secondary dilution.

E-Reported value is estimated because of the presence of interference.

Table B-16 Groundwater Analytical Results: Inorganics

BDL - below detection limit; detection limit not available
Dup - duplicate sample
J-Associated numerical value is an estimated quantity.
B-Analyte present in the blank and the sample.
*Spike recovery is equal to or outside the control criteria used.
P-> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D-Analytes analyzed at a secondary dilution.
E-Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

Table B-18 Groundwater Analytical Results: Pesticides

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

EPS

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

Table B-19 Groundwater Analytical Results: Semi-Volatile Organic Compounds

BDL - below detection limit; detection limit not available
Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.
B Analyte present in the blank and the sample.
* Spike recovery is equal to or outside the control criteria used.
P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D Analytes analyzed at a secondary dilution.
E Reported value is estimated because of the presence of interference.

Table B-19 Groundwater Analytical Results: Semi-Volatile Organic Compounds

BDL - below detection limit; detection limit not available
Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.
B Analyte present in the blank and the sample.
* Spike recovery is equal to or outside the control criteria used.
P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D Analytes analyzed at a secondary dilution.
E Reported value is estimated because of the presence of interference.

EPS

BDL - below detection limit; detection limit not available
Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.
B Analyte present in the blank and the sample.
* Spike recovery is equal to or outside the control criteria used.
P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D Analytes analyzed at a secondary dilution.
E Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available
Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.
B Analyte present in the blank and the sample.
* Spike recovery is equal to or outside the control criteria used.
P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D Analytes analyzed at a secondary dilution.
E Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J The associated numerical value is an estimated quantity.

B Analyte present in the blank and the sample.

* Spike recovery is equal to or outside the control criteria used.

P > 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)

D Analytes analyzed at a secondary dilution.

E Reported value is estimated because of the presence of interference.

Analytical Report for Service Request No: K1603757

Timmerly Bullman
Environmental Planning Specialists
1050 Crown Pointe Parkway
Suite 550
Atlanta, GA 30338

RE: Drexel / Drexel

Dear Timmerly,

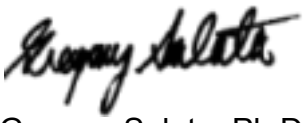
Enclosed are the results of the sample(s) submitted to our laboratory April 14, 2016
For your reference, these analyses have been assigned our service request number **K1603757.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at gregory.salata@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental



Gregory Salata, Ph.D.

EPA Method 504.1

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Environmental Planning Specialist	**Service Request No.:**	K1603757
Project:	Drexel	**Date Received:**	04/14/16
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier III deliverables including summary forms for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Three water samples were received for analysis at ALS Environmental on 04/14/16. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

EDB by Method 504.1

No anomalies associated with the analysis of these samples were observed.

1,2-Dibromoethane (EDB)	ND	0.249	0.239	104	0.247	0.240	103	65-135	1	30

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Analytical Report for Service Request No: K1604307

Timmerly Bullman
Environmental Planning Specialists
1050 Crown Pointe Parkway
Suite 550
Atlanta, GA 30338

RE: Drexel / Drexel

Dear Timmerly,

Enclosed are the results of the sample(s) submitted to our laboratory April 27, 2016
For your reference, these analyses have been assigned our service request number **K1604307.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at gregory.salata@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Project:	Drexel	**Date Received:**	04/27/16
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier III deliverables including summary forms for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Three water samples were received for analysis at ALS Environmental on 04/27/16. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

EDB by EPA Method 504.1

Relative Percent Difference Exceptions:
The Relative Percent Difference (RPD) for EDB in the replicate matrix spike analyses of Batch QC was outside control criteria. All spike recoveries in the MS, DMS, and associated Laboratory Control Sample (LCS) were within acceptance limits, indicating the analytical batch was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Analytical Report for Service Request No: K1604397

Timmerly Bullman
Environmental Planning Specialists
1050 Crown Pointe Parkway
Suite 550
Atlanta, GA 30338

RE: Drexel / Drexel

Dear Timmerly,

Enclosed are the results of the sample(s) submitted to our laboratory April 28, 2016
For your reference, these analyses have been assigned our service request number **K1604397.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at gregory.salata@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Environmental Planning Specialists	**Service Request No.:**	K1604397
Project:	Drexel	**Date Received:**	04/28/16
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier III deliverables including summary forms for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Three water samples were received for analysis at ALS Environmental on 04/28/16. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

EDB by EPA Method 504.1

Relative Percent Difference Exceptions:
The Relative Percent Difference (RPD) for EDB in the replicate matrix spike analyses of Batch QC was outside control criteria. All spike recoveries in the MS, DMS, and associated Laboratory Control Sample (LCS) were within acceptance limits, indicating the analytical batch was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Approved by

Analytical Report for Service Request No: K1604691

Timmerly Bullman
Environmental Planning Specialists
1050 Crown Pointe Parkway
Suite 550
Atlanta, GA 30338

RE: Drexel / Drexel

Dear Timmerly,

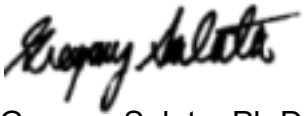
Enclosed are the results of the sample(s) submitted to our laboratory May 06, 2016
For your reference, these analyses have been assigned our service request number **K1604691.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at gregory.salata@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental



Gregory Salata, Ph.D.

Acronyms
Qualifiers
State Certifications, Accreditations, And Licenses
Case Narrative
Chain of Custody
EPA Method 504.1

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Environmental Planning Specialists	**Service Request No.:**	K1604691
Project:	Drexel	**Date Received:**	05/06/16
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier III deliverables including summary forms for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Four water samples were received for analysis at ALS Environmental on 05/06/16. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

EDB by EPA Method 504.1

No other anomalies associated with the analysis of these samples were observed.

FOURTH SEMIANNUAL VRP PROGRESS REPORT DREXEL CHEMICAL COMPANY Cordele, Georgia

Prepared by:

1050 Crown Pointe Parkway, Suite 550
Atlanta, Georgia 30338
Tel: 404-315-9113

April, 2013

DCN: DREXVRPS004

6 SOIL DELINEATION

6.1 Actions Completed

6.1.1 Background

According to the VRP schedule, horizontal delineation on the VRP property was to be demonstrated in the Second Progress Report. The only property in the VRP at the time of the second Progress Report was the Drexel Facility. Thus, in the Second Progress Report (April, 2012) delineation was demonstrated on the Drexel Facility property. The EPD concurred with soil and groundwater delineation of constituents on the Drexel Facility parcel in a letter dated December 5, 2012. Full delineation outside the Drexel Facility is presented in this report.

6.1.2 Delineation on the Drexel Facility

As mentioned above, delineation on the Drexel Facility was demonstrated in the Second Progress Report. A number of constituents (arsenic, EDB, DDD, DDE, DDT, chlordane, disulfoton, ethyl benzene, heptachlor, isopropylbenzene, malathion, methyl parathion, toxaphene, and o-xylene) were delineated horizontally to the property boundary with CSX. Thus, the delineation demonstration for the properties outside the Drexel Facility (below) also includes the continued delineation of these constituents from the Drexel Facility. Vertical delineation was demonstrated for all constituents on the Drexel Facility except disulfoton, for which there was an exceedance at 20ft bgs in B100. One of the resent borings (B-6) provides vertical delineation in this area for disulfoton, with a non-detect result at 35ft bgs.

6.1.3 Delineation outside the Drexel Facility

The samples that have been taken outside of the Drexel Facility are primarily on either the CSX or Drexel Additional Properties, which are both in the VRP. A few other samples have been taken outside of these properties for the purposes of collecting background samples or assessing conditions in and around wetland areas. As no release has been observed off the VRP properties, results from these additional samples are included in the tables and figures for thoroughness.

Table 4 shows the maximum soil concentration found outside the Drexel Facility for each constituent compared to its delineation criterion (Type 1 Risk Reduction Standard). Yellow highlighting indicates where the maximum concentration exceeds the delineation standard. Blue highlighting indicates the constituents that require delineation. These include constituents that are above the delineation criterion in more than two samples, and/or constituents that were delineated on the Drexel Facility to the property boundary.

Table 5 shows the analytical results (from all properties[4]) for constituents requiring a demonstration of delineation. A figure has been created (Figures 5 through 26) for each of these constituents showing the results for samples collected outside the Drexel Facility (circles). For the constituents where the property boundary was used to demonstrate delineation on the Drexel Facility, the locations of the exceedances on the Drexel Facility are also shown on the figures (blue triangles). Additionally, the results from the new boring (B-6) that is located on the Drexel Facility is also shown (green triangle).

These figures demonstrate delineation north of the Drexel Facility (the "A" series, which is the CSX property) and east of the Drexel Facility (the "B" series, which includes the CSX property and the Drexel Additional Property). Each sample location is color coded to indicate whether there is at least one exceedance of the delineation criterion at that location for that constituent. Green indicates that all samples collected at that location are below the delineation criterion and blue indicates that at least one sample at that location is above the delineation criterion. Every constituent was not analyzed in every sample; therefore, the grey circles indicate where samples were collected but not analyzed for the particular constituent. Table 6 provides a summary of the delineation demonstration. These figures and table show that each constituent has been delineated horizontally and vertically.

6.2 Upcoming Actions

The results of all the soil sampling will be used to develop a remediation plan, which will be presented in the next Progress Report.

[4] This includes samples collected on all the VRP properties (Drexel Facility, CSX, and Additional Drexel Property) and some additional samples collected outside the VRP properties. Additionally, some samples that may be properly defined as sediments are also included in this analysis even though there is no requirement to delineate sediments. As mentioned in the VIRP, for the purposes of corrective action, Drexel considers sediments to be material covered by water the majority of the time. Thus, sample locations that do not appear (based on GIS coordinates and aerial photographs) to be covered by water are also included in the tables and figures in this section.

Greater than delineation standard

BDL - below detection limit; detection limit not available

Dup - duplicate sample

Qualifiers:

J	The associated numerical value is an estimated quantity.
B	Analyte present in the blank and the sample.
*	Spike recovery is equal to or outside the control criteria used.
P	> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D	Analytes analyzed at a secondary dilution.
E	Reported value is estimated because of the presence of interference.

6 DELINEATION

6.1 Overview

According to the VRP schedule, horizontal delineation on the VRP property is to be demonstrated in this Progress Report. The only property currently in the VRP is the Drexel facility. With this Progress Report additional properties (CSX and additional property owned by Drexel to the east and south of the Drexel facility) are applying to be accepted into the VRP. As they have not been accepted into the program yet, delineation in this Progress Report is only being shown for the current VRP property, which is the Drexel facility itself.

The soil samples collected on the Drexel facility can be divided into two types. The first is soil collected from within the surface impoundment structures (see Section 6.2 for more information) and the second is the remaining soil samples collected throughout the Drexel facility.

6.2 Surface Impoundments

There are eight former surface impoundments (SIs) at the facility. Each SI lies beneath concrete, either outside in a paved area or inside under a floor slab. Seven of the eight SIs are buried concrete structures. The bottom of the containers are approximately 7 feet bgs (below ground surface) in the center. The concrete structure from the other SI (SI 9) was removed in a past remedial action. Samples collected from SI 9 and samples collected below the concrete bottom of the other SIs are included as data to be delineated with the other soil samples collected at the facility (Section 6.3). The SIs are self-contained structures; thus, delineation of the soil within the structures is not necessary as the soil is bounded by the presence of the structures themselves.

6.3 Delineation Complete for VRP Property (Drexel Facility)

The maximum soil concentration found at the Drexel facility (excluding the samples collected within the SI structures) for each constituent is compared to its delineation criterion (Type 1 Risk Reduction Standard) in Table 3. Yellow highlighting indicates where the maximum concentration exceeds the delineation standard. The results for constituents that exceed the delineation criteria are shown in Table 4. A figure has been created (Figures 3 through 18) for each constituent that has been detected in more than two samples. (There are a several constituents[1] that only had one or two samples that exceed the delineation criteria out of 138 to

[1] 1,2,3-trichloropropane, 4-nitrophenol, aldrin, alpha-BHC, benzene, cadmium, chlorobenzene, chloroethane, chlorpyrifos, copper, coumaphos, diazinon, dimethoate, endosulfan I, endosulfan II, endosulfan sulfate, gama-BHC, mevinphos, nitrobenzene, parathion, pentachlorophenol, selenium, silver, styrene, and zinc

486 samples. These constituents are not discussed further, as delineation of the other constituents (which are more pervasive) will also provide delineation of these constituents.) Appendix F contains a compact disk (CD) of Figures 3 through 18 in an interactive format where by clicking on the sample location the analytical results for that location may be seen. The program ArcReader is needed to view these figures. The CD includes the files needed to install ArcReader. Alternately, the program can be downloaded for free from the ESRI website (http://www.esri.com/software/arcgis/arcreader/download.html).

Two profiles are shown on each figure. The top portion of the figures show plan view (horizontal) projections. The bottom portion shows vertical projections. The vertical projections were created using 3-dimensional software, where the view was rotated to show the ground surface as a horizontal line.

The plan-view projections demonstrate horizontal delineation. Each sample location is color coded to indicate whether or not there is at least one exceedance of the delineation criterion at that location for that constituent. Thus, a green circle indicates that all samples collected at that location are below the delineation criterion. Every constituent was not analyzed in every sample; therefore, the grey circles indicate where samples were collected that were not analyzed for the particular constituent. These figures show that each constituent has been delineated horizontally on the south and west using results from samples collected at the facility. For some constituents, horizontal delineation to the north and/or east is demonstrated by samples collected at the facility. The remaining constituents are delineated horizontally to the property boundary with the CSX property (which is north / northeast of the Drexel facility). A future Progress Report will demonstrate horizontal delineation of these constituents on CSX's property. Table 5 provides a summary of the delineation status of each constituent with more than two exceedances of the delineation criterion.

The vertical projections on Figures 3 through 18 demonstrate vertical delineation. The red horizontal line represents the ground surface. The gray rectangles represent the buildings. The vertical dimension has a two-fold vertical exaggeration to better show the data. A circle is shown at each depth that a sample was collected at each location. Red circles indicate an exceedance of the delineation criterion. With one exception (disulfoton), these figures show that each constituent has been delineated vertically.

Table 5 shows that cyclohexanone and dieldrin are fully delineated on the Drexel facility and that a number of constituents (EDB, arsenic, chlordane, DDD, DDE, DDT, disulfoton, ethyl benzene, heptachlor, isopropylbenzene, malathion, methyl parathion, toxaphene, and o-xylene) have been delineated to the property boundary with CSX. Delineation of these constituents on the CSX property will be provided in a future Progress Report. It is anticipated that the additional Drexel property (see Appendix B) and the CSX property will be accepted into the VRP. Thus, the delineation standards for constituents detected on these properties will also be the Type 1 Risk Reduction Standards. Additional information is needed to achieve delineation on the CSX property. A plan for sampling soil on the CSX property has been developed (see Section 7.1.1). Five borings are planned along the CSX rail line. An additional boring will be advanced on the Drexel facility near the AST tank farm to provide both vertical delineation of disulfoton and information about the soil characteristics in this area.

April, 2014

DCN: DREXVRPS006

4.6 Storm Water Handling

SI-15 and SI-20 were located outside. Some amount of stormwater accumulated within these excavation pits while awaiting results of confirmation samples. Despite creating berms around the SIs, rainwater accumulated in the excavation pits. The storm water was pumped into frac tanks and samples of the water were analyzed prior to sending the stormwater offsite for appropriate disposal.

4.7 Incorporation into Site-wide Certification

The Fifth Progress Report contained the results of the area-averaging modeling for each of five exposure domains at the Site. All of the former SIs are located within the Drexel West exposure domain. Thus, now that the remediation has been completed, the confirmation samples have been incorporated into the area-averaging model for the Drexel West domain using the same methodology presented in the Fifth Progress Report.

A screening process was first used to determine which constituents needed to be evaluated further. Table 5 shows some general statistics for each detected constituent in each depth interval (0-2 ft, 2-5 ft, 5-15 ft and greater than 15 ft). The maximum concentration observed is compared to the Residential RRS. This comparison (shown in Table 5) shows that a number of constituents in the 0-2 ft and 5-15 ft depth ranges were selected to be evaluated further by interpolation. Using the methodology presented in the Fifth Progress Report, the concentrations of each of these constituents across the entire domain were estimated using interpolation techniques and concentrations were assigned to 10x10ft square grids. These concentrations were then imported into EPA's ProUCL software to determine the 95% Upper Confidence Limit (UCL) on the mean. These 95% UCL values are also shown on Table 5 and are included in Appendix F. The 95% UCL values are all well below the residential RRSs. Thus, the Drexel West domain is in compliance with residential RRSs.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Memorandum

Date: **November 11, 2013**

To: **EPD (John Maddox)**

From: **EPS (Kirk Kessler, Timmerly Bullman)**

Subject: **Drexel VRP Project: Former Surface Impoundment Remediation**

BACKGROUND

The Drexel Chemical Company (Drexel) facility located 120 Cape Road, Cordele, Georgia is part of the Georgia Voluntary Remediation Program (VRP). The final remediation plan for the Site is to be included in the Fifth Semiannual Progress Report, which is due to the EPD by December 28, 2013. However, Drexel plans to start implementing one phase of the remediation plan (addressing the former surface impoundments) starting November 18, 2013. Accordingly, this memo is to notify the EPD of the intended remedial action to allow an opportunity for the EPD to comment on the action prior to it being implemented.

The selected cleanup criteria for the Site are the Risk Reduction Standard (RRS), as approved by the EPD during the application for and acceptance into the VRP program. The majority of the Site will be evaluated based on an area-averaging approach, as described in Drexel's Voluntary Remediation Plan Application (VIRP), and as will be described more fully in the upcoming Fifth Progress Report. However, as the former surface impoundments (SIs) are self-contained units it is not appropriate to evaluate them with an area-averaging approach, but instead to look at each SI individually. Although averaging techniques (allowed under the VRP) would likely indicate that very little (if any) of the SIs would need to be remediated, Drexel has decided to remove any SIs where the environmental condition of the materials in the SIs are in excess of the residential RRSs. This memo provides more specifics as to how this will be implemented.

FORMER SURFACE IMPOUNDMENTS

There are eight former surface impoundments at the facility (see Figure 1). Based on aerial photography, the units were constructed at least by 1962. According to the 2001 Compliance Status Report (prepared by Peachtree Environmental for the former site owner, Gold Kist):

> Prior to the pesticide operation, the liquid fertilizer operation was designed to use eight surface impoundments as part of the production process. However, USEPA recorded in its February 1985 Site Inspection that the Gold Kist Plant Manger reported that the basins were used to collect rainwater, but did also receive "floor sweepings" and pesticide residues and waste containers. This practice dates back until at least 1973 when an EPD inspector noted the impoundments were used for this purpose, and that sodium hydroxide was being used to "break down the pesticides." For a period of time in the late 1970's,

and possibly into the early 1980's dust from air pollution control systems was placed in at least one impoundment. The quantity has been described by the former Gold Kist Plant Manger as "a few wheelbarrow loads per year" and reportedly consisted mainly of inert clays (Pyrax dust) which were carriers for liquid pesticides.

The SIs were constructed of poured concrete, each approximately 45 feet in diameter at the surface and sloping down (in a bell-like shape) to the bottoms, which are at approximately 7ft below the ground surface (bgs) in the center.

In approximately 1985, some of the contents in each SI were removed and the SIs were backfilled and graded. The concrete structure from SI 9 was also removed at some unknown date. The remaining seven SIs still have the concrete structure underground. Currently, each SI lies beneath concrete, either outside in a paved area or inside under a floor slab.

SOIL DATA ASSOCIATED WITH SURFACE IMPOUNDMENTS

Soil in and around the SIs have been investigated since 2000. As the surface impoundments are covered by concrete, the exact boundaries of the concrete SI structures were determined by historical aerial photographs. Thus, some samples designated as being associated with a surface impoundment, may not have actually been soil from within the SI. Figure 2 shows the locations of the soil borings associated with the SIs. Table 1 shows a comparison of the maximum concentration of each detected constituent from soil borings related to the SIs to the residential and industrial RRSs. Table 2 shows the analytical data for the constituents that have a maximum concentration higher than the residential RRS. Note that one of the columns in this table indicates whether the boring logs indicate that the samples are collected in an SI, under an SI, or just outside an SI.

SI 4, SI 14, SI 19 As shown in Table 2, for these three surface impoundments, none of the associated soil results exceed the residential RRS. Thus, no remedial action will be taken for these SIs.

SI 10 For the soils associated with SI 10, only one result (disulfoton in SI-10 at the surface) exceeds its residential RRS. The result (0.16 mg/kg), is above the residential RRS (0.03 mg/kg), and barely above the industrial RRS (0.15 mg/kg). However, the boring log for this boring does not indicate that concrete was encountered and, instead it indicates the presence of root matter at 7ft bgs. It is believed that this boring was located just outside the SI and is not representative of the material within the SI. Thus, none of the soils within the SI exceed the residential RRS and no remedial action will be taken for this SI. However, the SI-10 boring results will be included in the area-averaging analysis for the site.

SI 5 The soils collected within SI 5 exceeded at least one residential RRS from the surface to 15ft bgs. The soil samples collected from 18-20ft had no residential RRSs exceedances. Drexel will conduct remedial action at this SI.

SI 9 The soils collected within SI 9 exceeded at least one residential RRS from the surface to 10ft bgs. However, the samples collected at 13-15ft and 18-20ft bgs did not exceed any residential RRSs. Drexel will conduct remedial action at this SI.

SI 15 The soils collected from 3 to 6ft bgs exceeded residential RRSs. However, none of the soil beneath the SI structure exceeded the residential RRSs. Drexel will conduct remedial action at this SI.

SI 20 The soils collected from 4 to 6ft bgs exceeded residential RRSs. However, none of the soil beneath the SI structure exceeded the residential RRSs. Drexel will conduct remedial action at this SI.

REMEDIATION PLAN

The remedial action consists of the following:

- Surface impoundment #5: Removal of the concrete surface impoundment structure, excavation of soils contained within the structure, and soils beneath the structure to an estimated total depth of 15 ft. One confirmation sample will be collected at the base of the excavation and analyzed for chlordane and toxaphene. If the results are below the residential RRSs, then the excavation will be considered complete. If not, either the data will be evaluated as part of the area-averaging analysis for the site or the excavation will continue to a depth of 18ft, where existing data (see Table 2) demonstrates that the soil is below the residential RRS.

- Surface impoundment #9: The surface impoundment structure was removed in earlier remedial action at the site. This remedial work will consist of excavation of the soils in the former surface impoundment area and soils below the former impoundment to an estimated total depth of 10 ft. One confirmation sample will be collected at the base of the excavation and analyzed for chlordane and toxaphene. If the results are below the residential RRSs, then the excavation will be considered complete. If not, either the data will be evaluated as part of the area-averaging analysis for the site or the excavation will continue to a depth of 13ft, where existing data (see Table 2) demonstrates that the soil is below the residential RRS.

- Surface impoundment #15: Removal of the concrete surface impoundment structure and excavation of soils contained within the structure. The total depth is approximately 7 ft. No confirmation samples will be collected as data previously collected underneath the SI are all below the residential RRSs.

- Surface impoundment #20: Removal of the concrete surface impoundment structure and excavation of soils contained within the structure. The total depth is approximately 7 ft. No confirmation samples will be collected as data previously collected underneath the SI are all below the residential RRSs.

The estimated soil excavations are as follows:

SI	Concrete Bottom	Depth of Excavation	Estimated Diameter of SI	Estimated Volume of Soil
5	7 ft	15 ft	45 ft	884 CY
9	None	11 ft	45 ft	589 CY
15	7 ft	7 ft	45 ft	412 CY
20	7 ft	7 ft	45 ft	412 CY

The gray shading on Table 2 indicates the samples that will be excavated. Figure 2 shows the locations of the former surface impoundments that will be removed and the approximate areas where concrete will be removed. The excavated material will be temporarily stock-piled on-site in approximately 500 cubic yard piles. Representative samples of the material will be collected and analyzed to determine whether the material may be disposed of as hazardous or non-hazardous. The material will then be transported to the appropriate disposal facility. The excavation areas will be backfilled with stone and the concrete slab will be replaced.

INCORPORATION INTO SITE-WIDE CERTIFICATION

By taking the action specified above, Drexel will be able to certify the SIs to residential RRSs. As mentioned previously, as the SIs are self contained units, it is not appropriate to include data collected within them in an area averaging analysis. However, the analytical results from soil collected beneath the SIs (that are not going to be excavated) and outside the SIs will be incorporated into the area averaging analysis for the Site. The samples that will be included in this analysis are indicated on Table 2.

7 ECOLOGICAL EVALUATION

7.1 Actions Completed

EPS submitted a Revised Screening Level Ecological Risk Assessment (SLERA) Steps 1 & 2 and Problem Formulation Step 3 Report to the EPD in January, 2012 and Ecological Remedial Goals (RGs) on September 11, 2012. The EPD approved the SLERA and RGs in a letter dated December 5, 2012. On December 21, 2012, EPS submitted an Ecological Remediation Plan. The areas to be addressed based on ecological concerns are shown on Figure 5. CSX does not permit excavation of soil within twelve feet of the centerline of the main rail line. This area is referred to as the "no-cut zone" and no remedial action is planned within the "no-cut zone." Thus, the ecological areas shown on Figure 5 are outside the "no-cut zone."

7.2 Upcoming Actions

The Ecological Remediation Plan is incorporated into the overall Remediation Plan (Section 9).

8 HUMAN HEALTH EVALUATION

8.1 Introduction

The VRP incorporates the concept of exposure domains within which representative concentrations of constituents can be derived from the site characterization data. Although the VRP Act defines the representative concentration as an "average concentration," the 95% upper confidence limit (UCL) on the average concentration is more typically used in risk assessment to address potential uncertainties in the site characterization data and to ensure that exposures are not underestimated. The USEPA has developed a software tool called ProUCL specifically for computing these 95% UCL values (USEPA, 2007). However, the statistical models used for computing 95% UCL values are all based on the assumption that site data were generated following a random or systematic sampling strategy. In many cases, including the Drexel site, environmental samples are collected using a biased strategy in which many more samples are collected from areas of known or suspected contamination than from areas without contamination. In these situations, the USEPA acknowledges that it is appropriate to compensate for the sampling bias when computing the mean and the 95% UCL of the mean to avoid overestimating these parameters (USEPA, 2011).

Approaches for compensating for sampling bias typically involve the use of geospatial software tools that can interpolate concentrations such that all areas within an exposure domain contribute equally to the calculated representative concentration. By correlating distance and direction to the specific constituent concentrations being interpolated, interpolation determines how the constituent concentration at sampled points can be used to estimate the concentration across areas not sampled. Therefore, we used an approach that integrates the spatial interpolations[2] with the robust statistical models of ProUCL (referred to herein as the interpolation/area-average approach). This approach was used with the soils data as part of the development of the final remediation plan. Refer to Appendix F for an example of the geospatial analysis of toxaphene at various depth intervals at the Site.

8.2 Exposure Domains and Depth Intervals

Five exposure domains were designated to encompass the areas where the soil condition exceeds the RRS (see Figure 6). On the Drexel Facility, the soil condition exceeding RRS is limited to the northern half of the facility (the process area of the Site); therefore, the exposure domains on the Drexel Facility address only the northern half of the property (Figure 6). Three exposure domains were established for soils outside the Drexel facility: 1) CSX, which encompasses the facility rail spur area and extending north across the CSX rail line), 2) North Drainage Swale that is in the low-lying area adjacent to the CSX rail on the north side of the track, and 3) South Drainage Swale that is in the low-lying area adjacent to the CSX rail on the south side of the

[2] Using the nearest neighbor method in ArcGIS 3D Analyst.

track. Each exposure domain is about 1-1.5 acre in surface area and configured to separate the different areas of impact within unique exposure domains (e.g. the sources and impacts in the swales are different than from the rail car unloading area). The approximate 1-1.5-acre dimension of the exposure domains is appropriate for potential future use scenarios for the property including the potential for residential use (residences in this agricultural area are commonly on one or more acres of land).

Many of the sampled locations contain multiple samples with depth. Therefore the vertical dimension was segregated in order to separate data into unique layers for interpolation, considering also such factors as exposure (e.g. surface soils defined as 0-2ft and the exposure of typical construction workers is generally limited to 10-15ft), data density within a given layer, and break-points in concentrations (e.g., most exceedances are observed in depths shallower than 15ft). Considering these factors, the soils data set was segregated into the following depth intervals:

- 0-2ft
- 2-5ft
- 5-15ft
- Deeper than 15ft

The data used for the area-averaging analysis is shown in Table 4. Soil matrix results from samples collected within the surface impoundments were not included in the area-averaging analysis as the surface impoundments are self-contained concrete basins and are undergoing a separate remedial action (see Section 9.2).

8.3 Screening

A screening process was used to determine which constituents needed to be evaluated further. Table 5 shows some general statistics for each detected constituent in each depth interval for each exposure domain. The maximum concentration observed is compared to the Residential RRS. This comparison (shown in Table 5) shows that a number of constituents in each exposure domain (except the North Swale) have maximum concentrations higher than the Residential RRS. Thus, these constituents were carried forward in the evaluation.

Although there are numerous constituents where at least one sample exceeds the RRS, there are a few "primary" constituents that stand out in terms of frequency and magnitude of RRS exceedences. Thus, the iterative modeling exercise initially focused upon the primary constituents in honing in on the appropriate remediation plan, after which the plan was checked against all other constituents where the RRS is exceeded.

8.4 Determination of Areas Requiring Further Action

An iterative process was used to determine areas of the site that require further action. A small-sized grid of 10ft by 10ft was applied in the analysis. This grid dimension is sufficiently small given the lateral distance between sampled points on the Site, such that the sample results are not

averaged downward in concentration in the interpolation analysis. For the primary constituents, various model runs were conducted to determine the specific dimensions of areas of the site that needed to be addressed. In other words, if certain areas of the site were addressed (i.e., soil excavation), the resulting post-remediation condition (i.e. area-average concentration) would be below the Residential RRS. Next, other constituents were also evaluated using the process to ensure that the areas to be remediated were sufficient to address all constituents. An example of the interpolation and area-average technique for toxaphene is presented in Appendix F.

Figures 7 through 9 show the results of the interpolation/area-averaging method for the primary constituents in each depth interval. The areas requiring further action (remedial action areas) based on this iterative process (and including the ecological remediation areas), are outlined on each figure.

8.5 Post-Remedial Action Condition

8.5.1 Shallow Soils (< 15 ft)

After the remedial action areas were determined based on the interpolation and area-averaging approach, the post-remedial action condition was assessed for all constituents that had a pre-remedial action maximum concentration above the Residential RRS (from Table 5), more than one detect, and a frequency of detection greater than 10%. Figure 12 shows the combined remedial action areas and also shows for a 2:1 sloped excavation, where the start of slope would begin in the areas where shoring would not be required. Based on these excavation footprints, it was determined which existing soil samples would be removed during excavation. These samples to be excavated are shaded gray in Table 4.

Table 6 shows a comparison between the Residential RRS, pre-remediation maximum concentration and post-remediation values. Two post-remediation values are shown. The first is maximum concentration outside of the remedial action areas (based on actual analytical data of soil borings outside the remedial action footprint). For those constituents that have a post-remediation maximum concentration in excess of the Residential RRS, the interpolated area-average is also shown. This area-average is the 95% UCL of the interpolated data outside the remedial action areas. This area-average is conservative as 1) it does not include any data for clean fill material that would be in place after the remedial action, and 2) it does not account for the soil that will be excavated in order to slope down to the excavation areas. Table 6 shows that all constituents meet the Residential RRS in all shallow (<15 ft) depth ranges and all exposure domains based on the interpolation and area-averaging technique. Thus, after remedial action is complete, the shallow soils (< 15ft) can be certified to the Residential RRS.

8.5.2 Deep Soils (> 15 ft)

Table 6 shows that EDB is the only constituent that exceeds the Residential RRS at depths greater than 15 ft. Figure 10 shows the locations of the EDB samples. Despite the concentrations being higher than the Residential RRS, the concentrations at depth are still protective of human health as will be demonstrated in this section. The Residential RRS is based

on the higher of the Type 1 RRS and the Type 2 RRS, which for EDB is the Type 1 RRS[3]. The Hazardous Site Response Act (HSRA) Rules state that the Type 1 RRS "poses no significant risk on the basis of standardized exposure assumptions and defined risk levels for residential properties." RRS are determined based on a decision matrix, the purpose for which is to develop standards that are protective of humans in contact with both soil and groundwater. Constituents present in soil may leach into the groundwater. Thus, a component of the decision matrix for soil RRS is groundwater protection. The Type 1 soil RRS is determined based on the lessor of concentrations based on two considerations:

1) protection of groundwater: concentrations which will not cause contamination of groundwater
2) direct-contact: concentrations which are unlikely to result in any noncancer toxic effect or excess cancer risk to humans in direct contact with the soil

For EDB, these concentrations based on these considerations are:

1) protection of groundwater: 0.01 milligrams per kilogram (mg/kg)
2) direct-contact: 0.5 mg/kg

Thus, the Type 1 RRS (and Residential RRS) is set as the lower of these two concentrations, which is 0.01 mg/kg for protection of groundwater. Table 6 shows a comparison of the EDB RRS based on protection of groundwater and direct-contact with soils. The interpolated area-average concentrations (0.03 mg/kg for the CSX domain, and 0.02 mg/kg for the Drexel East domain), are above the protection of groundwater RRS (0.01 mg/kg), but well below the direct-contact RRS (0.5 mg/kg). Thus, the concentrations of EDB in soil are protective of human health based on the residential scenario. However, it is unlikely that any residents (or industrial/construction workers for that matter) would ever reasonably come into contact with the soils at these depths (15-60 ft). Thus, the deep soils (> 15ft) can be certified for Residential RRS based on direct contact.

The only remaining consideration for deep soils is protection of groundwater, which will be addressed by implementation of a groundwater pump and treat system on Drexel's property and an environmental covenant restricting groundwater usage (see Section 9). The pump and treat system will capture whatever may be leaching and will operate until groundwater is in compliance with groundwater RRSs. Once groundwater meets the Residential RRS, the deep soils would be certified for protection of groundwater on the basis of an empirical site-specific demonstration of soil leaching, i.e., the site groundwater underlying the soil meets the RRS (from which the leaching-based RRS is derived).

[3] RRS calculations are presented in *Technical Memorandum Revision 2: Development of Soil- and Groundwater-based Risk Reduction Standards*, EPS July 2010.

To be excavated as part of remedial action plan

Bold: Exceeds residential RRS

Qualifiers:

J	The associated numerical value is an estimated quantity.
B	Analyte present in the blank and the sample.
*	Spike recovery is equal to or outside the control criteria used.
P	> 40% difference for detected concentrations between two columns - changed from 25% per DOE SOW Rev. 4 (6/30/04)
D	Analytes analyzed at a secondary dilution.
E	Reported value is estimated because of the presence of interference.
