Former Manufactured Gas Plant Site Macon, Georgia
HSI #10511

Dear Mr. Brownlee:

Attached please find one hard copy and two cd copies of the ***VRP 2nd Semiannual Progress Report*** for the Atlanta Gas Light Company Former Manufactured Gas Plant Site located in Macon Georgia.

Should you have any questions, please do not hesitate to contact me.

Sincerely,

Mark A. Fleri, P.E.
Project Manager

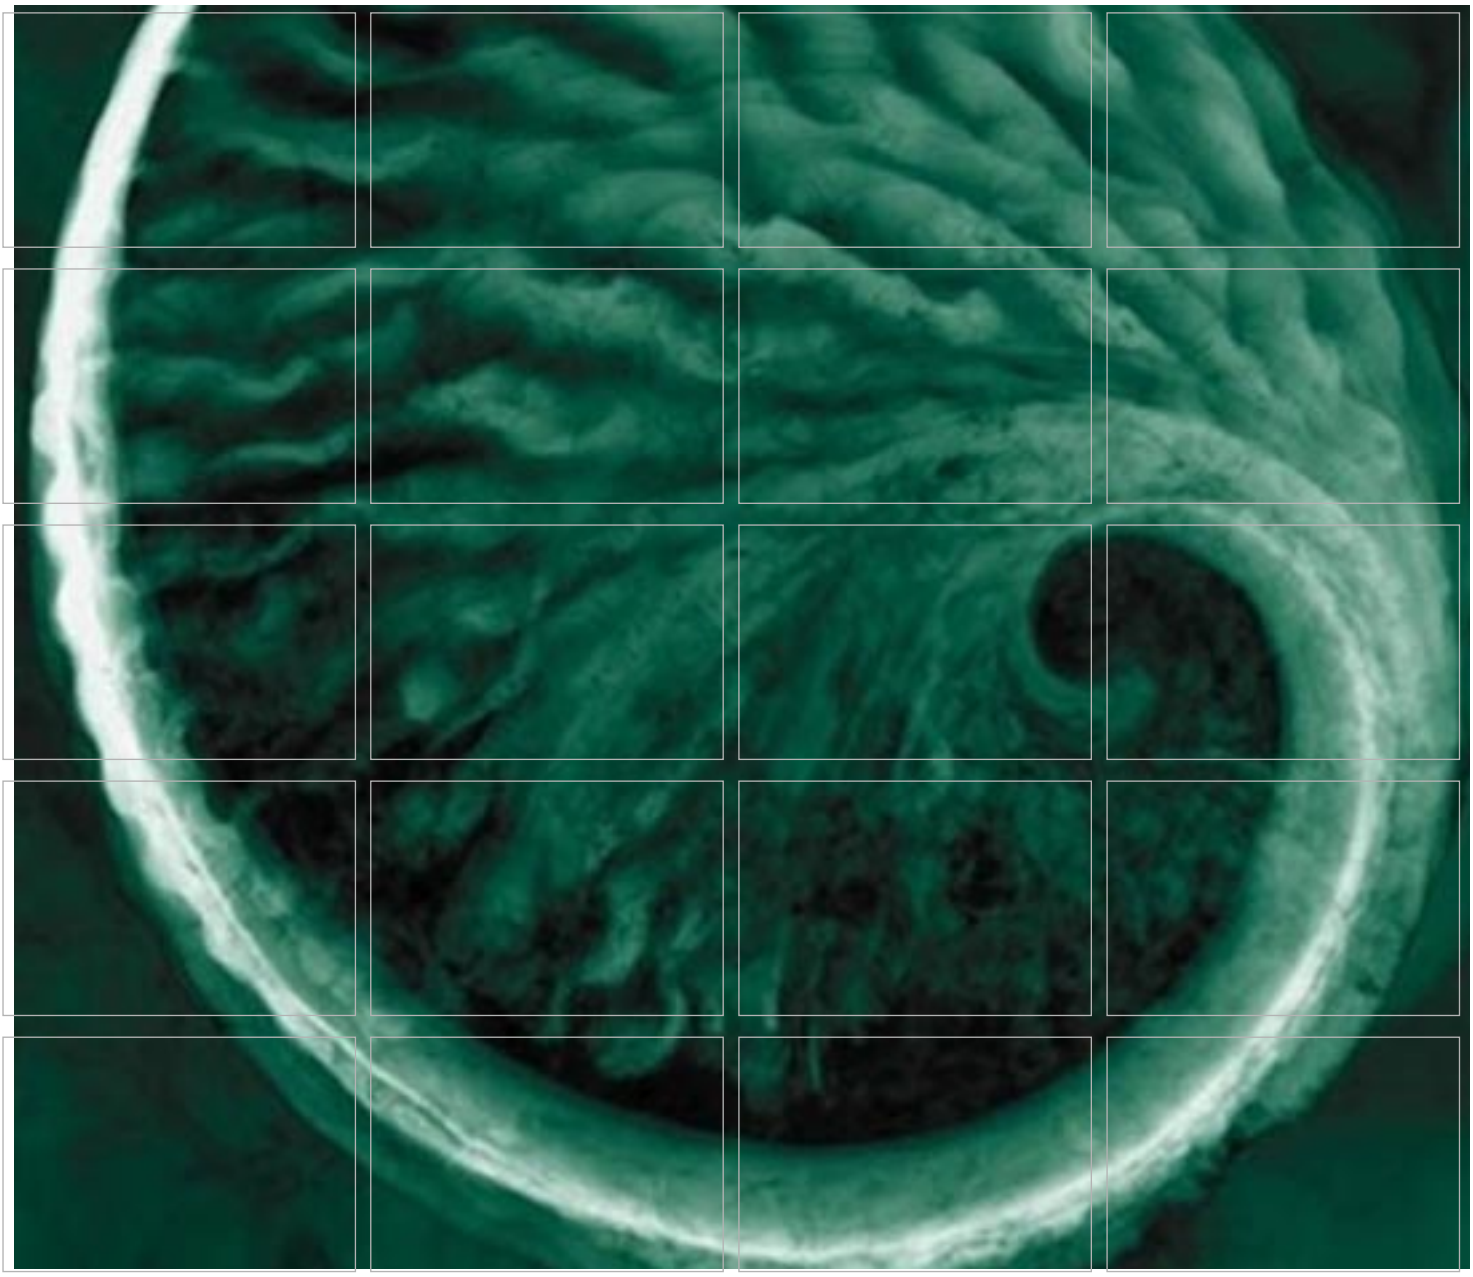
Subject: **VRP 2st Semiannual Progress Report**
Atlanta Gas Light Company
Former Manufactured Gas Plant Site Macon, Georgia
HSI #10511

I have enclosed electronic versions of Transmittal of Electronic version VRP 2st Semiannual Progress Report Atlanta Gas Light Company Former Manufactured Gas Plant Site Macon, Georgia HSI #10511 pdf files on Compact Disc to accompany the hard copy report. This certification states that the electronic copy is complete, identical to the paper copy and virus free.



I, Holly H. McDonald, on May 23, 2016 made a complete electronic copy of the following document:

Transmittal of Electronic Version of the Submittal of the
VRP 2st Semiannual Progress Report
Atlanta Gas Light Company
Former Manufactured Gas Plant Site Macon, Georgia
HSI #10511
then confirmed that the electronic copies did not contain a virus utilizing Symantec antivirus software.

You can contact me at 678.486.2700 with any questions or comments.

Best regards,

Holly H. McDonald

1.0 INTRODUCTION

This *2nd Semiannual Progress Report* is being submitted on behalf of Atlanta Gas Light Company (AGLC) for the former Macon Manufactured Gas Plant (MGP) site located in Macon, Bibb County, Georgia (Figure 1-1). Two MGP facilities formerly operated in the area of Mulberry Street and 6th Street in Macon. The former MGP located at 137 Mulberry Street (southeast of 6th Street) has been the subject of numerous investigation and corrective actions since the 1980s. This portion of the Macon MGP site is referred to as the Mulberry Street MGP (also referred to as the Eastern Portion MGP in previous correspondence). The property is bounded by Walnut Street, 7th Street, Mulberry Street, and 6th Street, and is currently owned by Macon Urban Development Authority (MUDA.

The second MGP was located northwest of 6th Street. Investigation of this property began in 2005 and in 2007; soil and groundwater impacts requiring additional investigation were identified during the demolition of structures on the property. The results of the investigation established that this location was a separate former MGP site that used different MGP production processes relative to the Mulberry MGP. This former MGP is referred to as the Western Portion MGP (Figure 1-2).

AGLC and the Georgia Environmental Protection Division (EPD) entered into Consent Order EPD-HSR-227 on July 11, 2000. The Consent Order was administered under the Hazardous Site Response Act (HSRA) and the Site was listed on the EPD Hazardous Site Inventory (HSI) as number 10511. AGLC completed a series of investigations and implemented numerous EPD-approved corrective actions while under the HSRA program to address residual MGP impacts in the unsaturated and saturated materials at the Site and on neighboring parcels.

AGLC submitted an application to enter the Georgia Voluntary Remediation Program (VRP) and a Voluntary Investigation and Remediation Plan (VIRP) to EPD in October 2014. On January 14, 2015, AGLC and EPD signed and executed Consent Order EPD-VRP-12, providing for transition of the Site from regulation under HSRA to the VRP. EPD acknowledged acceptance to the VRP in correspondence dated May 21, 2015 and provided comments on the VIRP in correspondence dated May 26, 2015. For the purposes of this document, the term "Site" is defined as the portion of AGLC's contiguous property and any other owner's property potentially impacted by the former MGP operations.

The Site, additional VRP-qualifying properties, and adjoining properties are shown on Figure 3-1.

Under the VRP, the schedule for submittal of progress reports is May 21st and November 21st annually. The purpose of this report is to provide EPD with an update of activities completed since submittal of the *1st Semiannual Progress Report* on November 21, 2015. In addition, the progress report describes upcoming planned activities. In correspondence dated May 26, 2015, EPD provided comments to the October 2014 VIRP; the comments were addressed in the *1st Semiannual Progress Report*. No additional comments have been received from EPD at the time of preparation of this report.

2.0 ACTIVITIES COMPLETED SINCE 1ST SEMIANNUAL PROGRESS REPORT SUBMITTAL

This section describes all activities that have been completed since the *1st Semiannual Progress Report* was submitted in November 2015. These activities include implementation of the corrective actions detailed in the 2014 CAP Addendum (ERM, 2014) and groundwater monitoring and sampling events.

2.1 REMEDIATION PROGRESS

The following corrective action activities have been conducted at the site since the time of the *1st Progress Report* submission:

Primary Site Activity	Completion Date
Planning, Permits, and Coordination	05/15/2015
Mobilization	05/18/2015
Site Prep and Baseline Air Monitoring	06/05/2015
Excavation, Stockpiling, T&D	04/15/2016
In Situ Stabilization/Solidification	11/18/2015
Utility Removal (Gas, Electric, Phone)	10/15/2015
Site Backfill and Grading	04/15/2016
Site Vegetation Restoration	04/15/2016
Utility Restoration	04/29/2016
Roadway Restoration	04/29/2016

Appendix A provides the Corrective Action Completion Report with details regarding the completion of the soil excavation, in situ solidification (ISS), and site restoration work for the Western Portion former MGP site.

2.2 *GROUNDWATER INVESTIGATIONS AND MONITORING*

Groundwater sampling at the site is typically conducted in February (annual event) and August (semiannual event). As discussed in Appendix A, ISS into the saprolite for remediation of MGP-derived byproduct-like material (BPLM) and/or source materials below the groundwater table at the former Macon MGP site was completed in late 2015, excavation of unsaturated soil to remove BPLM and/or source material was completed in mid-April 2016, and site restoration activities were completed in late April 2016. These activities are known to have the potential to create disturbances in the aquifer for some time following implementation. The short duration between completion of the corrective action and an event completed in February could provide anomalous results; therefore, groundwater sampling was postponed until April 2016.

As an interim measure to monitor potential variations in localized groundwater flow, groundwater elevation and total well depth measurements were collected on March 3, 2016 from each accessible alluvium and bedrock groundwater monitoring well. Each well was also evaluated for the presence of dense non-aqueous phase liquid (DNAPL).

A groundwater monitoring report summarizing the results of the March 2016 groundwater level monitoring event and the April 2016 groundwater sampling event is included as Appendix B.

2.3 *BEDROCK DNAPL INVESTIGATIONS*

2.3.1 *DNAPL Observations and Measurements*

During this reporting period DNAPL was observed in MW-111D and MW-309D. The presence of DNAPL in these two (2) bedrock wells is consistent with historical observations.

MW-111D

DNAPL accumulation monitoring was conducted at MW-111D in January, March and April 2016. The following summarizes DNAPL monitoring and recovery efforts at MW-111D since the August 26, 2015 VEFR event.

MW-111D		
Date	**Event**	**Observations – DNAPL Thickness (feet)**
August 26, 2015	Pre-VEFR Monitoring	0.13 ft
August 26, 2015	VEFR	0.00 ft post-VEFR
October 4, 2015	DNAPL Monitoring/ VEFR Follow-up Event	0.00 ft
January 19, 2016	Interim Monitoring	0.55 ft
March 3, 2016	Interim Groundwater Level Monitoring	0.68 ft
April 4, 2016	Semiannual Monitoring	1.4 ft

MW-309D

DNAPL was first observed in MW-309D during well development in July 2015 following well installation. The following table provides a summary of DNAPL thickness monitoring and DNAPL recovery efforts at MW-309D since the August 26, 2015 VEFR event.

MW-309D		
Date	**Event**	**Observations - DNAPL Thickness (feet)[1]**
August 26, 2015	Pre-VEFR Monitoring	Estimated 10 ft of DNAPL with NAPL globules suspended in water column
August 26, 2015	VEFR	0.00 ft post-VEFR
October 4, 2015	DNAPL Monitoring/ VEFR Follow-up Event	Estimated 1.1 ft of DNAPL with minor NAPL globules suspended in bottom 2 ft of well
January 19, 2016	Interim Monitoring	Estimated 1.5 - 7 ft of DNAPL
March 3, 2016	Interim Groundwater Level Monitoring	Estimated 1.5 - 7 ft of DNAPL
April 4, 2016	Semiannual Monitoring	Estimated 1.5 - 7 ft of DNAPL

[1]Thickness of DNAPL estimated. Range was difficult to determine due to density, conductivity and emulsification of the DNAPL in the well.

Additional bedrock wells are planned to further investigate the presence of DNAPL in the vicinity of MW-309D (see Section 3.2).

2.3.2 DNAPL Recovery

The first vacuum enhanced fluid recovery (VEFR) event was performed in February 2011 to remove DNAPL in MW-111D. There have been subsequent events performed in September 2013 (MW-111D and MW-302D), May 2015 (MW-111D), and August 2015 (MW-111D, MW-309D and SW-1). No VEFR events were completed during the monitoring period.

2.4 VAPOR INTRUSION EVALUATION

No vapor intrusion (VI) investigation activities were conducted during this monitoring period.

2.5 SURFACE WATER

Monthly monitoring of rainfall in the Macon area was completed during this reporting period to determine if the Ocmulgee River incurred a 100-year flood event. Such an event would require a supplemental river survey be conducted by AGLC. A 100-year flood event did not occur during this period.

No additional surface water investigations or corrective actions were completed during this monitoring period. Per Comment 2 of the May 26, 2015 EPD correspondence, a summary of the history of investigations and corrective actions completed for the Ocmulgee River near the Site was provided in the *1st Semiannual Progress Report*. A description of the surface water exposure pathway, including surface water and sediment data, was included.

2.6 REGISTERED PROFESSIONAL SUPPORTING DOCUMENTATION

To document the direct oversight of the development of the Voluntary Remediation Plan, implementation of corrective action and long-term monitoring, a monthly summary of hours invoiced and description of services provided by Hunter Sartain, P.E. (Georgia No. 032318) to the VRP participant since the previous submittal to EPD is shown in the following table:

Hunter Sartain, P.E. (Georgia No. 032318)		
Month	Hours Invoiced	Work Completed
November 2015	73.0	Oversight of the work summarized in this report
December 2015	29.5	
January 2016	57.5	
February 2016	34.5	
March 2016	29.0	
April 2016	27.5	

3.0 PLANNED CORRECTIVE ACTIONS AND INVESTIGATIONS

The following sections describe corrective actions and investigations that are planned to be initiated and/or completed during the next monitoring period. A projected milestone schedule is included as Figure 3-1.

3.1 GROUNDWATER INVESTIGATIONS AND MONITORING

3.1.1 Semiannual Groundwater Monitoring

As approved by EPD, groundwater monitoring of alluvium wells was suspended during the ISS and excavation activities. As ISS and excavation activities were recently completed, the first post-corrective action groundwater monitoring event was postponed from February 2016 to April 2016 (Section 2.2) to avoid the collection of potentially anomalous data resulting from the recent disturbances to the aquifer.

During the next reporting period, groundwater monitoring will be conducted in accordance with the Alluvial Groundwater Monitoring Work Plan (GMWP) provided in Appendix H of the 2014 CAP Addendum, with revisions as shown in Table 3-1. The GMWP is intended to provide data regarding constituents of interest (COIs) in wells to monitor corrective action conditions and outline overall effectiveness of the remedy at the site.

During the next reporting period, bedrock groundwater monitoring will continue per the *Bedrock Groundwater Monitoring Plan* (Appendix I of the 2014 VIRP). The bedrock groundwater monitoring network is shown in Table 3-2.

The objective of the groundwater monitoring program is to collect data necessary to evaluate corrective action effectiveness, monitor impacts to the dissolved phase plume and DNAPL impacts, and provide information to update the conceptual site model (CSM) as necessary. After four post-remediation semiannual bedrock and alluvial groundwater sampling events, the need and/or value of continued performance verification monitoring will be assessed for VRP regulatory compliance. The analytical schedule and frequency will be adjusted, as needed to continue compliance demonstrations. The next groundwater monitoring event is scheduled for August 2016.

3.1.2 *Bedrock Well Installations*

Additional wells will be installed to better define the extent of DNAPL in bedrock. The total number and location of additional bedrock wells will be determined based on results of the ongoing bedrock investigation and monitoring program. These wells and any others installed to refine understanding of the extent of dissolved phase impacts will be incorporated into the semiannual groundwater monitoring schedule upon installation, and the results documented in future VRP progress reports.

3.2 *BEDROCK DNAPL INVESTIGATION AND RECOVERY*

DNAPL investigation activities are planned for the next reporting period to refine the CSM in regard to DNAPL presence, extent, and recoverability. The proposed investigation locations are shown on Figure 2-1. The investigation will be completed in accordance with the methods described in the DNAPL Investigation Work Plan provided in Appendix G of the VIRP.

Two primary investigatory borings (DIB-7 and DIB-8) will be advanced, with a contingent boring to be advanced northeast of DIB-7 if DNAPL is detected at DIB-7. Sump wells are proposed for installation at locations where potentially recoverable DNAPL is encountered. Two additional locations (proposed locations MW-310D and MW-311D shown on Figure 2-1) will be advanced to investigate the extent of DNAPL identified at MW-309D and to provide groundwater quality information southwest and east of MW-309D. If recoverable DNAPL is detected in partially weathered rock (PWR) during the drilling of these wells, a sump will be installed and a second borehole will be advanced adjacent to the sump in order to install shallow bedrock well. If DNAPL is not encountered, only the shallow bedrock well will be drilled and installed.

Results of the DNAPL investigation and DNAPL monitoring and recovery efforts will be provided in subsequent semiannual progress reports.

3.3 *VAPOR INTRUSION EVALUATIONS*

If warranted based upon COI concentrations and Site conditions, current and applicable VI guidance will be used to determine whether the VI pathway may be complete at the Macon MGP site. The VI pathway may be complete where a building is located or is planned and where reported COI concentrations may pose an unacceptable risk for existing buildings or future construction. Control methods (e.g., Uniform Environmental

Covenants [UEC], barriers or specific construction design) may be utilized to mitigate the potential for vapors to enter indoor air in existing buildings or future construction.

The small unused building located on the corner of 6th Street and Mulberry Street (Prodigy Woodworks parcel) is being planned for demolition in 2016, to be replaced by a parking lot. A UEC will be placed on the parcel requiring control measures, (e.g., installation of a vapor barrier) as part of the construction of any future structures on the property. The UEC will eliminate the concern for a complete VI pathway at the Prodigy Woodworks parcel.

3.4 SURFACE WATER EVALUATION

A summary of activities that have been completed to support that the surface water exposure pathway associated with the Ocmulgee River has been eliminated was included in the *1st Semiannual Progress Report*. As detailed in that report, a substantial river armoring event was completed in 2004. A baseline river bottom survey and two subsequent surveys to monitor for erosion and scouring of the armored portion have been conducted since 2004, with the most recent event completed in October 2015. The October 2015 survey demonstrated that a minimum of three (3) feet or more of sediment cover remains in the armored area.

Based on the history of the investigation, remediation, and subsequent monitoring of the Ocmulgee River sediments near the Upper and Lower Outfalls, the compliance certifications previously provided, and the historical monitoring, the *1st Semiannual Progress Report* recommended that sediments and surface water be excluded from further evaluation. As such, no surface water evaluations are planned to occur during the upcoming reporting period, and monitoring of rainfall in the Macon area will be discontinued.

3.5 MODELLING AND POINT OF DEMONSTRATION WELLS

As discussed in section 2.1 of this report, corrective actions for alluvial groundwater were completed in April 2016. Investigations of dissolved phase impacts will continue with semiannual groundwater monitoring event, and investigation of DNAPL presence in bedrock is planned for the next reporting period (Sections 3.1 and 3.2) . Data collected during the

next reporting period will be used to monitor post-corrective action conditions and to evaluate when the aquifer has returned to steady-state (or static) conditions. Once the data set considered to represent steady-state groundwater conditions is considered sufficiently robust, the CSM will be updated and groundwater modelling will be performed. Modelling will be used to determine and validate the locations of point of demonstration (POD) wells.

As shown in Figure 3-1, it is anticipated that two (2) groundwater monitoring events (semiannual event in August 2016 and an annual event in February 2017) will provide sufficient data to beginning the modelling and POD well evaluation efforts. Groundwater conditions will be evaluated following each event and additional groundwater sampling will be completed if necessary to meet project objectives and milestones (i.e., wells may be added to the proposed schedule, or a quarterly sampling event may be completed).

3.6 RISK ASSESSMENT AND REPRESENTATIVE EXPOSURE CONCENTRATIONS

Post-corrective action groundwater COI concentrations and results of the ongoing bedrock investigations will be evaluated during the next reporting period, and groundwater monitoring wells will be installed and sampled as necessary to comply with VRPA delineation requirements. If warranted, additional properties may be entered into the VRP. Upon completion of the post-implementation monitoring of the effectiveness of the corrective actions described in Appendix A, the bedrock investigations described in the 2014 VIRP and herein, and inclusion of any additional properties into the VRP, the human health exposure pathway assessment and risk evaluation outlined conceptually in the VIRP for COIs in soil and groundwater will be completed.

3.7 UNIFORM ENVIRONMENTAL COVENANTS

Continued monitoring and maintenance activities, and/or restrictions on disturbance of soil, and/or restrictions to groundwater use at VRP-qualifying properties will be implemented as needed in the form of UECs. Existing UECs (e.g., current restriction on groundwater use at the MUDA property) will be revised if appropriate and new UECs will be enacted as necessary based on post-remedy conditions and the results of the risk evaluation.

PROFESSIONAL ENGINEER CERTIFICATION

"I certify that I am a registered professional engineer who has received a baccalaureate or post- graduate degree and have sufficient training and experience in remedial action engineering and related fields, as demonstrated by state registration and completion of accredited university courses that enable me to make sound professional judgments regarding remedial actions. I further certify that I have participated in the preparation and have reviewed the contents of this report."

Mark Fleri, P.E.
Georgia Professional Engineer License No. 25460

1.0 INTRODUCTION

This *Corrective Action Completion Report* (CACR) is being submitted on behalf of Atlanta Gas Light Company (AGLC) for the Macon former Manufactured Gas Plant (MGP) site located in Macon, Bibb County, Georgia (Figure A-1). The remedial action area is located east of downtown Macon, and is bounded in general by Terminal Avenue to the west, Walnut Street to the north, and 6th Street and/or Mulberry Street to the east.

Two MGP facilities formerly operated in this area. One of the MGP facilities was located at 137 Mulberry Street and the other was located on what is now Terminal Avenue (*Western Portion MGP*). Surrounding features and the location of these former MGP sites are presented in Figure A-2.

The Macon former MGP Site was previously listed on the Georgia Environmental Protection Division (EPD) Hazardous Site Inventory (HSI) as HSI No. 10511. AGLC has performed a series of investigations and implemented several EPD approved corrective actions, which have addressed the unsaturated and saturated materials at the Site.

AGLC submitted an application to enter the Georgia Voluntary Remediation Program (VRP) and a *Voluntary Investigation and Remediation Plan* (VIRP) to EPD in October 2014 (ERM, 2014). The *Western Portion and MW-101 Area Groundwater Corrective Action Plan Addendum* (Groundwater CAP-Addendum [ERM, 2014a]) was included as an appendix to the VIRP. The Macon former MGP Site was accepted into the VRP on May 21, 2015 and entered into EPD Consent Order EPD-VRP-012. For the purposes of this document, the term "Site" is defined as the portion of AGLC's contiguous property and any other owner's property potentially impacted by the former MGP operations.

The VRP remedial action included in the VIRP and Groundwater CAP-Addendum (ERM, 2014a) was implemented from May 2015 through April 2016. This CACR has been prepared by ERM to satisfy the requirement for remedial action completion reporting within 90 days of the finish of remedial activities, as described in the Groundwater CAP Addendum (ERM, 2014a).

2.0 SUMMARY OF THE CORRECTIVE ACTIONS

As described in the VIRP, the Site remedy consisted of two distinct components:

- Excavation and off-site disposal of vadose zone soils that were impacted above established Risk Reduction Standards (RRS) , or were visually observed to contain MGP-related byproduct-like material (BPLM); and/or source material.

- In-Situ Solidification (ISS) of media below the water table with a cement-slag-bentonite grout mixture. The limits of ISS encompassed the full horizontal and vertical extent of alluvial soils where soil borings encountered MGP-derived BPLM.

A summary of the VRP remediation activities is presented in Table A-1. Figure A-3 shows the pre-existing conditions at the Site prior to the start of this remedial action. The ISS treatment area extended horizontally from the edge of the previously-existing ISS monolith west to Terminal Avenue, as shown on Figure A-2. The top of the ISS monolith varied from 8 feet to 13 feet below ground surface (bgs), while the bottom of the ISS monolith varied from about 12 feet bgs to 30 feet bgs, which included penetration of at least two feet into the saprolite unit beneath the impacted alluvial soil, or to refusal. In addition, widths of three ISS columns were installed around the perimeter of the ISS area at least five feet into the saprolite unit. This "key" into saprolite provides greater probability that the ISS was installed into competent material to limit the potential migration of contaminants from the residual monolith.

The goal of the VRP ISS remedy was to remove MGP-impacted soil above groundwater and replace with clean back-fill, and to immobilize MGP-derived BPLM within a low-permeability soil- cement monolithic matrix. The VRP remedial action was specifically designed to address BPLM and source material in alluvial soils and, consequently, protect groundwater in the alluvium. The low hydraulic conductivity of the soil-cement matrix will significantly reduce the mobility of groundwater through the new ISS monolith and thereby retard the contact of constituents of interest (COI) with alluvial groundwater.

3.0 PROJECT ORGANIZATION AND CONTRACTING

ERM prepared the Remedial Design for the project as part of the *Request for Proposal for In-Situ Solidification (ISS) of Source Materials and Associated Activities* (ERM, 2014b) and then implemented the remedy providing construction management, safety services, quality assurance (QA), and subcontracted construction services. ERM directly subcontracted the following services:

- Geo-Solutions, Inc. (GSI): Remedial construction
- AES: Chemical Analytical Laboratory and ISS Leachability Analyses
- KEMRON: Geotechnical Laboratory and ISS Leaching Procedure Extractions
- Donaldson, Garrett, and Associates, Inc. (DGA): Surveying
- Ground Penetrating Radar Systems, Inc. (GPRS): Utility locate services
- Vibra-Tech Inc.: Monitoring ISS ground vibration on the neighboring Norfolk Southern property
- Ferrell Gas: Relocation of a propane tank on an adjacent property near the ISS limits
- Ridge Environmental Solutions: Permanent Restoration Fencing

GSI was selected as the remedial construction contractor on this project. GSI performed all general construction duties including soil excavation, disposal and installation of the solidified ISS monolith. GSI used a number of direct subcontractors and material and equipment providers, including:

- AA Action Fence Company: Temporary Construction Fencing
- SBX: General Site Preparation Tree Clearing and Earthwork
- Lehigh: Supplier of Portland cement and granulated ground blast furnace slag (ISS reagents)
- H&H Environmental, Inc.: Supplier of bentonite (ISS reagent)
- Advanced Disposal: Transport and disposal of impacted soil and debris
- Neff Rental: Construction equipment rental
- Rain for Rent: Contact water treatment system, storage tanks (frac tanks), and transfer pumps
- Geotechnical Environmental Consultants (GEC): Geotechnical testing of backfill soil and nuclear density field testing of compacted backfill and asphalt
- Sam Hall and Sons: Sidewalk and curb installation, road pavement reconstruction, utility relocations and restoration
- Middle Georgia Hydroseeding: Soil Amendment Placement and Seeding

TRC who performed third party perimeter air monitoring was subcontracted by Kazmarek Mowrey Cloud Laseter, LLP (KMCL).

4.0 SITE PREPARATION AND EXCAVATION

4.1 SITE PREPARATION

ERM and GSI mobilized to the Site on May 18, 2015. Appendix A-1 is a photographic log of the project activities. DGA performed a pre-construction topographic survey and staked out the necessary project controls.

During mobilization, GSI took delivery of rental equipment, traffic control barriers and signage, temporary facilities, and materials. Six flatbed trucks delivered the pieces of the ISS crane on May 27th, and crane assembly commenced immediately. Initial site work included installation of erosion controls, storm water basin excavation, and installation of storm water diversion berms, the gravel haul road, trailers, parking area, and truck staging area. GSI also installed perimeter fencing with privacy/dust control fabric, placed traffic barriers and signage, received reagent storage equipment (cement "pigs") and reagents (bentonite).

Once equipment and materials were mobilized, GSI prepared the crane to receive the ISS drilling platform; erected, plumbed, and wired the grout batch mixing plant; took delivery of reagents (Portland cement and slag, bentonite); began excavation of topsoil and overburden soil from within the ISS footprint; and constructed a lined stockpile for temporary storage and testing of potentially-impacted soils.

Following mobilization and set-up of temporary facilities, GSI transported the assembled crane and auger into the ISS footprint.

4.2 PREPARATORY EXCAVATION

4.2.1 Storm Water Detention Basin Excavation

Excavation of approximately 500 cubic yards of soil for the temporary storm water detention basin was performed between June 6th and June 9th. This excavation did not encounter any impacted soil. Excavated soil and topsoil were stockpiled for testing and later reuse as fill. Photographs of the work, as well as the completed storm water detention basin after a rain event, are provided in Appendix A-1.

4.3 MONITORING WELL ABANDONMENT

As noted in the *1st Semiannual Progress Report*, a total of three (3) bedrock monitoring wells located within the footprint of the ISS work were abandoned in May 2015 prior to mobilization to the Site and initiation of the corrective actions. During the course of the corrective actions, 13 alluvial monitoring wells located in the footprint of the soil excavation and/or ISS work area were abandoned.

Abandoned alluvial wells located within the footprint of the ISS monolith were "over-drilled" by the ISS auger and all of the remnant well casings were thereby incorporated into the ISS monolith. Alluvial wells located outside the ISS area but within the soil excavation area were excavated during the excavation activities. Two (2) wells in the vicinity of the corrective actions (MW-25 and MW-25D) were covered by debris during the site restoration activities; the wells will be located and assessed for future monitoring. One well (AMW-9) was potentially destroyed during the corrective action activities; an attempt will be made to locate the well and assess suitability for future monitoring. The locations of the abandoned wells and additional details are shown on Figure A-2 and well abandonment records are included in Appendix A-2.

4.4 CORRECTIVE ACTION EXCAVATION AND CONFIRMATION SAMPLING

Prior to initial ISS work, the majority of the necessary soil excavation work to remove soils in excess of applicable RRS was performed. Some areas were remediated concurrently or after the ISS work. Work in each area is described in more detail in subsections below. Soils with confirmation sample results above applicable RRS were excavated, directly loaded onto transport vehicles, and disposed offsite.

Confirmatory samples were collected and analyzed to demonstrate that soil at the excavation limits met applicable remedial goals. The confirmation sample results are presented in Table A-2. When a confirmation sample resulted in an unacceptable concentration, over-excavation was conducted (rendering the original sample obsolete), and a new confirmation sample was collected. Table A-2 presents the confirmation sample results, the applicable RRS (parcel specific), and the statistical computation showing compliance with the applicable RRS. Analytical results for confirmation samples are provided in Appendix A-3.

Remedial excavation areas (Areas 4, 5, 6, 7, and 10) were located outside the ISS limits. The remaining identified remediation areas overlaid the ISS area, and were excavated to enable the ISS work. The excavation areas are shown on Figures A-4, A-5, and A-6. Confirmation sample locations are presented where applicable.

4.4.1 Area 1- Type 4 RRS

As shown on Figure A-4, Area 1 excavation was limited in depth from 0 to 2 feet bgs. Impacted soil was not anticipated above remedial goals in Area 1 (Type 4 RRS), and was to be excavated only to access deeper impacted soil and/or to access the ISS drilling elevation.

Approximately 1,330 cubic yards of soil and material were excavated from Area 1. Approximately 950 cubic yards of soil were excavated and transported

to the on-site soil stockpiles area for re-use. Refer to Section 6.1 for discussion about the stockpile management and testing.

From within Area 1, approximately 380 cubic yards of asphalt and concrete pavement were removed and transported off-site for disposal.

4.4.2 Area 2 - Type 4 RRS

Area 2 was comprised of known impacted soil from 0-2 feet bgs as shown on Figure A-4. Originally delineated to contain 2,640 cubic yards of soil, the limits of Area 2 were extended to due to elevated confirmatory sample analytical results. Approximately 3,160 cubic yards of soil were excavated from Area 2 and disposed of off-site.

4.4.3 Area 3 - Type 4 RRS

As shown on Figure A-4, Area 3 excavation depth was 0 to 2 feet bgs. Area 3 was anticipated to contain soil that was not impacted above remedial goals, and was to be excavated only to access deeper impacted soil and/or to access the ISS drilling elevation.

Approximately 1,300 cubic yards of soil and material were excavated from Area 3. Approximately 1,200 cubic yards of soil were excavated and transported to the on-site soil stockpiles area for re-use. Refer to Section 6.1 for discussion about the stockpile management and testing.

From within Area 3, approximately 100 cubic yards of asphalt pavement were removed and transported off-site for disposal, solely because the asphalt could not be reused on site.

4.4.4 Area 4 - Type 4 RRS

The Area 4 excavation depth was from 0 to 2 feet bgs, as shown on Figure A-4. Soil from Area 4 (approximately 235 cubic yards) was excavated and transported to the on-site soil stockpiles area for re-use. Refer to Section 6.1 for discussion about the stockpile management and testing.

4.4.5 Area 5 - Type 2RRS

Area 5 was comprised of known impacted soil from 0-2 feet bgs as shown on Figure A-4. Originally delineated to contain 106 cubic yards of soil, the limits of Area 5 were extended to the north due to elevated confirmatory sample analytical results. Approximately 130 cubic yards of soil were excavated from Area 5 and disposed off-site.

4.4.6 *Area 6 - Type 4 RRS*

Area 6 was comprised of known impacted soil from 0-2 feet bgs as shown on Figure A-4. Originally delineated to contain 1,066 cubic yards of soil, the limits of Area 6 were extended due to elevated confirmatory sample analytical results. Approximately 1,252 cubic yards of soil were excavated from Area 6 and disposed of off-site.

4.4.7 *Area 7 - Type 2RRS*

Area 7 was comprised of known impacted soil from 0-2 feet bgs as shown on Figure A-4. Originally delineated to contain 280 cubic yards of soil, the limits of Area 7 were extended due to visual impacts in the soil. Approximately 400 cubic yards of soil were excavated from Area 7 and disposed of off-site.

4.4.8 *Area 8 - Type 4 RRS*

As shown on Figure A-5, Area 8 extended from 2 to 6 feet bgs. Area 8 was anticipated to contain soil that was not impacted above remedial goals, and was to be excavated only to access deeper impacted soil and/or to access the ISS drilling elevation.

Approximately 7,730 cubic yards of soil were excavated from Area 8. Of this volume, approximately 7,515 cubic yards of soil were excavated and transported to the on-site soil stockpiles area for re-use. Refer to Section 6.1 for discussion about the stockpile management and testing.

Although anticipated to be un-impacted, approximately 215 cubic yards of soil from within Area 8 were removed and transported off-site for disposal, due to visual, olfactory, and/or PID impacts. Once these conditions were observed the soils were disposed directly off-site without additional testing.

4.4.9 *Area 9 - Type 4 RRS*

Area 9 was comprised of known impacted soil from 2-6 feet bgs as shown on Figure A-5. Area 9 was originally delineated to contain 2,605 cubic yards of soil. The limits of Area 9 were not extended during the field activities, thus the original quantity was excavated and disposed of off-site.

4.4.10 *Area 10 - Type 4 RRS*

Area 10 was comprised of known impacted soil from 2-6 feet bgs as shown on Figure A-5. Originally delineated to contain 465 cubic yards of soil, the limits of Area 10 were extended to the north and east due to elevated confirmatory sample analyses and the presence of an old steel tank and MGP-related structures. Approximately 610 cubic yards of soil were excavated from Area 10 and disposed of off-site.

4.4.11 *Area 1 - Type 4 RRS*

As shown on Figure A-6, Area 11 extended nominally from 6 to 10 feet bgs. Area 11 was anticipated to contain soil that was not impacted above remedial goals, and was to be excavated only to access the ISS drilling elevation. Although the depth of Area 11 was to extend nominally to 10 feet below grade, in a few small areas the ISS elevation was encountered shallower than 10 feet.

Approximately 7,390 cubic yards of soil were excavated from Area 11. Of this volume, approximately 5,310 cubic yards of soil were excavated and transported to the on-site soil stockpiles area for re-use. Refer to Section 6.1 for discussion about the stockpile management and testing.

Although anticipated to be un-impacted, approximately 2,080 cubic yards of soil from within Area 11 were removed and transported off-site for disposal, due to visual, olfactory, and/or PID impacts. Once these conditions were observed the soils were disposed directly off-site without additional testing.

4.4.12 *Area 12 - Type 4 RRS*

Area 12 was comprised of known impacted soil from 6-10 feet bgs as shown on Figure A-6. Area 12 was originally delineated to contain 1,205 cubic yards of soil. The limits of Area 12 were extended due to sensory impacts in the soil, and 1,275 cubic yards of soil were excavated and disposed of off-site.

4.4.13 *Area 13 - Type 4 RRS*

Area 13 was comprised of known impacted soil from 6-10 feet bgs as shown on Figure A-6. Originally delineated to contain 1,100 cubic yards of soil, the limits of Area 13 were extended due to sensory impacts in the soil. Approximately 1,195 cubic yards of soil were excavated from Area 13 and disposed of off-site.

4.4.14 *Area 14 - Type 4 RRS*

Area 14 was comprised of known impacted soil from 6-10 feet bgs as shown on Figure A-6. Approximately 655 cubic yards of soil was excavated with 400 cubic yards of soil disposed of off-site.

4.4.15 *MGP Structures*

A historic MGP gas holder was encountered at the southwest corner of the ISS area, shown on Figures A-4, A-5, and A-6. The gas holder was comprised of brick walls and a brick bottom, and measured approximately 60 feet in diameter and about 14 feet deep as measured from the top-of-pavement elevation on Terminal Avenue.

The gas holder was excavated in two phases (north and south) in consideration of ISS sequencing objectives. The north phase was excavated prior to ISS to access the drilling elevation. The south phase was located outside the ISS area, and was excavated after the ISS work was completed, in part to take advantage of the ISS mass for slope stability on one side of the excavation. The final excavation depth of the holder impacts was approximately 18 feet bgs.

Excavation progressed until all features identifiable by sensory observations had been removed (bricks, black soil staining). Removed material was transported and disposed off-site. The removal limits were then confirmed through soil sampling and analysis as shown on Figure A-5

Two confirmation samples were collected at the eastern and western portion of the holder wall approximately midway between grade and the groundwater table or 5 feet bgs. Two additional samples were collected to determine if the sand encountered in the holder could be used for backfill. Locations of the samples can found on Figure A-5. The subsequent results indicated that both the confirmation samples and the sand samples passed the Type 1 RRS.

Additionally, two exploratory trenches were completed south of the gas holder to a depth of 4 feet to investigate the area for the presence of additional MGP structures. Shallow (<3 ft) building footers were observed, but no additional MGP structures were identified during the exploratory trenching.

4.4.16 Prodigy Property Debris

As part of the final site preparation activities prior to remediation or ISS work, approximately 1,672 tons of loose construction and demolition debris (wood, concrete rubble) was removed from the Prodigy property south of the site. The material was transported and disposed off-site.

4.4.17 Utility Excavation

In 6th Street north of Mulberry Street, MGP-like impacts were discovered in initial cut and cap pit excavated by a separate AGLC contractor during their efforts to disconnect the gas service through the project site. The AGLC contractor vacated the initial pit, and shifted the disconnect location and completed a second cut and cap pit approximately 110 feet farther north in 6th Street. These locations are shown on Figure A-4.

ERM/GSI later remediated the initial cut and cap pit location. Soil was excavated from 0-3.5 feet bgs as shown on Figure A-4. Approximately 10 cubic yards of soil were excavated from this utility pit and transported and disposed of off-site. The excavation limits were then confirmed through soil sampling and analysis (Figure A-4).

4.4.18 Utility Corridors

Utility corridors were constructed for the benefit of the City of Macon. The Terminal Avenue, Mulberry Street and 6th Street corridors were constructed by removing the ISS columns to 10 feet below street grade. The Terminal Avenue corridor columns removed consisted of ISS rows 2 through 4; the 6th Street corridor columns removed consisted of ISS rows 28 through 33; and the Mulberry Street corridor columns removed consisted of ISS rows 34 through 48 from the edge of the MUDA ISS mass to within six feet of the Prodigy Woodworks building (Figure A-7). The utility corridors were then backfilled with clean fill as described in Section 6.0.

4.5 ISS WORKING PLATFORM EXCAVATION

The ISS working platform elevation was designed in accordance with the specifications included in the 2014 CAP Addendum to be 3-4 feet higher than the historic low groundwater level. The ISS working platform is the surface upon which the ISS crane was positioned to provide a stable work surface for the crane and drill attachment. The ISS platform elevations varied across the site due to the steep groundwater gradient across the area. The excavation to the ISS working platform began at about 10 feet bgs (the bottom design elevations for excavation Areas 11-14 within the ISS footprint) and continued to approximately 3-4 feet above the target top of ISS column elevation.

4.6 PRE-ISS EXCAVATION

Just prior to drilling the ISS column the remaining overburden (top of ISS working platform to top of ISS column) was excavated to allow for the survey and placement of center column stakes to determine the exact depth and alignment of each column to be drilled. The soils removed to construct the working platform were characterized based on visual observations, odor and PID readings and were transported to the clean stockpile areas for further characterization or transported offsite for disposal as appropriate based on observations and laboratory analytical results of stockpile areas.

Approximately 12,100 cubic yards of soil from the pre-ISS zone were excavated and transported to the on-site soil stockpiles area for re-use. Refer to Section 6.1 for discussion about the stockpile management and testing.

Although anticipated to be un-impacted, approximately 3,680 cubic yards of soil from within the pre-ISS soil zone were removed and transported off-site for disposal, due to visual, olfactory, and/or PID impacts. Once these conditions were observed, the soils were disposed directly off-site without additional testing.

5.0 IN-SITU SOLIDIFICATION

In-situ solidification was performed using a crane-mounted auger to mix soil with grout comprised of cement, ground granulated blast furnace slag (GGBFS), and bentonite. ISS commenced on Thursday, July 9, 2015. Between July 9 and November 18, 2015, GSI solidified a total of 47,075cubic yards of alluvial soil through the installation of 1,125 10-foot-diameter ISS columns. A total of 27 columns were advanced to refusal. All refusals were consistent with variations in saprolite thickness and resistance; no refusals were attributed to obstructions as can be seen in Figure A-7. Table A-1 contains a high-level summary of daily construction activities, Table A-3 summarizes the construction qualities of each ISS column, and Table A-4 summarizes ISS quality control sample results. Figure A-7 shows the as-built column locations along with the QC sample locations. Figure A-8 shows the final grade of the top of ISS columns and associated top and depth/bottom elevation of each column are included in Table A-3. Multiple pictures of the ISS operations are included in Appendix A-1.

5.1 GROUT MIX DESIGN AND GROUT BATCH PLANT

Based on the results of bench-scale treatability study performed by KEMRON and as proposed in the Groundwater CAP Addendum (ERM 2014a), a grout mix of 6-7 percent cementitious material (4.5 % GGBFS cement and 1.5-2.5 % Portland cement) and 0.5 % bentonite was selected for full-scale implementation (Appendix A-4). Reagent quantities were calculated based on an estimated (wet) soil unit weight of 125 pounds per cubic foot. The selected grout mix was similar to that used for the 2002 remedial action at the Site[1].

Each of the solidification reagents (GGBFS, Portland cement, and bentonite) is a fine-grained off-white powder. Flatbed trucks delivered bentonite in 1,000-pound "jumbo bags," and GSI used a forklift to empty the bentonite into a silo to feed the grout batch plant. Pneumatic pumper trucks delivered GGBFS and Portland cement. GGBFS and Portland Cement was stored in a bulk storage vessel known as a "pig" prior to pneumatically transferring the reagent to individual silos to feed the grout batch plant..

Screw augers transferred the reagents from the silos into a 1,000-gallon batch mix tank. Scales beneath the mix tank allowed the operator to control and record the weight of water, bentonite, GGBFS, and Portland cement delivered to each batch of grout.

---

[1] In 2002, the selected grout mix was initially 4.5 percent slag, 1.5 percent Portland, and 0.5 percent bentonite. It was adjusted over the course of that remedial action to a final mix of 3.6 percent slag, 2.4 percent Portland, and 0.5 percent bentonite. Due to the short duration of this project, an additional 1 percent of cement/slag was added to reduce curing time required to meet the performance standards.

The reagents were homogenized in water to create grout using a high-shear paddle-blade mixer. Completed grout batches were pumped to a separate 1,000-gallon holding tank to await transfer to the ISS crane auger rig.

5.2 ISS CRANE AUGER RIG OPERATION

At the direction of the crane operator, a positive displacement pump sent grout from the holding tank via a 2.5-inch diameter reinforced rubber hose (used for concrete pumping application) up the crane mast to the top of the auger assembly, where the hose mated with a swivel fitting and the grout descended through the wet "kelly" bar to the auger and was sprayed from the trailing edge of one or more auger flights. The crane operator and grout batch plant operator communicated to adjust the grout flow rate to match the drilling and soil mixing progress. Typical flow rates ranged from 30 to 100 gallons per minute (gpm).

The crane operator typically installed each column in thirds: penetrate a third of the depth (typically 8 to 10 feet), surface the auger to scrape off soil stuck to the flights, and then mix the soil well in that 5- to 7-foot interval. The operator repeated this pattern for the second third and bottom third of the column depth, typically surfacing the auger once per interval. After reaching the design bottom elevation as determined by a fixed height reference[2] or upon encountering refusal as documented and approved by the QA Officer, the crane operator made a total of six mixing "passes" to homogenize the soil-cement within the column.

The general definition of refusal was less than 0.5 feet of penetration in 15 minutes. All determinations of refusal required the approval of the project manager. After the design bottom elevation (or refusal) was met, mixing passes typically required 15 to 45 minutes each.

5.3 ISS COLUMN LAYOUT

All ISS columns were installed with a 10 feet diameter multi-blade auger mixer. In order to cover the entire ISS footprint with maximum efficiency, the interior columns were spaced 8.67 feet-on-center in a hexagonal pattern. Every column overlapped its neighbors to form a continuous monolith.

---

[2] GSI employed a total station to determine the depth of each column based on the depth of the lowest teeth of the auger (not the pilot bit) by reference to a fixed point on the Kelly bar. Vertical reference benchmarks were set by the contracted surveyor.

[3] A single mixing pass was defined as either top-to-bottom or bottom-to-top. Three mixing passes so-defined were necessary to satisfy ERM's design and to achieve complete mixing

5.3.1 Interior Columns

Interior columns required the use of Mix Design 2 and would only be installed after the perimeter columns were installed. This sequence minimized the potential transport of MGP impacted materials and served to reduce the groundwater intrusion in the work area. The mix design was revised later in the work as discussed in Section 5.5.4 below.

5.3.2 Perimeter Columns

The design called for the perimeter columns to be installed first and keyed five feet into saprolite to prevent the potential minimize the potential conveyance of MGP impacted materials from migrating beyond the ISS boundaries. The original design contemplated the installation of one row of bentonite perimeter columns but this was revised to require the use of Mix Design 1 rather than bentonite and increase the perimeter column width from one row to three rows for constructability reasons. As mentioned in Section 5.5.4 below the mix design was revised to Mix Design 2 later in the work.

5.4 SPOILS GENERATION AND w:c RATIO

The ISS process generates spoils (also called grout fluff or swell) whose volume is roughly equal to the volume of grout injected. In saturated soils like those below approximately 293 feet amsl at the Site, every cubic foot of grout injected results in approximately one cubic foot of spoils to be managed. ERM designed the work to minimize the volume of spoils generated by minimizing the volume of grout injected; however, decreasing the volume of grout means increasing the reagent concentrations in the grout (e.g., 100 gallons at 10 percent is the same as 50 gallons at 20 percent). As reagent concentrations increase, grout becomes stiffer, more viscous, and less useful as a drilling fluid.

The amount of water in the grout was expressed as weight of water per weight of cement (plus bentonite), or w:c ratio. The target w:c ratio was 1.4:1-2.0:1, which was used in the bench-scale treatability study but proved too stiff for the full-scale field application. The thinner grout mixture proved necessary to provide the auger enough drilling fluid to adequately mix the column without wasting reagent. The controlling variable was the quantity of fluid required to mix the column. When the w:c ratio was optimized to account for soil conditions, the grout addition was adjusted to deliver the target quantity of reagent in that volume of fluid. The appropriate w:c ratio for the Site ranged from about 2.5:1 for soils with more sand to about 3:1 in soils with more clay[4].

During soil mixing, ISS spoils[5] were allowed to swell up from the top of ISS elevation until they reached the "top of solidified spoils" elevation (3 feet higher). The spoils then cured in place (solidified) to become part of the ISS monolith.

5.5 ISS QUALITY ASSURANCE/CONTROL SAMPLING AND ANALYSIS

GSI performed QC sampling of the ISS throughout the course of remedy implementation, following the guidance of its *Quality Control Plan* (Appendix A-5). Columns selected by the ERM QA Officer for geotechnical confirmation and/or QA testing (described below) are shown on Figure A-7. QC sample collection methods and results are described below.

5.5.1 *Sampling Methods*

Depth-discrete ISS samples were retrieved using a hydraulically driven tube sampler immediately after the auger completed mixing each designated column. One depth-discrete sample was collected from a 5-foot interval selected by the ERM QA officer (e.g., a 15- foot column may have been sampled at 5, 10, or 15 feet). Shackled to an excavator bucket, the tube sampler dipped into the freshly mixed column, paused at the designated depth, and opened to collect a sample. The tool collected approximately 1 gallon of sample at a time, which the contractor QC Officer captured in a 5-gallon bucket.

After making the field observations described below in Section 5.5.3, the contractor QC Officer passed each sample through a 0.25-inch (#4) wire mesh sieve into a single bucket to create a composite sample. The QC Officer then filled plastic cylindrical molds with the composite sample and placed the molds in a humid, sealed cooler at between 60 ˚F and 80˚F ("standard cure" conditions) to begin the curing process. Cylinder quantities were determined by the ERM QA officer. More details regarding the sample collection/curing process are described in Section 5.5.5.

5.5.2 *Sampling Frequency*

ISS mix samples were collected once every 250 cubic yards stabilized for the first 4,000 yards, after which samples were collected once every 750 cubic yards. Samples were collected from 78 of the 1,125 columns installed representing 47,075 cubic yards of soils solidified, or one QC sample collected for every 604 cubic yards. Sample columns were selected by the ERM QC Officer to be well-distributed across the treatment area as shown on Figure A-7.

---

[4]Similar w:c ratios (2.5:1 to 3:1) were reported for the ISS performed in 2002

[5]Grout spoils or grout "fluff" is the mixture of cement grout and impacted soil that returns to the surface during ISS column drilling/installation. The top of ISS elevation was set at the low groundwater table, and the top of solidified spoils elevation was set at the high groundwater table (4 feet higher). This design is consistent with the ISS performed at the Site in 2002 and limits the ISS monolith to the saturated zone defined by the high groundwater table.

5.5.3 *Visual Criteria*

The QA Officer visually evaluated every depth-discrete sample at the time of collection in the field, prior to sieving and compositing and before the soil-cement cured and hardened, for the following criteria:

- Homogenous and evenly mixed material (even, consistent color with little or no unmixed soil)
- Absence of separate-phase BPLM

5.5.4 *Geotechnical Laboratory Testing and Criteria*

Each ISS soil-cement sample collected was sent for laboratory analysis of geotechnical performance criteria. These parameters were evaluated on the cured soil-cement sample cylinders:

- Unconfined compressive strength (UCS): greater than 50 pounds per square inch (psi)
- Permeability (or hydraulic conductivity, K): lower (i.e., less permeable) than 1x10-6centimeters per second (cm/sec)
- Wet/dry durability: less than 10 % relative mass loss (compared to control) after the completion of 12 wetting and drying cycles

UCS was measured by American Society for Testing and Materials (ASTM) D 1633: Standard Test Method for Compressive Strength of Molded Soil-Cement Cylinders. Permeability was measured by ASTM D 5084: Standard Test Method of Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter. Wet/dry durability was measured by ASTM D 4843: Standard Test Method for Wetting and Drying of Solid Wastes.

ISS quality control sample results are summarized in Table A-4. Geotechnical laboratory reports are provided in Appendix A-6. Throughout the project ERM conducted QC of the geotechnical results to ascertain compliance with the performance criterion or make adjustments as needed. The primary performance criteria are UCS and permeability. One hundred percent of the UCS and hydraulic conductivity results complied with the performance criterion.

Eight wet/dry durability results were found to be non-compliant with the requisite specification. On September 28, 2015 ERM directed the contractor to use Mix Design 2 for all remaining columns to achieve compliance. Mix Design 2 consisted of increasing the overall reagent dosage rate from 6.5% to 7.5% by increasing the Portland Cement content from 1.5% to 2.5%. Between September 28 and October 13, 2015 three columns did not meet the requisite specification for wet/dry durability.

On October 22, 2015 ERM made an additional field adjustment to the mix design (s) to achieve compliance with the project needs by increasing the reagent dosage. The overall additive dosage rate was increased to 8% by reducing the GGBFS content from 4.75% to 3.75%, increasing the Portland Cement content from 2.5% to 3.75% and keeping the bentonite content the same at 0.5%. All subsequent wet/dry results passed as a result of the revised design mix.

As part of the corrective actions, ERM had the ISS contractor remix the perimeter columns at Remix Areas 1-3 and interior columns in Remix Areas 4-6 (Figure A-7). The remix of the perimeter columns required the revised mix design dosage rate and required the column be remixed from top of column to the historical low groundwater table. By removing and remixing the upper column above the historic low groundwater table the resulting composite column would function as originally designed since the lower portions of the column would not be subjected to the annual groundwater fluctuation.

Remix #	Remix Date	Production Day	Column Number
1	November 19,2015	August 19, 2015	P22, R22 and T22
2	November 20, 2015	August 20, 2015	V22, X22, Y23, X24 and Y25
3	November 21, 2015	November 21, 2015	BS 11, BT12, and BS13
4, 5, and 6	February 17 /18, 2016	October 19,2015, September 1, 2105, and August 29, 2015	BA27,BC27, BE27, BG27 BI27, BK27, BM27,BO27,BQ27,BS27, BU27,BW27,BY27,CA27, CC27,CE27,CG27,CI27 and CK27

Two interior areas for production days 9/3/2015 and 9/9/2015 were not remixed because of the location in the ISS mass which precludes the columns from exposure to groundwater fluctuations. The columns for each of these production days were surrounded by columns which passed all three performance criteria.

ERM provided correspondence to the Georgia EPD and discussed the approach with EPD on January 28, 2016 regarding this modification to the mix design. The correspondence is included in Appendix A-7.

5.5.5 Leachability Testing

Of the 78 ISS samples collected, 10 were selected (based on a frequency of one per 5,000 cy solidified) for additional testing of post-treatment leachability. The original *Macon Site Soil and Groundwater Corrective Action Plan (*ThermoRetec, 2001) called for ANS 16.1 testing every 1,000 cy. However, in correspondence with EPD on August 20, 2015 (after an EPD site visit) the leachability testing program was modified to allow for both ANS 16.1 testing and LEAF 1315 testing at a frequency of one per 5,000 cy. The EPD correspondence can be found in Appendix A-8. Both methods were utilized at this frequency during the project execution.

Geotechnical laboratory analytical reports including the results of the leachability testing are provided in Appendix A-6 and complete leachability data summary tables and laboratory reports are provided in Appendix A-9.

Table A-5 presents a summary of the statistical evaluation of the data sets. Observations of the analytical leachability test results indicate the following:

- Of the 37 analytes (COIs) that were evaluated using leachability methods on post-treatment ISS samples, only three (3) indicated concentrations greater than a potentially applicable regulatory standard (i.e., residential RRS for benzo(a)pyrene, dibenz(a,h)anthracene and naphthalene) in both methods, with one (1) additional COI exceeding the potential RRS for the LEAF methods (cadmium).
- The overall frequency of non-detect concentrations for samples tested is 87.3% in the case of the ANS 16.1 Method, and 84.4% in the case of the LEAF Method.
- The overall frequency of COIs below the potentially applicable RRS, in leaching test results for ANS 16.1 and LEAF methods is 99.7%% and 99.6%, respectively.
- Of the 37 analytes (COI) that were evaluated using leach methods on post-treatment ISS samples, only two (2) indicated concentrations above the potentially applicable non-residential RRS (naphthalene and dibenz(a,h)anthracene).
- The overall frequency of COIs below the non-residential RRS, in leachability test results for ANS 16.1 and LEAF methods is 99.8% and 99.6%, respectively.

5.5.6 Sample Curing

All ISS mix cylinders were cured on site for at least the first three days following sample collection. Samples were held on site under "standard" conditions in humid coolers and then shipped to Kemron via their courier as soon as possible after the samples cured for a minimum of three days.

5.6 ISS EQUIPMENT DEMOBILIZATION

ISS column installation work was completed on November 18, 2015, and demobilization of the ISS equipment began shortly thereafter. The ISS rig exited the excavation near the Seventh Street construction entrance, and the tracks, undercarriage, auger, and Kelly bar were decontaminated using a pressure washer. The grout batch plant was also dismantled shortly following the completion of ISS, but was later reassembled to address outstanding wet/dry durability failures on the eastern perimeter. GSI demobilized the batch plant equipment on flatbed trucks to their yard in Pittsburgh, PA during the week of February 21, 2016.

5.7 *TRIMMING GROUT SPOILS TO DESIGN ELEVATIONS*

Concurrent with ISS equipment demobilization, GSI prepared the ISS footprint for backfill and restoration. During ISS column installation, grout spoils were allowed to cure in place above their final design elevations and the cured spoils were graded or "trimmed" before backfilling the ISS footprint. Grout spoils were allowed to cure in place for at least a week prior to trimming. The final top of spoils layer was a well-cured and a competent part of the ISS monolith.

Figure A-8 shows the surveyed top of grade for the solidified media across the ISS footprint. In addition, the columns and their respective depths and final grade are shown in Table A-3.

5.8 *TRANSPORTATION AND DISPOSAL OF MEDIA/WASTE*

Throughout the project, transportation and disposal (T&D) of impacted media and wastes was conducted. Wastes transported and disposed included:

- Unsaturated soils from Areas 1-14;
- ISS spoils trimmed above the high water table;
- Miscellaneous bricks, concrete, and debris encountered during excavation;
- Concrete and asphalt encountered during the removal of roads for utility work; and
- Vegetative matter.

A total of 60,411 tons of material described above was transported and disposed of in the Advanced Disposal, Wolf Creek Subtitle D landfill in Dry Branch, GA. The T&D log and all supporting disposal information is provided in Appendix A-10.

5.9 *UTILITY CORRIDORS*

In addition to the final grading, additional excavation of ISS spoils was conducted to allow for the planned utility corridors (within the right-of-ways) consistent with the City of Macon needs for future utility work. Figure A-9 also presents the location of the utility corridors at the site.

6.0 BACKFILL AND RESTORATION ACTIVITIES

This section describes the backfill and restoration activities performed on the site following the completion of remedial excavation and ISS work.

6.1 STOCKPILED SOIL SAMPLING AND ANALYSIS FOR RE-USE

Approximately 15,000 cubic yards of native soil were excavated and stockpiled by GSI, and then sampled and analyzed by ERM, for potential re-use on site as fill material. Approximately 11,800 cubic yards of this soil were transported to the on-site soil stockpile areas for testing. The remaining 3,200 cubic yards of stockpiled soil were stockpiled and tested within the ISS area.

A total of sixty (60) stockpile soil samples were collected from an estimated volume of 15,000 cy, a frequency of one sample per 250 cubic yards of native soil. The stockpiled soil analytical results are provided in Table A-6, and laboratory reports are included in Appendix A-11.

All of the stockpiled native soil met acceptable RRS and was used as on- site fill material, for final cover and final grading. A total of 1,500 cubic yards of tested soil exceeded residential RRS but met non-residential RRS, and thus was placed as fill over the ISS monolith, in the southern portion of the AGLC-owned portion of the Site south of Terminal Avenue. The remaining 13,500 cubic yards of tested soil met residential RRS and were able to be placed anywhere on the site as backfill without restriction.

Soils meeting the Type 2 RRS were used as backfill in the following areas:

- Mulberry Street Subgrade (utility corridor)
- 6th Street Subgrade (utility corridor)
- Terminal Avenue Subgrade (utility corridor)
- City of Macon and Prodigy properties fill
- General backfill on the AGLC property

6.2 BACKFILL PLACEMENT, COMPACTION, AND TESTING

Native soil backfill was placed as follows in different site areas:

- Subgrade Under Roadways: 8-inch loose lifts, compacted to 95% maximum dry Modified Proctor density (ASTM D-1557). The top two feet of soil subgrade under the roadways was compacted to 98% of maximum dry Modified Proctor density. These provisions meet Macon-Bibb County requirements for soil backfill placement beneath roadways.

- A minimum of two feet of clean fill (meeting Type 2 RRS), was placed over the ISS swell surface as part of final grading.
- All other site areas including the ISS area: soils were placed in 12-inch loose lifts, compacted to 90% maximum dry Modified Proctor density.
- The bottom of the Holder excavation was sufficiently below the groundwater table that self-compacting trap rock was placed in the bottom 5 feet (12-17 ft bgs) of the excavation, without post-placement compaction.

Necessary compaction was achieved in the native soil backfill with sheep foot rollers, operated in varying static and vibratory modes, depending on soil behavior and location. A smooth-drum roller was used at times for fine grading compaction.

Appendix A-12 contains the Modified Proctor moisture-density laboratory reports generated by Geotechnical & Environmental Consultants (GEC-Macon, GA) from testing performed for soils excavated and stockpiled on site for reuse. Table A-7 summarizes the compaction testing results.

Field compaction testing was performed at a minimum frequency of one test per 5,000 square feet per lift. Testing was performed by nuclear densitometer (i.e., "Troxler" testing) via ASTM D-6938. Results were compared to the laboratory Modified Proctor tests to confirm that sufficient compaction was achieved. Appendix A-12 contains the field density testing reports.

Geo-Solutions addressed failed compaction tests either by re-compacting the area until a passing test was obtained, or (in several cases) removing the compacted lift, blending it with drier fill to decrease the moisture content, then replacing and re-compacting the lift.

6.3 YARD AND STORM DRAINAGE IMPROVEMENTS

During site preparation, a storm water detention basin was constructed at the lowest surface elevation of the site at Walnut Street and 6th Street to intercept storm water sheet flow to minimize the potential for transport of sediment off site during construction. Additionally during this time a lined gravel drainage trench was installed to intercept a surface water seep identified at the entrance to the site at Walnut Street and tied into the detention basin as shown on Figure A-9.

As part of final site restoration, GSI installed additional gravel drainage trenches as shown on Figure A-9. The detention basin was also retro-fitted into a permanent storm water detention basin, with an outfall pipe tied into the Macon Bibb County storm drainage system in Walnut Street.

6.4 FENCING, TOPSOIL, AND SEEDING

During construction activities, existing fencing was removed on the MUDA property, the main site, and along parts of Terminal Avenue on Norfolk Southern property. Temporary 8-foot-high chain link fencing was installed during construction. At the end of construction, the MUDA fence and Norfolk Southern fence were restored along the original fence lines with new chain link fencing to match the existing fencing. The 8-foot-high construction fencing and entrance gate were left in place along Walnut Street. On the main site, the existing site fence along part of Terminal Avenue was maintained. The remainder of the AGLC property was fenced along the property line with new fence. All final fencing is shown on Figure A-9.

Topsoil was not imported for site restoration. Rather, the backfilled native soil was amended with the addition of composted organics from Proganics, to support vegetation. Based on chemical analyses by the Georgia Cooperative Extension Service, organic material was added to achieve the minimum five percent specified in the specifications, and lime and fertilizer selected

After spreading the organic material, lime, fertilizer, Bermuda seed, and mulch were applied by hydro seeding. The seed selection, seed application rate, and amendment materials and rates were appropriate for the area and the planting season encountered. As of April 22, 2016, the grass is well established with an estimated 70 percent coverage across the Site. Follow up inspections will occur during the performance period to monitor growth.

6.5 FINAL RECORD SURVEY

DGA performed a topographic and final features survey after the completion of all work at the Site. Figure A-9 is a record survey of the final features, which includes all Site improvements made during the performance of the work that are observable above ground.

6.6 FINAL CONSTRUCTION DEMOBILIZATION

GSI demobilized all equipment and facilities between February 24 and February 29, 2016. Restoration activities continued after this time, and were performed by GSI subcontractors. Final demobilization of all site parties including ERM, and all remaining equipment and supplies, occurred during late April 2016.

7.0 SITE MANAGEMENT AND ENVIRONMENTAL CONTROLS

The Site was managed to protect workers and the community from exposure to environmental hazards and to minimize disturbances to adjacent buildings and traffic. ERM required GSI to institute a number of environmental controls, including storm water diversion and collection, runoff prevention, contact water collection and treatment, dust and odor mitigation, and traffic controls. A third party implemented perimeter air monitoring to document the concentrations of dust and volatile constituents leaving the Site.

7.1 PERIMETER MONITORING

TRC implemented perimeter air monitoring on behalf of KMCL to document the concentrations of dust and volatile constituents leaving the Site. The perimeter air monitoring program consisted of continuous monitoring of total volatile organic compounds (TVOC) and particulates (PM_{10}) from four stations surrounding the Site. A meteorological station measured wind speed, wind direction and ambient temperature. In addition, Summa canisters were used to collect time-weighted average ambient air samples weekly, with predominant upwind and downwind samples submitted for analysis by EPA Method TO-15. Background sampling was conducted in May 2015 before the start of remediation activities, and the remediation phase monitoring continued throughout the project until all ISS, excavation, stockpiling or loading of potential impacted soils was complete. No action levels for TVOC (1.0 ppm) or PM_{10} (150 µg/m^3) were exceeded at any of the locations throughout the project. TO-15 results collected during the remediation phase were generally similar to background concentrations, and upwind and downwind sample results were generally comparable. Based on the air monitoring data collected, there were no significant air emissions impacts to adjacent properties associated with the remediation.

7.2 STORM WATER MANAGEMENT

The Site received about 21 inches of rainfall over the 10 months (May to March) this work was performed. Extensive use of silt fence and straw bales on the downgradient edges of unimpacted stockpile and work areas mitigated off-site sediment transport.

ERM's design required GSI to construct a shallow earthen berm to direct clean rainwater from about 3 of the 5 acres of the Site upgradient of the main work area into a temporary storm water detention basin. The excavation and construction of this basin was described in Section 4.2.1. Under normal conditions, the basin contained less than 1 foot of water. During several rainfall events, it filled to within 2 feet of the ground surface, and then receded by

infiltration at a rate of about 1 foot per day. GSI obtained a National Pollutant Discharge Elimination System (NPDES) GAR100001 general permit. None of the storm water collected in the detention basin was ultimately discharged, and no storm water exceedances were noted during the performance of the work.

Impacted areas were protected from storm water run-on by shallow earthen berms (in the case of the ISS footprint and excavation area) and lined earthen berms (for the impacted stockpile and wheel wash areas).

7.3 CONTACT WATER MANAGEMENT

Contact water was containerized using two (2) 20,000 gallon frac tanks. Five (5) tank volumes of water was collected and re-used for ISS production (i.e., approximately 100,000 gallons of water). The generation and management of contact water are further described in this Section.

7.3.1 Rainfall Contact Water

Earthen berms minimized storm water run-on to the excavation, stockpile, and wheel wash areas. Rain that fell into impacted areas became contact water and was containerized, treated, and disposed as described below. Approximately 21 inches of rain fell into the (roughly) 0.5-acre ISS footprint while it was an open excavation, which generated rainfall contact water. Contact water was pumped from the excavation using 3-inch diameter diesel-powered centrifugal pumps and was conveyed through 2.5-inch diameter reinforced rubber hoses to on-site frac tanks: portable steel tanks that hold approximately 20,000 gallons each. The treatment, reuse, and disposal of contact water are described later in this Section.

7.3.2 Contact Water Reuse

GSI had mobilized two frac tanks (about 20,000 gallons each) and filled them with rainfall contact water. The contact water was stored on site and was used for mixing grout for ISS.

GSI mobilized a water treatment system from Rain for Rent at the beginning of the project. The treatment system consisted of two duplex bag filter housings configured with 25 and 10 micron bags in series followed by two 1,500-pound granular activated carbon (GAC) vessels in series. GSI operated the treatment system using a 3-inch diameter transfer pump to convey water from the influent frac tanks to the two effluent holding tanks. A 4-inch diameter pump was dedicated to pumping treated water from the holding tanks to the grout batch plant.

No water disposal occurred during the execution of the project.

7.4 DUST AND ODOR MITIGATION

GSI utilized a variety of engineering controls to suppress dust and odor generation and transport. Dust suppression included plastic film covers for all stockpiles, potable water spray onto haul roads, the use of fabric shrouds around the grout batch plant and the bentonite loading silo, and bag filter housings on the slag and Portland cement pneumatically loaded silos.

Fabric installed around the entire perimeter fence line provided dust and odor mitigation by acting as a partial barrier to off-site transport and by promoting mixing and dilution of air currents that flowed up and over the fence.

Odor suppression and mitigation included plastic film covers for all stockpiles, application of spray foam (Rusmar AC-645, dispensed from a PFU 400/25 unit) to impacted stockpiles and disturbed areas within the ISS footprint.

7.4.1 Stakeholder Communication

During the work a notification concerning odors was received from Prodigy Woodworks property owner, which is the parcel adjacent to the southern limits of the project site on September 15, 2015. GSI, ERM's contractor immediately addressed the issue by increasing foaming activities. Subsequently, the property owner followed up and confirmed that the odors had dissipated. No other notification or formal complaints concerning odors were received throughout the duration of the project. As mentioned in Section 7.1, based on the air monitoring data collected, there were no significant air emissions impacts to adjacent properties associated with the remediation.,

7.5 TRAFFIC CONTROLS

The ISS footprint extended into the right-of-way and onto City of Macon streets (Mulberry, 6th, and Terminal Avenue). As a result, road closures were conducted, with appropriate signage for detours to accommodate traffic during the project. Temporary fencing extending across the full width of the roads was used.

8.0 HEALTH AND SAFETY

ERM, GSI, and their subcontractors completed the work with no first aids, OSHA recordable or lost time incidents injuries. A total of approximately 47,733 on-site man-hours were expended in the execution of the work.

8.1 PERSONNEL MONITORING AND CONTROLS

GSI performed personnel air monitoring for VOCs in the breathing zone on a real-time basis using a PID. During the course of the work, the VOC levels measured by GSI in the breathing zone did not exceed the prescribed action levels in the Project HASP.

The minimum level of personal protective equipment (PPE) required for work within the exclusion zone was Level D: steel toe boots, hard hat, safety glasses with side shields, safety vests or hi-visibility clothing, and hearing protection (when necessary). While working within the active ISS footprint excavation area (near the crane), personnel donned disposable coveralls and boot covers or rubber boots. Personnel working more than 6 feet off the ground (such as climbing the grout batch plant silos or operating the aerial man lift) utilized fall protection equipment. Respiratory protection was not required for any task performed by GSI personnel.

9.0 JOB SUMMARY TOTALS

- 60,504 tons of impacted soil, ISS spoils, and debris were disposed as non-hazardous waste at the Wolf Creek Landfill (Subtitle D).
- 47,075 cubic yards of saturated soil were solidified via ISS through the installation of 1,125 - 10 ft. diameter columns.
- Approximately 15,000 cubic yards (in-place) of backfill were utilized to attain the final site grade and provide cover to the ISS mass.
- Roadways and utilities have been restored and are fully functional.
- All confirmation soil samples met the appropriate risk reduction standards specific to each parcel.
- All performance standards for the ISS mass were obtained and validated through geotechnical testing of 78 ISS mix samples.
- Leachability testing results have been obtained and can be utilized for future groundwater impact evaluations.

"<" Gray font - analyte was not detected above laboratory detection limit

0.083 Black font - analyte was detected above laboratory detection limit

23 Black font & shading - analyte concentration exceeds the Type 4 RRS

Not detected; 1/2 of the laboratory detection limit used for statistical analysis

N/A; initial sample met Type 4 RRS and was therefore not analyzed in step out sample, or location was overexcavated to achieve RRS

Atlanta Gas Light Company

Former Manufactured Gas Plant

Macon, Bibb County, Georgia

LEGEND

- AMW-4 — SHALLOW MONITORING WELL
- MW-303D — BEDROCK MONITORING WELL
- DROP INLET
- MANHOLE
- FIRE HYDRANT
- UTILITY POLE
- WATER VALVE
- SS — SANITARY SEWER
- G — GAS LINE
- OHP — OVERHEAD POWER LINE
- W — WATER LINE
- WATER LINE (UNCONFIRMED)
- EXISTING FENCE
- 320 — EXISTING SURFACE 10 FOOT INDEX CONTOUR
- 328 — EXISTING SURFACE 2 FOOT INTERMEDIATE CONTOUR
- TREE LINE
- ABANDONED RAIL SPUR
- ABANDONED RAIL SPUR (UNCONFIRMED)
- ACTIVE RAIL LINE
- APPROXIMATE LOCATION OF FORMER BUILDINGS

NOTES

1). EXISTING MONITORING WELLS WITHIN REMEDIATION AREA WILL BE ABANDONED BY OTHERS PRIOR TO MOBILIZATION

2). THE INFORMATION AND DATA SHOWN OR INDICATED ON THIS DRAWING WITH RESPECT TO EXISTING UTILITIES AND FACILITIES AT OR CONTIGUOUS TO THE PROJECT SITE ARE BASED ON INFORMATION AND DATA FURNISHED TO THE OWNER OR THE ENGINEER BY THE OWNERS OF SUCH UTILITIES OR FACILITIES OR BY OTHERS. THE OWNER AND THE ENGINEER SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ANY SUCH INFORMATION OR DATA RELATING TO UTILITIES OR FACILITIES. CONTRACTOR IS REQUIRED TO VERIFY ALL LOCATIONS PRIOR TO SUBSURFACE WORK IN ACCORDANCE WITH ENGINEER'S SUBSURFACE CLEARANCE (SSC) PROGRAM.

3). DATA SOURCES:
PHOENIX SOLUTIONS, INC. – LOGANVILLE, GA (SURVEY)
MACON-BIBB COUNTY ENGINEERING DEPARTMENT (TOPOGRAPHIC)

4). IN AREAS WHERE FORMER BUILDINGS WERE LOCATED, DEBRIS AND/OR FOUNDATION MAY BE ENCOUNTERED DURING EXCAVATION.

1. DONALDSON, GARRETT AND ASSOCIATES, INC. AND THE LAND SURVEYOR WHOSE SEAL IS AFFIXED HEREON DO NOT GUARANTEE THAT ALL EASEMENTS THAT MAY AFFECT THIS PROPERTY ARE SHOWN.
2. THIS DRAWING HAS BEEN GENERATED ELECTRONICALLY. THIS MEDIA SHOULD NOT BE CONSIDERED A CERTIFIED DOCUMENT UNLESS IT HAS BEEN PROPERLY SEALED AND ORIGINALLY SIGNED BY A REGISTERED LAND SURVEYOR OF DONALDSON, GARRETT AND ASSOCIATES, INC. AUTHORITY OF O.C.G.A. 43-15-22.
3. THIS SURVEY HAS BEEN PREPARED IN CONFORMITY WITH THE TECHNICAL STANDARDS FOR PROPERTY SURVEYS IN GEORGIA AS SET FORTH IN CHAPTER 180-7 OF THE RULES OF THE GEORGIA BOARD OF REGISTRATION FOR PROFESSIONAL ENGINEERS AND LAND SURVEYORS AND AS SET FORTH IN THE GEORGIA PLAT ACT O.C.G.A. 15-6-67,43-15-4,43-15-6,43-15-19, & 43-15-22.
4. THE SURVEYOR MAKES NO GUARANTEE THAT THE UNDERGROUND UTILITIES SHOWN COMPRISE ALL SUCH UTILITIES IN THE AREA, EITHER IN SERVICE OR ABANDONED. UNDERGROUND UTILITIES NOT OBSERVED OR LOCATED MAY EXIST BUT MAY NOT BE SHOWN, AND MAY BE FOUND UPON EXCAVATION. THE SURVEYOR FURTHER DOES NOT WARRANT THAT THE UNDERGROUND UTILITIES SHOWN ARE IN THE EXACT LOCATION INDICATED. INFORMATION REGARDING UNDERGROUND UTILITIES WERE COMPILED FROM FIELD OBSERVATIONS AND/OR MARKINGS BY THE UTILITY OWNERS. THIS INFORMATION MAY BE INACCURATE OR INCOMPLETE AND IS SUBJECT TO THE LIMITATIONS OF SUBSURFACE DETECTION EQUIPMENT, AVAILABLE RECORDS AND OTHER FACTORS. VERIFICATION OF UTILITIES SHOULD BE MADE PRIOR TO ANY CONSTRUCTION.
5. ONE FOOT CONTOUR INTERVAL SHOWN.
6. THIS SURVEY IS REFERENCED TO THE GA STATE PLANE GRID, WEST ZONE, NAD83(1990) HORIZONTAL & NAVD88 VERTICAL DATUMS AND IS BASED UPON GEORGIA POWER COMPANY CONTROL MONUMENTS GPC-011-3 AND GPC-011-4 PROVIDED BY GEORGIA POWER COMPANY.
7. CONTROL POINT COORDINATES SHOWN AS NAD83(2011)DATUM AND ARE BASED ON STATIC GPS OBSERVATIONS ON 6/8/2015 AND WERE PROCESSED USING NGS OPUS. THE ELEVATIONS SHOWN WITH THESE COORDINATES ARE BASED ON THE SAME STATIC GPS OBSERVATIONS AND PROCESSING AND ARE NAVD88(GEOID12B) DATUM.
8. THE PROPERTY LINES SHOWN WERE TAKEN FROM A BOUNDARY SURVEY PERFORMED BY DG&A FOR HARMONY GROUP PROPERTIES, LLC, DATED FEBRUARY 12, 2010, DRAWING NO. 4785-10-C. NO BOUNDARY SURVEY WAS PERFORMED BY DG&A OR THIS SURVEYOR AT THIS TIME.

RE: Macon Remediation

Dear Nic Vrey: Order No: 1506H53

Analytical Environmental Services, Inc. received 19 samples on 6/17/2015 10:06:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client ERM-SE Work Order Number 1506H53

Checklist completed by Katie Forum 6/17/15
Signature Date

Carrier name: FedEx __ UPS __ Courier ✓ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.2°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted ✓ Yes __ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by KF

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Macon Remediation

Dear Nic Vrey: Order No: 1506R04

Analytical Environmental Services, Inc. received 32 samples on 6/25/2015 7:18:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample Receiving Nonconformance:

For samples 1506R04-001A through 1506R04-005A and 1506R04-020A through 1506R04-029A, unpreserved samples for Percent Moisture analysis were not received. Percent Moisture analysis could not be performed. Nic Vrey was notified via email 6/26/2015.

The received date on the Chain of Custody was signed by the courier as "5-25-15". However, samples were received 6/25/2015.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on sample 1506R04-021A was outside control limits biased low due to suspected matrix interference.

Percent recoveries for the internal standard compounds Pentafluorobenzene, Chlorobenzene-d5, and 1,4-Dichlorobenzene-d4 on sample 1506R04-026A were outside control limits biased low due to suspected matrix interference.

Due to sample matrix, samples 1506R04-022A, -028A, and -029A required dilution during preparation and/or analysis resulting in elevated reporting limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1506R04

Checklist completed by [signature] 6/26/15
Signature Date

Carrier name: FedEx __ UPS __ Courier ✓ Client __ US Mail __ Other _____

Shipping container/cooler in good condition?	Yes ✓	No __	Not Present __
Custody seals intact on shipping container/cooler?	Yes ✓	No __	Not Present ✓ TD6696
Custody seals intact on sample bottles?	Yes __	No __	Not Present ✓
Container/Temp Blank temperature in compliance? (0°≤6°C)*	Yes ✓	No __	

Cooler #1 3.3 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present?	Yes ✓	No __	
Chain of custody signed when relinquished and received?	Yes ✓	No __	
Chain of custody agrees with sample labels?	Yes ✓	No __	
Samples in proper container/bottle?	Yes ✓	No __	
Sample containers intact?	Yes ✓	No __	
Sufficient sample volume for indicated test?	Yes ✓	No __	
All samples received within holding time?	Yes ✓	No __	
Was TAT marked on the COC?	Yes ✓	No __	
Proceed with Standard TAT as per project history?	Yes __	No __	Not Applicable ✓
Water - VOA vials have zero headspace?	No VOA vials submitted __	Yes ✓	No __
Water - pH acceptable upon receipt?	Yes ✓	No __	Not Applicable __

Adjusted? _____ Checked by Tanya

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Macon Remediation

Dear Nic Vrey: Order No: 1507058

Analytical Environmental Services, Inc. received 7 samples on 7/1/2015 10:45:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound Pentafluorobenzene on sample 1507058-005 A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recoveries for the internal standard compound 1,4-Dichlorobenzene-d4 on samples 1507058-001A, -003A, and -006 A were outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

PAH Analysis by Method 8270D SIM:

Due to sample matrix, samples 1507058-001C, -002C, -003C and -006C required dilution during analysis resulting in elevated reporting limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1507058

Checklist completed by JamB 7/1/15
Signature Date

Carrier name: FedEx ✓ UPS __ Courier __ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.2 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by JB

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Macon Remediation

Dear Nic Vrey: Order No: 1507905

Analytical Environmental Services, Inc. received 8 samples on 7/10/2015 10:30:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

PAH Analysis by Method 8270D SIM:

Due to sample matrix, sample 1507905-001A, -003A required dilution during preparation and/or analysis resulting in elevated reporting limits.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on samples 1506905-004A, & -005A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1507905

Checklist completed by Jan B 7/10/15
Signature Date

Carrier name: FedEx ✓ UPS __ Courier __ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.4° Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by JB

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Macon Remediation

Dear Nic Vrey: Order No: 1507B75

Analytical Environmental Services, Inc. received 11 samples on 7/15/2015 8:10:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample Receiving Nonconformance:

Preserved soil vial in accordance with Method 5035 was not received for sample 1507B75 -007A. Vial 2 of 3 only had the sodium bisulfate liquid inside, no soil. Preserved soil vials were prepared at the laboratory from the sample jar.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on samples 1507B75-005A, -006A,& -007 A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Semi-Volatile Organics Analysis by Method 8270D SIM:

Matrix spike and matrix spike duplicate analyses were not performed with Batch 210332 due to insufficient sample volume.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1507B75

Checklist completed by Tanya Delles 7/15/15
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.8°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes __ No ✓

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by Tanya

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Macon Remediation

Dear Nic Vrey: Order No: 1507L89

Analytical Environmental Services, Inc. received 3 samples on 7/27/2015 7:05:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Two business day turnaround and three business day turnaround were both indicated on the Chain of Custody (COC). Per Nic Vrey, three business day turnaround was required.

Per Nic Vrey 7/29/2015, arsenic was not required for all samples and Benz(a)anthracene was not required for sample "SCS-24A-2W-(0-2)-20150724-01".

RE: AGLC-Macon Remediation

Dear Nic Vrey: Order No: 1507O94

Analytical Environmental Services, Inc. received 6 samples on 7/30/2015 10:25:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Macon Remediation

Dear Nic Vrey: Order No: 1508330

Analytical Environmental Services, Inc. received 5 samples on August 6, 2015 10:40 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Samples 1508330-005A collection times were taken from the containers.

Sample 1508330-005 requests cyanide on the coc but no container was received in the lab. A portion of the 1L amber was preserved and used for the analysis.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on sample 1508330-001A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1508330

Checklist completed by Aaron B 8/6/15
Signature Date

Carrier name: FedEx ✓ UPS __ Courier __ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.2 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes __ No ✓

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by JB

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGL Macon Remediation

Dear Nic Vrey: Order No: 1509H68

Analytical Environmental Services, Inc. received 6 samples on September 22, 2015 10:05 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Macon Remediation

Dear Nic Vrey: Order No: 1509M23

Analytical Environmental Services, Inc. received 12 samples on 9/25/2015 10:25:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

PROJECT INFORMATION
PROJECT NAME: AGL Macon Remediation
PROJECT #: 0176740
SITE ADDRESS: 224 Walnut St Macon GA 31201
SEND REPORT TO: Nic.Vreg@erm.com
INVOICE TO: (IF DIFFERENT FROM ABOVE)
QUOTE #:_____ PO#:_____

RECEIPT
Total # of Containers

Turnaround Time Request
- Standard 5 Business Days
- 2 Business Day Rush
- Next Business Day Rush
- Same Day Rush (auth req.)
- X Other 3 DAY TAT

STATE PROGRAM (if any): _____
E-mail? Y / N; Fax? Y / N
DATA PACKAGE: I II III IV

SAMPLES RECEIVED AFTER 3PM OR ON SATURDAY ARE CONSIDERED RECEIVED THE NEXT BUSINESS DAY. IF TURNAROUND TIME IS NOT INDICATED, AES WILL PROCEED WITH STANDARD TAT OF SAMPLES. SAMPLES ARE DISPOSED 30 DAYS AFTER REPORT COMPLETION UNLESS OTHER ARRANGEMENTS ARE MADE.

MATRIX CODES: A = Air GW = Groundwater SE = Sediment SO = Soil SW = Surface Water W = Water (Blanks) DW = Drinking Water (Blanks) O = Other (specify) WW = Waste Water

PRESERVATIVE CODES: H+I = Hydrochloric acid + ice I = Ice only N = Nitric acid S+I = Sulfuric acid + ice S/M+I = Sodium Bisulfate/Methanol + ice O = Other (specify) NA = None

Analytical Environmental Services, Inc

Date: 2-Oct-15

Client: ERM-Southeast
Project: AGL Macon Remediation
Lab ID: 1509M23

Case Narrative

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on sample 1509M23-003 A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1509M23

Checklist completed by _____ 9/25/15
Signature Date

Carrier name: FedEx ✓ UPS __ Courier __ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.1° Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGL Macon

Dear Nic Vrey: Order No: 1511O46

Analytical Environmental Services, Inc. received 13 samples on 11/25/2015 9:50:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

TEL: (678) 486-2700
FAX: (404) 745-0103

RE: AGL Macon

Dear Nic Vrey: Order No: 1512C45

Analytical Environmental Services, Inc. received 3 samples on 12/14/2015 7:45:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

TEL: (678) 486-2700
FAX: (404) 745-0103

RE: AGL Macon

Dear Nic Vrey: Order No: 1512E55

Analytical Environmental Services, Inc. received 8 samples on December 16, 2015 10:50 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Macon

Dear Nic Vrey: Order No: 1601E03

Analytical Environmental Services, Inc. received 7 samples on January 20, 2016 8:56 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample Receiving Nonconformance:

Sample information on the Chain of Custody did not match that on the sample bottle labels for sample 1601E03-001A. The vials for this sample were not labeled with the sample ID. Samples were matched based on the jars they were packaged with. Samples were logged in using the information on the COC.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on sample 1601E03-001A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1601E03

Checklist completed by _____ 1/20/16
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 4.5 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes __ No ✓

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

FAX: (404) 745-0103

RE: AGL Macon

Dear Nic Vrey: Order No: 1601E04

Analytical Environmental Services, Inc. received 8 samples on 1/20/2016 8:56:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Macon Remediation

Dear Nic Vrey: Order No: 1601I29

Analytical Environmental Services, Inc. received 1 samples on January 25, 2016 6:30 pm for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Macon Remediation

Dear Nic Vrey: Order No: 1601K21

Analytical Environmental Services, Inc. received 5 samples on 1/27/2016 10:10:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1601K21

Checklist completed by Signature Date 1-27-16

Carrier name: FedEx ✓ UPS __ Courier __ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present __

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 2.9°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGL Macon

Dear Nic Vrey: Order No: 1601M81

Analytical Environmental Services, Inc. received 1 samples on 1/29/2016 10:35:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Macon

Dear Nic Vrey: Order No: 1601N80

Analytical Environmental Services, Inc. received 2 samples on January 30, 2016 11:40 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES's accreditations are as follows:
-NELAC/Florida State Laboratory ID E87582 for analysis of Non-Potable Water, Solid & Chemical Materials, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-NELAC/Louisiana Agency Interest No. 100818 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 07/01/15-06/30/16.
-NELAC/Texas Certificate No. T104704509-16-6 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 03/01/16-02/28/17.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

RE: AGL Macon

Dear Nic Vrey: Order No: 1602D01

Analytical Environmental Services, Inc. received 7 samples on February 13, 2016 9:35 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/15-06/30/16.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Re: Macon AGL In-Situ Stabilization Treatability Study
Macon AGL Site
KEMRON ATG Project #SH0487

Dear Mr. Morrison:

KEMRON Environmental Services, Inc. (KEMRON) is pleased to present this letter report summarizing the results of testing performed for Environmental Resources Management (ERM). The study was conducted on site materials sampled from the Macon AGL located in Macon, Georgia (the site). The objective of the study is to determine if in-situ stabilization technology will meet the following remediation objectives:

- a hydraulic conductivity less than 10^{-6} centimeters per second (cm/s);
- an unconfined compressive strength (UCS) greater than 50 pounds per square inch (psi);
- a relative mass loss less than 10 percent (%) when subjected to 12 wet/dry cycles; and
- the absence of liquid in the extruded UCS specimens.

Testing was conducted to evaluate selected reagents, reagent addition rates, and chemical and physical properties of the treated soils. The following sections of this report include information regarding the protocols followed during each phase of the study and the results of testing performed. Additionally, attachments include chain of custodies, chemical and physical datasheets, and mixture development sheets for the testing conducted.

Untreated Material Characterization

In May 2013, KEMRON received two shipments of materials from the site, one containing untreated material from the "low" concentration area and the other containing material from the "high" concentration area. Immediately following receipt of the site materials, KEMRON logged the material into its sample tracking database and placed the material in secure

refrigerated storage maintained at a temperature of approximately 4 degrees Celsius (^{o}C). Note that the shipment of untreated "low" material contained nine one-gallon bags. KEMRON was directed to composite the nine one-gallon bags into a single batch of untreated "low" material for the study. The Material Chain of Custody is included in **Attachment A**.

Prior to initiating the study, KEMRON homogenized the materials. Homogenization was performed by passing each site material through a sieve screen to remove all materials larger than 1/2-inch in diameter. The removal of oversized materials was performed in order to facilitate bench-scale evaluations of the site soils. Once screened, each material was gently mixed by hand using stainless steel utensils.

Following homogenization, KEMRON collected a representative aliquot of the untreated "low" material and a representative aliquot of the untreated "high" material for characterization testing. The establishment of the baseline characteristics of the untreated materials is important for ensuring that the materials are similar to what is expected at the site and for evaluating the effectiveness of stabilization treatment. The following physical characterization analyses were conducted on the aliquots of untreated soil in accordance with the referenced test methods:

PARAMETER	**METHOD**
Moisture Content	ASTM D2216
Bulk Unit Weight	ASTM D2937
Specific Gravity	ASTM D854
pH	EPA Method 9045

The results of the physical characterization analyses performed on the untreated "low" material and the untreated "high" material are summarized in **Table 1** below. The Untreated Physical Properties Datasheets are included in **Attachment B**.

Table 1
Untreated Physical Properties Datasheet

Testing Parameter	Test Method	Unit	Untreated Material Type	
			Low	High
Moisture Content	ASTM D2216

Stabilization Evaluations

KEMRON understands that in-situ solidification is the preferred site remedy. Therefore, additives were incorporated into the untreated materials as a pumpable slurry to facilitate in-situ auger mixing. Mixture development was performed by introducing the reagent slurry into the site materials while mixing using a standard bench-top mixer. All reagents and water were added on a by-weight basis. For example, with a mixture containing a 10% addition of reagent and 8% water addition, 10 grams of reagent will be slurried with 8 grams of water and then blended with 100 grams of the site material.

Mixture designs applied to the site material were provided by ERM and include the addition of reagents including Type I Portland Cement (PC), LaFarge Ground Granulated Blast Furnace Slag (GGBFS) 120, and Bentonite. A complete summary of mixture designs is provided in **Table 2.** Mixture Development Datasheets are provided in **Attachment C**.

Table 2
Mixture Designs

KEMRON Sample Number	Untreated Material Type	Reagent Type and Identification Number(s)	Reagent Addition % by Wet Soil wt.	Water Addition % by Untreated wt.
0487-001	Low	Portland Cement #842/LaFarge GGBFS120 #948/Bentonite #807	1.5/4.5/0.5	16.7
0487-002	High	Portland Cement #842//LaFarge GGBFS120 #948Bentonite #807	1.5/4.5/0.5	16.7
0487-003	High	Portland Cement #842/LaFarge GGBFS120 #948/Bentonite #807	2.5/4.5/0.5	16.7
0487-004	High	Portland Cement #842/LaFarge GGBFS120 #948/Bentonite #807	2.5/3.5/0.5	16.7

Each initial screening mixture was prepared as batches using 3,000 grams of the site material to evaluate potential setting and physical properties of the treated materials via unconfined compressive strength (UCS), hydraulic conductivity, wet/dry durability, and liquid release testing. The testing results are discussed in the subsequent paragraphs. A summary of the

Data contained on this sheet shall not be disclosed without prior approval from KEMRON Environmental Services, Inc. (Proprietary)

testing results are also provided in **Tables 3, 4, 5, and 6** below and the Treated Physical Properties Datasheet in **Attachment D**.

UCS testing was performed at a 7 and 28 day curing interval in accordance with ASTM D2166. UCS testing was conducted by removing the cured sample specimen from the cylindrical mold. The weight and physical dimensions of the sample were determined and recorded on the appropriate data sheet. The specimen was then placed in the load frame and compressed at a rate of 1% strain per minute until the sample fails or 15% strain has been achieved. Throughout the testing, KEMRON documented the load at specific strain values. A representative aliquot of the post test specimen are then subjected to moisture content testing. UCS testing results are provided in **Table 3**.

Table 3
Summary of Unconfined Compressive Strength Testing

KEMRON Sample Number	Cure Days	Unconfined Compressive Strength			
		Moisture Content %	Bulk Density (lb/ft^3)	Dry Density (lb/ft^3)	UCS (lb/in^2)
0487-001	7	38.03	111.7	80.9	40.1
	28	39.43	109.8	78.8	66.8
0487-002	7	42.32	111.0	78.0	10.0
	28	40.57	108.4	77.7	31.7
0487-003	7	41.69	109.9	77.5	45.0
	28	42.08	108.2	76.2	87.90
0487-004	7	38.37	110.3	79.7	40.8
	28	36.43	110.7	81.1	58.2

Notes:
% = percent
lb/ft^3 = pounds per cubic feet
lb/ft^2 = pounds per square feet

Hydraulic conductivity testing was performed at a 28 day curing interval in accordance with ASTM D5084. Hydraulic conductivity testing was conducted by recording the weight and physical dimensions of the sample specimen. The specimen was then placed into a flexible wall permeameter with a 2 psi confining pressure applied to the water surrounding the specimen. This differential is utilized to ensure that the specimen integrity is not compromised. Testing was initiated by saturating the specimen with de-aired water. Saturation was accomplished over time by increasing the backpressure applied to the sample in increments of 10 psi until a 95% saturation value was achieved. Once saturated, the sample was then consolidated using a 10 psi confining pressure. That is, the pressure differential between the confining pressure, applied to the outside of the sample, was 10 psi higher than the backpressure applied to the specimen itself. The quantity of water forced out of the sample was recorded over time and plotted to ensure

Data contained on this sheet shall not be disclosed without prior approval from KEMRON Environmental Services, Inc. (Proprietary)

appropriate consolidation had been achieved. The results of the hydraulic conductivity testing are provided in **Table 4**.

Table 4
Summary of Hydraulic Conductivity Testing

KEMRON Sample Number	Cure Days	Hydraulic Conductivity (K) (cm/sec)			
		Moisture Content (%)	Bulk Density (lb/ft³)	Dry Density (lb/ft³)	K (cm/sec)
0487-001	7

cm/sec = centimeters per seconds

Wet / dry durability testing was performed at a 28 day curing interval in accordance with ASTM D4843. Wet / dry durability testing employs 12 cycles of wetting and drying of the sample to simulate long term weathering. This test was performed on a sample specimen measuring 2 inches in diameter by 4 inches in height. The specimen was placed in a beaker and dried for 24 hours at a temperature of 65 degrees Celsius (^oC) $\pm$ 5 ^oC. Following the drying period, the sample was removed from the oven and allowed to cool to room temperature. It was then covered with water to simulate saturation from rain and or surface water. After 24 hours the sample was removed from the water, and the leachate was filtered to remove any solid particles that may have come from the sample. The specimen was then weighed and measured to determine any physical change in the monolith, and the filter paper was then dried and the weight of the solids was recorded. A "control" sample was subjected to the same protocol as the sample specimen with one exception. Rather than placing the "control" specimen in a drying oven, it was placed into a humid environment at ambient temperature during the drying cycle. Calculations were performed following the 12^{th} full cycle in which the mass loss of the test sample is compared to that of the "control" sample. The results of the wet / dry durability testing are provided in **Table 5**.

Data contained on this sheet shall not be disclosed without prior approval from KEMRON Environmental Services, Inc. (Proprietary)

Table 5
Summary of Wet / Dry Durability Testing

KEMRON Sample Number	Cure Days	Relative mass loss %/Pass/Fail
0487-001	7	
	28	8.17/ Pass
0487-002	7	
	28	12.64/Fail *
0487-003	7	
	28	3.92/Pass
0487-004	7	
	28	39.23/Fail

Notes:
% = percent
*= Testing was stopped after 7 cycles due to excessive mass loss

A liquid release test was performed by placing the sample specimen in a device capable of simulating landfill overburden pressures. The specimen was placed between twin stainless steel screens and two stainless steel grids. An absorbent filter pad was placed on the side of each stainless steel grid opposite the sample specimen. A compressive force of 50 psi was applied to the top of the sample. The release of liquid in the sample was indicated by a visible wet spot on either of the filter papers. The results of the liquid release test are provided in **Table 6**.

TESTING METHOD:	EPA Method 9096		

TESTING PARAMETER AND RESULTS		
QUANTITY OF MATERIAL	357.00	**g**
LENGTH OF TEST	10.0	**min.**
RESULTS (PASS / FAIL) *	Pass	

* In accordance with EPA Method 9096, if any liquid from the test material collects on the filters after 10 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the liquid release test.

WET / DRY TESTING

SUMMARY OF TEST RESULTS

PROJECT:	Macon ISS	SAMPLE No. (Test):	0487-001
PROJECT No.:	SH0487	SAMPLE No. (Control):	0487-001C
START DATE:	7/15/2013	SAMPLE DESCRIPTION:	0
TRACKING CODE:	9119		

INITIAL SPECIMEN CONDITIONS	TEST		CONTROL	
1. BULK UNIT WEIGHT	112.2	pcf	111.1	pcf
2. DRY UNIT WEIGHT	80.4	pcf	79.7	pcf
3. MOISTURE CONTENT	39.43	%	39.43	%

TEST RESULTS	TEST		CONTROL	
1. MAX VOLUMETRIC CHANGE*	-11.9	%	-0.9	%
2. TOTAL MASS LOSS	8.29	%	0.12	%
3. RELATIVE MASS LOSS	8.17	%		

* A positive value denotes expansion and a negative value denotes shrinkage.

LIQUID RELEASE TESTING

SUMMARY OF RESULTS

PROJECT:	Macon ISS	TESTING DATE:	6/6/2013
PROJECT No.:	SH0487	TESTED BY:	RPH
SAMPLE No.:	0487-002 (7 day)	TRACKING CODE:	9042
TESTING METHOD:	EPA Method 9096		

TESTING PARAMETER AND RESULTS		
QUANTITY OF MATERIAL	346.00	**g**
LENGTH OF TEST	10.0	**min.**
RESULTS (PASS / FAIL) *	pass	

* In accordance with EPA Method 9096, if any liquid from the test material collects on the filters after 10 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the liquid release test.

LIQUID RELEASE TESTING

SUMMARY OF RESULTS

PROJECT:	Macon AGL	TESTING DATE:	6/27/13
PROJECT No.:	SH0487	TESTED BY:	RPH
SAMPLE No.:	0487-002 (28-day)	TRACKING CODE:	9120
TESTING METHOD:	EPA Method 9096		

TESTING PARAMETER AND RESULTS		
QUANTITY OF MATERIAL	338.00	**g**
LENGTH OF TEST	10.0	**min.**
RESULTS (PASS / FAIL) *	Pass	

* In accordance with EPA Method 9096, if any liquid from the test material collects on the filters after 10 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the liquid release test.

WET / DRY TESTING

SUMMARY OF TEST RESULTS

PROJECT:	Macon ISS	SAMPLE No. (Test):	0487-002
PROJECT No.:	SH0487	SAMPLE No. (Control):	0487-002C
START DATE:	7/15/2013	SAMPLE DESCRIPTION:	0
TRACKING CODE:	9120		

INITIAL SPECIMEN CONDITIONS	TEST		CONTROL	
1. BULK UNIT WEIGHT	109.3	pcf	106.3	pcf
2. DRY UNIT WEIGHT	77.7	pcf	75.6	pcf
3. MOISTURE CONTENT	40.57	%	40.57	%

TEST RESULTS	TEST		CONTROL	
1. MAX VOLUMETRIC CHANGE*	-11.3	%	-1.5	%
2. TOTAL MASS LOSS	12.76	%	0.12	%
3. RELATIVE MASS LOSS	12.64	%		

* A positive value denotes expansion and a negative value denotes shrinkage.

LIQUID RELEASE TESTING

SUMMARY OF RESULTS

PROJECT:	Macon ISS	TESTING DATE:	10/25/2013
PROJECT No.:	SH0487	TESTED BY:	TNR
SAMPLE No.:	0487-003 (28 day)	TRACKING CODE:	9198
TESTING METHOD:	EPA Method 9096		

TESTING PARAMETER AND RESULTS		
QUANTITY OF MATERIAL	175.50	**g**
LENGTH OF TEST	10.0	**min.**
RESULTS (PASS / FAIL) *	Pass	

* In accordance with EPA Method 9096, if any liquid from the test material collects on the filters after 10 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the liquid release test.

WET / DRY TESTING

SUMMARY OF TEST RESULTS

PROJECT:	Macon ISS	SAMPLE No. (Test):	0487-003
PROJECT No.:	SH0487	SAMPLE No. (Control):	0487-003C
START DATE:	10/18/2013	SAMPLE DESCRIPTION:	0
TRACKING CODE:	9198_WDD		

INITIAL SPECIMEN CONDITIONS	TEST		CONTROL	
1. BULK UNIT WEIGHT	108.3	pcf	108.5	pcf
2. DRY UNIT WEIGHT	76.3	pcf	76.4	pcf
3. MOISTURE CONTENT	42.08	%	42.08	%

TEST RESULTS	TEST		CONTROL	
1. MAX VOLUMETRIC CHANGE*	-7.2	%	-1.2	%
2. TOTAL MASS LOSS	4.12	%	0.21	%
3. RELATIVE MASS LOSS	3.92	%		

* A positive value denotes expansion and a negative value denotes shrinkage.

LIQUID RELEASE TESTING

SUMMARY OF RESULTS

PROJECT:	Macon ISS	TESTING DATE:	11/18/2013
PROJECT No.:	SH0487	TESTED BY:	TNR
SAMPLE No.:	0487-004 (7 day)	TRACKING CODE:	9335
TESTING METHOD:	EPA Method 9096		

TESTING PARAMETER AND RESULTS		
QUANTITY OF MATERIAL	359.50	**g**
LENGTH OF TEST	10.0	**min.**
RESULTS (PASS / FAIL) *	PASS	

* In accordance with EPA Method 9096, if any liquid from the test material collects on the filters after 10 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the liquid release test.

LIQUID RELEASE TESTING

SUMMARY OF RESULTS

PROJECT:	Macon ISS	TESTING DATE:	11/21/2013
PROJECT No.:	SH0487	TESTED BY:	TNR
SAMPLE No.:	0487-004 (28 day)	TRACKING CODE:	9364
TESTING METHOD:	EPA Method 9096		

TESTING PARAMETER AND RESULTS		
QUANTITY OF MATERIAL	360.00	**g**
LENGTH OF TEST	10.0	**min.**
RESULTS (PASS / FAIL) *	PASS	

* In accordance with EPA Method 9096, if any liquid from the test material collects on the filters after 10 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the liquid release test.

1. INTRODUCTION

Geo-Solutions, Inc. (GSI) will be responsible for Quality Control of its work. This will include performing real-time monitoring of the grout mixing, soil mixing, and other GSI portions of the project and verifying that the completed work meets the project specification requirements. GSI will endeavor to maintain the highest quality of work possible for the duration of the project. This document outlines the methods by which GSI intends to maintain the quality of its work.

1.1 PERSONNEL

Quality control (QC) personnel on-site will include a QC technician and a QC manager. Position of quality control manager will be served by Trae Deri. All quality control sampling, procedures, reports, controls, and testing will be performed by the quality control technician or quality control manager. The quality control manager will be on site full-time and is experienced in managing and executing quality-assurance and quality-control procedures similar in nature and the extent to those required for this project. Trae's resume can be found as an attachment to the Work Plan.

The site superintendent will be Keith Adamson. He will also assist Trae in his responsibilities of performing daily quality control duties as well as insuring all work is performed per the project plans and specifications. The site superintendent will be on-site full time and will also be included in enacting GSI safety standard operating procedures. Keith's resume can be found as an attachment to the Work Plan.

2. PROCEDURES

2.1 SUBMITTAL PROCEDURE

Submittals will be prepared and submitted to Environmental Resources Management (ERM) for review and approval. Submittals will be tracked by transmittals following a sequential numbering system with alphabetic suffix as needed for follow-up submittals. Only submittals required by the project specifications will be transmitted to ERM for review and approval.

A submittal tracking log will be maintained and updated by GSI.

Submittals will be typically transmitted via email with a hard copy given to on-site ERM personnel. The submittals will be prepared by personnel that have the technical qualification to prepare an adequate submittal to ensure it meets the contract requirements per the specifications.

3. RELATED DOCUMENTS

- Specification Section 01330 – Submittal Procedures and Startup Submittals
- Specification Section 01400 – Quality Requirements
- Specification Section 02196 – In Situ Solidification
- GSI's ISS Work Plan

4. MATERIALS

The materials required for the soil mixing are water, bentonite, Portland Cement, and Ground Granulated Blast Furnace Slag (GGBFS). Originals or copies of the material certificates of analysis will be provided after they are received from the suppliers. GSI plans to receive the GGBFS and Portland Cement separately from the manufacturer. GSI will blend the materials at the 3:1 ratio during batching to meet the mix design.

Cement. GSI plans on using Portland cement, ASTM C-150, Type I or II, supplied by a local manufacturer. Portland cement will be supplied as a component of the slag/ cement blend.

Slag. GSI plans on using Ground Granulated Blast Furnace Slag, Grade 100, supplied by a local manufacturer. Slag will be supplied as a component of the slag/ cement blend.

Water. Potable water from temporary on-site 3-inch water line or reuse of MGP contact water.

Bentonite. API 13A Section 9 bentonite to be delivered via supersack and loaded into vertical silo for batching.

5. GROUT MIXING AND PROPORTIONING

Reagent (slag/ portland cement blend, bentonite) will be stored in bulk storage containers and silos after being unloaded at the site and prior to being utilized in the grout mix. Proportioning of the grout mix at the batch plant will be accomplished using the following measuring devices:

Water: Flow meters
GGBFS/ Cement / Bentonite: Silo/ Mixer Load Cells and Mud Balance

Geo-Solutions batch plant is specially designed for accurate proportioning of multiple grout ingredients. Dry reagents are added by weight which is measured at the load cell readouts by the plant operator. Water is added via flow meters and/ or by weight. Density is monitored every 3rd batch once parameters are stable at the start of each day. The plant is designed for soil mixing demands for a project of this size.

Quality control equipment will be calibrated and checked on a routine basis. Mud balances will be checked for calibration every morning. Upon initial set up, scales will be calibrated by a certified scale technician. Following set up, the load cells will be checked with certified weights every 1-2 weeks and calibrated accordingly. If a considerably discrepancy is noted or equipment is in need of repair a technician will be contacted. Flow meters will also be checked and calibrated at the outset of the work and routinely thereafter. Flowmeters are checked by pumping a volume of water through the meter and measuring it in a graduated container. ERM will be notified when maintenance or calibration activities are planned.

Grout density measurements will be compared to the theoretical grout density computed by the absolute volume method:

Absolute Volume

For Mix 1 – Perimeter Area, the water to dry grout ratio is 1:1 for soil mixing, and we will use the parameters provided in the contract documents for the following grout densities for each material:

Soil Mixing**:

Cement – 11.5%	(SG = 3.15)
Slag – 34.6%	(SG = 2.92)
Bentonite – 3.8.0%	(SG = 2.35)
Water – 50.0%	(SG = 1)
Density =	**93.5 pcf**

**Grout ratios subject to change pending soil conditions and after testing of initial columns.

For Mix 2 – Central Area, the water to dry grout ratio is 1:1 for soil mixing, and we will use the parameters provided in the contract documents for the following grout densities for each material:

Soil Mixing**:

Cement – 16.7%	(SG = 3.15)
Slag – 30.0%	(SG = 2.92)
Bentonite – 3.3%	(SG = 2.35)
Water – 50.0%	(SG = 1)
Density =	**93.6 pcf**

**Grout ratios subject to change pending soil conditions and after testing of initial columns.

Grout is prepared by first adding water to the batching tank. After the water has been added, the cement/slag blend is added until the target density is reached. Once pumping to the ISS rig commences, water and cement/ slag is added at a consistent rate, always maintaining the target density. The grout is continuously agitated in the holding tank. Agitation helps to keep the solid particles in suspension.

A batch plant operator will monitor the grout production and notify the supervisor of any problems. The batch plant operator will also be in charge of performing and recording the results of quality control tests on the freshly mixed grout. The quality control testing at the batch plant will consist primarily of density measurements. Quality control testing performed at the batch plant will be recorded on the “Batch Plant Quality Control Form” which will be submitted daily as part of the “Daily Quality Control Report”.

6. SAMPLE GROUT ADDITION CALCULATIONS

The selected pattern of columns for soil mixing will ensure 100% coverage of the ISS work limits. A proposed column layout is provided in Appendix B of the Work Plan. Column center-to-center spacing is based on the equation: 0.867 x diameter (D) = column spacing. Once

the column locations are finalized and depths can be calculated, the grout addition per column will be determined. Please find a sample grout addition calculation attached in **Attachment A**. Grout addition will be calculated according to the following equation:

((Treated Volume, ft^3 – Previously Treated Overlap Area) x Assumed Soil Density, pcf x Reagent Dosage, %) / Reagent Weight per Unit Volume of Grout, lbs/gal = **Gallons of Grout / Column**

The QC officer, batch plant operator and drill rig operator will communicate during each column installation to ensure that the appropriate volume of grout is delivered to each column. The actual grout volume delivered to each column will be recorded on the "SM Drill Rig Quality Control Report", which will be submitted daily as part of the "Daily Quality Control Report".

7. COLUMN IDENTIFICATION AND LOCATION

Each column will be assigned a unique identification. Generally, GSI utilizes a letter, number identification system where the letter corresponds to the row and the number corresponds to the column of the grid that the soil mix column centerpoint falls on. For instance a soil mix column located at the intersection of the third row and fourth column might be identified as C4.

GSI will verify control points existing at the site and establish additional points to be maintained during the project. The column layout, prepared in Autocad, will be used to locate each column's centerpoint in relation to known site features. These centerpoints will be loaded into a data acquisition system tied to a GPS system established for use at this site. GSI will use this GPS system to perform daily layout. The GPS systems that GSI uses have a horizontal and vertical tolerance of +/- 0.1'. After the column has been accurately located, a pin flag/stake is placed at the location (see photo), the drill rig is pulled into position, and centered over the pin flag/ stake.

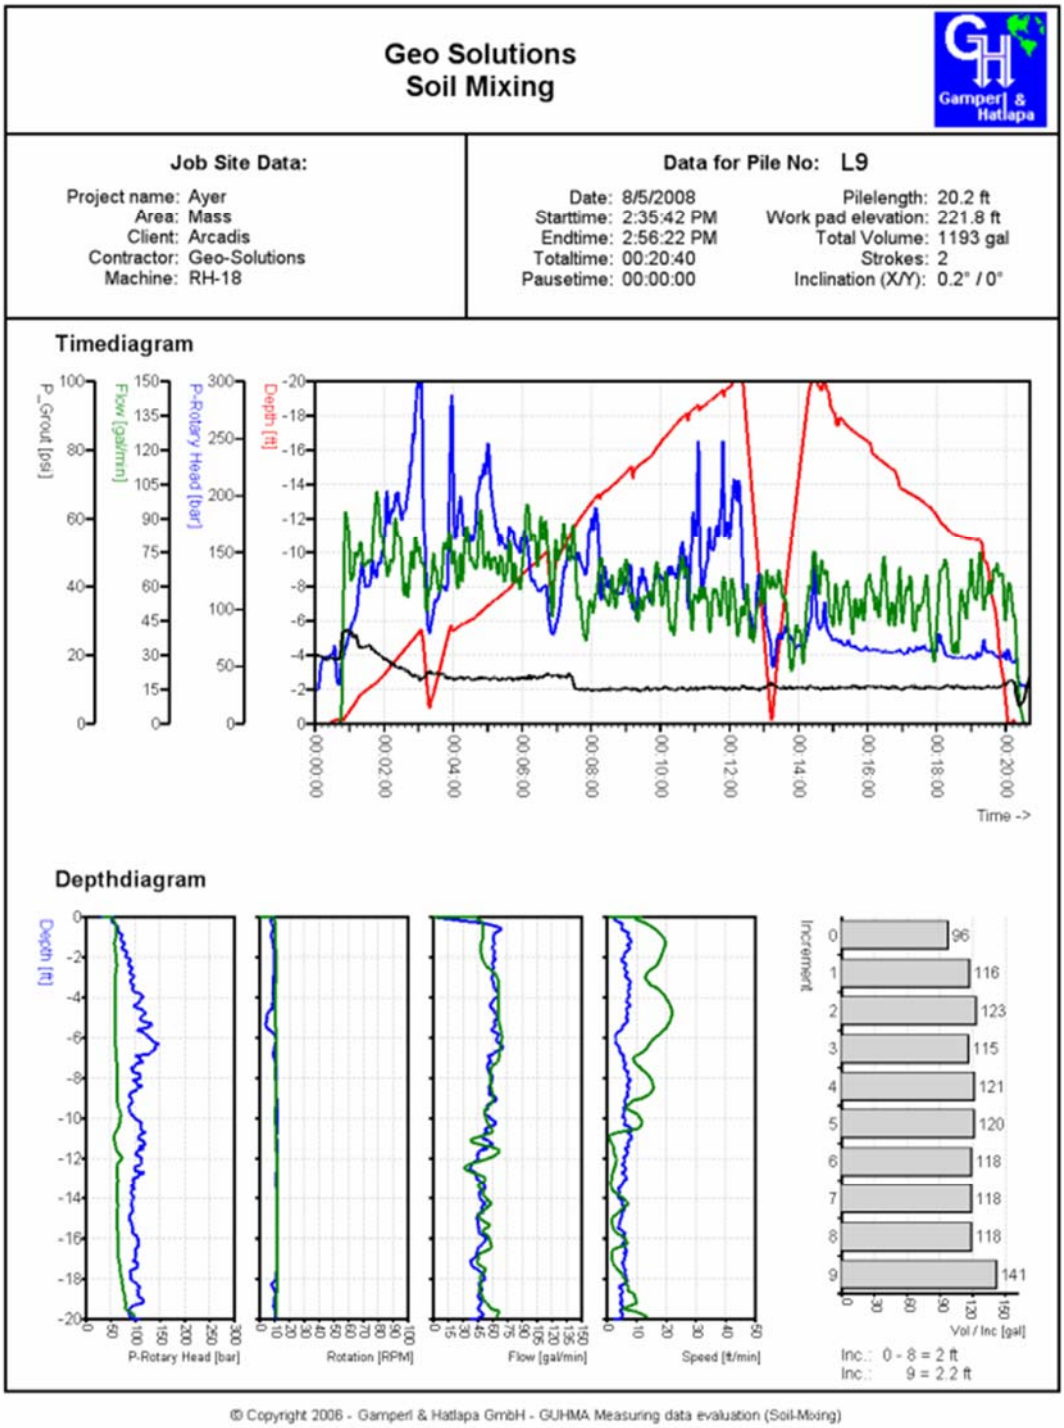

Photo of Soil Mixing Layout

8. DRILL RIG REPORT

GSI's drill rig is equipped with the Guhma data acquisition system (or similar). This system includes an onboard computer where the operator can continuously monitor soil mixing parameters as applicable. The system stores all of this information and compiles "rig reports" that are downloaded at the end of each shift. The report includes grout injection pressures, grout flow rates, vertical speed of auger, and rotation speed of auger (rpm). An example rig report is included below. The column depth is determined by establishing zero at the top of the column, which is determined during GPS staking of the column's horizontal location. Zero depth begins with the auger teeth flush with the top of the working platform.

Example Rig Report

9. TESTING AND INSPECTION

9.1 SAMPLE COLLECTION AND TESTING

Wet "grab" samples will be taken from within recently mixed columns at a frequency of 1 sample set per day or once every 1000 treated cubic yards, whichever is more frequent, and 1 sample every 200 linear feet around the perimeter of the ISS area. Grab samples of soil-cement will be taken using a hydraulic or mechanical "thief" sampler. Samples will be stored to allow curing. Once the samples have cured for either 3, 7, 14, or 28 days testing, the samples will be provided to ERM for shipment to testing laboratory. Initially, GSI will be taking "split" samples along with ERM to receive preliminary data on column testing. Additional samples may be taken approximately every 1,000 to 3,000 cubic yards of soil mix. Typically, the grab samples will be used to cast 2" x 4" (for unconfined compressive strength (UCS testing) and 3" x 6" (for permeability testing) specimens. Specimens will be cast in a manner that limits the entrapment of air. Immediately after casting, the specimens will be stored in a moisture and temperature controlled environment (normally a cooler kept in the air conditioned site trailers) to cure, undisturbed, prior to transport. When the samples have taken their initial "set" (normally 3 to 5 days) they will be provided to ERM for shipment to a laboratory for UCS, permeability, wet/ dry durability testing at appropriate curing intervals per the specifications.

9.1.1 SAMPLE IDENTIFICATION NOMENCLATURE

Samples will be identified by a simple naming convention using a combination of the date the sample was collected and from what specific column. For example, a sample collected on May 11, 2015 from column S1 will have a sample identification of 2015-0511-S1 or similar.

9.2 CONTRACTOR PERFORMED TESTS

GSI will perform sampling and testing throughout the work day during ISS operations to inspect and ensure all columns are able to meet or exceed performance requirements. The sampling method and test results will recorded and documented as part of the "Daily Quality Control Report" with test results updated when they are received from the testing laboratory.

9.3 INSPECTION

GSI will perform daily and frequent inspections on all aspects of work including subcontractor performed work to ensure all is being conducted in accordance with contract documents and local and state requirements.

Work activities by GSI personnel and subcontractors will be monitored by GSI supervision and any deficiencies in workmanship identified will be corrected immediately and brought to the attention of the engineer. If the deficiencies are not able to be immediately corrected, a corrective action plan will be developed in coordination with the engineer and other as necessary to bring all work into compliance.

9.3.1 DOCUMENTATION

A log of inspections and testing will be documented throughout the course of work to include acceptable work and work needing adjustments and corrective measures. Documentation discussing work the engineer has indicated as nonconforming or defective and any corrective actions/measures.

10. GENERAL

As part of the "Daily Quality Control Report" submittal, GSI will report a summary of daily site activities including the weather, conversations between GSI and other site personnel, safety issues, production issues, and GSI personnel onsite. Observations and suggestions for future site operations on the project will be included on this report so that management can make appropriate decisions about how to best continue the project.

11. ACCEPTANCE

The soil mixing will be considered acceptable when the permeability, unconfined compressive strength, and mass loss criteria are achieved. GSI understands that these criteria are as follows:

1. ISS performance Goals of the ISS columns:

    a. Hydraulic Conductivity $1x10^{-6}$ cm/sec

    b. UCS strength greater than 50 psi but less than 500 psi (28 day)

    c. Mass loss following wetting and drying less than 10%

Note: Should undesirable results be achieved, GSI will first test archived specimens from the same sample set. If unacceptable results persist, then GSI will retest following additional cure time. Unlike concrete, soil-grout continues to improve well beyond 28 days of curing. Finally, GSI will test additional sample sets collected around the time of the failing set to help to determine whether or not the failing set is anomalous.

12. CORRECTIVE PROCEDURES

If the results of the UCS and permeability testing indicate that a column or columns of the site are not in compliance with the project objectives, these columns will be retreated. GSI will endeavor to notify ERM of defective portions of the work as quickly as possible. GSI and ERM will jointly decide the most appropriate course of action to deal with defective areas.

Re: Final Letter Report of Confirmation Testing
ERM Project No. 176740
KEMRON Project No. SH0578

Dear Mr. Rivera:

Enclosed, please find the testing results for samples received between July 16, 2015 and February 23, 2016 for confirmation testing. All analytical testing was performed by Analytical Environmental Services (AES) located in Atlanta, GA.

This letter report includes the summary tables, supporting laboratory data and the sample chain of custodies. The following methods were completed for selected samples:

Unconfined Compressive Strength – ASTM D2166
Hydraulic Conductivity – ASTM D5084
Wet/Dry Durability – ASTM D4843
Leachability – ANSI 16.1
Leachability – EPA LEAF Method 1315

KEMRON Environmental Services, Inc. appreciates this opportunity to provide laboratory services to ERM. If you have any questions, or require additional information, please contact me at (404) 636-0928.

Sincerely,

KEMRON Environmental Services, Inc.

James Moyer
Staff Chemist

Tommy A. Jordan, P.G.
Program Manager

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084

Constant Volume

Sample Type:	Intact	Permeant Fluid:	De-aired Distilled water
Orientation:	Vertical	Cell #:	15/4

Sample Preparation: Placed into permeameter at as-received density and moisture content.

Assumed Specific Gravity: 2.50

Parameter	Initial	Final
Height, in	1.80	1.80
Diameter, in	3.04	3.04
Area, in^2	7.26	7.26
Volume, in^3	13.1	13.1
Mass, g	358	364
Bulk Density, pcf	104	106
Moisture Content, %	41.0	43.3
Dry Density, pcf	74.0	74.0
Degree of Saturation, %	92	97

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	100.44	Increased Cell Pressure, psi:	110.43	Cell Pressure Increment, psi:	9.99
Sample Pressure, psi:	90.28	Corresponding Sample Pressure, psi:	98.74	Sample Pressure Increment, psi:	8.46
				B Coefficient:	0.85

*B value did not increase with increase in pressure.
Final degree of saturation >95%.

TESTING PARAMETER	INITIAL	FINAL
BULK UNIT WEIGHT	**106.6 lb/ft³**	**106.9 lb/ft³**
DRY UNIT WEIGHT	**74.9 lb/ft³**	**74.2 lb/ft³**
MOISTURE CONTENT	**42.3 %**	**44.0 %**
PERMEABILITY @ 20°C	**2.7E-09 cm/sec**	

Client:	Kemron Environmental		
Project Name:	Macon AGL		
Project Location:	---		
GTX #:	303565		
Start Date:	8/14/2015	Tested By:	jcw
End Date:	8/24/2015	Checked By:	mcm
Boring #:	---		
Sample #:	CH22-20-20150718-06 (28-day)		
Depth:	---		
Visual Description:	Moist, yellowish brown soil cement mix		

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084

Constant Volume

Sample Type:	Intact	Permeant Fluid:	De-aired Distilled water
Orientation:	Vertical	Cell #:	4/5

Sample Preparation: Placed into permeameter at as-received density and moisture content.

Assumed Specific Gravity: 2.55

Parameter	Initial	Final
Height, in	1.55	1.55
Diameter, in	3.03	3.03
Area, in^2	7.21	7.21
Volume, in^3	11.2	11.2
Mass, g	308	311
Bulk Density, pcf	105	106
Moisture Content, %	46.1	47.6
Dry Density, pcf	71.6	71.6
Degree of Saturation, %	96	99

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	90.02	Increased Cell Pressure, psi:	95.06	Cell Pressure Increment, psi:	5.04
Sample Pressure, psi:	80.23	Corresponding Sample Pressure, psi:	84.99	Sample Pressure Increment, psi:	4.76
				B Coefficient:	0.94

*B value did not increase with increase in pressure.
Final degree of saturation >95%.

Visual Description:	Moist, Stabilized soil/cement		

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084 Increasing Tailwater

Sample Type:	Core	Permeant Fluid:	de-aired tap water
Orientation:	Vertical	Cell #:	P2

Sample Preparation: Sample placed into permeameter at as-received density and moisture content, (28 day cure).

SUMMARY OF RESULTS

PROJECT:	Macon AGL	TESTED BY:	JDM
PROJECT No.:	SH0578	TRACKING CODE:	A291_PM
SAMPLE No.:	AR10-(5)-20150731-21 (7-Day)	EQUIPMENT No.:	2
TEST DATE:	8/7/15		

TESTING PARAMETER	INITIAL	FINAL
BULK UNIT WEIGHT	**101.1 lb/ft³**	**102.4 lb/ft³**
DRY UNIT WEIGHT	**65.6 lb/ft³**	**65.4 lb/ft³**
MOISTURE CONTENT	**54.2 %**	**56.7 %**
PERMEABILITY @ 20°C	**1.4E-08 cm/sec**	

Client:	Kemron Environmental
Project Name:	Macon AGL
Project Location:	---
GTX #:	303565
Start Date:	9/1/2015
End Date:	9/8/2015
Tested By:	jcw
Checked By:	mcm
Boring #:	---
Sample #:	AR10-5-20150731-21 (28-day)
Depth:	---
Visual Description:	Moist, yellowish brown soil cement mix

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084

Constant Volume

Sample Type:	Intact	Permeant Fluid:	De-aired Distilled water
Orientation:	Vertical	Cell #:	9

Sample Preparation: Placed into permeameter at as-received density and moisture content.

Assumed Specific Gravity: 2.65

Parameter	Initial	Final
Height, in	1.65	1.65
Diameter, in	3.03	3.03
Area, in^2	7.21	7.21
Volume, in^3	11.9	11.9
Mass, g	314	321
Bulk Density, pcf	100	103
Moisture Content, %	53.0	56.5
Dry Density, pcf	65.5	65.5
Degree of Saturation, %	92	98

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	89.78	Increased Cell Pressure, psi:	94.89	Cell Pressure Increment, psi:	5.11
Sample Pressure, psi:	79.97	Corresponding Sample Pressure, psi:	84.71	Sample Pressure Increment, psi:	4.74
				B Coefficient:	0.93

*B value did not increase with increase in pressure.
Final degree of saturation >95%.

PERMEABILITY ASTM D5084

SUMMARY OF RESULTS

PROJECT:	Macon AGL	TESTED BY:	JDM
PROJECT No.:	SH0578	TRACKING CODE:	A306_PM
SAMPLE No.:	AB10-5-20150810-24 (7-Day)	EQUIPMENT No.:	10
TEST DATE:	8/17/15		

TESTING PARAMETER	INITIAL	FINAL
BULK UNIT WEIGHT	**102.2 lb/ft³**	**102.7 lb/ft³**
DRY UNIT WEIGHT	**66.8 lb/ft³**	**66.2 lb/ft³**
MOISTURE CONTENT	**53.1 %**	**55.2 %**
PERMEABILITY @ 20°C	**1.7E-08 cm/sec**	

Client:	Kemron Environmental		
Project Name:	Macon AGL		
Project Location:	---		
GTX #:	303565		
Start Date:	9/9/2015	Tested By:	jcw
End Date:	9/15/2015	Checked By:	mcm
Boring #:	---		
Sample #:	AB10-5-20150810-24 (28-day)		
Depth:	---		
Visual Description:	Moist, yellowish brown soil cement mix		

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084

Constant Volume

Sample Type:	Intact	Permeant Fluid:	De-aired Distilled water
Orientation:	Vertical	Cell #:	3/14

Sample Preparation: Placed into permeameter at as-received density and moisture content.

Assumed Specific Gravity: 2.65

Parameter	Initial	Final
Height, in	1.67	1.67
Diameter, in	3.04	3.04
Area, in^2	7.26	7.26
Volume, in^3	12.1	12.1
Mass, g	317	320
Bulk Density, pcf	99	100
Moisture Content, %	55.6	57.4
Dry Density, pcf	63.8	63.8
Degree of Saturation, %	93	95

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	90.04	Increased Cell Pressure, psi:	95.10	Cell Pressure Increment, psi:	5.06
Sample Pressure, psi:	79.95	Corresponding Sample Pressure, psi:	84.08	Sample Pressure Increment, psi:	4.13
				B Coefficient:	0.82

*B value did not increase with increase in pressure.
Final degree of saturation >95%.

Sample #:	AN24-15-20150824-35		
Depth:	---		
Visual Description:	Moist, Stabilized soil/cement		

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084 Increasing Tailwater

Sample Type:	Core	Permeant Fluid:	de-aired tap water
Orientation:	Vertical	Cell #:	K4

Sample Preparation: Sample placed into permeameter at as-received density and moisture content, (7 day cure).

Parameter	Initial	Final
Height, in	1.65	1.65
Diameter, in	3.04	3.04
Area, in^2	7.26	7.26
Volume, in^3	12.0	12.0
Mass, g	308	312
Bulk Density, pcf	98	99
Moisture Content, %	59.7	62.0
Dry Density, pcf	61.2	61.2
Degree of Saturation, %	---	96

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	90	Pressure Increment, psi:	9.5
Sample Pressure, psi:	80	B Coefficient:	0.95

Client:	Kemron Environmental		
Project Name:	Macon AGL		
Project Location:	---		
GTX #:	303565		
Start Date:	9/24/2015	Tested By:	jcw
End Date:	9/28/2015	Checked By:	mcm
Boring #:	---		
Sample #:	AR18-15-20150910-44 (7 day)		
Depth:	---		
Visual Description:	Moist, brownish yellow soil cement mix		

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084

Constant Volume

Sample Type:	Intact	Permeant Fluid:	De-aired Distilled water
Orientation:	Vertical	Cell #:	14/11

Sample Preparation: Placed into permeameter at as-received density and moisture content.

Assumed Specific Gravity: 2.55

Parameter	Initial	Final
Height, in	1.46	1.46
Diameter, in	3.04	3.04
Area, in^2	7.26	7.26
Volume, in^3	10.6	10.6
Mass, g	287	293
Bulk Density, pcf	103	105
Moisture Content, %	44.9	47.8
Dry Density, pcf	71.1	71.1
Degree of Saturation, %	92	98

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	90.02	Increased Cell Pressure, psi:	95.00	Cell Pressure Increment, psi:	4.98
Sample Pressure, psi:	79.88	Corresponding Sample Pressure, psi:	83.45	Sample Pressure Increment, psi:	3.57
				B Coefficient:	0.72

*B value did not increase with increase in pressure.
Final degree of saturation >95%.
