Subject: **Fifth VIRP Semi-annual Progress Report**
Former McKenzie Tank Lines Site
HSI Site No. 10406
111 Grange Road, Port Wentworth, Georgia
Tax Parcels: 1-0729-01-007 and 1-0729-01-009

Dear Mr. Metzger:

On behalf of McKenzie Tank Lines, Inc. (MTL), Environmental International Corporation (EIC) is pleased to submit the attached Fifth VIRP Semi-annual Progress Report for the above referenced site.

Enclosed are the following:

1. One signed and sealed certification page for the report.
2. One bound paper copy of the report.
3. Two Compact Discs, each with the report in searchable PDF format.

If you have any questions regarding this submittal, please contact Mr. Thomas F. Panebianco of MTL at 1-800-828-6495 or me at the above location.

Sincerely,

ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.
President & CEO

CERTIFICATION AND SUPPORTING DOCUMENTATIONS
Fifth VIRP Semi-annual Progress Report
Former McKenzie Tank Lines Site, Port Wentworth, Georgia
HSI Site No. 10406
November 21, 2016

"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

1.0 Introduction

On behalf of McKenzie Tank Lines, Inc. (MTL), Environmental International Corporation (EIC) is pleased to submit this "Fifth VIRP Semi-annual Progress Report" to Georgia Environmental Protection Division (EPD) to chronicle project activities concerning the former MTL site, Hazardous Site Inventory (HSI) site 10406, located at 111 Grange Road, Land Lot 30, Tax Parcel IDs 1-0729-01-007 and 1-0729-01-009, Port Wentworth, Georgia, (Site). This report was prepared as specified in the January, 29, 2014 "Voluntary Investigation and Remediation Plan (VIRP) Application" that was approved by the EPD on May 20, 2014 under the Voluntary Remediation Program (VRP) (EIC, 2014a).

1.1 Primary Objective

The primary objective of this report is to chronicle the tasks completed by MTL during the six-month time frame during the period of from May 2016 through October 2016. This report documents the following tasks:

- Responses to October 6, 2016 EPD Comment letter;
- Follow-up responses to selected comments from January 8, 2016 EPD Comment letter;
- The third semi-annual groundwater monitoring event;
- The abandonment of 5 recovery wells; and
- Delineation soil sampling for chlorinated volatile organic compounds (CVOCs) in Areas of Concern (AOCs) and other areas identified by the EPD.

A Site map is included as Figure 1-1. The following sections describe the aforementioned tasks.

SECTION

2

2.0 Response to EPD Comment Letter

2.1 Responses to October 8, 2016 Comment Letter

The following is a response on behalf of MTL to EPD's review and list of comments letter, dated October 6, 2016 (EPD, 2016b).

Comments and Responses

EPD Comment 1:

Responses to EPD's January 8, 2016 Comment Letter, which were included in Section 2 of the above referenced report, still indicated that metals detected in the holding pond area and arsenic detections in monitoring well MW-13S have not been delineated. Please ensure that these outstanding issues have been addressed prior to submitting the final CSR.

Response to EPD Comment 1:

Metals contamination will be addressed to the extent possible prior to the submission of a Compliance Status Report (CSR).

EPD Comment 2:

Shallow well groundwater analytical data was not included in the VRP Progress Report 4 tables. Please submit the shallow well groundwater analytical data tables for the VRP Progress Report 4 and include this data in future progress reports.

Response to EPD Comment 2:

The table including new and historical shallow groundwater analytical data was inadvertently omitted from the Fourth Semi-annual Progress Report (EIC, 2016). Table 3-3 in this report includes cumulative shallow groundwater analytical data from all VIRP sampling events, as well as for all available historical data.

EPD Comment 3:

EPD concurs with abandoning monitoring wells G-22 and MW-U2; however, EPD does not concur with removing these well locations from the monitoring well network. If G-22 and MW-U2 are abandoned, please replace each well as close to its original location, depth and screen interval as possible, and follow EPA Region 4 SESD guidance documents for installing and abandoning monitoring wells. EPD understands that no well construction data exists for MW-U2. If abandoned, please replace MW-U2 to a depth representative of shallow groundwater contamination conditions.

Response to EPD Comment 3:

Considering the MW-U2 lies within the known extents of the monitored CVOC plumes and additional shallow monitoring wells, MW-31 and MW-32 already exist in the vicinity it does not appear that a replacement monitoring well at the location of MW-U2 would be useful. Since MW-32 is a shallow well located within 70 feet east of MW-U2, it is EIC's position on behalf of MTL that well MW-32 adequately serves the purpose of substituting for MW-U2 within the monitoring well network. EIC agrees, however that a well of comparable depth and screened interval (although a 2-inch ID cased rather than a 1-inch ID cased, as G-22 is) should be installed within five feet of G-22 once it is abandoned.

EPD Comment 4:

EPD concurs with the proposed additional soil samples to complete delineation in AOC-6.

Response to EPD Comment 4:

EPD's comment is noted. Additional soil sampling is proposed in Section 4.0 of this report.

2.2 Follow-up Responses to the January 8, 2016 Comment Letter

The following is a follow-up response, on behalf of MTL, to select comments from the EPD's review and list of comments letter, dated January 8, 2016 (EPD, 2016a) that were originally addressed in the Fourth Semi-annual Report (EIC, 2016).

EPD Comment 1:

Responses to EPD's May 20, 2014, VRP Application Comments letter, which were included in Section 2 of the above referenced progress report, still indicated that information and documentation necessary to address previous comments will be provided in future report submittals. Please ensure that by no later than the November 2016 scheduled VRP Progress Report submittal that the following outstanding issues are addressed: additional groundwater and soil delineation data,

additional surface water/sediment sampling and ecological impact evaluation, and a conceptual site model update.

Response to EPD Comment 1 from Fourth Semi-annual Report:

"EPD's comment is noted. Additional soil and sediment sampling data has been collected and is discussed in Section 4.0 of this report. A conceptual site model update was included in the Third VIRP Semi-annual Progress Report (EIC, 2015b). The model will be further updated as additional pertinent information is collected."

Follow-up Response:

An ecological impact evaluation has been initiated, and will be discussed in a future semi-annual progress report, and a further refinement of the conceptual site model is presented in Section 6.0 of this report. Furthermore, the completion of the evaluation is pending the completion of the delineation of soil and sediments in AOC 6.

EPD Comment 4:

[Response to Comment (4)] The Section 2.0 "Response" continues to indicate that the area associated with the "Former Office and Shop" does not warrant any additional investigations. EPD requests that the surface soils (0-2 feet) in this area be screened for the contaminants of concern either by utilizing a photoionization detector (PID) or a GORE Sorber type sampler. The necessity for further assessments in this area can be dependent upon the results of the soil gas screening.

Response to EPD Comment 4 from Fourth Semi-annual Report:

"EPD's comment is noted. Screening samples will be collected and their results be included in future semi-annual reports."

Follow up response:

Screening samples were collected in the area of the "Former Office and Shop" and are discussed in Section 4.0 of this report. No COCs above laboratory detection limits were detected in any of these samples.

EPD Comment 6:

EPD does not concur with the conclusion that PCE and TCE have been delineated in groundwater to the Type I risk reduction standard (RRS). To complete the required delineation, please conduct additional groundwater investigations in the following locations:

a. *To the south of MW-32 and MW-47D, between the wells and the surface water feature.*

b. *North of MW-44D, and east of MW-47D and MW-44D.*

Response to EPD Comment 6 from Fourth Semi-annual Report:

New groundwater monitoring wells will be installed at these locations to delineate PCE, TCE and the other defined constituents of concern (COCs) DCE and VC in groundwater to Type I RRS.

Follow up response:

Based on a follow-up site visit, EIC has determined that new monitoring wells to be installed to the east of wells MW-44D and MW-47D would lie in active operating areas of the GPA facility. This area has a high amount of truck traffic and is actively used by GPA for moving and parking truck trailers and containers. Jersey barriers, that could present surface obstructions to drilling or sampling activities, are also located in these areas. EIC will contact and coordinate with GPA on determining the appropriate well locations for GPA and EIC. New monitoring wells to the south of MW-32 and MW-47D have also been proposed. EIC will consider well depth and the average groundwater flow direction in determining the placement of these new wells.

EPD Comment 7:

EPD concurs with the replacement/abandonment of recovery wells RW-2, -3, -5, -6, and -7.

Response to EPD Comment 7 from Fourth Semi-annual Report:

EPD's comment is noted. Abandonment activities will be detailed in future semi-annual reports. In addition to these wells, based on the discussion of well limitations in Section 3.4.5 and Section 3.6.2 of this report, wells G-22 and MW-U2 will also be abandoned.

Follow up response:

In July 2016, EIC abandoned wells RW-2, -3, -5, -6, and -7. Details on the abandonment of these wells is described in Section 5.0 of this report. EIC plans to abandon both wells G-22 and MW-U2 as discussed in the response to comment 3 from October 2016 above.

SECTION

3

3.0 Groundwater Monitoring

The sixth VIRP groundwater monitoring event was conducted in April 2016. This monitoring event included gauging groundwater levels at all wells of the monitoring well network onsite and the collection of groundwater samples from each of these wells for CVOC analysis.

3.1 Groundwater Monitoring Objectives

The primary objectives of the groundwater monitoring program are to meet the following goals set forth in the VIRP:

- Establish a baseline for CVOC plume stability analysis,
- Track MNA by monitoring the groundwater concentrations of CVOCs and water quality parameters within the existing plume,
- Determine if the prevailing groundwater contaminant concentrations are meeting or trending towards meeting the established RRS, and
- Determine if the horizontal and vertical extents of the CVOCs have been defined.

3.2 Groundwater Monitoring Field Program

During the April 2016 monitoring event, EIC conducted groundwater monitoring activities at a total of 43 wells onsite. As designated in the VIRP, wells with screened intervals that are less than 20 feet below ground surface (bgs) were historically defined as shallow wells and those with screened intervals reaching greater than 20 feet bgs are defined as deep wells (EIC, 2014a). Of the 43 wells monitored, 19 are so defined as shallow wells and 24 are defined as deep wells. Four of the 24 deep wells are recovery wells (RW-1, RW-4, RW-8, and RW-9). Each recovery well consists of either a 4-inch or 6-inch ID PVC well casing/screen. The inner diameters (ID) of the solid well casings and screens of the monitoring wells range in size from 3/4-inch to 1-inch to 2-inches.

3.2.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. EPA Region 4 groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

3.2.2 Site Access

Prior to the field visit, EIC coordinated with the GPA in gaining access to the Site to conduct groundwater monitoring and related tasks. All work at the Site was completed under the supervision of EIC.

3.2.3 Groundwater Gauging

Prior to sampling, EIC gauged each well with a decontaminated oil-water interface meter (or "probe") to determine the static depth to groundwater. EIC utilized TOC elevations from October 2013, July 2015, and January 2016 well surveys previously conducted by EIC to determine the current groundwater elevations. The gauging data for the April 2016 monitoring event is tabulated in Table 3-1.

3.2.4 Groundwater Sampling

Following the "low-flow" purge technique, noted in Section 3.4.1, EIC utilized a peristaltic pump with variable lengths of disposable 1/4-inch ID Teflon-lined tubing and a 6-inch segment of 3/16-inch ID silicon tubing at the pump head to purge each well until groundwater quality parameters reached stabilization prior to sampling. The length of Teflon-tubing necessary to place the intake at the center of the wetted screened interval of each well was determined considering water levels gauged just prior to purging during this sampling event and considering the available well construction data, as noted in EIC well purging and sampling data field logs (Attachment 3-1).

Groundwater stabilization parameters were monitored via direct pumping to a multi-parameter field water quality field meter equipped with a flow-through cell. These parameters were recorded at approximately five-minute intervals on EIC field logs (Attachment 3-1). Additionally, purge volumes and depth-to-water (DTW) measurements were recorded at the same five-minute intervals when possible. At each well, the pumping rate was decreased and/or the tubing depth increased when drawdown lowered the water level to the tubing intake level, causing air to be pumped. When purging 1-inch and 3/4-inch diameter wells, while the Teflon tubing (that has a 3/8-inch outer diameter (OD)) was inserted in the well, the oil-water interface probe (that has a 5/8-inch OD) could not be simultaneously inserted into the well to gauge the depth to water due

to space limitations. At these wells, gauging could only be performed only just prior to inserting the tubing and immediately after the tubing was removed.

EIC considered that stabilization was reached when 3 consecutive groundwater quality parameter readings were within ± 0.1 units for pH and ± 5% for specific conductivity during purging. Reasonable attempts were made at each well to reach 0.2 mg/L of dissolved oxygen (DO) and a turbidity reading at or below 10 Nephelometric Turbidity Units (NTUs) prior to sampling. Groundwater quality field parameters (Temperature, pH, oxygen reduction potential (ORP), conductivity, turbidity, and DO) after stabilization and prior to sample collection are summarized in Table 3-2. Note that, during the April 2016 sampling event, 2 wells had turbidity levels higher than 10 NTUs. Additionally, wells G-22 and MW-U2 were sampled without stabilization due to poor recharge. All samples were collected using the "soda straw method" specified in the SOP SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

3.2.5 Sample Custody and Laboratory Analysis

Immediately after each sample set was collected, the sample bottles were labeled, and the samples were stored with ice in double-sealed bags insulated thermal containers ("coolers") provided by the laboratory. The samples were maintained with sufficient ice in these coolers until they were relinquished to the laboratory. Completed chain-of-custody forms accompanied all samples. EIC delivered the samples to Test America Laboratories in Savannah, Georgia - a Georgia Department of Natural Resources (DNR) certified laboratory. The laboratory conducted analysis of volatile organic compounds using EPA method 8260B. The laboratory report for the April 2016 event is included as Attachment 3-2. The results of the laboratory analysis are summarized in Table 3-3 and 3-4 along with historical analytical data.

3.3 Quality Assurance and Quality Control

To prevent cross-contamination, new disposable Teflon-lined tubing was utilized to collect a sample at each well. EIC's oil/water interface meter and any other reusable field equipment that came in contact with groundwater was decontaminated prior to use and between sample locations. This was accomplished by first washing this equipment with a pressurized phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. Brushes and/or wipes were also utilized if necessary. After each sample was collected, the water quality parameters instrument flow-through cell was opened and decontaminated with pressurized DI water. In the event of gross contamination, EIC used detergent solution in addition to DI water in cleaning this instrument.

For sample quality assurance and quality control, EIC maintained a trip blank set in each of the sample containers. Each trip blank was analyzed along with the groundwater samples collected at the Site.

3.4 Data Evaluation

EIC conducted an evaluation of the data compiled and tabulated from field measurements and laboratory analyses. This evaluation enabled the definition of the groundwater potentiometric surface and flow direction, as well as the extents of the prevailing CVOC plumes at the time of the April 2016 monitoring event.

As discussed in the VIRP, EIC has continued to distinguish between unconfined shallow and deep aquifers in illustrating groundwater potentiometric surfaces and CVOC plumes. The following subsections describe EIC's analysis and understanding of the potentiometric surfaces and the prevailing CVOC plumes at the Site.

3.4.1 Groundwater Potentiometric Surfaces

3.4.1.1 Shallow Groundwater Potentiometric Surface

The April 2016 groundwater gauging event data is summarized in Table 3-1. In addition, Table 3-5 summarizes all shallow groundwater gauging data collected at the Site following the initiation of the VIRP program. EIC compared the shallow well gauging data from the April 2016 sampling event to historic events summarized in Table 3-5. Referring to Table 3-5, the shallow groundwater potentiometric surface elevations at the Site are lower than those of the April 2015 gauging event, but similar to the global average observed since VIRP monitoring began.

Utilizing the data presented in Table 3-1, EIC prepared a shallow groundwater potentiometric surface map, as illustrated in Figure 3-1. Due to the historically anomalous groundwater surface elevations observed at wells MW-2S and MW-U2, relative to the surrounding groundwater elevations, the data from these wells were not considered for potentiometric surface contouring. The anomalies observed at these wells may have resulted from a relative shallow depth of completion (which are less than 10 feet bgs), relative to confining or partially confining stratums, and may represent perched groundwater conditions. Furthermore, groundwater recharge at MW-U2 is normally anomalously low as compared with other shallow wells. This anomaly could be caused due to poor well design (currently no data is available on its design), and/or silt accumulation, and/or a clogged well screen.

EIC compared Figure 3-1 to previous shallow potentiometric surface maps included in previous VIRP semi-annual progress reports (EIC 2014b, 2015a, 2015b, 2016). From this comparison, a prominent trough feature, which extends across the Site, has become more clearly apparent since the addition of the monitoring wells since the implementation of the VIRP tasks. The potentiometric surface data also indicates that groundwater generally flows from east-northeast to west-southwest across the Site and the shallow unconfined potentiometric surface remains relatively stable in elevation over time.

3.4.1.2 Deep Groundwater Potentiometric Surface

As with the shallow potentiometric surface elevations at the Site, EIC also compared the deep well gauging data from the April 2016 sampling event to all other previous events summarized in Table 3-6. Referring to Table 3-6, the average potentiometric surface elevations in deep wells are lower than those of the previous April 2015 events. Referring to the data presented in Table 3-6, there is no apparent seasonal trend in the deep groundwater potentiometric surface at the Site. EIC will continue to evaluate the gauging data collected during each semi-annual groundwater gauging and sampling event to determine if any trends become apparent.

Utilizing the gauging data in Table 3-1, EIC prepared a deep groundwater potentiometric surface map, Figure 3-2. EIC then compared Figure 3-2 to previous potentiometric surface maps included in previous VIRP semi-annual progress reports (EIC 2014b, 2015a, 2015b and 2016). In comparing Figure 3-2 to these maps, it is apparent that a persistent trough feature, which extends through the center of the Site, is still the predominant deep potentiometric surface feature affecting the groundwater flow path at the Site. In comparing the potentiometric surface from the April 2015 event with those of previous groundwater monitoring events, it is apparent that groundwater generally flows from east-northeast to west-southwest across the Site and the deep potentiometric surface remains relatively stable in elevation over time.

3.4.2 Horizontal Extent of CVOC Plumes

The COCs at the Site consist of CVOCs: tetrachloroethene or perchloroethene (PCE), trichloroethene (TCE), cis-1, 2 dichloroethene (DCE), and vinyl chloride (VC). Utilizing analytical results summarized in Tables 3-3 and 3-4, EIC prepared Figures 3-3 through 3-10, which illustrate the horizontal extent of the four CVOC constituent plumes within both the defined shallow and deep aquifer horizons. In addition, the figures illustrate the horizontal extent of the plumes with concentrations above RRS and above delineation criteria.

As discussed in the previous Fourth Semi-annual Progress Report, COC concentrations in groundwater collected from well MW-U2 were not considered in preparing each of the shallow isoconcentration maps. Consequently, EIC will discontinue gauging and sampling at MW-U2 and has effectively removed this well from the monitoring well network for all future sampling events.

3.4.2.1 PCE Plume

Utilizing the analytical results of samples collected during the April 2016 sampling event that are summarized in Tables 3-3 and 3-4, EIC prepared PCE isoconcentration maps to illustrate the horizontal extent of this plume. The following subsections describe the concentrations in shallow and deep environments.

Shallow PCE

Figure 3-3 illustrates the horizontal extent of the shallow portion of the PCE plume during the April 2016 monitoring event. Referring to Figure 3-3, the shallow plume is confirmed to be above delineation criterion only at wells MW-31 and MW-32. PCE concentrations at the majority of remaining monitoring wells were below the laboratory method detection limit (MDL). It is important to note, however, that the laboratory method detection limits (MDLs) were much higher for MW-4S, MW-40S and MW-50S due to dilution. The MDL was lower than the RRS but above delineation criteria. For the purposes of mapping, these concentrations were assumed to be equivalent to the MDL for each sample analyzed. The April 2016 sampling event is the fifth consecutive VIRP sampling event in which PCE concentrations above RRS did not occur at any shallow wells.

Deep PCE

Figure 3-4 illustrates the horizontal extent of the PCE plume at the defined deep wells during the April 2016 monitoring event. Referring to Figure 3-4, concentrations above RRS were found at only monitoring well MW-2D. The concentrations in the remainder of the plume were above delineation standards only at wells PAW-4, MW-47D and MW-49D. The peak concentration observed at MW-2D decreased, as compared to the October 2015 monitoring event, while the overall plume extent remained similar.

3.4.2.2 TCE Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared TCE isoconcentration maps to illustrate the horizontal extent of this plume. The following subsections describe the concentrations in shallow and deep environments.

Shallow TCE

Figure 3-5 illustrates the horizontal extent of the shallow portion of the TCE plume during the April 2016 monitoring event. Shallow TCE concentrations above RRS and above the delineation criterion were detected at monitoring wells MW-4S, MW-31, MW-32, and MW-40S. Considering that the sample from well MW-40S was diluted during laboratory analysis, the concentration value at this well is assumed to be the upper limit determined in analysis and concentration contours were drawn based on this assumption in Figure 3-5. The overall extent of the April 2015 shallow TCE plume reduced significantly relative to the plume observed during the October 2015 sampling event.

Deep TCE

Figure 3-6 illustrates the horizontal extent of the deep portion of the TCE plume during the April 2016 monitoring event. Deep TCE concentrations above RRS and above the delineation criterion were found at monitoring wells MW-2D, MW-44D, MW-47D, MW-49D, and PAW-4. The overall extent and concentrations of the April 2016 deep TCE plume are similar to those which

occurred during the October 2015 event with the exception of an increase in concentration observed at MW-49D.

3.4.2.3 cis-1, 2 DCE Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared DCE isoconcentration maps to illustrate the horizontal extent of this plume. The following subsections describe the concentrations in shallow and deep environments.

Shallow DCE

Figure 3-7 illustrates the horizontal extent of the shallow portion of the DCE plume during the April 2016 monitoring event. Shallow DCE concentrations above RRS occurred at monitoring wells MW-4S, MW-40S, and MW-50S. The overall extent of the shallow DCE plume during the April 2016 monitoring event was similar to the extent during the October 2015 monitoring event with general reductions in concentrations, except at MW-4S.

Deep DCE

Figure 3-8 illustrates the horizontal extent of the deep portion of the DCE plume in April 2016. Deep DCE concentrations above RRS were found in monitoring wells MW-2D and MW-49D. Relative to the DCE plume prepared from the October 2015 sampling event, the overall extent of the April 2016 deep DCE plume increased with higher concentrations observed at several wells; particularly at well MW-49D. These increases may be indicative of the degradation of the parent constituents, PCE and TCE.

3.4.2.4 VC Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared VC isoconcentration maps to illustrate the horizontal extent of this plume. The following subsections describe the concentrations in shallow and deep environments.

Shallow VC

Figure 3-9 illustrates the horizontal extent of the shallow portion of the VC plume during the April 2016 monitoring event. Shallow VC concentrations above RRS were found at monitoring wells MW-4S, MW-33, MW-46S, and MW-50S. It is important to note that the concentration observed at MW-40S was below the MDL. However, since the MDL was higher than the RRS, EIC cannot confirm whether or not the concentration observed at MW-40S was below the RRS. As such, the concentration value at this well is assumed to be equivalent to the MDL and concentration contours were drawn based on this assumption in Figure 3-9. The overall extent of the shallow VC plume remained similar to that which occurred during the October 2015 event with the peak of the plume shifting from well MW-50S to MW-4S.

Deep VC

Figure 3-10 illustrates the horizontal extent of the deep portion of the VC plume during the October 2015 monitoring event. Deep VC concentrations above RRS were found in monitoring wells MW-2D, MW-49D, MW-51D, MW-54D, MW-55D, and PAW-4. The known extent of the deep VC plume was further defined with the addition of RW-9 to the monitoring well network, such that it has been determined that the plume extended north of RW-9. It should be noted, however, that concentrations across the plume remained stable with the exception of an increase at well MW-49D.

3.4.3 Horizontal Delineation of COC Plumes

As EPD noted in its January 2016 comment letter (Comment 6 in Section 2), horizontal delineation of COCs has not been completed due to observed concentrations at certain shallow and deep wells located at the eastern and southern periphery of the COC plumes. Specifically, the delineation of shallow COC plumes south of well MW-32 and deep COC plumes upgradient of wells MW-44D and MW-47D is incomplete. Nevertheless, it appears that there is a general downward trend of COC concentrations at each of these three wells over the last three sampling events. As discussed in the follow-up response to Comment 6 in Section 2, however, EIC plans to install four new wells – one shallow well south of shallow well MW-32 – one deep well south of MW-47D -- and two deep wells upgradient of wells MW-44D and MW-47D to further define the horizontal extent of the plume.

3.4.3 Vertical Delineation of COC Plumes

Of the current monitoring well network, well MW-35 is the deepest known well within the footprint of the COC plumes. This well is also located near the downgradient extent or leading edge of the COC plumes. Based on gauging measurements that EIC has collected and historical well data provided by a previous consultant, the total depth of the well is 38.02 feet bgs. MW-35 has a 10-foot screen interval at the well bottom.
Under the VIRP, EIC has sampled this well since February 2014, with gauging data listed in Table 3-4. Referring to Table 3-4, the concentrations of all monitored COCs in groundwater samples

from MW-35 have consistently been below MDLs during all sampling events since February 2014 with the exception of a concentration of 0.58 µg/L of DCE in April 2016 which is well below the established RRS limit of 204 µg/L for DCE. EIC will continue to include well MW-35 in the monitoring program but it appears that vertical delineation of the plume has been completed.

3.4.4 Plume Attenuation and Stability

Based on the relatively high levels of PCE degradation products and their relative concentrations observed at the Site, it is clearly evident that natural attenuation is occurring at the Site. Also, an overall comparison of the COC plume extents and concentrations between the July 2014 baseline monitoring event (following the installation of 20 new monitoring wells) and the April 2016 monitoring event indicates that the plumes are confined to a relatively small area within the Site and continue to decrease in concentration. This finding substantiates plume stability. EIC will continue to evaluate this trend and evaluate the extent of natural attenuation while developing plans for active remediation.

SECTION

4

4.0 Soil and Sediment Sampling

4.1 Background

As discussed in previous semi-annual reports, EIC has completed delineation of COCs in soil and sediments within nine of the ten AOCs established in the VIRP for the Site. However, further delineation was required within AOC-6. In its January 2016 comments letter, EPD requested soil sampling in three additional areas beyond the ten AOCs identified in the VIRP. These areas include two possible areas of pipe failure along a subgrade storm water drainage pipe and the area of a former office and shop.

EIC completed the aforementioned additional soil and sediment sampling activities in July 2016. One sediment boring and 24 soil borings were conducted in AOC-6 and the three additional areas identified by EPD. Soil samples collected within AOC-6, were collected just above the groundwater level inside each soil core. Soil samples collected within the three additional areas were collected in two depth-discrete intervals, further described in Section 4.3. These activities resulted in the collection of one sediment sample from AOC-6 and 42 soil samples from AOC-6 and the three additional areas identified by the EPD. The samples were submitted to a Georgia-certified laboratory for analysis via EPA method 8260B (VOC analysis). The following subsections describe the general sampling approach, field procedures, and analytical results.

4.2 Sample Locations

Based on the results of previous soil and sediment sampling activities conducted by EIC under the VIRP, EIC determined the locations for additional proposed soil and sediment sampling locations for further delineation. In general, within AOC-6, additional soil borings were conducted approximately 5 feet in each cardinal direction from the locations of previous soil borings where samples concentrations of COCs were above the delineation criteria. Figure 4-1 illustrates the new locations and previous soil and sediment sample locations within AOC-6.

Based on site observations, aerial photography, and historical maps, EIC identified the two possible areas of storm water pipe failure and the approximate locations of the former office and shop at the Site. Figure 4-2 illustrates the approximate locations of these features, as well as the

position of each sample location relative to each of these features. The following subsections describe the sampling process.

4.2.1 AOC-6

Referring to Figure 5-7 of the Second VIRP Semi-annual Progress Report (EIC, 2015a), soil concentrations in one sample (AOC6-SD-3) collected within AOC-6, were above the delineation criteria. To further delineate the COCs in surrounding soil/sediment, EIC conducted additional soil and sediment borings within AOC-6 utilizing the patterned method described in the Second VIRP Semi-annual Progress Report.

Referring to Figure 4-3 of the Fourth VIRP Semi-annual Progress Report (EIC, 2016), analytical results of soil and sediment samples collected during the January 2016 sampling event indicated that soil/sediment samples from borings to the north and to the west of the AOC6-SD-3 sample location were above the delineation criteria. Consequently, EIC conducted 1 additional sediment and 6 additional soil borings within AOC-6. These borings were conducted to the north and west of AOC6-SD-3, to further delineate AOC-6. Figure 4-1 illustrates both the previous and new boring locations within AOC-6.

As discussed in Section 4.5, following the July 2016 sampling event, EIC has determined that further delineation soil sampling is required to the west of AOC-6. If COCs in soil are detected outside of the bounds of the original AOC-6 border, EIC will modify the boundaries of AOC-6 to accommodate the delineated areas of COCs in soil.

4.2.2 Storm water Pipe Failure and Former Office and Shop Locations

Figure 4-2 illustrates the boring locations near the two areas of possible storm water pipe failure and at the former office and shop. Six (6) borings were conducted on each side of the storm water pipe near each of the two possible areas of storm water pipe failure. The borings were spaced approximately 10 to 15 feet apart along the length of the pipe, for a total of twelve (12) borings. Also, as illustrated in Figure 4-2, four (4) borings were conducted along the periphery of the approximate location of the former office and shop.

4.3 Sampling Procedures

Following the soil sample collection guidelines specified in SESDPROC-300-R3 (EPA, 2014b), a Geoprobe rig, hand-operated bucket auger, or hand-operated sand probe with a disposable acetate sleeve was utilized to collect soil cores at each boring location. Since the groundwater depth at the Site typically ranges from 3 to 6 feet bgs, soil borings were conducted from 0 to 5 feet bgs.

As needed, EIC utilized a photo-ionization detector (PID) instrument to screen each core sample for VOCs prior to sample collection. When PID readings were elevated, EIC biased soil samples to the approximate location within the soil core where the PID readings most exceeded

background concentrations. If PID readings did not indicate relatively high levels of VOCs, EIC collected samples at two discrete depths (2.0-2.5 and 4.0-4.5 feet bgs) at each boring location. EIC collected samples at discrete depth intervals from each soil core. EIC collected soil samples from each soil core utilizing Terra-core soil sampling kits. For any soil where EIC encountered groundwater at a shallow depth, EIC collected one sample just above the saturation point of that core sample.

EIC collected sediment samples following the guidelines documented in SESDPROC-200-R3 (EPA, 2014a). To collect samples, EIC advanced the sand probe lined with an acetate sleeve approximately 2 feet into sediments of the streambed of the north-south ditch at each sampling location and then retracted the probe. EIC then removed the acetate sleeve from the probe to drain any excess water, if necessary. Then, utilizing a Terra-core sampler, EIC collected a sample from the acetate sleeve.

EIC tabulated the collection depth and other related data for each soil and sediment sample in Tables 4-1 and 4-2. EIC individually labeled all sample bottles and field rinsate blank samples and placed them, along with laboratory-supplied temperature blanks, in insulated coolers with ice, continuously maintained ice in the coolers, and then relinquished the samples to a Georgia-certified laboratory for analysis via EPA Method 8260B. Completed and signed chain-of-custody forms were submitted to the laboratory with the samples by EIC.

4.3.1 Decontamination Procedures

To ensure that reusable equipment utilized to collect soil and sediment samples did not cause cross-contamination during sampling activities, EIC implemented an extensive decontamination procedure following the collection of samples from each location. The following subsections describe the decontamination procedure for each sampling equipment type.

4.3.1.1 Geoprobe Direct-Push Technology (DPT) Boring

EIC, with the assistance of a drilling contractor, conducted several soil borings utilizing a Geoprobe™ drill rig with reusable stainless steel Megacore™ sampling tubes with disposable acetate sleeves. After completing each boring, the Megacore sampling tube was decontaminated both inside and out by flushing and spraying with a phosphate-free detergent (Alconox™) solution. EIC then had the drilling contractor thoroughly wash the stainless steel tube in this solution with a wire brush, rinse the tube with deionized water, and then allow it to dry before reuse.

4.3.1.2 Sand Probe

EIC conducted both the sediment and soil borings within the relatively soft/loose sediment and soils within AOC-6 utilizing a metallic sand probe, disposable acetate sleeve inserts, and a sliding hammer. Prior to and following the collection of these samples with the sand probe, EIC dismantled the probe for decontamination. Smaller parts of the probe, such as a removable probe

tip and extension rod cotter connecting pins, were submerged in a phosphate-free detergent (Alconox) and scrubbed with a wire brush. The probe tube was then filled with an Alconox solution, temporarily sealed, and agitated to remove any gross contamination. The tube was then scrubbed with a pipe brush. After the sand probe assembly was thoroughly washed, the probes were rinsed with deionized water and allowed to dry before reassembling and reuse.

4.4 Quality Assurance and Quality Control

To insure the quality of each soil/sediment sample collected, laboratory-supplied liquid trip blanks were kept with all sample bottle sets in each cooler container at all times throughout all sampling activities and these were submitted to a Georgia certified laboratory along with the soil/sediment samples collected for analysis via EPA method 8260B (VOC analysis). Each trip blank underwent the same EPA method 8260B analysis as did the soil/sediment samples. The laboratory results for the July 2016 sampling event are presented in Attachment 4-1 and include the results of the trip blanks. The analytical results of the trip blanks document that all VOCs were below detection limits indicating that no cross-contamination occurred within each sample cooler.

In addition to the trip blanks utilized for each cooler container, EIC also collected one equipment rinsate sample from the decontaminated sand probe utilized in the July 2016 sampling event. The rinsate sample was analyzed by EPA method 8260B. The results of the equipment rinsate sample for this event are included in Attachment 4-1. Referring to Attachment 4-1, the VOC concentrations were below the method detection limits for all VOCs analyzed in the equipment rinsate sample. These results indicate that the thorough decontamination procedures implemented by EIC during soil and sediment sampling activities were sufficient in preventing cross-contamination between samples.

4.5 Analysis and Analytical Results

Each soil and sediment sample was analyzed by a Georgia certified laboratory (Analytical Environmental Services (AES)) using EPA method 8260B. The laboratory results for all samples collected are included in Attachment 4-1. Results for each sample collected are also tabulated in Tables 4-1 and 4-2 and illustrated in Figures 4-1 through 4-2. The following subsections describe the sample results and subsequent delineation status for each AOC.

4.5.1 AOC-6 Delineation

As discussed in Section 4.2, EIC conducted 6 additional soil borings and 1 additional sediment boring within AOC-6 to complete sediment delineation sampling. EIC collected samples along the centerline of the north-south ditch from the same sample depth interval as the original AOC6-SD-3 boring. Along the banks of the north-south ditch - to the east and west of AOC6-SD-3, respectively - EIC collected soil samples above the apparent groundwater depth.

The results for each additional soil and sediment sample collected within AOC-6 are presented in Table 4-1 and the boring locations are illustrated in Figure 4-1. Referring to Figure 4-1, it is apparent that sediment within AOC-6 has been horizontally delineated to the north, south, and east. However, samples collected along the western side of AOC-6 were above the delineation criteria. Therefore, it is apparent that further delineation sampling is necessary to complete the horizontal delineation of contamination within AOC-6. Since soil samples just above the depth of saturated soil have been collected at all soil borings within AOC-6, the soil in the vadose zone within AOC-6 has been vertically delineated.

4.5.2 Storm water Pipe Collapse and Former Office and Shop Locations

As discussed in Section 4.2, EIC conducted 18 new soil borings to characterize the soil near two possible areas of storm water pipe failure along a north-south running storm water pipe and near the former office and shop. The laboratory results for each soil sample collected from these borings are presented in Table 4-2. Referring to Table 4-2 and Figure 4-2, it is evident that all soil samples collected from the possible areas of storm water pipe collapse and former office and shop locations are below method detection limits for each COC. As such, it is apparent that no further characterization or delineation is required near these areas.

SECTION

5

5.0 Recovery Wells Abandonment

Following EPD's concurrence in a January 2016 comment letter (EPD, 2016a) of EIC's recommendations (EIC, 2015b) to abandon recovery wells RW-2, -3, -5, -6, and -7, EIC completed the abandonment of all five wells in July 2016. The following subsections describe the abandonment procedures conducted by EIC.

5.1 Background

As discussed in previous semi-annual progress reports (EIC 2016, 2015b), recovery wells RW-2, -3, -5, -6, and -7 was observed to be fully silted over time (with well screens in these wells ranging from approximately 50 percent silted to 100 percent silted) and declined in usability for monitoring purposes. Additionally, as 20 new monitoring wells were installed at the Site under the direction of EIC during the first quarter of 2015, effectively replacing these recovery wells for monitoring purposes, and as EIC had removed these wells from the monitoring well network, these wells were no longer needed for groundwater monitoring purposes. EIC commenced the abandonment of these five wells in July of 2016.

5.2 Well Abandonment Procedure

EIC completed abandonment in accordance with SESDGUID-101-R1 (EPA, 2013) and Water Well Standards Act of 1985, O.C.G.A. 12-5-120 (GA 2011). Due to lack of well construction logs that identify well construction and borehole diameter, EIC determined that well casing extraction or over-drilling would not be practical. As such, EIC utilized the grouting in place method of abandonment described in SESDGUID-101-R1 (EPA 2013).

At each recovery well, MTL removed the outer casing and any remaining electric cables or tubing related to previously utilized groundwater pumps. EIC then used a drilling contractor to excavate soil around the top of the well casing to a depth of approximately three (3) feet bgs and stockpile this soil near the well. The contractor then cut the top of inner well casing at this depth. Next, the drilling contractor filled the inner casing with a 30% bentonite grout mixture to the depth of the water table (saturated zone) in each respective well. The contractor then used cement to grout the remainder of the bore hole. Once the cement grout was allowed to fully set, the contractor utilized the stockpiled soil to fill the ground surface flush-to-grade.

SECTION

6

6.0 SCM Update

As part of the VIRP submittal, EIC prepared an initial site conceptual model (SCM) based on information known at the time. As described in the VIRP, the SCM was planned to be updated as additional material was progressively gained during the implementation of the VIRP. Accordingly, EIC has compiled additional data to further define the site characteristics and potential fluid flow hydrodynamics. An updated SCM report will be submitted to the EPD under a separate cover.

In preparing an updated SCM report, EIC made revisions to the groundwater hydrology, COC plume delineation, and COC concentration trend analysis sections including data gathered following the installation of new monitoring wells. Additionally, revisions were made to the soil COC sections following further soil delineation sampling.

SECTION

7

7.0 Summary

After the submittal of the Fourth Semi-annual Progress Report in May 2016, EIC continued the implementation of various tasks outlined in the VIRP and as directed by the EPD. The following paragraphs describe these activities.

EIC conducted the first semi-annual groundwater monitoring event of 2016 in April 2016. This event served as the third round of sampling after the installation of 20 new monitoring wells. The data from this event was used for comparative analysis of the CVOC plumes. Based on the relatively high levels of PCE degradation products observed at the Site, it is evident that natural attenuation is occurring at the Site. The CVOC plume is stable and confined to a relatively small area within the Site and it continues to decrease overall in concentration.

EIC also completed additional confirmatory soil sampling, as discussed in the previous semi-annual report. The delineation of soils with COC concentrations above the delineation criteria within AOC-6 remains incomplete along the western edge of AOC-6, as discussed in Section 4.0. Further analysis and planning for soil delineation sampling west of AOC-6 is being conducted by EIC. Confirmatory sampling that EIC conducted at the areas where the storm water pipe apparently collapsed and at the former office and shop location indicated that all COCs are below detection limits in these areas and these areas are considered to be fully delineated.

In July of 2016, EIC completed the abandonment of five recovery wells that had accumulated significant amounts of silt since their installation. For future groundwater remediation purposes, recovery wells RW-8 and RW-9 have been installed as initial replacements for the abandoned recovery wells.

EIC also updated the site conceptual model (SCM) to include additional information gathered from aquifer testing and new well installations. Further updates will be made to the SCM as new information becomes available.

Notes:

Field parameters were recorded by EIC during groundwater monitoring events after stabilization had been reached and prior to sampling Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell.

* G-22 was not sampled on 10/7/2014 due to lack of recharge. Parameters recorded are from only reading taken.

** MW-35 was discovered during the July 2014 sampling event and the well formerly identified as MW-35 is considered to be MW-15S based on well design

SU = Standard Unit

mV = Millivolts

mS/cm = Microsiemens per centimeter

NTU = Nephelometric Turbidity Unit

mg/L = Milligrams per liter

McKenzie Tank Lines, Port Wentworth, GA

Notes:

110.0

0.3

All data prior to August 2013 reported by previous environmental consultants
U = Value is below detection limits
NA = Well not accessible
NS = Well not sampled
NI = Well not installed
NU = Well not utilized in groundwater sampling program
NL = Well not located
< = less than method detection limit (MDL)
J = this is an estimated value that is above the MDL but below the practical quantitation limit
I*= not certain

Notes:

Top of casing (TOC) elevations are based on surveys conducted by Brewer Land Surveying in October 2013, EMC Engineering Services in June 2015, and Mock Surveying in January 2016.

*** = Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

***[2] = MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from July 2014 to October 2015 where available.

***[3]= Global Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from July 2014 to APR 2016

NI - Not Installed
N/A - Not Applicable
NL - Not Located
NM - Not Measured

20,000 = Concentration is greater than delineation criteria
5 = Concentration is above method detection limits but below delineation criteria
<1.3 = Concentration is below method detection limits
J = Concentration is less than the recovery limit but greater than or equal to the method detection limit and therefore the concentration is an approximate value

Notes:

20,000 = Concentration is greater than delineation criteria

5 = Concentration is above method detection limits but below delineation criteria

<1.3 = Concentration is below method detection limits

J = Concentration is less than the recovery limit but greater than or equal to the method detection limit and therefore the concentration is an approximate value

B = Compound was found in method blank and sample

* = Due to labeling error, samples could not be distinguished from one another. Since analytical results for all analytes in both samples were below detection limits, the higher of the two limits is shown.

NOTES: AERIAL PHOTO IS FROM USGS 0.15m RESOLUTION ORTHOIMAGERY DATABASE. FORMER MCKENZIE PROPERTY BOUNDARY IS DERIVED FROM HISTORICAL TAX PLAT MAPS AVAILABLE FROM THE CHATHAM COUNTY TAX ASSESSORS OFFICE. WELL LOCATIONS AND OTHER SITE FEATURES ARE BASED UPON SURVEYS CONDUCTED BY BREWER LAND SURVEYING COMPANY IN OCTOBER 2013 AND EMC ENGINEERING SERVICES IN JUNE 2015. OTHER FORMER SITE FEATURES WERE PLOTTED BASED UPON HISTORICAL SITE MAPS FROM McKENZIE TANK LINES. WELLS SCREENED AT INTERVALS APPROXIMATELY BETWEEN 10 AND 20 FEET BELOW GROUND SURFACE ARE CONSIDERED SHALLOW WELLS. WELLS SCREENED AT INTERVALS APPROXIMATELY 20 FEET OR GREATER BELOW GROUND SURFACE ARE CONSIDERED DEEP WELLS.

- FORMER MCKENZIE PROPERTY BOUNDARY

NOTES: AERIAL PHOTO IS FROM USGS 0.15m RESOLUTION ORTHOIMAGERY DATABASE. FORMER MCKENZIE PROPERTY BOUNDARY IS DERIVED FROM HISTORICAL TAX PLAT MAPS AVAILABLE FROM THE CHATHAM COUNTY TAX ASSESSORS OFFICE. SITE FEATURES ARE BASED UPON SURVEY CONDUCTED BY BREWER LAND SURVEYING COMPANY IN OCTOBER 2013.

AOC SOIL SAMPLING RESULTS ARE FROM JANUARY, MARCH, OCTOBER, AND NOVEMBER 2015 SOIL SAMPLING EVENTS. CONSTIUENTS OF CONCERN (COCS) INCLUDE PCE, TCE, DCE, VC.

COMMENTS:

SAMPLE COLLECTION TIME: 15:59

PREPARED BY: S Helmly

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

Length of tubing cut (ft.)	23
Initial tubing depth (ft.) BTOC	20
Final tubing depth (ft.) BTOC	20
Initial pump speed	300
Time pump speed was initialized	15:35
Pump speed at flow into cylinder	306
Started new roll of tubing at	

	Time	Time	Time	Time	Time	Time	Time	Time
2,000 mL volume poured into bucket								
Actual Volume (ml)								

Additional remarks: Small (~0.5cm) plug of red bacteria in first pull. Clear after with plug of orange bacteria

TestAmerica Job ID: 680-124371-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 680-124371-1

Laboratory: TestAmerica Savannah

Narrative

CASE NARRATIVE

Client: Environmental International Corporation

Project: MTL/460009

Report Number: 680-124371-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

RECEIPT

The samples were received on 04/21/2016; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.2 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples G-17 (680-124371-1), G-19 (680-124371-2), MW-2S (680-124371-3), MW-2D (680-124371-4), MW-4S (680-124371-5), MW-11D (680-124371-6), MW-14D (680-124371-7), MW-15S (680-124371-8), MW-26 (680-124371-9), MW-29 (680-124371-10), MW-31 (680-124371-11), MW-32 (680-124371-12), MW-33 (680-124371-13), MW-35 (680-124371-14), MW-36 (680-124371-15), MW-37S (680-124371-16), MW-38D (680-124371-17), MW-39D (680-124371-18), MW-40S (680-124371-19), MW-41D (680-124371-20), MW-42S (680-124371-21), MW-43D (680-124371-22), MW-44D (680-124371-23), MW-45S (680-124371-24), MW-46S (680-124371-25), MW-47D (680-124371-26), MW-48S (680-124371-27), MW-49D (680-124371-28), MW-50S (680-124371-29), MW-51D (680-124371-30), MW-52D (680-124371-31), MW-53D (680-124371-32), MW-54D (680-124371-33), MW-55D (680-124371-34), MW-56D (680-124371-35), PAW-3 (680-124371-36), PAW-4 (680-124371-37), RW-1 (680-124371-38), RW-4 (680-124371-39), RW-8 (680-124371-40), RW-9 (680-124371-41), MW-U2 (680-124371-42), G-22 (680-124371-43) and Trip Blank (680-124371-45) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/28/2016, 04/29/2016, 04/30/2016, 05/02/2016, 05/03/2016 and 05/04/2016.

Chloromethane was detected in method blank MB 680-431426/10 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Tetrachloroethene failed the recovery criteria high for LCS 680-431433/4. Tetrachloroethene failed the recovery criteria high for LCS 680-431584/4. Tetrachloroethene failed the recovery criteria high for LCSD 680-431433/5. Tetrachloroethene failed the recovery criteria high for LCSD 680-431584/5. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Refer to the QC report for details.

Samples MW-2D (680-124371-4)[50X], MW-4S (680-124371-5)[20X], MW-4S (680-124371-5)[50X], MW-40S (680-124371-19)[50X], MW-49D (680-124371-28)[10X], MW-49D (680-124371-28)[20X] and MW-50S (680-124371-29)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Job Number: 680-124371-1

Login Number: 124371

List Source: TestAmerica Savannah

List Number: 1

Creator: Banda, Christy S

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

RE: MTL

Dear Dana Johnson: Order No: 1607G89

Analytical Environmental Services, Inc. received 45 samples on 7/21/2016 3:06:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES's accreditations are as follows:
-NELAC/Florida State Laboratory ID E87582 for analysis of Non-Potable Water, Solid & Chemical Materials, and Drinking Water Microbiology, effective 07/01/16-06/30/17.
-NELAC/Louisiana Agency Interest No. 100818 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 07/01/16-06/30/17.
-NELAC/Texas Certificate No. T104704509-16-6 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 03/01/16-02/28/17.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Metals, PCM Asbestos, Gravimetric), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

Case Narrative

Sample Receiving Nonconformance:

Sample information on the Chain of Custody (COC) did not match that on the sample bottle labels for samples -014, -034A, -036, and -037.

Sample -014 has a collection time on the COC of 10:19, however on the sample container its written as 9:57.
One of the vials for sample -034A has a sample ID of SB16-2-3 , however on the COC its written as "SB14-(2-3FT). Sample was correctly logged in based on the correct collection time & date.
Sample -036 has a collection time on the COC of 11:11, however on the sample container its written as 11:06.
Sample -037 has a collection time on the COC of 11:11, however on the sample container its written as 11:06.
All information was taken from COC received.

The sample ID for samples "SB-2 (3-4FT)" and "SB-13 (2-3 FT)" were written on the sample bag instead of the sample containers. This was discovered after sample receiving personnel opened the bags randomly causing their identity to be unknown. By process of emilation, the two set kits are "SB-2 (3-4FT)" and "SB-13 (2-3 FT)". Due to not knowing which sample is which they were given the sample ID of "TB-1" and "TB-2". Per Kenneth, volatile analysis will be performed in order to determine which sample is "SB-2 (3-4FT)" and "SB-13 (2-3 FT)".

Per Kenneth via phone 8/2/16, Sample Ids for samples 1607G89-001 & -007 were changed.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on samples 1607G89-002A, -005A, -010A,-016A, -026A, -028A,-030A, & -031A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recovery for the internal standard compounds 1,4-Difluorobenzene, and Chlorobenzene-d5 on sample 1607G89-013 A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Due to sample matrix, sample 1707G89-015A, & -017A required dilution during preparation and/or analysis resulting in elevated reporting limits.

Percent recovery for the internal standard compounds Chlorobenzene-d5 and 1,4-Dichlorobenzene-d4 on sample 1607G89-018A, & -019A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recovery for the internal standard compounds Pentafluorobenzene, Chlorobenzene-d5 and 1,4-Dichlorobenzene-d4 on sample 1607G89-020A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recovery for the internal standard compounds Pentafluorobenzene, 1,4-Difluorobenzene, Chlorobenzene-d5 and 1,4-Dichlorobenzene-d4 on samples 1607G89-012A, -014A, & -021 A was outside control limits biased low due to suspected matrix interference.

cis-1,2-Dichloroethene, & Trichloroethene values for sample 1607G89-004A are "E" qualified indicating estimated values over linear calibration range. Sample was diluted and reanalyzed using the supplied methanol preserved sample at the minimum dilution allowed resulting in analytes being below reporting limits.

Sample/Cooler Receipt Checklist

Client ENV. INTERNATIONAL CORP. Work Order Number 1607689

Checklist completed by _____ 7/21/2016
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 1.8°C Cooler #2 0.9°C Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes __ No ✓

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.
