TMDL Implementation Plans are platforms for establishing a course of actions to restore the quality of impaired water bodies in a watershed. They are intended as a continuing process that may be revised as new conditions and information warrant. Procedures will be developed to track and evaluate the implementation of the management practices and activities identified in the plans. Once restored, appropriate management practices and activities will be continued to maintain the water bodies. The overall goal of the Plan is to define a set of actions that will help achieve water quality standards in the state of Georgia. This plan was originally prepared as an implementation inventory by the South Georgia RDC with a Section 604(b) Grant. TMDL load allocation information has been updated to reflect the approved TMDL.

Lowndes County, Georgia
TMDL Implementation Plan

Background
Franks Creek, located within Lowndes County, Georgia (near the City of Hahira) is a 9-mile stream segment that meanders through primarily agricultural land. The Georgia Environmental Protection Division currently lists it as an impaired stream segment. Franks Creek has a water use classification of fishing and according to the Georgia 305(b) data that was used to place it on the Georgia 1996 303(d) list, Franks Creek is “partially supporting” this designated use classification.

Existing Land Use
Since Franks Creek is located in a rural part of Lowndes County, the impaired stream segment is surrounded almost entirely by agricultural land uses. Most of the land uses are served by well and septic systems.

Monitoring Data
In June of 2000, the Fecal Coliform TMDL Development Plan for Franks Creek was completed. That plan listed the stream segment as being impaired based on “limited fecal coliform data that was readily available and used to put the stream segment on the Georgia 1996 303(d) list.” The necessary load reductions were based primarily on modeling data from 1987 and 1988.

Existing Regulatory or Voluntary Action
Currently, the City of Hahira and Lowndes County have several required and voluntary ordinances as well as several proposed regulatory actions that are designed to regulate and limit stream pollutants. They are:
- **The Sanitary Code**-Regulates the installation of on-site septic systems.
- **Zoning Ordinance-Part V: Environmental Regulations**-mandated by the state of Georgia for Ground Water Recharge Areas, Protected River Corridors, and Wetlands, (in this case, only Wetlands will apply) is pending adoption.
- **Storm Water Management Plan**-Designed for the management of storm water run-off.
- **Erosion Control and Sedimentation Act**-Construction code to reduce pollutants to navigable waters.
- **Tree and Landscape Ordinance**-Voluntary actions for soil and sedimentation control.

Recommended Regulatory or Voluntary Action
It is recommended that the City of Hahira/Lowndes County conduct periodic monitoring of the impaired stream segments. This could be done on a monthly basis to determine when, if any, impairment is at its peak. The city/county could also conduct thirty day
monitoring periods at least once a year. This would also be instrumental in determining if action plans should be more pro-active or re-active.

It should be noted that the Upper Suwannee River Watershed Initiative (USRWI) is a citizen-led coalition partnered with public and private agencies to bring together residents of the USRW to identify and solve problems that affect their water, soils, and forest. The main goal of this group is to address potential problems early and help avoid costly and continuous battles over limited resources.

**Schedule For Implementing Management Measures**
The schedule for implementing such a monumental plan as this should be as follows:

**Year One**
- Stakeholders Group is formed identifying major constituents that would be impacted by the impaired stream segment.
- Organize implementation work with stakeholders and local officials to identify remedial measures and potential funding sources. *(this would continue for the entire five year period)*
- Identify sources of TMDL parameters *(this would continue into year two)*
- Develop management programs to control runoff including identification and implementation of BMPs. *(this would continue into year two)*
- Organize and implement education and outreach programs. *(this would continue into year three)*

**Year Two**
- Monitor and evaluate results.

**Year Three**
- Evaluate additional management controls needed. *(this would continue into year five)*
- Provide periodic status reports on implementation of remedial activities.

**Year Four**
- Reassess TMDL allocations. *(this would continue into year five)*
- Monitor and evaluate results.

**Year Five**
- Provide periodic status reports on implementation of remedial activities.
- Monitor and evaluate results.

There are three particular aspects of the plan that need to be addressed separately because of their importance. First, it is important to determine if fecal coliform levels still warrant listing the creek on the 303(d) list. This needs to be done as soon as possible. Second, if monitoring determines fecal coliform levels still exceed acceptable limits, the stream segment should be monitored in several different locations to identify a source of the contamination. Then, the necessary measures can be taken to decrease the fecal coliform levels and have the stream taken off the 303(d) list. Finally, after the sources of the fecal coliform contamination have been determined and measures have been taken to abate the impairment, periodic monitoring needs to be done to ensure the integrity of the segment has remained below the acceptable fecal coliform levels.
It should be noted, however, these measures will require proper funding and coordination from specialized groups to ensure the measures are implemented correctly.

**Funding**
It is recommended that if preliminary monitoring shows no significant reduction in levels of fecal coliform, funding should be sought for extensive long term monitoring to identify sources of the pollutants and also to determine proper action to reduce levels of fecal coliform. Funds could be used not only for water quality monitoring, but also for the “proper” checking of on-site sewage systems as well as city sewer lines. It could also be used to monitor ground water for potential contamination beyond the surface level of the streams. This would help ensure quality of water both above and below the surface.

**Conclusion**
It has been determined that more extensive monitoring and up-to-date data collection needs to be done before determining the specific cause and source of impairment of the stream segment. Once this has been completed, then the proper actions can be taken to ensure the highest quality of sustainability for our waters.

</tr>
</tbody>
</table>
IV. PROJECTED ATTAINMENT DATE AND BASIS FOR THAT PROJECTION:

The projected attainment date is 10 years from acceptance of the implementation plan by EPD.

V. MEASURABLE MILESTONES:

- Number of management controls and activities already implemented 3
- Number of management controls and activities proposed in five-year work program 4
- Number of management controls and activities actually implemented in five-year work period (to be completed after 5 years)
- Stream sampled to identify areas of concern See monitoring plan
- Other ________________________________
- Other ________________________________

VI. MONITORING PLAN:

Monitoring data that placed stream on 303(d) list will be provided if requested.

Describe previous or current sampling activities or other surveys to detect sources or to measure effectiveness of management measures or other controls.

<table>
<thead>
<tr>
<th>ORGANIZATION</th>
<th>TIME FRAME</th>
<th>PARAMETERS</th>
<th>PURPOSE</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

VII. CRITERIA TO DETERMINE WHETHER SUBSTANTIAL PROGRESS IS BEING MADE:

- % concentration or load change (monitoring program)
- Categorical change in classification of the stream (delisting the stream is the goal)
- Regulatory controls or activities installed (ordinances, laws)
- Best management practices installed (agricultural, forestry, urban)
