

APPENDIX C

Air Quality Model Performance Evaluation: Evaluation at VISTAS and Nearby Class I Areas

C.1 OVERVIEW

The discussion of model performance in this Appendix focuses on the comparison of observational data from the Interagency Monitoring of PROtected Visual Environments (IMPROVE) monitors and model output data from the 2002 VISTAS BaseG2 Actual annual air quality modeling. The evaluation will primarily focus on the air quality model's performance with respect to individual components of fine particulate matter (PM_{2.5}), as good model performance of the component species will dictate good model performance of total or reconstituted fine particulate matter from which visibility is constructed. Model performance of the total fine particulate matter and the resulting total light extinction will also be provided as a means to discuss the overall model performance for this Implementation Plan.

C.1.1 IMPROVE Monitoring Sites

There are eighteen (18) Class I areas within the VISTAS States (VISTAS region) as shown in Figure C-1. There are also several Class I areas adjacent to the VISTAS region where we also project future-year visibility conditions. Figure C-2 displays the IMPROVE monitoring sites within and nearby the VISTAS region. The 18 VISTAS Class I areas and nearby Class I areas where the CMAQ Base G2 modeling results are evaluated in this Appendix are as follows:

VISTAS Class I Areas

- Sipsey Wilderness Area (SIPS), Alabama
- Chassahowitzka Wildlife Refuge (CHAS), Florida
- Everglades National Park (EVER), Florida
- St. Marks Wildlife Refuge (SAMA), Florida
- Cohutta Wilderness Area (COHU), Georgia
- Wolf Island Wildlife Refuge (WOIS), Georgia
- Okefenokee Wildlife Refuge (OKEF), Georgia
- Mammoth Cave National Park (MACA), Kentucky
- Linville Gorge Wilderness Area (LIGO), North Carolina
- Shining Rock Wilderness Area (SHRO), North Carolina
- Swanquarter Wildlife Refuge (SWAN), North Carolina
- Joyce Kilmer-Slickrock Wilderness Area (JKSR), North Carolina
- Cape Romain Wildlife Refuge (ROMA), South Carolina
- Great Smoky Mountains National Park (GRSM), Tennessee-North Carolina
- James River Face Wilderness Area (JARI), Virginia
- Shenandoah National Park (SHEN), Virginia
- Dolly Sods Wilderness Area (DOSO), West Virginia
- Otter Creek Wilderness Area (OTCR), West Virginia

Nearby Class I Areas

- Breton Island Wildlife Refuge (BRET), Louisiana
- Caney Creek Wilderness Area (CACR), Arkansas
- Upper Buffalo Wilderness Area (UPBU), Arkansas
- Mingo Wildlife Refuge (MING), Missouri
- Hercules Glade Wilderness Area (HEGL), Missouri
- Brigantine Wildlife Refuge (BRIG), New Jersey

Note that not all Class I areas have their own IMPROVE monitor. The Wolf Island Class I area shares the Okefenokee IMPROVE monitor in Georgia and in West Virginia, the Otter Creek Class I area shares the Dolly Sods IMPROVE monitor and the Joyce Kilmer-Slickrock Class I area shares the IMPROVE monitor at Great Smokey Mountains National Park. So when presenting model performance evaluation and visibility projections for Okefenokee, Dolly Sods and Great Smokey Mountains IMPROVE monitors they are also represented of, respectively, Wolf Island, Otter Creek and Joyce Kilmer-Slickrock Class I areas, respectively. Also note that there are some IMPROVE sites not located in Class I areas. Although data at these sites are used in the regional evaluation discussed in Appendix B, the performance at the individual IMPROVE monitors not located at a Class I area are not discussed in this section. For the VISTAS region, the Cadiz (CADI) site is one such IMPROVE monitor.

VISTAS

Figure C-1. Class I areas within the VISTAS region.

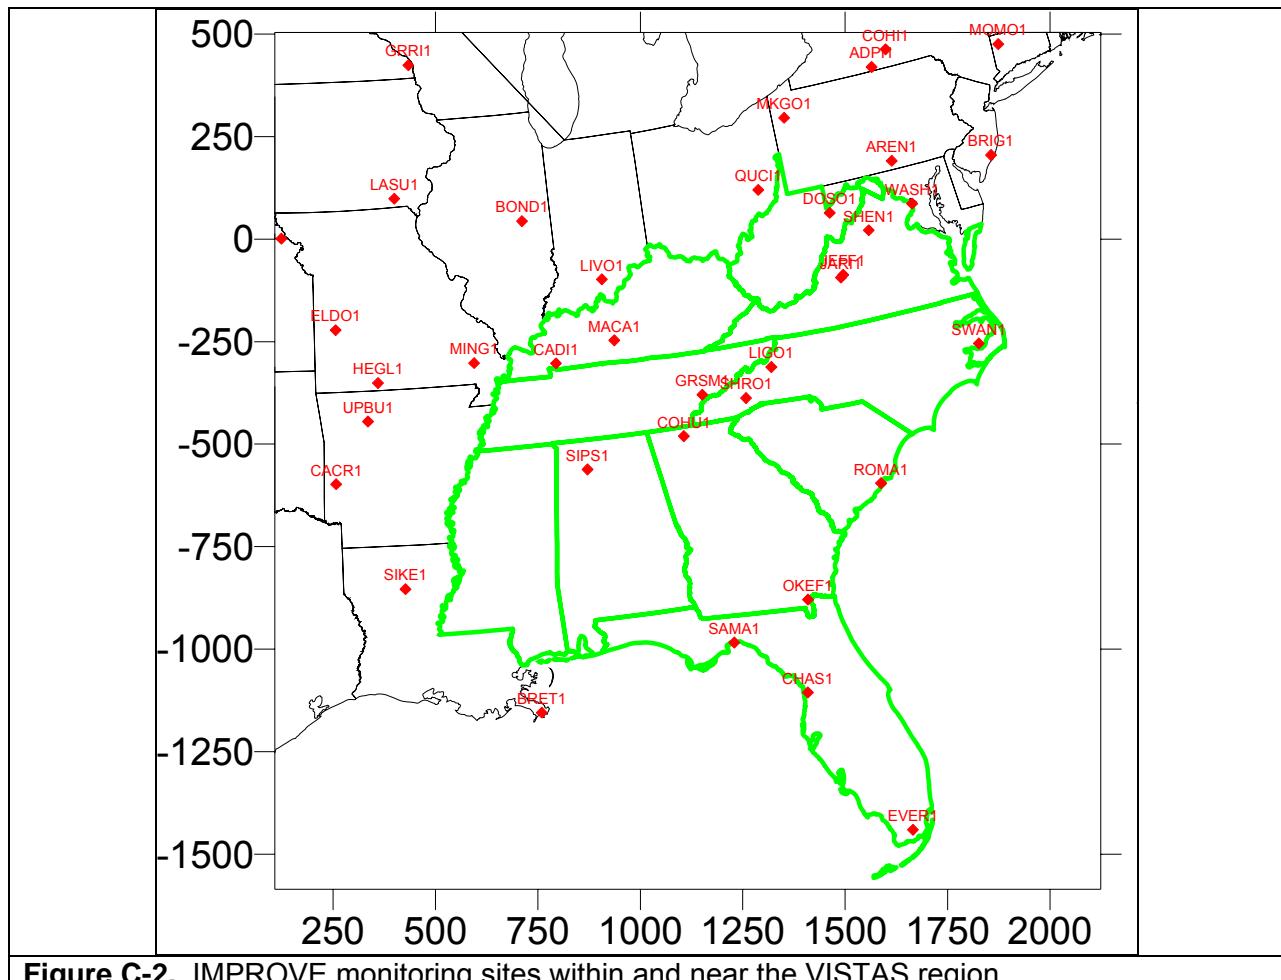

Figure C-2. IMPROVE monitoring sites within and near the VISTAS region.

C.1.2 Particulate Matter and Component Species

Regional haze is calculated by estimating light scattering and absorption by components of PM_{2.5}. Regional haze is measured by an extinction coefficient (b_{ext}), which represents the light attenuation resulting from scattering and absorption of light from ambient particulate matter plus scattering of light due to gas molecules in the air (i.e., Rayleigh scattering).

Some scattering does occur from air molecules; however, the bulk of light extinction is caused by the presence of suspended particles, particularly fine particles (aerodynamic mass <2.5 μm). Fine particulate matter can be composed of varying amounts of several different species, including:

- Sulfates
- Nitrates
- Ammonium
- Organic carbon (OC)

- Elemental carbon (EC)
- Coarse particulate matter (i.e., PM₁₀ - PM_{2.5})
- Soil (also known as crustal material, fine soil, major metal oxides, inorganic particulates, or other PM)
- Sea Salt (NaCl) [new IMPROVE equation]

The composition of particulate matter can vary from day-to-day, allowing a day with a large concentration of sulfates to be closely followed by a day dominated by organic carbon. This is an important fact as some of the components of fine particulate matter are more effective at light scattering than others. Since there can be such a large variability in the concentrations of the component species, the model will actually be evaluated on a per species basis, followed by a an evaluation of total reconstructed fine particle mass. This is also a more stringent test of the model, as simply looking at particle pollution performance may provide good results, even though the underlying constituent concentrations are incorrect. Only a brief overview of total fine particles after component evaluation is necessary, since the accuracy of the model in predicting the component species will dictate the accuracy of the total fine particulate mass prediction.

C.1.3 20% Best and Worst Days

Projections of light extinction for the evaluation of regional haze are based on a subset of days for which there is monitored data. IMPROVE monitors collect 24-hour PM samples every third day. Observations of component species on these days are used to calculate light extinction, which is the basis on which these days are ranked. These rankings are then used to identify the 20% most impaired days, or “worst days”, and the 20% least impaired days, or “best days”, for use in visibility projections. Table C-1 lists of the 20% best and worst days for all of Class I areas within and nearby of the VISTAS region. .

Since the ultimate future year projections are based on these 20% best and worst days, the following performance evaluation of the model has mainly focused on the best and worst days for VISTAS and nearby Class I areas.

C.2 Model Performance Statistics

To quantify model performance, several statistical measures were calculated and evaluated for all the IMPROVE monitors within the VISTAS 12 km domain and individually for each IMPROVE monitor associated with a VISTAS or nearby Class I areas. The statistical measures selected were based on the recommendations outlined in section 18.4.1 of the USEPA's Guidance On The Use Of Models And Other Analyses for Demonstrating Attainment of Air Quality Goals for Ozone, PM2.5, and Regional Haze (EPA, 2007a).

In 2004, VISTAS established model performance goals and criteria for components of fine particle mass (Table C-2) based on previous model performance for ozone and fine particles. EPA modeling guidance for fine particulate matter at the time noted that PM models might not be able to achieve the same level of performance as ozone models. VISTAS' evaluation considered several statistical performance measures and displays.

Table C-2. Model performance goals and criteria for components of fine particle mass.

Fractional Bias	Fractional Error	Comment
$\leq 15\%$	$\leq 35\%$	Goal for PM model performance based on ozone model performance, considered excellent performance
$\leq 30\%$	$\leq 50\%$	Goal for PM model performance, considered good performance
$\leq 60\%$	$\leq 75\%$	Criteria for PM model performance, considered average performance. Exceeding this level of performance indicates fundamental concerns with the modeling system and triggers diagnostic evaluation.

The statistical measures were calculated for all of the component species of particulate matter responsible for light extinction, and for total light extinction. For convenience, these statistical measures or metrics, along with a variety of additional statistical measures, are summarized in Table C-3.

Table C-3. Statistical metric calculations.

Statistical Measure	Shorthand Notation	Mathematical Expression	Notes
Accuracy of Paired Peak	A_p	$\frac{P - O_{peak}}{O_{peak}}$	
Coefficient of Determination	R^2	$\frac{\left[\sum_{i=1}^N (P_i - \bar{P})(O_i - \bar{O}) \right]^2}{\sum_{i=1}^N (P_i - \bar{P})^2 \sum_{i=1}^N (O_i - \bar{O})^2}$	P_i = prediction at time and location i; O_i = observation at time and location i; \bar{P} = arithmetic average of P_i , $i = 1, 2, \dots, N$; \bar{O} = arithmetic average of O_i , $i = 1, 2, \dots, N$;
Normalized Mean Error	NME	$\frac{\sum_{i=1}^N P_i - O_i }{\sum_{i=1}^N O_i}$	Reported as %
Root Mean Square Error	RMSE	$\left[\frac{1}{N} \sum_{i=1}^N (P_i - O_i)^2 \right]^{\frac{1}{2}}$	Reported as %
Mean Fractional Error	MFE	$\frac{2}{N} \sum_{i=1}^N \frac{ P_i - O_i }{P_i + O_i}$	Reported as %
Mean Absolute Gross Error	MAGE	$\frac{1}{N} \sum_{i=1}^N P_i - O_i $	
Mean Normalized Gross Error	MNGE	$\frac{1}{N} \sum_{i=1}^N \frac{ P_i - O_i }{O_i}$	Reported as %
Mean Biased	MB	$\frac{1}{N} \sum_{i=1}^N (P_i - O_i)$	Reported as concentration
Mean Normalized Bias	MNB	$\frac{1}{N} \sum_{i=1}^N \frac{(P_i - O_i)}{O_i}$	Reported as %
Mean Fractionalized Bias (Fractional Bias)	MFB	$\frac{2}{N} \sum_{i=1}^N \left(\frac{P_i - O_i}{P_i + O_i} \right)$	Reported as %
Normalized Mean Bias	NMB	$\frac{\sum_{i=1}^N (P_i - O_i)}{\sum_{i=1}^N O_i}$	Reported as %
Bias Factor	BF	$\frac{1}{N} \sum_{i=1}^N \left(\frac{P_i}{O_i} \right)$	Reported as BF:1 or 1:BF or in fractional notation (BF/1 or 1/BF)

C.2.1 Statistical Tables

The statistical data is calculated collectively for all of the IMPROVE monitors within the VISTAS 12 km domain, as well as individually for each of the IMPROVE monitors associated with a VISTAS Class I area along with the IMPROVE monitors associated with nearby Class I areas. These statistics have been calculated separately for the 20% Best days (Section C.2.1.1) and 20% Worst days (Section C.2.1.2).

C.2.1.1 Model Performance Statistics for the 20% Best Days

Table C-4 displays the model performance statistical measures for the Best 20 percent visibility days during 2002. Table C-4a contains statistical performance metrics for the Best 20 percent days across all IMPROVE monitors in the VISTAS 12 km domain, whereas the remainder of the tables contain statistics for each individual IMPROVE monitor associated with a Class I area within and near the VISTAS region.

C.2.1.2 Model Performance Statistics for the 20% Worst Days

Statistical performance measures for the Worst 20 percent days in 2002 and the CMAQ Base G2 12 km base case are shown in Table C-5.

Table C-4a. Model performance statistics for the Best 20% Days across Class I areas in the 12 km VISTAS grid.

C.2.3 Class I Area Model Performance Evaluation

Below we summarize the CMAQ 2002 Base G2 12 km Actual base case model performance at each of the Class I area within and nearby the VISTAS region for the best and worst 20% days and then for all days during 2002.

C.2.3.1 Sipsey Wilderness Area (SIPS), Alabama

C.2.3.1.1 SIPS Best 20 Percent Days

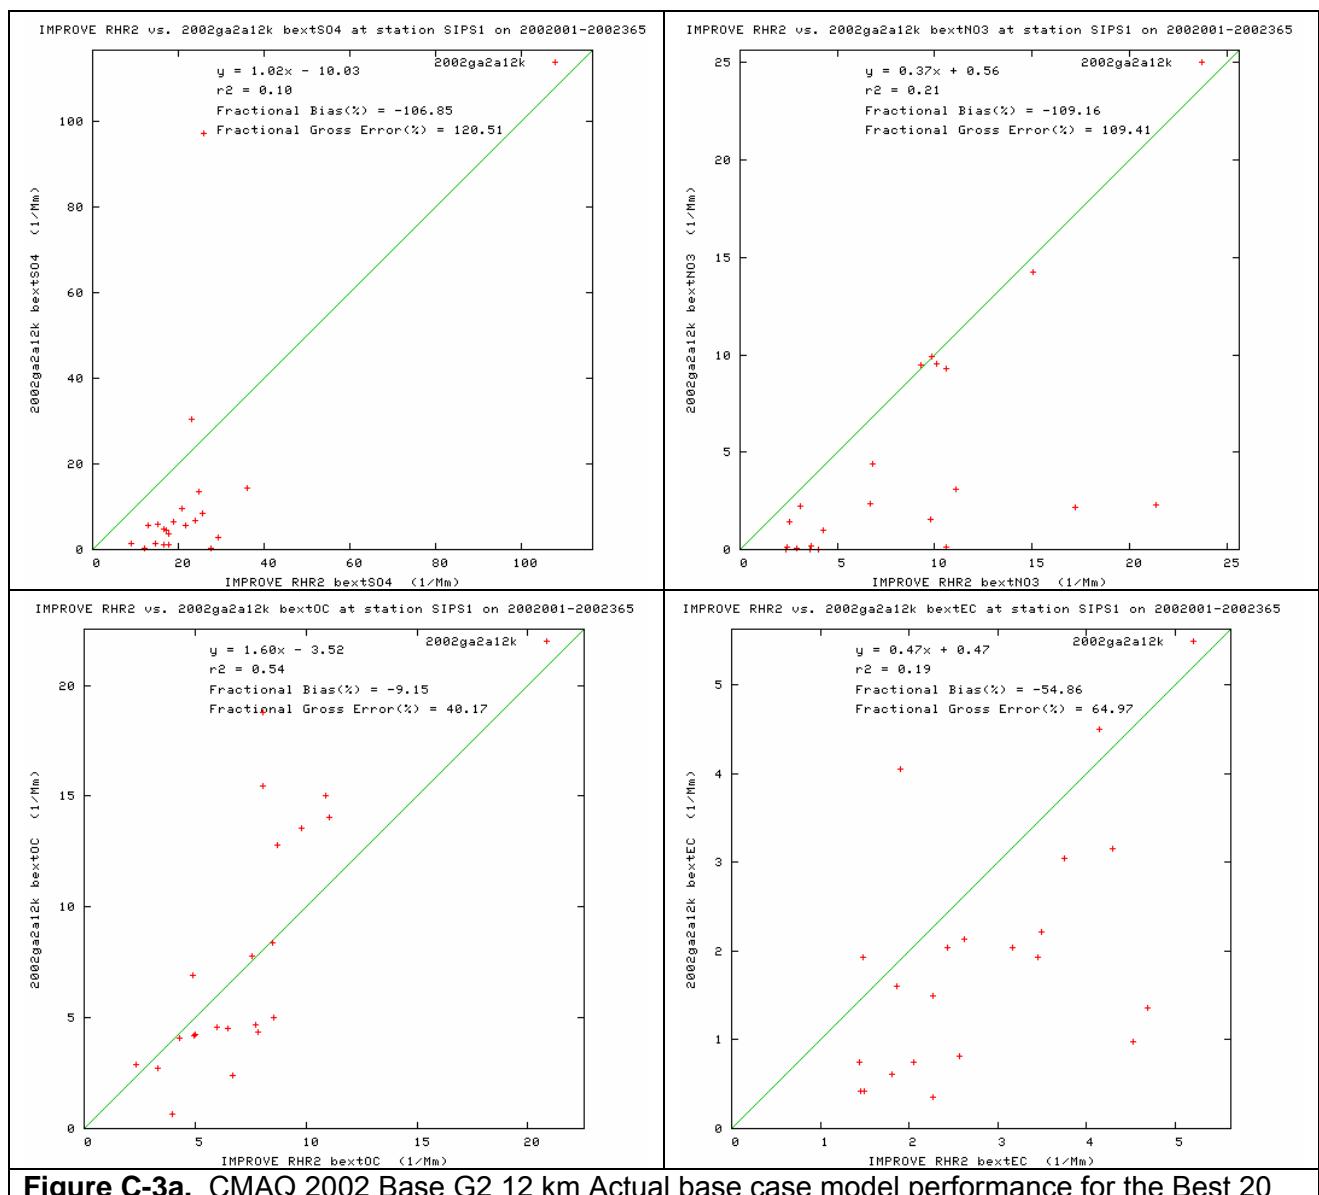

Figure C-3a. CMAQ 2002 Base G2 12 km Actual base case model performance for the Best 20 percent days at Sipsey (SIPS), Alabama for SO_4 (top left), NO_3 (top right), OMC (bottom left) and EC (bottom right).

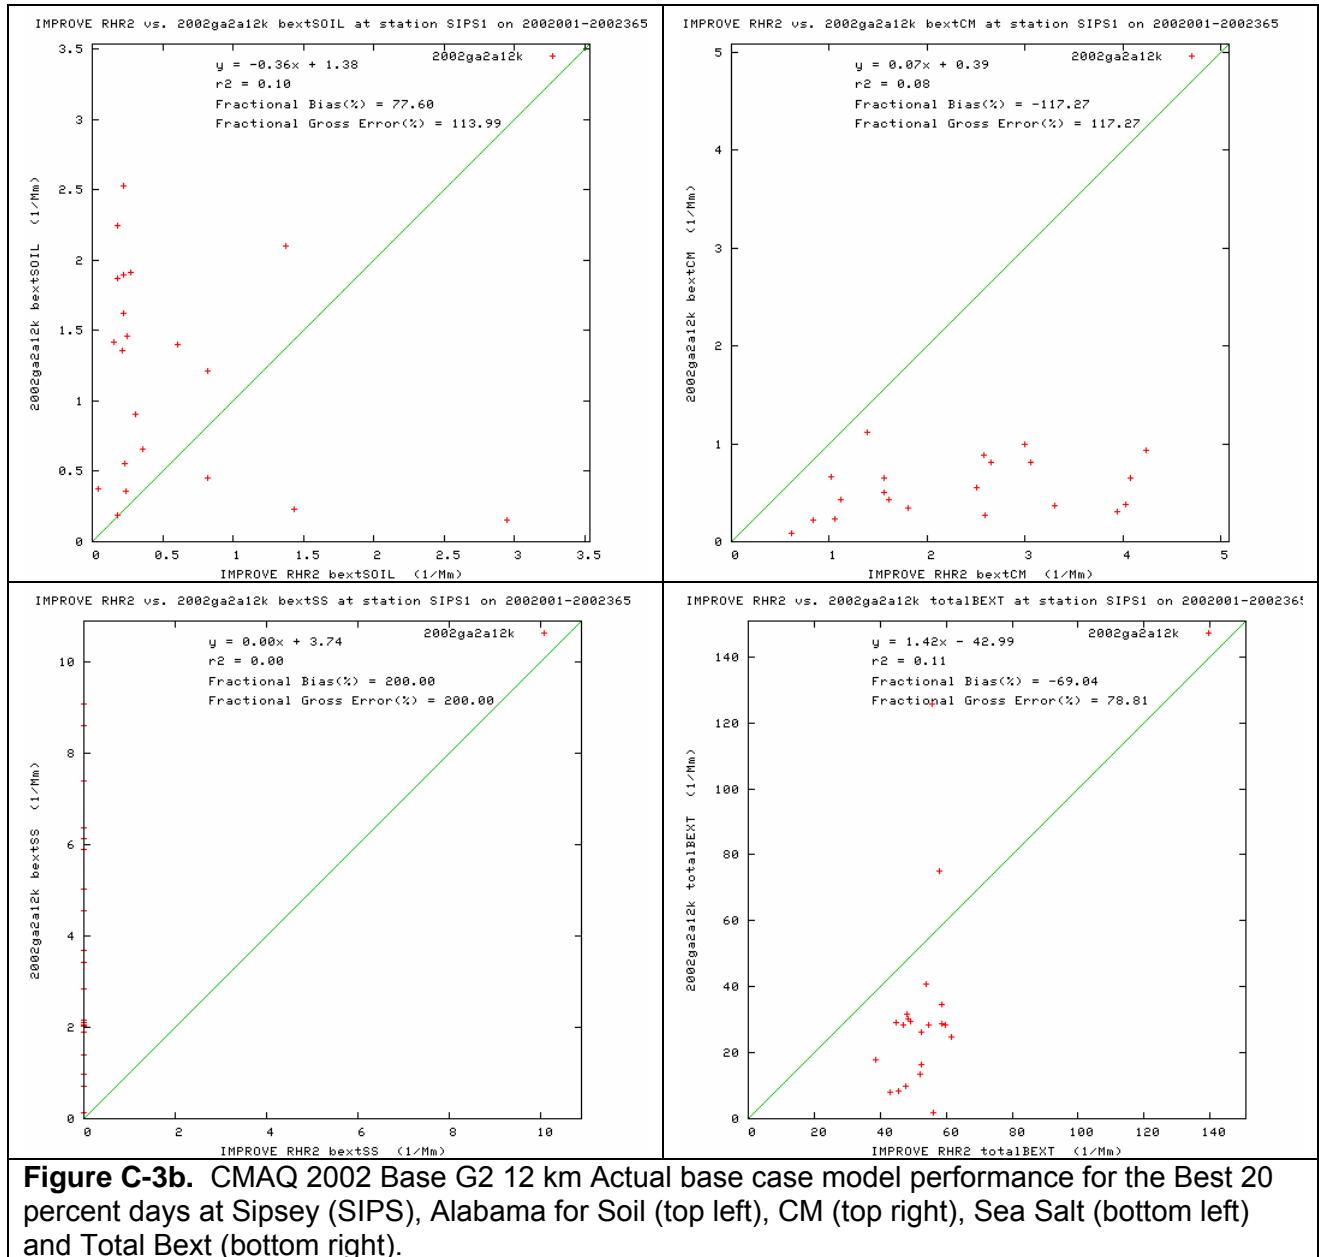

Figure C-3b. CMAQ 2002 Base G2 12 km Actual base case model performance for the Best 20 percent days at Sipsey (SIPS), Alabama for Soil (top left), CM (top right), Sea Salt (bottom left) and Total Bext (bottom right).
