

Appendix H.1

Industrial Boiler/Process Heater/RICE MACT

Industrial Boiler/Process Heater/RICE MACT

The Environmental Protection Agency (EPA) issued final rules to substantially reduce emissions of toxic air pollutants from industrial, commercial and institutional boilers, process heaters and from stationary reciprocating internal combustion engines (RICE). These rules reduce emissions of a number of toxic air pollutants, including hydrogen chloride, manganese, lead, arsenic and mercury by 2009. This rule also reduces emissions of sulfur dioxide and particulate matter in conjunction with the toxic air pollutant reductions. The applied Maximum Achievable Control Technology (MACT) control efficiencies were 4 percent for SO₂ and 40 percent for PM10 and PM2.5. However, EPA's industrial boiler MACT rules were vacated on June 8, 2007. The emissions reductions that were modeled to account for the industrial boiler MACT were 1,343.5 tons/year of SO₂, 879.4 tons/year of PM2.5, and 1,304.2 tons/year of PM10 [see Tables 1-3]. These reductions are insignificantly small (0.69% for SO₂, 0.39% for PM2.5, and 0.13% for PM10) compared to the statewide totals (193,665.5 tons/year SO₂; 225,104.5 tons/year PM2.5; and 1,002,873.2 tons/year PM10) and should not impact the conclusions made in the SIP. If another VISTAS "best and final" modeling run is performed, it will remove control assumptions solely due to this MACT rule.

Table 1: SO₂ emissions (tons/year) for Boiler MACT Sources
