Atlanta, Georgia 30334-9000

Subject: **AGLC-Augusta MGP Site**
1st Semi-Annual VRP Status Report
Amec Foster Wheeler Project No.: 6122140098

Dear Mr. Collins:

Amec Foster Wheeler Environment and Infrastructure, Inc. is pleased to submit the First Semi-Annual Voluntary Remediation Program (VRP) Status Report on behalf of Atlanta Gas Light Company as required under the VRP for the Former Manufactured Gas Plant (MGP) located in Augusta, GA (HSI #10132) to the Georgia Environmental Protection Division.

Please call me at (770) 421-7022 with any questions concerning this report.

Sincerely,

Amec Foster Wheeler Environment & Infrastructure, Inc.

David Price, P.E.
Project Manager

Leslie Miller, P.E.
Senior Engineer

cc: Mr. Greg Corbett, PE, AGLC
Mr. Jim Ussery, Joe Tanner and Associates
Mr. Derrick Williams, GAEPD

GROUNDWATER SCIENTIST CERTIFICATION

I certify that I am a qualified groundwater scientist who has received a baccalaureate or post-graduate degree in the natural sciences or engineering, and have sufficient training and experience in groundwater hydrology and related fields, as demonstrated by state registration and completion of accredited university courses, that enables me to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport. I further certify that this report was prepared by me or by a subordinate working under my direction. Data contained herein gathered and reported by professionals other than Amec Foster Wheeler Environment & Infrastructure, Inc. are accepted as accurate and have been integrated into this report as such.

1.0 PROJECT SUMMARY

The former Augusta Manufactured Gas Plant (MGP) is located at the intersection of Walton Way and 8th Street in the City of Augusta, County of Richmond, Georgia (Figure 1-1). Atlanta Gas Light Company (AGLC) owns three parcels of land on which a MGP and ancillary facilities formerly operated, which collectively occupy approximately 3.5 acres (Figure 1-2). These properties as well as those surrounding properties potentially impacted by the former MGP operations are collectively referred to as the "Augusta MGP Site" or the "Site" in this Status Report.

AGLC has performed a series of investigations and implemented numerous Georgia Environmental Protection Division (EPD) approved corrective actions and has addressed the MGP impacts in the unsaturated and saturated zone materials over large areas of the Site and surrounding areas since the mid-1980s. After further evaluation and coordination, AGLC and EPD agreed that the Augusta MGP Site was a candidate for enrollment in the Georgia Voluntary Remediation Program (VRP).

EPD agreed to move the Augusta MGP Site into the VRP upon execution of a new Consent Order and submittal of an acceptable Voluntary Investigation and Remediation Plan (VIRP) by August 28, 2014. The Consent Order was signed by AGLC and EPD and executed on September 23, 2014. AGLC submitted an initial VIRP Application Form and Checklist with associated VRP application fee on August 6, 2014 and the VIRP on August 28, 2014. EPD approved the VIRP and accepted AGLC into the VRP and provided comments on the VIRP in two separate letters dated December 3, 2014.

The December 3, 2014 EPD acceptance letter established the schedule for submittal of progress reports to EPD, which will be December 1st and June 1st annually. The goals of this Status Report are to comply with the June 1, 2015 progress report submittal schedule and to update EPD on the progress of activities at the Site. This report is also provided to document modifications from the initial VIRP submittal, including qualifying additional properties into the VRP, and to address EPD's comments from the December 3, 2014 letter. Responses to EPD's comments are provided in Appendix A. As documented in the reponses, comments not addressed in this report will be addressed in future VRP submittals for the Site.

2.0 SITE ACTIVITIES

Site activities completed during this reporting period are summarized in the following sections. Progress during this reporting period have been primarily focused on finalizing the 60% design for planned remedial activities. Additional activities evaluating applicable exposure pathways have been completed during this reporting period to support progression of the Site through the VRP and to address EPD's comments from the December 3, 2014 letter. In addition, semi-annual groundwater data was collected from existing wells and the results of this sampling have been documented in a corrective action effectiveness report included as Appendix B.

2.1 REMEDIAL DESIGN

Preparation of the 60% remedial design is currently substanitially complete to support implementation of the site-wide in situ solidification (ISS) remedy for the saturated zone source impacts. However, due to recent inquiries by several stakeholders regarding the fate of the former Trinity Church building, AGLC is considering alternative remediation technologies for Block E (Subarea 2) with the building remaining in place. Discussions related to the fate of the buildings will take into consideration several scenarios related to preserving the building while addressing the underlying source impacts. It is still contemplated that the other areas (Subarea 1 and 3) will receive ISS as the final saturated zone source remedy. AGLC will communicate with EPD independent of this status report regarding decisions concerning the former church building, Block E remediation, and any changes to the remedial approach for the other areas.

2.2 SURFACE WATER EXPOSURE PATHWAY

The only surface water feature at the Site is the Third Level Canal, which parallels the Northern Parcel to the west as shown on Figure 1-2. This section has been prepared to document the previous work performed at the Third Level Canal to support that the surface water exposure pathway has been addressed for the Site.

Remediation activities for the Third Level Canal were performed as agreed upon between AGLC and EPD and consisted of the following:

- Known MGP impacted unsaturated soils were excavated and transported to soil stockpile areas for subsequent off site disposal;
- Excavation of the Canal extended to the bottom of visually impacted material or to deeper depths at known impacted areas as identified during the remedial investigation and supplemental soil investigation;
- The Canal excavation was extended to the limits of visually impacted soils. Additionally, outside the Canal excavation the upper two feet of soil from the top of Canal bank to the adjacent property was excavated and replaced with clean soil. In some instances, excavations were extended beyond the limits of visually impacted soils to accommodate Canal improvements;
- Collection of confirmation samples (verification sampling) at the adjacent property boundary to confirm that the adjacent property complied with applicable Risk Reduction Standards (RRS) after removal of soils from Third Level Canal corridor. Property line confirmation samples were obtained in the upper two feet of soil exposed in the excavation sidewalls;
- Backfill with clean, compacted soil; and,
- Canal civil improvements, which consisted of installation of a newly constructed concrete Canal liner, bridge replacement/modifications, and mulch/matting and/or grass seeding on all Canal slopes.

Excavated soils were characterized and transported off-site for disposal. Soil backfill from both on- and off-site sources was placed prior to initiating Canal civil improvements. A 30- to 40-foot wide concrete liner with 3.5- to 9-foot high retaining walls was constructed after backfilling was completed. Unimpacted soils were then placed behind the walls and topped with a 2-foot cap of clean soil.

This corrective action was completed in compliance with the requirements of the Consent Orders with EPD, the EPD approved Basis of Design Work Plan (BDWP) (MACTEC 2002), and the Corrective Action Plan, Augusta MGP Site – Northern Parcel (CAP) (ThermoRetec 1999). In a letter dated March 30, 2009, EPD approved the Corrective Action Closure Report and Compliance Status Report, Third Level Canal, Operable Unit (OU) 3 dated January 16, 2009 and concurred with AGLC's certification. A copy of EPD's letter is provided in Appendix C for reference.

To support elimination of the surface water exposure pathway and address EPD's December 2014 comments, surface water samples were collected from two locations along the Third Level Canal on March 17, 2015. One sample was obtained northwest of the site in Reach G (TLC-001) and the other sample was obtained between the Northern and Western Parcels (TLC-002) as shown in Figure 2-1. As shown in Table 2-1, samples collected from both locations have similar concentrations with most being below the reporting limit and/or instream standards. The exception to this is copper, which has a concentration of 1.65 ug/L at TLC-001 northwest of the Site and 46.2 ug/L at TLC-002 adjacent to the site. With the absence of other Site constituents of interest (COIs), the elevated copper concentration observed at TLC-002 is not likely related to former MGP operations. Analytical laboratory data for TLC-001 and TLC-002 is provided in Appendix D.

Based on the extensive remediation completed to date and current surface water data in the Third Level Canal, which suggests that impacts in surface water are not related to the Site, the surface water exposure pathway for the Site has been addressed to the extent practicable and does not warrant further evaluation under the VRP.

2.3 GROUNDWATER AND VAPOR INTRUSION EXPOSURE PATHWAYS

As discussed in the VIRP, groundwater impacted by COIs is not accessible for direct contact because the aquifers beneath the Site are not used for water supply and the Site and adjacent properties are supplied with municipal water. An updated well survey to verify the number of wells and well uses within the Site vicinity is planned to be completed as discussed in the VIRP and is anticipated to be reported in the second Semi-Annual Status Report.

It is planned that qualifying parcels will have groundwater use restrictions eliminating the ingestion and dermal exposure pathways to groundwater. With these use restrictions in place, vapor intrusion (VI) from groundwater to indoor air will be the primary exposure pathway for potential residual impacts in the upper aquifer post remediation. An updated VI risk assessment has been completed for the Site using the most recent sampling data to represent current conditions. The risk assessment is discussed in Section 5.0.

The most recent groundwater data collected in July 2014 and January 2015 from the Galliard and Bedrock wells is presented in Tables 2-2 and 2-3, respectively. The January 2015 semi-annual sampling report is included as Appendix B. Extent of dissolved phase impacts in the Galliard and Bedrock formations for July 2014 and January 2015 sampling is presented in Figures 2-2 through

2-5. Groundwater will continue to be sampled semi-annually consistent with the current program until construction is initiated. Some wells in the remedial footprint will need to be abandoned due to the construction activities. Additionally, wells located on the Georgia Power property on Block D will need to be abdandoned in the fall of 2015 to accommodate expansion of the Georgia Power Substation. A modified program with a subset of existing wells will be sampled during ISS implementation to continue to evaluate groundwater quality. After implementation of ISS is complete, groundwater flow in the upper aquifer will be altered by the solidified ISS mass. Additionally, permeability and leaching potential will be greatly reduced within the ISS footprint. For these reasons, locations of potential new/replacement wells will be identified after completion of construction activities and after an evaluation of Post ISS groundwater data from the subset of retained wells has been completed. Additional monitoring wells are planned to be installed prior to or during construction activities to address delineation requirements under the Voluntary Remediation Program Act (VRPA) and are described in Sections 4.2 and 4.4. Indication of delineation criteria and cleanup standards used to previously demonstrate compliance are located in Table 2-4 for groundwater.

2.4 SOIL/SEDIMENT EXPOSURE PATHWAY

As documented in the VIRP, the unsaturated soil/sediment exposure pathway has already been remediated as shown in Figure 2-6. The BDWP (MACTEC, 2002) incorporated remedial objectives including removing and/or treating in place all by-product-like material (BPLM) and addressing soil to achieve compliance with the applicable RRS and removing free phase contamination to the extent practicable. Delineation criteria and cleanup standards used to demonstrate compliance are located in Table 2-4 for the soil exposure pathway. Copies of approval letters from EPD and compliance certification for soils/sediments for the Site are included in Appendix C. Table 2-5 provides a summary of documents where the standards/criteria for surface soil and sediments can be found supporting that this exposure pathway has been remediated at the Site.

3.0 ADDITIONAL QUALIFYING PROPERTIES

The properties previously qualifying for the VIRP include parcels 106, 109, 185, 186, 187, 188, 189, 225, 227, 228, 230, 231, 248, 327.2, 327.1, 328, 329, 330, and 374.1 owned by AGL. Walton Way and 8th Street are being added as qualifying for the VRP as shown on Figure 3-1. A letter from the City of Augusta granting AGLC permission to enroll portions of Walton Way and 8th Street into the VRP is included in Appendix E. Appendix E also contains filed declarations and affidavits for the Site as requested by EPD.

All of these properties are either listed on the Georgia Hazardous Site Inventory or otherwise have a release of regulated substances into the environment. None of these properties are listed on the federal National Priorities List, are undergoing response activities required by an United States Environmental Protection Agency (USEPA) order, or are a facility required to have a permit under O.C.G.A 12-8-66. AGLC is the owner of these properties or has express permission of the owner to enroll the qualifying properties in the VRP.

4.0 ADDITIONAL INVESTIGATION

Additional investigation is necessary prior to further remedial actions for characterization and refinement of the remedial footprint and has been revised since the initial submittal of the VIRP. Planned activities currently include: 1) delineation of residual BPLM in Subareas 1, 2 and 3; 2) understanding the extent of possible TCE impacts in groundwater in the Galliard zone from an off-site source in Block C; 3) investigation of potential residual BPLM northwest of the former carwash (Block A) in the areas of MW-502D and MW-603; and 4) investigation delineation of Galliard groundwater impacts in the area north of MW-603; and 5) horizontal delineation of Bedrock groundwater impacts northwest of MW-318. Details of the planned investigations are presented below.

4.1 SOIL SAMPLING FOR VISUAL BPLM ANALYSIS IN SUBAREAS

The planned investigative activities include soil borings for additional characterization and delineation for Subarea 1 (Western Parcel), Subarea 2 (Walton Way), and Subarea 3 (Block E). Initial soil borings will be located based on the observed extent of BPLM as illustrated on Figure 4-1. Additional soil borings will be conducted along the 8th Street/Walton Way intersection, east of the Car Wash area, on the Western Parcel, and surrounding the BPLM areas in Block E at 25 to 50 foot intervals. Supplemental borings will be performed as needed based on visual observations of the soil cores. Up to 96 borings are anticipated to be completed as part of the planned investigative activities.

The soil borings will be installed using direct push technology (DPT) and extended through the Alluvial and Gaillard formations to the top of Saprolite. Soil cores will be collected by advancing a five-foot polyethylene lined dual tube stainless steel sampler through the designated sample depth interval. Soil cores will be collected continuously from ground surface to the top of Saprolite (approximately 30-feet (ft) below ground surface (bgs)). Upon extraction from the sampler, each soil core will be examined for the presence of visual staining. Soil cores will be logged by a qualified professional in accordance with the Site Specific MGP soil logging protocol (RETEC 2003).

All down-hole equipment used for the collection of soil cores will be decontaminated prior to advancing each individual borehole to prevent cross-contamination. The work will be conducted in accordance with a site specific Health and Safety Plan (HASP). Soil cuttings and other investigation derived materials (IDM) generated during the investigation will be containerized in 55-gallon drums, properly labeled, and left adjacent to the groundwater treatment building pending analytical results and final disposition. Prior to initiating DPT operations, applicable permits will be received and the utilities protection center will be contacted to obtain utility clearance for the site. A private utility locator will also be employed to clear the area around each of the boring locations.

4.1.1 REPORTING

Once visual observations of the soil cores are logged, the information will be tabulated and the figures summarizing the investigation will be updated to incorporate the newly acquired data, including the interpreted extent of BPLM from the visual analysis. The BPLM additional delineation will then be used to refine the ISS remediation boundary and will be reported in the subsequent semi-annual report.

4.2 BLOCK C MONITORING WELL INSTALLATION

Three new monitoring wells will be installed in Blocks C and J for the purpose of better understanding trichloroethylene (TCE) impacts. The locations for these wells will be selected to complement the existing monitoring well network to better understand TCE impacts and groundwater flow direction within the Galliard Formation. These wells will be constructed comparable to MW-401D and terminate at a depth of approximately 36-ft bgs. The proposed monitoring well locations are presented on Figure 4-2 and may be adjusted contingent upon access and conditions encountered in the field.

The new monitoring wells will be installed using a Roto-Sonic drill rig equipped with 6x4 drilling rods. During advancement of the borehole, soil cores will be collected continuously in 10-foot polyethylene soil core sample liners, and logged in accordance with the specific MGP soil logging protocol. Analytical testing of soils from these three monitoring well borings will not be performed.

The borings will be advanced through the Alluvium and Gaillard formations to the top of Saprolite (approximately 36-feet bgs) and the wells will be installed as described below.

All down-hole equipment used for monitoring well installation will be decontaminated prior to drilling each individual well to prevent cross-contamination. The work will be conducted in accordance with a site specific HASP. Soil cuttings, well development water, and other IDM generated during installation of the monitoring wells will be containerized in 55-gallon drums, properly labeled, and left adjacent to the groundwater treatment building pending analytical results and final disposition. Prior to initiating drilling, applicable permits will be received and the utilities protection center will be contacted to obtain utility clearance for the site. A private utility locator will also be employed to clear the area around each of the proposed monitoring well locations.

The monitoring wells for TCE will be constructed of 2-inch I.D. flush joint threaded Schedule 40 polyvinyl chloride (PVC) with ten feet of 0.010-inch machine slotted screen and will be installed in accordance with Science and Ecosystem Support Division (SESD) guidance document SESDGUID-101-R0 *Design and Installation of Monitoring Wells*.

Newly installed wells will be completed at the surface as lockable flush mounted wells. At least 24 hours after installation, the newly installed wells will be properly developed to remove sediment and drilling fluids in preparation for groundwater sample collection. Well development will consist of pumping of the well while monitoring the water quality parameters of temperature, pH, specific conductivity and turbidity. Well development will be considered complete when a minimum of five well volumes of water have been removed, the water quality parameters have stabilized, and the turbidity is less than 10 nephelometric turbidity units (NTU).

Prior to sampling for TCE, the wells will be purged using low-flow purging methodology as described in USEPA Region 4's FBQSTP *Groundwater Sampling Operating Procedure (Groundwater Sampling OP;* SESDPROC-301-R1). Groundwater quality parameters, including turbidity, specific conductance, temperature, and pH will be monitored during well purging. Purging will continue until the monitored water quality parameters stabilize, indicating the presence of representative formation water, at which point the samples will be collected. Samples will be collected for TCE analysis using USEPA method 8260 in appropriate environmental grade sample containers, properly labeled, placed immediately on ice, and shipped under proper chain-

of-custody protocol for overnight delivery to the laboratory within the allowable sample holding time.

4.2.1 REPORTING

Once the analytical laboratory reports for field sampling activities have been received, the data will be tabulated, and the figures summarizing the groundwater testing for the newly installed monitoring wells will be updated to incorporate the newly acquired data and reported to EPD in the subsequent semi-annual status report. The groundwater data will then be used to better understand TCE groundwater impacts.

4.3 SOIL SAMPLING FOR VISUAL BPLM ANALYSIS IN BLOCK A

Dense non-aqueous phase liquid (DNAPL) has been observed in MW-502D and MW-603 during the 2014 and 2015 Semiannual Corrective Action Effectiveness sampling. Additional investigation will take place in the areas of MW-502D and MW-603 in the former carwash area of Block A. Investigative activities will include soil borings for additional visual characterization of BPLM and delineation in this area. Initial soil borings will be located as illustrated on Figure 4-1. Supplemental borings will be performed as needed based on visual observations of the soil cores. Up to 8 borings are anticipated to be needed to complete the planned investigative activities in this area. It should be noted that MW-502D was not able to be located during the most recent inspection conducted on May 7, 2015 due to other construction activities in the area. An attempt to locate MW-502D will be made during the planned additional investigation activities. If the well cannot be located, appropriate next steps will be identified in the subsequent semi-annual status report.

The soil borings will be installed using DPT and extended through the Alluvial and Galliard formations to the top of Saprolite. Soil cores will be collected by advancing a five-foot polyethylene lined dual tube stainless steel sampler through the designated sample depth interval. Soil cores will be collected continuously from ground surface to the top of Saprolite (approximately 30-ft bgs). Upon extraction from the sampler, the soil core will be examined for the presence of visual staining. Soil cores will be logged by a qualified professional in accordance with the Site Specific MGP soil logging protocol (RETEC 2003).

All down-hole equipment used for the collection of soil cores will be decontaminated prior to advancing each individual borehole to prevent cross-contamination. The work will be conducted in accordance with a site specific HASP. Soil cuttings and other IDM generated during the investigation will be containerized in 55-gallon drums, properly labeled, and left adjacent to the groundwater treatment building pending analytical results and final disposition. Prior to initiating DPT operations, applicable permits will be received and the utilities protection center will be contacted to obtain utility clearance for the site. A private utility locator will also be employed to clear the area around each of the boring locations.

4.3.1 REPORTING

Once visual observations of the soil cores are logged, the information will be tabulated and the figures summarizing the investigation will be updated to incorporate the newly acquired data, including the interpreted extent from the visual analysis. The additional delineation will then be used to evaluate appropriate corrective action, if necessary, in this area and will be reported in the subsequent semi-annual status report.

4.4 GALLIARD AND BEDROCK MONITORING WELL INSTALLATION

Additional wells in both the Galliard and Bedrock formations are needed to complete horizontal delineation. One new well will be installed north of MW-603 for purpose of completing delineation of the dissolved groundwater impacts in the Galliard, and one new monitoring well will be installed northwest of MW-318 to complete horizontal delineation of the dissolved groundwater impacts in the bedrock. These locations for these wells will be selected to complement the existing monitoring well network. The Galliard well will be constructed comparable to MW-603 and will terminate at approximately 30-ft bgs. The Bedrock well will be constructed comparable to MW-318 and terminate at approximately 90-ft bgs. The proposed monitoring well locations are presented on Figure 4-2 and may be adjusted contingent upon access and conditions encountered in the field.

The new monitoring wells will be installed using a Roto-Sonic drill rig equipped with 6x4 drilling rods. During advancement of the borehole, soil cores will be collected continuously in 10-foot polyethylene soil core sample liners, and logged in accordance with the specific MGP soil logging

protocol. Analytical testing of soils from these monitoring well borings will not be performed. The boring for the Galliard well will be advanced through the Alluvium and Gaillard formations to the top of Saprolite (approximately 30-feet bgs) and the well installed as described below. The boring for the Bedrock well will be advanced through the Alluvium, Gaillard, and Saprolite formations and the well will be installed in the bedrock formation as described below.

All down-hole equipment used for monitoring well installation will be decontaminated prior to drilling each individual well to prevent cross-contamination. The work will be conducted in accordance with a site specific HASP. Soil cuttings, well development water, and other IDM generated during installation of the monitoring well will be containerized in 55-gallon drums, properly labeled, and left adjacent to the groundwater treatment building (with the other well cuttings from Block C) pending analytical results and final disposition. Prior to initiating drilling, applicable permits will be received and the utilities protection center will be contacted to obtain utility clearance for the site. A private utility locator will also be employed to clear the area around each of the proposed monitoring well locations.

The Galliard and Bedrock monitoring wells will be constructed of 2-inch I.D. flush joint threaded Schedule 40 PVC with ten feet of 0.010-inch machine slotted screen and will be installed in accordance with SESD guidance document SESDGUID-101-R0 *Design and Installation of Monitoring Wells*. The boring for installation of the Bedrock well will require installation of an 8-inch diameter temporary surface casing to the top of Saprolite. The boring will then be advanced to depth of 90 feet bgs, to core barrel resistance on hard rock, using a 4-inch casing pipe and over-reaming the hole to a diameter of 6 inches.

The newly installed wells will be completed at the surface as lockable flush mounted wells. At least 24 hours after installation, the newly installed wells will be properly developed to remove sediment and drilling fluids in preparation for groundwater sample collection. Well development will consist of pumping of the well while monitoring the water quality parameters of temperature, pH, specific conductivity and turbidity. Well development will be considered complete when a minimum of five well volumes of water have been removed, the water quality parameters have stabilized, and the turbidity is less than 10 NTU.

Prior to sampling the Bedrock well northwest of MW-318 for benzene and naphthalene and the Galliard well north of MW-603 for Site COIs, the wells will be purged using low-flow purging methodology as described in USEPA Region 4's FBQSTP *Groundwater Sampling Operating Procedure (Groundwater Sampling OP;* SESDPROC-301-R1). Groundwater quality parameters, including turbidity, specific conductance, temperature, and pH will be monitored during well purging. Purging will continue until the monitored water quality parameters stabilize, indicating the presence of representative formation water, at which point the samples will be collected. Samples will be collected for Site chemicals of concern (COC) analysis using USEPA methods listed in Table 2-4 in appropriate environmental grade sample containers, properly labeled, placed immediately on ice, and shipped under proper chain-of-custody protocol for overnight delivery to the laboratory within the allowable sample holding time.

4.4.1 REPORTING

Once the analytical laboratory reports for field sampling activities have been received, the data will be tabulated, and the figures summarizing the groundwater testing for the newly installed monitoring wells will be updated to incorporate the newly acquired data and reported to EPD in the subsequent semi-annual status report. If delineation is not achieved, appropriate next steps will be evaluated based on the analytical data received and path forward for further delineation of the Galliard and/or Bedrock groundwater.

4.5 VACCUM TRUCK PUMP OUT OF MW-603

MW-603 and MW-502D were installed to monitor impacts downgradient of the Georgia Power electrical vault in Block A. There is currently an accumulation of DNAPL within the screened interval of the wells at a depth of 19 to 23 feet below ground immediately above the saprolite. EPD has requested corrective measures for DNAPL observed in MW-603 and MW-502D. A vacuum truck will be deployed to attempt to remove product in MW-603. The well will then be monitored to observe how quickly, if at all, product re-enters the well and then appropriate next steps will be identified. Since MW-502D has not had continuous DNAPL reported, an interface probe will be used to evaluate conditions in MW-502D and then determine appropriate next steps.

MW-205 has also recently had observations of DNAPL (on interface probe) from the most recent sampling event in January 2015. An interface probe will also be deployed at MW-205 to evaluate conditions and determine appropriate next steps. Product and water removed from MW-603 will be properly containerized and disposed of at the on-site treatment system. Prior to vacuum removal, a sample of the observed product in MW-603 will be collected, if possible, and analyzed for site COIs. If product is observed in MW-502D and MW-205, sampling will also be attempted and the samples analyzed for site COIs from these wells. Results from this corrective action will be reported in the subsequent status report.

5.0 VAPOR INTRUSION

As discussed in Section 2.3, with groundwater use restrictions in place, VI from groundwater to indoor air will be the driving exposure pathway for potential residual impacts in the upper aquifer post ISS. To support addressing this exposure pathway, the potential for volatile compounds in groundwater to migrate into the indoor air of future potential overlying residential buildings has been evaluated. This hypothetical "vapor intrusion" risk evaluation conservatively assumes that residential houses may be constructed directly over the groundwater plume at the Site without the use of vapor barriers or other engineering controls (ECs) designed to prevent vapor intrusion exposure. Samples from groundwater monitoring wells screened in the alluvium, saprolite, and Galliard water zones collected during the last four semi-annual sampling events (July 2013, January 2014, July 2014, and January 2015) were considered representative of current groundwater conditions. Five volatile organic compounds (VOCs) and 16 semi-volatile organic compounds (SVOCs) were detected in these groundwater samples. The maximum detected VOC and SVOC groundwater concentrations are listed in Table 5-1 and were conservatively used in the initial screening step of the risk evaluation.

5.1 EXPOSURE ASSESSMENT

In order to identify constituents of potential concern (COPCs) for the vapor intrusion exposure pathway, the maximum detected current groundwater concentrations were compared to target groundwater concentrations from the USEPA's Vapor Intrusion Screening Level (VISL) Calculator Version 3.3 (USEPA, 2014a). The output from the VISL calculator and the chemical and physical parameters used for the initial screening assessment are provided in Appendix F; the VISLs are summarized in Table 5-1. These VISLs are based on a residential exposure scenario with target carcinogenic risk of 10^{-5} and target hazard index of 1. As a result of this conservative screening step, five constituents (benzene, ethylbenzene, TCE, xylenes, and naphthalene) were identified as groundwater-to-indoor air COPCs requiring further evaluation.

These particular groundwater COPCs are consistent with the findings of previous indoor air sampling conducted at the Site by Environmental Cost Management, Inc. (ECM, 2013). The ECM evaluation included: the collection of indoor air and ambient air samples, comparison of the sample data with risk-based target levels and typical indoor air concentrations, and a forensic

(source identification) analysis of the indoor air samples and groundwater samples (ECM, 2013). The ECM report concluded that:

- only benzene was detected at concentrations greater than the risk-based target levels
- the VOCs in the indoor air samples were derived from fuel hydrocarbons and not from manufactured gas plant sources and
- the detected indoor air concentrations of benzene were not significantly different from the ambient air sample concentrations.

In accordance with USEPA Region 4 recommendations (USEPA, 2014b), groundwater exposure point concentrations (EPCs) for the five identified COPCs in this current vapor intrusion risk evaluation were based on the 95 percent Upper Confidence Limit (UCL) of the arithmetic mean for data collected within the core of the groundwater plume. The groundwater plume was defined by groundwater monitoring wells with detected concentrations greater than the VISLs. This resulted in using the available data for eleven groundwater monitoring wells (MW-12, MW-205, MW-304, MW-311, MW-401SAP, MW-401D, MW-502D, MW-505D, MW-600, MW-601, and MW603). Nine of these wells are located in the Galliard formation and 2 in saprolite. The most shallow groundwater zone, the alluvial zone, was not significantly impacted. By using the two lower zones that are more distant from the ground surface, the exposure point concentrations are potentially overly conservative. The analytical data for one well, MW-21, was not included in the evaluation. Because there are non-detect wells between the Site and MW-21, the constituents detected in MW-21 are considered to be related to sources other than the Site. For each of the COPCs, the 95 percent UCL of the mean concentration was calculated using the USEPA's ProUCL Software, Version 5.00 software (USEPA, 2013). The analytical data used for the ProUCL program and the reports generated with ProUCL are presented in Appendix F.

The COPCs in groundwater were evaluated as a potential source of volatile emissions into a hypothetical future residential-use building located directly over the groundwater plume. USEPA's Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (USEPA, 2002) was used as a primary guidance document for this evaluation. In accordance with the guidance, site-specific future indoor air concentrations at the site were estimated, using USEPA's Johnson and Ettinger Model for Subsurface Vapor Intrusion into Buildings (GW-ADV, Version 3.1) (the J&E Model) (USEPA, 2004) and the 95 percent UCLs of the COPCs present in underlying groundwater.

Default and site-specific modeling parameters were used for estimating indoor air concentrations (Table 5-2). Based on site-specific depth to groundwater measurements in January 2015, the average depth to groundwater was estimated as 8.12 feet. The soil type at the Site is sandy clay loam and a soil classification of SCL was used for the purposes of estimating indoor air concentrations from subsurface vapor intrusion. The dimensions of a default residential building from the J&E model (32.8 feet by 32.8 feet with 12 foot ceilings) and a default air exchange rate of 0.25 exchanges per hour were assumed. Basement construction was assumed based on local building practices. The results of the J&E modeling for each COPC are located in Appendix F. The modeled indoor air EPCs are summarized in Table 5-3.

5.2 TOXICITY ASSESSMENT

Toxicity values [Inhalation Reference Concentrations (RfCs) and Inhalation Unit Risk (IURs)] used in this evaluation were obtained from the USEPA Integrated Risk Information System (IRIS) and USEPA's January 2015 Regional Screening Level Table (USEPA, 2015). IRIS has released a Toxicity Assessment for TCE that recommends TCE be addressed as a potential mutagen with risk for kidney-related impacts being assessed using age-specific adjustment factors and with liver and non-Hodgkin lymphoma (NHL) risk addressed using the standard carcinogenic equations. Separate TCE IURs have been derived for the mutagenic kidney and non-mutagenic liver-NHL endpoints. Table 5-3 includes the age-specific adjustment factors used to adjust the TCE exposure intakes.

The toxicity values used in this assessment are listed on Table 5-3. The RfC is used to estimate non-carcinogenic inhalation hazards. The RfC is an estimate of the daily exposure to the human population (including sensitive subgroups such as children and the elderly) that is likely to be without an appreciable risk of deleterious effects. The estimated hazard is compared to a target hazard index (HI) of one. In accordance with the Georgia Hazardous Site Response Act (HSRA), cumulative hazards less than one are not likely to be associated with systemic or non-carcinogenic health risks.

The IUR is characterized as an upper-bound estimate designed to be protective of the majority of the human population. Using the chemical-specific and endpoint-specific IURs, the total excess cancer riskfor the indoor vapor intrusion pathway were calculated for both mutagenic (TCE) and cancer risks (all COPCs) and the combined risks were compared to a target risk of

10^{-5}. If the total excess cancer risk for residents is less than 10^{-5}, risk is considered to be in the acceptable range under the Georgia HSRA Rule.

5.3 RISK CHARACTERIZATION

The modeled indoor air concentration of the COPCs were used to assess potential indoor air exposures and calculate incremental risks and hazards related to potential vapor intrusion into future residences at the Site for 30-year residents (Table 5-3). The estimated total excess cancer risk from vapor intrusion in indoor air is 2×10^{-4} for residents, which is greater than the target risk of $1x10^{-5}$. The majority of the hypothetical future cancer risk is associated with vapor intrusion of benzene, ethylbenzene, and naphthalene in groundwater. The estimated HI for vapor intrusion to indoor air is 3 for residents, which is greater than the threshold of 1. The majority of the hypothetical future hazard is associated with vapor intrusion of benzene in groundwater.

5.4 GROUNDWATER CONCENTRATIONS THAT ARE PROTECTIVE OF RESIDENTIAL INDOOR AIR EXPOSURES

The selected COCs for the site are those constituents that potentially contribute to a hazard index greater than 1 or total excess cancer risk greater than 1×10^{-5}. The particular groundwater COCs identified for the AGLC Augusta Site for protection of indoor air are benzene, ethylbenzene, and naphthalene.

The calculation of risk-based groundwater concentrations that are protective of indoor air for these COCs are presented in Table 5-4. These protective risk-based groundwater concentrations, also known as “remediation goals”, were back-calculated using the same assumptions used to estimate potential current risks and hazards associated with potential vapor intrusion from groundwater. Because the three COCs each act on different target organs, the non-carcinogenic remediation goals were calculated for a HI of 1. Because all three of the COCs are carcinogens, the carcinogenic remediation goals were calculated for a target risk of 3.3×10^{-6} so that the total excess cancer risk would not exceed 1×10^{-5}. The more conservative of the carcinogenic and systemic remedial goals for each compound were selected as the groundwater concentrations that are protective of indoor air exposures without need of vapor barriers or other ECs to prevent vapor intrusion exposure.

5.5 UNCERTAINTY ANALYSIS

The intent of the current study was to evaluate the potential for vapor intrusion into hypothetical future residences built above the groundwater plume at the Site without the use of vapor intrusion barriers or other (ECs) to prevent vapor intrusion exposure. Conservative risk-based screening criteria were used to complete a preliminary evaluation of risks and hazards for hypothetical future onsite residents. Key uncertainties associated with an inhalation risk evaluation include the estimation of representative exposure concentrations and exposure intakes, the choice of toxicity values, and the approach to estimating and aggregating risks (USEPA, 2009). Exposure point concentrations were based on wells located in the Galliard and Saprolite groundwater zones. To impact surface receptors, concentrations in these two zones would have to migrate through the overlying alluvial groundwater zone. Thus, the exposure point concentrations potentially overstate the groundwater source concentrations that could impact indoor air. If vapor transport is limited by the alluvial aquifer, then risk for future receptors would be negligible because the concentrations in the alluvial aquifer are less than vapor intrusion screening levels.

The assessment assumes future residents will be present 350 days a year with cumulative exposure durations of 30 years for residential adults and residential children to be consistent with the residential exposure duration used in the HSRA Rule. For the mutagenic risk calculation for TCE, the exposure is age-adjusted (6 years as a child, 12 years as an adolescent, and 12 years as an adult). These assumptions would tend to overestimate risks because residential tenure in one location averages approximately nine years (USEPA, 2011). In addition, the detected constituents are potentially biodegradable, and biodegradation and attenuation are not addressed by the J&E model.

The potential for increased sensitivity of children exposed to TCE was addressed through a quantitative adjustment of the toxicity values for TCE to account for early life susceptibility. Therefore, this assessment should be protective and not underestimate risks for early life exposures. (USEPA, 2015).

5.6 SUMMARY

To summarize, maximum detected concentrations of constituents detected in the upper three groundwater zones were conservatively compared to USEPA vapor intrusion screening levels for groundwater (Table 5-1). Based on this comparison, five volatile compounds were selected as COPCs for the VI pathway. The 95 percent UCL of the arithmetic mean for concentrations in 11 wells within an area of higher groundwater concentrations were used as the exposure point concentrations for VI modeling. Using the J&E model and default residential exposure assumptions (Table 5-2), the COPC UCLs were used to predict indoor air concentrations within a future hypothetical residence. The modeled indoor air concentrations were then used to estimate chemical-specific hazard quotients and excess cancer risks for future hypothetical residents. Three of the five COPCs (benzene, ethylbenzene, and naphthalene) had estimated excess cancer risks greater than 10^{-6} and contributed to a total excess cancer risk of 2×10^{-4}. Only benzene had a non-cancer hazard quotient greater than 1 (Table 5-3). Based on the results of the VI risk characterization, groundwater remediation goals protective of the indoor air vapor intrusion pathway were calculated for benzene, ethylbenzene, and naphthalene (Table 5-4). These remediation goals can be used to monitor improvement of the groundwater quality post-ISS. However, if residential properties were to be located above the groundwater plume in the future and groundwater concentrations remain at levels greater than the groundwater remediation goals, there is a potential for vapor to present an indoor air inhalation risk for future residents. Therefore, it is recommended on a case-specific basis, that vapor mitigation be incorporated into the design for future residential buildngs if located within the impacted groundwater area where groundwater concentrations remain greater than the groundwater remediation goals protective of indoor air exposures.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the recent Site assessments and activities, we offer the following conclusions and recommendations:

- The exposure pathways for surface water, unsaturated soil and sediment have been addressed and does not need to be further evaluated in the VRP for the Site.

- With groundwater use restrictions in place, VI from groundwater to indoor air may be the remaining complete exposure pathway for potential residual impacts in the upper aquifer post ISS. Based on the VI risk characterization, three VI COPCs (benzene, ethylbenzene, and naphthalene) may pose a VI risk for future residents and will be considered with the Site groundwater remedy.

- It is recommended on a case-specific basis that vapor mitigation be incorporated into the design for future residential buildings where groundwater concentrations remain impacted at concentrations greater than the groundwater remediation goals protective of indoor air exposures.

- Groundwater will continue to be sampled semi-annually consistent with the current program until construction is initiated. A modified program with a subset of existing wells will be sampled during ISS implementation to continue to evaluate groundwater quality.

- Locations of potential new/replacement wells will be identified after completion of construction activities and after an evaluation of Post ISS groundwater data from the subset of retained wells has been completed.

- Additional investigation for characterization and refinement of the remedial footprint as described in Section 4.0 will be performed prior to remedial actions.

- An updated well survey to verify the number of wells and well uses within the Site vicinity will be completed.

7.0 NEXT SUBMITTAL

As required by EPD, semi-annual progress reports must be submitted to EPD every June 1st and December 1st beginning in 2015 and ending in 2020, unless a compliance status report (CSR) is submitted and approved prior to 2020. A report for the second semi-annual period will be submitted by December 1, 2015 and is planned to include the following activities:

- Semi-annual groundwater monitoring reporting
- Results from completed additional investigation activities
- Updated well survey for the Site
- Update on planned corrective action of Subareas 1, 2, and 3
- Qualify additional Site parcels into the VRP

Notes:
N = Normal sample
DUP = Duplicate sample
DNAPL - Well not sampled due to presence of Dense Non-Aqueous Phase Liquid in well
BOLD=Analyte was detected above laboratory detection limit
Analyte concentration exceeds the Type 1 RRS
Detection limit exceeds the Type 1 RRS
H = Sample was prepped or analyzed beyond specified holding time

Notes:
N = Normal sample
DUP = Duplicate sample
DNAPL - Well not sampled due to presence of Dense Non-Aqueous Phase Liquid in well
BOLD=Analyte was detected above laboratory detection limit
Analyte concentration exceeds the Type 1 RRS
Detection limit exceeds the Type 1 RRS
H = Sample was prepped or analyzed beyond specified holding time

Prepared By: KPH 03/23/15
Checked By: SAG 03/26/15

Notes:
N = Normal sample
DUP = Duplicate sample
VAULT - Pump and Treat well sampled from manifold inside well vault
BOLD=Analyte was detected above laboratory detecti
Analyte concentration exceeds the Type 1 RRS
Detection limit exceeds the Type 1 RRS
H = Sample was prepped or analyzed beyond specified holding time
*MW-307BR and MW-308BR were resampled due to anomalous results likely due to rainwater infiltration through manifest attached to well. Resampled results are shown in the table.

Table 2-3
Groundwater Analytical Results for Bedrock Wells

Notes:
N = Normal sample
DUP = Duplicate sample
VAULT - Pump and Treat well sampled from manifold inside well vault
BOLD=Analyte was detected above laboratory detection limit
Analyte concentration exceeds the Type 1 RRS
Detection limit exceeds the Type 1 RRS
H = Sample was prepped or analyzed beyond specified holding time
*MW-307BR and MW-308BR were resampled due to anomalous results likely due to rainwater infiltration through manifest attached to well. Resampled results are shown in the table.

Prepared by: ADB 04/10/15
Checked by: RRY 04/13/15

RRS - Risk Reduction Standards
DL - Detection Limit
GW - Groundwater
NC - Not calculatable because toxicity values are not available
* If value exceeeded 100,000 mg/kg, the RRS was limited to 100,000 mg/kg
bgs - below ground surface
+ - soluble salts and complexes, n.o.s.
(a) When subsurface RRS is lower than direct contact value for surface soil, surface soil RRS defaults to subsurface RRS
(b) The calculated leaching to groundwater value is greater than the calculated value based on direct contact. Therefore, the calculated values for direct contact controls the RRS.
(c) USEPA Region 4 suggested screening levels limit maximum concentrations to 100,000 or less.
-- Not Applicable
Notes:
Delineation to upper background limits was completed for the Site as part of the EPD approved 2003 Remedial Investigation (RI) with details documented in Section 4.3 and Table 4-2 of the RI

Notes:
1) Delineation to upper background limits was completed for the Site as part or the EPD approved 2003 Remedial Investigation (RI) with details documented in Section 4.3 and Table 4-2 of the RI
2) Parcel numbers are abbreviated

Table 5-1
Summary of Groundwater Concentrations

Parameter	Maximum Detected Groundwater Concentration, µg/L (a)	Target Groundwater Concentration Protective of Indoor Air, µg/L (b)	Indoor Air COPC? (c)	95% Upper Confidence Limit µg/L (d)	Basis (d)
Volatile Organic Compounds					
Benzene	31,000	19	**Yes**	8,640	95% Adjusted Gamma KM-UCL
Ethylbenzene	2,400	44	**Yes**	699	95% Adjusted Gamma KM-UCL
Toluene	17,000	27,000	No	NA	
Trichloroethylene	41	7.1	**Yes**	15.3	95% KM(t) UCL
Xylenes, total	4,600	720	**Yes**	1,410	95% Adjusted Gamma KM-UCL
Semi-Volatile Organic Compounds					
Acenaphthene	130	NT	No	NA	
Acenaphthylene	210	NT	No	NA	
Anthracene	8.9	NT	No	NA	
Benzo(a)anthracene	2.8	NV	No	NA	
Benzo(a)pyrene	2.1	NV	No	NA	
Benzo(b)fluoranthene	1.8	NV	No	NA	
Benzo(g,h,i)perylene	0.79	NV	No	NA	
Benzo(k)fluoranthene	0.68	NV	No	NA	
Chrysene	2.1	NV	No	NA	
Dibenzo(a,h)anthracene	0.31	NV	No	NA	
Fluoranthene	6.9	NV	No	NA	
Fluorene	53	NT	No	NA	
Indeno(1,2,3-cd)pyrene	0.69	NV	No	NA	
Naphthalene	10,000	64	**Yes**	4,830	95% KM (Chebyshev) UCL
Phenanthrene	53	NT	No	NA	
Pyrene	8.5	NT	No	NA	

(a) Maximum detected concentrations for the alluvium, galliard, and saprolite formations during sampling events in July 2013, July 2014, and January 2015.
(b) Calculated with residential OSWER Vapor Intrusion Screening Level (VISL) Calculator Version 1.0,May 2014 RSLs using Target Cancer Risk = 0.00001 and Target Hazard Quotient = 1 and a site-specific average groundwater temperature of 18.6 degrees Celsius (January 2015 average) (Appendix E).
(c) Compound selected as a Chemical of Potential Concern (COPC) if maximum detected concentration is greater than target groundwater concentration protective of indoor air.
(d) Calculated using ProUCL, Version 5 (Appendix E). Rounded to 3 significant figures.
µg/L = micrograms per liter.
NT = No inhalation toxicity values available for this compound.
NV = Not volatile, USEPA Regional Screening Level table (January 2015).

m^3 = cubic meters
mg = milligram
RfC = Reference Concentration
µg = micrograms
IRIS - Integrated Risk Information System; Cal EPA - California Environmental Protection Agency
[1] Calculated using Johnson & Ettinger Spreadsheet (GW-ADV) and site-specific exposures. 95 percent Upper Confidence Limit (UCL) groundwater concentration used as the exposure point concentration (Appendix E).
[2] Exposure Concentration = See Equations below
[3] Hazard Quotient (Noncarcinogens) = Noncarcinogen Exposure Concentration/RfC x 1000 µg/mg
[4] Mutagenic Kidney Excess Cancer Risk = Mutagenic Exposure Concentration x Mutagenic Kidney Inhalation Unit Risk
[5] Excess Cancer Risk = Carcinogenic Exposure Concentration x Inhalation Unit Risk
[6] Total Excess Cancer Risk = Mutagenic Kidney Excess Cancer Risk + Non-Mutagenic Excess Cancer Risk

Prepared by: LWC 4/1/15
Checked by: LMS 4/2/15

Carcinogen Exposure Concentration = $CA \times ET \times EF \times ED / AT_c$ where: Noncarcinogen Exposure Concentration = $CA \times ET \times EF \times ED / AT_{nc}$ where:
Mutagenic Exposure Concentration = $CA \times ET \times EF \times ((ED2 \times AF2)+(ED4 \times AF4)+(ED10 \times AF10)+(ED14 \times AF\ 14)) / ATc$ where:

CA = Constituent Concentration in Air (estimated)	See above	(ug/m^3)	AT_{nc} = Averaging Time (Noncarcinogen, hours)	210,240
ET = Exposure Time (hours per day)	24	(hours/day)	AT_c = Averaging Time (Carcinogenic, hours)	613,200
EF = Exposure Frequency (days per year)	350	(days/year)		
ED = Exposure Duration (years)	30	(years)		
ED2 = Exposure Duration 2 (mutagen)	2	(years)		
ED4 = Exposure Duration 4 (mutagen)	4	(years)		
ED10 = Exposure Duration 10 (mutagen)	10	(years)		
ED14 = Exposure Duration ≥14 (mutagen)	16	(years)		
AF2 = Age-Dependent Adjustment Factor	10			
AF4 = Age-Dependent Adjustment Factor	3			
AF10 = Age-Dependent Adjustment Factor	3			
AF14 = Age-Dependent Adjustment Factor	1			

Table 5-4
Summary of Groundwater Remediation Goals Protective of Indoor Air Exposures

Receptor	Parameter	Target Organ	Concentration	Goal for Groundwater Concentration (HI=1), µg/L	Goal for Groundwater Concentration (TR=3.3 x 10^{-6}), µg/L
Onsite Residential Adult	Benzene	Blood	8,640	4,380	**180**
	Ethylbenzene	Developmental Toxicity	699	124,000	**476**
	Naphthalene	Nasal Effects	4,830	5,170	**487**

Note: Target Risk (TR) set at 3.3 x 10^{-6} so that the cumulative cancer risk equals 1 x 10^{-5}. Hazard index (HI) set at 1 because different target organs are affected. (Appendix E)

Goal for Groundwater (HI) = Groundwater Exposure Point Concentration - UCL (Table 5-1) / Chemical-specific Hazard Quotient (Table 5-3).

Goal for Groundwater (TR=3.3 x 10^{-6}) = (Groundwater Exposure Point Concentration - UCL (Table 5-1) x 3.3 x 10^{6}) / Chemical-specific Risk (Table 5-3).

Bold font indicates the selected groundwater remediation goals protective of residential indoor air exposures.

Notes:

BPLM extent revised based on results of data-gap investigation and installation of additional Galliard wells.

BPLM extent based on visual BPLM observations (before remediation) during boring and drilling; adjusted with the removal of BPLM in areas of In-Situ Solidification (ISS) and excavation; and comparison to 3d BPLM source model.

Extent shown conservatively assumes that observed BPLM were not reduced by ISCO.

Excavation areas for offsite properties from Corrective Action Closure Report (CACR), MACTEC, 1/16/2009.

Response to EPD's December 3, 2014 Comment Letter on the Augusta MGP Site Voluntary Investigation and Remediation Plan Application dated August 2014

Conceptual Site Model

1) No surface water data has been presented within the VRP Application to support or demonstrate the elimination of the noted 3rd Level Canal as a surface water exposure pathway. Please include a description of the surface water exposure pathway, including current surface water data, a more detailed description of the past corrective actions completed in the 3rd Level Canal, and a rationale for why the Canal should or should not be considered a complete pathway.

AGLC Response: *Language has been included in Section 2.2 of the First Semi-Annual Status Report to describe the surface water exposure pathway, past corrective actions completed in the 3rd Level Canal, and rationale for why the Canal should not be considered a complete pathway. Additionally, to evaluate current conditions in the 3rd Level Canal, two surface water samples were collected, one north of the Site and one south of the Site, on March 17, 2015 as shown on Figure 2-1 of the Status Report. Results for this recent surface water sampling are presented on Table 2-1 and discussed in Section 2.2.*

2) Considering that the in-situ stabilization (ISS) corrective action will be implemented to not only address source material, but to also address groundwater quality issues, groundwater cleanup criteria/goals should be developed prior to the implementation of the ISS corrective action. In particular, pre- and post-ISS groundwater evaluations should be developed and implemented to assess the degree of influence the ISS remedy will have on the groundwater quality at the site. Please note that this may require the installation of additional groundwater monitoring well locations to supplement the conceptual site model and contribute to the characterization of the dissolved phase groundwater plume.

AGLC Response: *As discussed in the VIRP, it is planned that qualifying parcels will have groundwater use restrictions eliminating the ingestion and dermal exposure pathways to groundwater. With these use restrictions in place, vapor intrusion (VI) from groundwater to indoor air will be the driving exposure pathway for potential residual impacts in the upper aquifer post ISS. An updated VI risk assessment has been completed using the most recent sampling data to represent current conditions. The risk assessment is included as Appendix E of the Status Report with a summary included in Section 5.0. A summary of the groundwater remediation goals protective of indoor air exposures is included in Tables 2-4 and 5-4.*

Groundwater will continue to be sampled semi-annually consistent with the current program until construction is initiated. Some wells in the remedial footprint will need to be abandoned due to the construction activities. A modified program with a subset of existing wells will be sampled during ISS implementation to continue to evaluate groundwater quality. After implementation of ISS is complete, groundwater flow in the upper aquifer will be altered by the solidified mass. Additionally, permeability and leaching potential will be greatly reduced within the ISS footprint. For these reasons, locations of potential new/replacement wells will be identified after completion of construction activities and after an evaluation of Post ISS groundwater data from the

subset of retained wells has been completed. It should be noted that AGLC does intend to install wells prior to construction as described in Section 4.4 of the Status Report to evaluate TCE impacts in Block C and support the delineation requirements identified in Comment 5.

Groundwater data collected in July 2014 and January 2015 have been added to the groundwater summary table presented in the VIRP and are included in the Status Report as Tables 2-2 and 2-3. The January 2015 semi-annual sampling report is included as Appendix C of the status report.

3) In support of addressing the delineation requirements included in Section 12-8-1-8 of the Act, please revise Table 1 to indicate the site specific delineation criteria and cleanup standards that were used or will be used for each of the established site-specific constituents of interest at the site as they are applied to each applicable exposure pathway (soils, sediment, groundwater, surface water, vapor intrusion).

AGLC Response*: Table 1 from the VIRP has been revised to include site specific delineation criteria and cleanup standards used for the established site-specific constituents of interest (COI) for soil, groundwater, and vapor intrusion pathways and is included as Table 2-4 of the Status Report. Soils/sediment in the Canal were remediated to the standards agreed upon between AGLC and EPD in the Basis of Design Work Plan (BDWP) and as documented in the approved OU-3 Corrective Action Closure Report. Additionally, the surface water exposure pathway is addressed in the response to Comment 1 and Section 2.2 of the Status Report.*

4) Section 3.4.2.1, Surface Soil and Sediments Ingestion and Contact, of the VRP Application indicated that AGLC has remediated this exposure pathway as described in Section 2.3 of the Application. However, Section 2.3 does not include definitive information to demonstrate that this exposure pathway has been remediated and eliminated. Additional information will be needed to demonstrate that the elimination of this exposure pathway including but not limited to the following:

   a. Indication of the delineation criteria and cleanup standards that were used to demonstrate compliance.
   b. Include copies of the formal letters from EPD approving the referenced criteria, cleanup standards, and associated compliance certification.
   c. Provide a reference to any applicable figure(s) and data table(s) that were used from previous report submittals to demonstrate compliance, or provide them as part of the supplemental supporting documentation to the VIRP.

AGLC Response: *Indication of delineation criteria and cleanup standards used to demonstrate compliance are located in Table 2-4 for the Surface Soil exposure pathway. As discussed in the response to Comment 3, soils/sediment in the Canal were remediated to the standards agreed upon between AGLC and EPD in the Basis of Design Work Plan (BDWP) and as documented in the approved OU-3 Corrective Action Closure Report. Copies of approval letters from EPD and compliance certification are included in Appendix A. Table 2-5 shows in which documents the standards/criteria for surface soil and sediments ingestion and contact can be found.*

5) Based on the groundwater data and associated file information for the site, additional groundwater data will be required at the following locations, in addition to those proposed within the VRP Application, in order to complete delineation requirements in accordance with Section 12-8-1-8 of the Act:

   a. Section 3.3.1 of the VRP Application indicated that the extent of impacts within the Galliard Zone north of monitoring well location MW-603 has not been delineated. Additional data will be required to delineate and characterize the vertical and horizontal extent of groundwater impacts in this area. In addition, according to the September 2014 16th Semiannual Corrective Action Effectiveness Report, dense non-aqueous phase liquid (DNAPL) was detected in monitoring locations MW-603 and MW-502D. Please ensure that the delineation and characterization activities in the area of MW-603 also include the delineation and characterization of the detected source material.
   b. Horizontal delineation the bedrock impacts to the northwest of monitoring well MW-318.
   c. Vertical delineation to the extent that will be influential to the established Remedial Action Objectives will need to be completed for the site.
   d. Please note that arsenic was detected in monitoring location MW-408S at 0.143 mg/L and nickel at monitoring location MW-306SAP at 0.378 mg/L. Please provide additional information relating to the origin of these particular contaminants and a determination of their associated delineation requirements.

AGLC Response: *Additional investigation of the areas listed in comment 5) a. and 5) b. above will be completed to support horizontal delineation in the referenced areas. A description of the planned additional investigation is presented in Section 4.0 of the Status Report. Vertical delineation to the extent that will be influential to the established RAOs will be evaluated and discussed in a future semi-annual report. MW-408S and MW-306SAP are both located on non-AGLC owned properties that may have impacts from their own property use or adjacent land use (i.e., gas station, railroad, city streets) and are likely not related to releases from former MGP operations since inorganic impacts are the primary constituents detected in these wells. MW-408S is approximately 1400 feet north by north west of Block A, and MW-306SAP is on Block A north of the gas station, as shown in Appendix C. These two wells will continue to be monitored as part of the ongoing groundwater sampling program, however ALGC does not consider the detected constituents in these wells to be indicative of releases from former MGP operations. Therefore, additional delineation efforts are not necessary at this time.*

6) Please include a proposed corrective action for the above referenced DNAPL source material identified in the areas of MW-502D and MW-603.

AGLC Response: *A vacuum truck will be deployed to attempt to remove product in MW-603 and will then be monitored to observe how quickly, if at all, product re-enters the well. DNAPL recovery observations will assist in developing appropriate next steps. Since MW-502D has only had a sheen of DNAPL observed, an interface probe will be*

used to evaluate conditions in MW-502D to assist in determining appropriate action which may include vacuum removal if measurable DNAPL is present. Prior to product removal from MW-603, a sample of the observed product will be collected for future analysis for site COIs. If measurable product is observed in MW-502D, a sample will also be collected for site COIs. A description of this scope of work is provided in Section 4.5 of the Status Report.

7) According the available file information for the subject site, a May 13, 2010, Continuing Action Monitoring Plan (CAMP) exists and includes deed restriction and affidavit documentation for multiple site related parcels. Please ensure that the warranty deed documentation included in the VIRP incorporates all pertinent deed documentation from this CAMP, and that the VIRP clearly links each of the warranty deed documents included in Appendix B to each of the listed qualifying properties.

AGLC Response*: Pertinent deed documentation from the CAMP has been added and is included in Appendix D of the Status Report.*

8) Please note that as part of future site related institutional controls that may be implemented as part of the VIRP, new Uniform Environmental Covenants (UEC) will need to be executed for all parcels where source materials will be left in place, in particular the parcels associated with the ISS remedy. For any additional parcels not associated with the ISS remedy but overlying the groundwater plume (above risk reduction standards), pre-existing groundwater use deed restrictions that were implemented as part of prior institutional controls will be acceptable. However, EPD is recommending that for any parcels that are found to overly the groundwater plume without pre-existing deed restrictions in place that all practical attempts be made to enact new UECs for these applicable parcels. Please note that at this time EPD cannot concur with the sole use of the Augusta-Richmond County Code well restriction to demonstrate the groundwater exposure pathway for these applicable parcels will remain incomplete during the future property use(s). In addition, please note that, as mentioned in Comment (3) above, implementation of the institutional controls for the impact to groundwater may require the installation of additional groundwater monitoring well locations to supplement the conceptual site model and ultimately limit the amount of parcels requiring UECs.

AGLC Response: *Comment noted. AGLC intends to work collaboratively with EPD to address the groundwater exposure pathway through the practical use of governmental and proprietary institutional controls to prevent exposure. The groundwater exposure pathway and related application of institutional controls will be further discussed with EPD and evaluated after implementation of remediation.*

17th SEMIANNUAL CORRECTIVE ACTION EFFECTIVENESS REPORT – JANUARY 2015 GROUNDWATER MONITORING EVENT
ATLANTA GAS LIGHT COMPANY
FORMER MANUFACTURED GAS PLANT SITE
AUGUSTA, GEORGIA
HSI NO. 10132

I certify that I am a qualified ground-water scientist who has received a baccalaureate or post-graduate degree in the natural sciences or engineering, and have sufficient training and experience in groundwater hydrology and related fields, as demonstrated by state registration and completion of accredited university courses, that enable me to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport. I further certify that this report was prepared by myself or by a subordinate working under my direction.

Adria Reimer, P.G. #002004

May 26, 2015

1.0 INTRODUCTION

Environmental Resources Management (ERM) has prepared this 17th Semiannual Corrective Action Effectiveness Report (CAER) on behalf of Atlanta Gas Light Company (AGLC). This report summarizes the results of the groundwater monitoring event performed in January 2015 at the former manufactured gas plant (MGP) Site in Augusta, Georgia (the Site).

The Site includes property owned by AGLC and formerly used for MGP operations, property owned by AGLC not used for MGP operations, surrounding and nearby parcels not owned by AGLC, a portion of the Third Level Canal, and city right-of-ways (ROW). The Site is divided between the "on-Site" areas for the AGLC property where former MGP operations were located (i.e., Northern Parcel, Southern Parcel, Western Parcel, and Southeastern Bituminous Parcel) and the "off-Site" areas for properties that were not part of the former MGP operations. The Site layout and location map (Figure 1-1) shows the setting of the AGLC property within the city of Augusta, Richmond County, Georgia.

The purpose of this report is to:

- Fulfill requirements of Consent Order EPD-VRP-011issued December 3, 2014;
- Fulfill requirements for groundwater monitoring outlined in the 2001 Corrective Action Plan (CAP) prepared for AGLC by ThermoRetec Consulting Corporation (ThermoRetec, 2001);
- Monitor changes in groundwater constituent-of-interest (COI) concentrations to determine post-remediation groundwater quality;
- Present monitored natural attenuation (MNA) results and evaluate MNA processes at the Site in the alluvium, Galliard Formation, saprolite, and bedrock groundwater units; and
- Confirm the continued stability of Galliard and bedrock groundwater plume extents.

2.0 BACKGROUND

Excavation and *in-situ* solidification (ISS) operations were completed for the Northern Parcel and Car Wash areas during fall 2003. In 2004, soil removal (excavation) activities were completed at Blocks A, E, G, and H; 8th Street and Fenwick Street; and along five segments of the Third Level Canal (designated Reach D, Reach E, Reach F, Reach G, and Reach H). The excavation and ISS remedial activities within the Northern Parcel were documented in the August 9, 2005, *Northern Parcel Corrective Action Closure Report* prepared by MACTEC and approved by the Georgia Department of Natural Resources, Environmental Protection Division (EPD) on February 24, 2006.

In-situ chemical oxidation (ISCO) of the church area (Block E), along the 8th Street ROW, within the Gas Station parcel, and along the Walton Way ROW was completed in November 2005. A *Corrective Action Closure Report* (CACR) for these off-Site areas (OU-1 and -2) was submitted by MACTEC on January 16, 2009, and was approved by EPD in a letter dated March 30, 2009. A separate CACR was also prepared for the Third Level Canal (OU-3) following completion of remediation activities adjacent to the CSX Railroad property. The CACR for OU-3 was submitted by MACTEC on January 16, 2009, and approved by EPD in a letter dated March 30, 2009. A bedrock groundwater extraction and treatment system has operated at the Site since November 2006. Groundwater is extracted from MW-307BR and MW-308BR, treated via activated carbon, and discharged to the publicly owned treatment works (POTW).

A supplemental bedrock investigation was performed by AECOM in July 2008 and included the installation of nine additional bedrock monitoring wells (MW-503BR, MW-504BR and MW-506BR through MW-512 BR). Results of this investigation are summarized in AECOM's *Bedrock Ground Water Investigation Report* dated February 19, 2009. All the installed bedrock monitoring wells were subsequently added to the monitoring network.

In correspondence dated March 6, 2009, AGLC responded to EPD's comments to the 4th CAER and provided a proposed approach and timeframe to develop a Site Conceptual Model (SCM) and conduct groundwater modeling (following approval by EPD of the SCM), and prepare a feasibility study (FS; following approval by EPD of the Ground Water Modeling Report) in order to address the Site as a whole and better define an effective path to closure. A draft SCM dated June 19, 2009, was submitted to EPD by Environmental Cost Management, Inc. (ECM) on behalf of AGLC. A revised SCM, addressing EPD comments dated August 3, 2009, was submitted by ECM on October 2, 2009. The revised SCM presented changes to the well network that were approved in EPD's August 3, 2009, letter. These changes to the monitoring well network were incorporated into the current sampling event. A revised SCM was submitted to EPD on December 28, 2009, and approved by EPD in a letter dated March 19, 2010.

A supplemental data gap investigation was performed by ECM in October 2010 in accordance with the recommendations of the December 2009 SCM. The investigation included the installation of one additional bedrock monitoring well (MW-513BR), and the installation of four additional Galliard Formation monitoring wells (MW-600, MW-601, MW-602, and MW-603). In addition, one alluvium well (MW-04) and five Galliard Formation wells (MW-18, MW-201, MW-210, MW-305, and MW-407D) were decommissioned based on the recommendations of the EPD-approved SCM. MW-408D was abandoned and replaced with MW-408DR. Results of this investigation are summarized in ECM's *Data-Gap Investigation and Monitoring Well Installation/Decommissioning Report* dated February 14, 2011. The installed monitoring wells have been included in the monitoring well network.

The results of the 2010 data gap investigation were incorporated in ECM's *Site Conceptual Model Addendum* (SCM Addendum) dated February 17, 2012. The SCM Addendum recommended an overall reduction to the monitoring well network, and the continued inclusion of bedrock monitoring wells MW-504BR and MW-510BR within the well network to monitor plume control. In a May 23, 2012 letter, the EPD approved a number of the reductions, including the abandonment of five wells (MW-11, MW-23, MW-211, MW-312, and MW-314), and the elimination of sampling and/or gauging in a number of Discrete Depth Sampling Port (DDSP) wells. Well abandonment work was completed in July 2012, with the exception of MW-211, which was not abandoned due to access issues and will be abandoned during future activities. Ongoing groundwater monitoring reflects the revised monitoring well network, which was documented in Table 3-8 of ECM's June 22, 2012 response to the EPD's May 23, 2012 letter.

The *Ground Water Flow and Transport Model* report was submitted to the EPD on June 5, 2012. The EPD provided comments on June 29, 2012. In general, the comments discussed the need for inclusion of a sensitivity analysis and a detailed calibration of the model results to historical monitoring data. A response with the additional analysis was provided to the EPD on August 14, 2012. In accordance with the Site-wide approach developed in 2009, an FS was prepared based on the results of the *SCM Addendum* and the groundwater modeling. The FS was submitted to the EPD on December 13, 2012, and recommended excavation in Block C (D'Antignac Street), with MNA in the street areas and Block E as access issues, utilities, and the presence of buildings limit effective implementation of a remedy. The FS also recommended discontinuing operation of the bedrock groundwater extraction system.

EPD provided comments to the FS in correspondence dated October 9, 2013, and required that actions be taken to address remaining source materials in all areas of the Site, including the street areas and Block E. Rather than submitting a revised FS, the EPD requested that the comments be addressed in a Revised Corrective Action Plan. In subsequent meetings and correspondence with EPD, it was agreed that AGLC would submit a Revised CAP by August 29, 2014.

After further evaluation and coordination, AGLC and EPD agreed that the Augusta MGP Site was a candidate for enrollment in the Georgia Voluntary Remediation Program (VRP). AGLC received a letter from EPD concurring with moving the Augusta MGP Site into the VRP contingent on execution of a new Consent Order moving the Augusta MGP Site into the VRP as well as submittal of an acceptable Voluntary Investigation and Remediation Plan (VIRP) in lieu of a Revised Corrective Action Plan (RCAP) by August 28, 2014., consistent with the original RCAP submittal deadline. The VIRP was hand-delivered to the EPD on August 28, 2014.

Proposed Consent Order EPD-VRP-011 was transmitted by EPD to AGLC on June 27, 2014 for review and signature. AGLC signed the proposed Consent Order and transmitted back to EPD on July 22, 2014. The public notice period for the proposed Consent Order EPD-VRP-011 closed on September 10, 2014. Additionally, to demonstrate AGLC's commitment to enrolling the Augusta MGP Site in the VRP, AGLC submitted an initial VIRP Application Form and Checklist with associated VRP application fee on August 6, 2014.

On behalf of AGLC, AMEC submitted the Voluntary Investigation and Remediation Plan (VIRP) to EPD on August 28, 2014. The VIRP provided the proposed remediation approach, schedule and supporting documentation, and included an updated VIRP Application form. The EPD approved the VIRP application in a December 3, 2014 letter, which also set forth the required schedule for semiannual progress reports on June 1st and December 1st of each year, and additional requirements for the December 1, 2017 progress report. A second letter from EPD, also dated December 3, 2014, provided additional technical comments on the VIRP, which are to be addressed in subsequent progress reports.

Groundwater sampling events conducted between 2001 and 2006 were summarized in previous semiannual groundwater monitoring reports. Groundwater sampling events conducted after completion of corrective actions described above from 2007 through the present have been summarized in CAERs.

2.1 GROUNDWATER MONITORING AND EVALUATION STUDIES

This semiannual corrective action effectiveness groundwater monitoring and evaluation event was conducted in accordance with the *Ground Water Monitoring and Evaluation Plan* presented as Section 5.0 of the 2001 *CAP* (ThermoRetec, 2001) and, in part, the *Update of the Revised Ground Water Monitoring Plan* (GMP; ENSR Correspondence, May 2007). The sampling event conducted in January 2015 was the 17th groundwater sampling event in the post-ISCO monitoring period as outlined in the revised *Basis of Design Work Plan* (LAW, 2002).

This section of the report describes procedures used for groundwater gauging, sampling, chemical analysis, quality assurance/quality control (QA/QC), and management of investigation-derived waste. Groundwater samples were collected using low-flow methods with peristaltic pumps.

2.2 SCOPE OF WORK

The 17th semiannual corrective action effectiveness groundwater sampling event included the following field and reporting tasks:

2.2.1 Field Tasks

- Gauge groundwater levels.
- Sample groundwater.
- Manage investigation-derived waste.

2.2.2 Reporting Tasks

- Prepare groundwater elevation maps for the alluvium, Galliard, and saprolite units.
- Prepare groundwater potentiometric surface contour lines within the bedrock and transition units.
- Prepare summary tables of laboratory analytical results for COI.
- Evaluate analytical results relative to Type 1 Risk Reduction Standards (RRS).
- Prepare maps showing Type 1 RRS exceedances for COI in alluvium, Galliard formation, saprolite, and transition zone/bedrock.
- Prepare benzene and naphthalene isoconcentration maps for the Galliard Formation and bedrock.
- Evaluate MNA indicator parameters.

2.3 GROUNDWATER MONITORING NETWORK

The list of wells selected for semiannual corrective action monitoring and evaluation was submitted to the EPD on July 8, 2001, along with the rationale for their inclusion. As noted earlier, the bedrock monitoring wells installed in July 2008 were included in the July 2014 sampling event.

As indicated in ERM's November 14, 2008 response to EPD, long-term inclusion of these wells in the monitoring network was evaluated based on the sampling results. In addition, the four Galliard monitoring wells and one bedrock monitoring well installed in October 2010 were included in this sampling event. The February 2012 *SCM Addendum* proposed further modifications to the monitoring well network. Most of these modifications were approved by the EPD in correspondence dated May 23, 2012. The revised monitoring well network was documented in Table 3-8 of ECM's June 22, 2012 response to the EPD. The current status of each active monitoring network well is listed in Table 2-1, and the locations of the existing monitoring wells are shown on Figure 2-1. The well list has been revised to reflect the comments in EPD's May 23, 2012 correspondence regarding the SCM Addendum.

Sixty (60) monitoring wells were included in the sampling network during the January 2015 sampling event. Two monitoring wells have been destroyed by activities associated with City of Augusta contractors (MW-5 and MW-506BR). MW-506BR was paved over during improvements to Dyess Park and is no longer accessible for sampling. MW-5 was destroyed during work conducted by the City of Augusta Canal Authority during construction of the Canal Trail. In addition, three monitoring wells were not sampled due to the presence of dense non-aqueous phase liquid (DNAPL) observed during gauging (MW-205, MW-502D, and MW-603). As a result, groundwater samples were collected from fifty-five (55) monitoring wells. A summary of well construction information is included as Table 2-2.

2.3.1 On-Site Wells Sampled

The following on-Site wells were sampled in January 2015:

MW-12	MW-19	MW-202DR	MW-203	MW-207
MW-213	MW-308BR	MW-310SAP	MW-310BR	MW-311
MW-402S	MW-402D	MW-508BR	MW-601	

- MW-5 has been destroyed by the City of Augusta Canal Authority during construction of the Canal Trail. As such, MW-5 was not sampled.
- MW-205 was not sampled due to DNAPL observed in the well.

2.3.2 *Off-Site Wells Sampled*

Off-Site monitoring wells sampled in January 2015 include the following:

- City of Augusta ROW: MW-21, MW-22, MW-206, MW-214, MW-313, MW-408DR, MW-408S, MW-500BR, MW-503BR, MW-504BR, MW-507BR, MW-509BR, MW-510BR, and MW-513BR
- Augusta Civic Center Authority: MW-318, MW-320, and MW-325
- AGLC owned and/or leased to Miracle Making Ministries: MW-401S, MW-401D, MW-401SAP, MW-404DR, MW-501S, MW-505D, and MW-602
- Miracle Making Ministries: MW-304
- Amoco: MW-306D, MW-306SAP, MW-306TZ, MW-306BR, MW-511BR, MW-512BR, and MW-600
- Joseph Norris: MW-303 and MW-309BR
- Georgia Power: MW-307D, MW-307SAP, MW-307BR, MW-321, and MW-324
- The Catholic Church of the Most Holy Trinity: MW-319
- United States Post Office: MW-315
- MW-502D and MW-603 were not sampled due to DNAPL observed in the well during purging.
- MW-506BR has been paved over (destroyed) by the City of Augusta sometime between July 2012 and January 2013. As such, MW-506BR has not been sampled since July 2012.

2.4 *GROUNDWATER SAMPLING AND ANALYSIS*

During the initial groundwater gauging task, the condition of each well was noted, including the concrete surface seal, outer casing, inner expandable well cap, and lock. ERM replaced or repaired any well caps or locks that were damaged or missing. In addition to MW-5 and MW-506BR, which have been destroyed, damage to the well vault lids and locking caps were noted for MW-408S and MW-408DR. AGL has contacted the Canal Authority regarding this damage and repairs are being scheduled. Prior to sampling, all wells were gauged with an oil-water interface meter for depth to water.

Due to the historical detections of non-aqueous phase liquid (NAPL) at MW-205, MW-502D, and MW-603 care was taken to prevent possible cross contamination. A dedicated interface probe was dropped to the bottom of these wells following the groundwater gauging event to assess whether NAPL was present. NAPL was detected at the bottom of well MW-603 and a non-continuous detection of NAPL thickness was measured within the well column of MW-205 and MW-

502D. Due to the detections of NAPL, MW-205, MW-502D, and MW-603 were not sampled.

Before groundwater samples were collected, each well was purged using low-flow/low-volume techniques conducted in accordance with ERM's standard operating procedures, which are based on technical guidelines from U.S. Environmental Protection Agency Region 4 Science and Ecosystem Support Division Operating Procedures (USEPA, 2013). Monitoring wells experiencing excessive drawdown (>0.3 feet) were purged by removing a minimum of three well volumes or until the well ran dry, with the exception of bedrock wells where the removal of so large a volume was infeasible. In addition, the DDSP wells were purged by removing a minimum of three volumes, or until dry, because the small diameter of the well prevents simultaneous monitoring of the depth to water. The purpose of purging the well is to draw fresh formation water into the well so that the samples are representative of the portion of the aquifer surrounding the well. If a well was completely evacuated during purging, it was allowed to recharge and the groundwater sample was collected immediately after the well had fully recharged.

Field documentation of groundwater quality measurements included pH, conductivity, temperature, dissolved oxygen (DO), oxidation-reduction potential (ORP), and turbidity. Field parameter values and corresponding purge volumes were recorded on groundwater sampling forms. Copies of these forms for the January 2015 sampling event are included in Appendix A.

Groundwater samples were analyzed for the COI list (Table 2-3) as referenced in the CAP and the revised GMP. Analytical Environmental Services (AES) laboratory performed the analytical services. Laboratory analytical reports are provided in Appendix B.

The post-remedy semiannual monitoring reports include an evaluation to determine if MNA is a viable remedy for alluvial, Galliard Formation, saprolite, or bedrock groundwater. MNA parameters analyzed during the January 2015 sampling event are also listed in Table 2-3. MNA analyses were performed by AES.

2.5 *QUALITY CONTROL/QUALITY ASSURANCE SAMPLES*

Field QC samples were collected and analyzed to document the accuracy and precision of the laboratory. QC samples included:

- Trip Blanks. One trip blank accompanied each cooler containing volatile organic compound (VOC) samples sent to the laboratory. Trip blanks were analyzed to determine if any contaminants were introduced while

samples were stored or while in transit to the laboratory. Trip blanks were analyzed for VOCs only.

- Field Duplicates. Six field duplicates were collected, one from each of the following wells: MW-12, MW-306TZ, MW-307BR, MW-308BR, MW-315, and MW-401SAP. All duplicate samples were analyzed for COI and DUP-02, DUP-03, and DUP-06 (surrogate samples MW-315, MW-12, and MW-401SAP, respectively) were also analyzed for selected MNA parameters. Duplicates were collected to determine the precision of groundwater sample analysis and the variability of collection procedures.
- Matrix Spikes and Matrix Spike Duplicates. A total of three Matrix Spike and Matrix Spike Duplicate (MS/MSD) sample sets were collected from MW-207, MW-401SAP, and MW-309 as part of the laboratory analytical batch QC.

2.6 MANAGEMENT OF INVESTIGATION WASTE

All purge water from sampling activities was treated by the on-Site treatment system prior to ultimate discharge to the publicly owned treatment works (POTW). Personal protective equipment and other trash was placed in bags and deposited in solid waste containers.

3.0 GROUNDWATER MONITORING RESULTS

This section summarizes results of the January 2015 corrective action monitoring and evaluation event, including groundwater flow and elevations, analytical results, QA/QC, and data validation.

3.1 GROUNDWATER FLOW AND ELEVATIONS

During the January 2015 sampling event, all groundwater wells were inspected and the groundwater levels were gauged and recorded, as applicable. Groundwater elevation data derived from water level measurements collected in January 2015 is presented in Table 3-1. With the exception of porosity for the bedrock hydrogeologic unit, seepage velocity calculations in each unit are based on hydraulic conductivity estimates provided in the 2009 *Site Conceptual Model*, the average of porosity estimates given in the 2003 *Remedial Investigation* report, and January 2015 horizontal hydraulic gradients calculated by solving three-point problems for wells screened in each unit. Parameters (and sources, where applicable) used to calculate seepage velocity in each hydrogeologic unit and the resultant seepage velocity is summarized in Appendix C. The groundwater pump and treat system was shut off for a carbon changeout December 29, 2014 and remained off for fourteen (14) days prior to the gauging event on January 12, 2015. Therefore, the January 2015 groundwater flow and directions are indicative of ambient conditions.

The ISS masses have created an obstacle to groundwater flow on the Northern Parcel and on the former Car Wash property, since the hydraulic conductivity of each mass is several orders of magnitude lower than that of the surrounding alluvium in those portions of the shallow aquifer. The lower hydraulic conductivity of each mass (ranging from 10^{-9} to 10^{-7} centimeters per second) causes increased groundwater flow in the more permeable alluvium. Because groundwater cannot effectively flow through the ISS mass, no groundwater elevation contours are associated with this area.

Prior to soil remediation and ISS, groundwater flow in both the alluvium and Galliard Formation was generally in an easterly direction, with exception of seasonal conditions in the unconfined alluvium aquifer, which sometimes reversed the direction of flow into the Third Level Canal. Alluvium groundwater in January 2015 flowed toward the Northern Parcel from the north (MW-306S and MW-501S), west (MW-402S), and the south (MW-17 and MW-401S) (Figure 3-1). Seepage velocity in alluvial groundwater is estimated to be $1.2*10^{-1}$ ft/day.

The general post-ISS local flow pattern in the Galliard Formation has been an easterly flow, with a steeper groundwater gradient along the western boundary of the canal west of the Northern Parcel with a zone of nearly flat gradient encompassing the Site. This pattern is observed during the January 2015 monitoring event with overall groundwater flowing easterly, toward the Savannah River (Figure 3-2). The groundwater flow conditions observed beginning in January 2011 differed from the pattern during previous monitoring events conducted from January 2008 through July 2010, where localized mounding occurred around the Site and groundwater flowed radially outward. Groundwater flow in the Galliard unit is influenced by the extremely low hydraulic conductivity of the ISS mass in the Northern Parcel and Car Wash area, which causes groundwater downgradient (east) of the ISS mass in the Northern Parcel to form a near-stagnant zone of very low gradient. Groundwater flow is complex in the immediate vicinity of the ISS masses, leading to some variability in localized groundwater flow patterns from event to event. Seepage velocity in Galliard groundwater outside the ISS mass is estimated to range from $2.4*10^{-3}$ to $9.9*10^{-3}$ ft/day.

The January 2015 groundwater elevation data for the saprolite unit indicates groundwater flow trends east towards MW-214 (Figure 3-3). The differences in the groundwater elevations between MW-307SAP (located adjacent to MW-307BR) and MW-306SAP (located approximately 250 feet upgradient of MW-307BR) were previously compared for operating and non-operating periods. In July 2008 (system shutdown), the elevation difference was 0.36 feet, while in January and July 2009 (system running) the elevation differences were 2.39 and 2.45 feet, respectively. Comparisons of elevation data for MW-214 (located near MW-308BR) and MW-309SAP (located over 400 feet downgradient) during the same time periods indicate similar relationships. This suggests that the bedrock extraction system influences groundwater flow within the saprolite. Any groundwater flow in saprolite (or bedrock) interpreted near or adjacent to the ISS mass is assumed to flow under the mass. Groundwater flow is possible in the saprolite unit since ISS was keyed only into the top of saprolite and not completed through the entire vertical extent of the unit. The elevation of groundwater in saprolite is lower than the elevation of the bottom of the ISS mass and therefore, interpreted groundwater flow is beneath the ISS mass. Seepage velocity in saprolite groundwater is estimated to be $8.6*10^{-5}$ ft/day.

The bedrock aquifer is a crystalline-rock aquifer that exhibits very high interconnectivity of the fracture sets and foliation planes to such a degree that groundwater flow simulates an anisotropic porous medium. Groundwater flow, as well as dissolved constituent transport, is dominated by the northeast-southwest orientation of the primary fracture system (see the *Bedrock Ground Water Investigation Report* [AECOM, 2009] for a more detailed discussion of the bedrock features).

Potentiometric surface contour lines are presented in Figure 3-4 to infer potential groundwater flow directions in bedrock in January 2015 following over seven years of extraction system operation.

Because of the influence of bedrock fracture orientation, localized groundwater flow is not necessarily perpendicular to the potentiometric surface at all locations. Since fractured bedrock aquifers are inherently anisotropic and heterogeneous, calculation of seepage velocity may not be representative using bulk porosity estimates. However, a range of porosity estimates may provide bounds on the expected seepage velocity of the bedrock aquifer. As presented in Appendix C, multiple estimates of seepage velocity were calculated by solving three-point problems for different areas of the Site and using a range of porosity estimates from the literature. The calculated range of seepage velocity in bedrock aquifer at the Site is between $6.5*10^{-3}$ and $6.1*10^{-1}$ ft/day.

Based on January 2015 data collected under ambient (non-pumping) conditions, groundwater flow in bedrock appears to be toward the southeast (Figure 3-4). The groundwater recovery well at MW-307BR, which has subsequently returned to operation following the January 2015 sampling event, has historically captured groundwater in the bedrock from up to 900 feet to the northeast as was evidenced by the groundwater gradient towards the pumping wells at MW-325 in previous reports.

3.2 GROUNDWATER ANALYTICAL RESULTS

Analytical results for groundwater samples collected in January 2015 from wells monitoring the various aquifers are summarized in Tables 3-2 through 3-6. These results were compared to Type 1 Risk Reduction Standards (RRS). Detected concentrations exceeding the Type 1 RRS are presented in Figures 3-5 through 3-8. Field sampling forms are included in Appendix A, copies of the laboratory analytical reports are provided in Appendix B, and data validation reports are attached in Appendix D. A complete summary of all analytical data collected for the groundwater monitoring program (since 2001) is provided in Appendix E. A summary of the January 2015 benzene and naphthalene monitoring results and comparison to historical data is presented in Section 4.

3.2.1 Alluvium

Analytical results for samples collected from alluvium monitoring wells were compared to their respective Type 1 RRS in Table 3-2. The number of alluvium monitoring wells sampled, number of detections for each COI, range of concentrations, and wells with Type 1 RRS exceedances is summarized in Table 3-7. The locations where exceedances occurred and the concentrations of COI detected above the Type 1 RRS during the January 2015 groundwater monitoring event are shown in Figure 3-5. Benzene (MW-501S) was the only VOC or SVOC detected above Type 1 RRS and arsenic (MW-408S) and cadmium (MW-501S) were the only exceedances are reported for groundwater samples collected at alluvium monitoring wells.

Benzene and cadmium were reported at MW-501S at concentrations of 35 µg/L and 0.0153 mg/L, respectively above the Type 1 RRS of 5 µg/L and 0.005 mg/L, respectively. Benzene has not historically been detected in MW-501S, which is located on the west side of the canal.

Prior to this event, all benzene results have been non-detect since February 2007, with the exception of an estimated concentration (0.37J µg/L) in July 2010. Arsenic was reported at 0.222 mg/L above the Type 1 RRS of 0.05 mg/L in the groundwater sample collected at MW-408S.

3.2.2 Galliard Formation

Analytical results of samples collected from the Galliard Formation wells were compared to their respective Type 1 RRS, as summarized in Table 3-3. The number of Galliard monitoring wells sampled, number of detections for each COI, range of concentrations, and wells with Type 1 RRS exceedances is summarized in Table 3-8. The locations where exceedances occurred and the concentrations of COI detected above the Type 1 RRS during the January 2015 groundwater monitoring event are shown in Figure 3-6. The distributions of benzene and naphthalene concentrations in groundwater samples collected from the Galliard Formation are depicted in Figure 3-9.

The greatest number of COI and the highest detected concentrations are found in groundwater sampled from wells MW-12, MW-600, and MW-601 located in the northeast corner of the Southern Parcel, in the city ROW south of Block A, and in the western-central portion of Block E, respectively (Figures 3-6 and 3-9). Monitoring wells MW-205, MW-502D and MW-603 contained DNAPL and were not sampled.

3.2.2.1 Volatile Organic Compound Results

During the January 2015 sampling event, benzene concentrations exceeding the applicable Type 1 RRS in groundwater were reported at four (4) well locations (MW-12, MW-304, MW-600 and MW-601). Ethylbenzene concentrations exceeding the applicable Type 1 RRS were reported in two (2) groundwater samples (MW-12 and MW-601). Toluene concentrations exceeding the applicable Type 1 RRS were reported in two (2) groundwater samples (MW-600 and MW-601; Table 3-3 and Table 3-8). The distribution of detected VOCs, specifically MGP-related compounds, in groundwater samples collect from the Galliard formation is similar to that reported in previous events.

Trichloroethylene (TCE) concentrations exceeding the applicable Type 1 RRS in groundwater were reported at well locations MW-21 and MW-401D. TCE is not an MGP-related constituent. No other VOCs were detected at MW-21 and MW-401D.

Specific VOCs were analyzed at a dilution due to the concentration of target compounds exceeding the calibration range of the instrument. The dilution factor and subsequent laboratory reporting limit exceeded the Type 1 RRS for specific VOCs analyzed in groundwater samples collected at monitoring wells MW-600 and MW-601 (Table 3-3). Samples that were analyzed at a dilution exceeding the Type 1 RRS have been highlighted in Table 3-3. The laboratory reports indicate the dilution factor for each laboratory sample (Appendix B).

3.2.2.2 Semivolatile Organic Compound Results

The number of SVOC detections and exceedances of Type 1 RRS and the respective wells in which the exceedances occurred are presented in Table 3-8. The spatial distribution of SVOC Type 1 RRS exceedances within the Galliard Formation are represented in Figure 3-6. During the January 2015 sampling event, naphthalene concentrations exceeding the applicable Type 1 RRS in groundwater were reported at four (4) well locations (MW-12, MW-304, MW-600 and MW-601). An isoconcentration map showing naphthalene distribution is presented as Figure 3-9. The distribution of SVOCs remains consistent with those reported in previous events.

3.2.2.3 Inorganic Compound Results

The data presented in Table 3-3, Table 3-8, and on Figure 3-6 indicate that the only inorganic compounds to exceed Type 1 RRS during the January groundwater monitoring event were as follows:

- Selenium at MW-207 was detected at 0.0687 mg/L, above the Type 1 RRS of 0.05 mg/L;
- Cadmium at MW-401D was detected at 0.0358 mg/L, above the Type 1 RRS of 0.005 mg/L; and
- Arsenic at MW-408DR was detected at 0.429 mg/L, above the Type 1 RRS of 0.05 mg/L.

The laboratory reporting limit for antimony (0.02 mg/L), beryllium (0.01 mg/L) and thallium (0.02 mg/L) exceeded the respective Type 1 RRS values (Table 3-3).

3.2.3 Saprolite

Analytical results for groundwater samples collected from the saprolite wells were compared to their respective Type 1 RRS in Table 3-4. The number of monitoring wells with detections and Type 1 RRS exceedances for the saprolite unit are presented in Table 3-9 and Figure 3-7.

Concentrations detected at MW-311 exceeded the Type 1 RRS for benzene (5 µg/L) at 370 µg/L and naphthalene (20 µg/L) at 560 µg/L, and at MW-401SAP exceeded the Type 1 RRS for TCE (5 µg/L) at 20 µg/L. TCE is not an MGP-

related constituent. No other VOCs or SVOCs exceeded Type 1 RRS for saprolite wells in the January sampling event.

Nickel concentrations were reported above Type 1 RRS (0.1 mg/L) at MW-306SAP (0.151 mg/L) and MW-310SAP (0.336 mg/L). No other inorganic compounds were detected at concentrations exceeding Type 1 RRS. Laboratory reporting limits for antimony (0.02 mg/L), beryllium (0.01 mg/L) and thallium (0.02 mg/L) exceeded the respective Type 1 RRS values.

3.2.4 Transition Zone

Analytical results for samples collected from transition zone well MW-306TZ are compared to their respective Type 1 RRS in Table 3-5. Type 1 RRS exceedances for the transition zone well are presented in Table 3-10. As shown on Figure 3-8, naphthalene was detected at a concentration exceeding the Type 1 RRS (20 µg/L) in MW-306TZ at 300 µg/L. There were no Type 1 RRS exceedances for VOCs or inorganic compounds in MW-306TZ during the January 2015 sampling event.

3.2.5 Bedrock

Bedrock sampling results reported from the January 2015 groundwater monitoring event were compared to their respective Type 1 RRS in Table 3-6. The number of bedrock monitoring wells sampled, number of detections for each COI, range of concentrations, and wells with Type 1 RRS exceedances are summarized in Table 3-11. The detected constituent concentrations exceeding Type 1 RRS and the locations of the monitoring wells are depicted in Figure 3-8.

3.2.5.1 Volatile Organic Compound Results

As shown on Figure 3-8, benzene, ethylbenzene, and toluene were the only VOCs detected at concentrations exceeding the Type 1 RRS in bedrock monitoring wells during the January 2015 sampling event.

- Benzene concentrations exceeded the Type 1 RRS (5 µg/L) in nine (9) bedrock monitoring wells ranging from a low of 35 µg/L at MW-503BR to a high of 13,000 µg/L at MW-500BR;
- Ethylbenzene was detected at concentrations exceeding the Type 1 RRS in four (4) bedrock monitoring wells: MW-213 (1,500 µg/L), MW-307BR (2,100 µg/L), MW-308BR (810 µg/L), and MW-500BR (1,200 µg/L); and
- Toluene was detected at concentrations exceeding the Type 1 RRS (1,000 µg/L) at MW-308BR (2,100 µg/L).

Specific VOCs were analyzed at a dilution due to the concentration of target compounds exceeding the calibration range of the instrument. The dilution factor and subsequent laboratory reporting limits exceeded the Type 1 RRS for specific VOCs analyzed in groundwater samples collected at monitoring wells

MW-307R, MW-308R, and MW-500BR. Samples that were analyzed at a dilution exceeding the Type 1 RRS have been highlighted in Table 3-6. The laboratory reports indicate the dilution factor for each sample ID (Appendix B).

3.2.5.2 *Semivolatile Organic Compound Results*

One or more SVOCs were detected at concentrations exceeding their Type 1 RRS in groundwater samples collected at eight (8) bedrock well locations during the January 2015 sampling event (Figure 3-8, Table 3-6, and Table 3-11). Naphthalene was the primary SVOC detected above Type 1 RRS (20 µg/L) at concentrations ranging from 150 µg/L (MW-511BR) to 14,000 µg/L (MW-213). Concentrations and specific COIs detected in bedrock groundwater samples above Type 1 RRS are similar to those reported in previous events.

3.2.5.3 *Inorganic Compound Results*

The only Type 1 RRS exceedances for metals in bedrock groundwater was for cadmium (Type 1 RRS value of 0.005 mg/L) in monitoring well MW-325 (0.0090 mg/L). Laboratory reporting limits for antimony (0.02 mg/L), beryllium (0.01 mg/L), and thallium (0.02 mg/L) exceeded the respective Type 1 RRS values.

3.3 NATURAL ATTENUATION PARAMETERS

During the January 2015 groundwater monitoring event samples were collected from the subset of alluvium, Galliard Formation, saprolite, transition zone and bedrock monitoring wells identified in the GMP and analyzed for MNA parameters. This is the 12th monitoring event for MNA parameters at the former Augusta MGP Site, where MNA evaluation is being performed to determine if it is a viable remedy for the alluvial (alluvium and Galliard Formation), saprolite, and bedrock groundwater units. A comparison between individual MNA parameters and COI concentrations in groundwater is presented in this section. AGLC plans on discontinuing sample collection of MNA parameters until the corrective actions performed under the VRP have been completed.

The following analytes were eliminated from the monitoring program following the July 2006 event, since they were either not detected or their concentrations did not exhibit distributions that were pertinent to the continued evaluation of natural attenuation processes:

Total Iron
Manganese (total and dissolved)
Ammonia nitrogen (as N)
Sulfide

MNA parameters for selected alluvium, Galliard Formation, saprolite, and bedrock monitoring wells are shown on Figures 3-11 through 3-14.

3.3.1 Electron Acceptors

When DO is present in groundwater at sites impacted by non-chlorinated organic contaminants, microorganisms will preferentially use the oxygen as a terminal electron acceptor as they oxidize organic compounds to carbon dioxide and water.
However, when oxygen is not present or has been consumed (below 2.0 mg/L), microorganisms may use available alternative electron acceptors (ferric iron, manganese (IV), nitrate, sulfate, and carbon dioxide) to metabolize organic compounds.

In the course of this process, electron acceptors are converted to their respective reduced forms (ferrous iron, manganese (II), nitrite, sulfide, and methane), which are then released as byproducts of the metabolic processes. Thus, measuring and comparing concentrations and distributions of electron acceptors and reduced metabolic byproducts to concentrations and distributions of organic constituents can reveal a pattern indicative of biodegradation activity.

A description of electron acceptors detected in groundwater from the Site is provided in the following sections.

3.3.1.1 Dissolved Oxygen and Oxidation-Reduction Potential

Field measurements indicated concentrations of DO in the Galliard groundwater unit ranged from 0.18 mg/L in MW-600 to 7.73 mg/L in MW-206, while DO concentrations in bedrock ranged from 0.33 mg/L in MW-213 to 2.24 mg/L in MW-507BR. Low dissolved oxygen in groundwater reflects oxygen potentially used during biodegradation of organic compounds. The observed DO distribution is consistent with both the distribution of organic impacts and methane data. Wells with elevated concentrations of organic COI and/or methane generally exhibited lower DO values. All DO laboratory analyses performed by AES utilizing Method SM4500-O-G were received and analyzed beyond the specified hold time of "immediate or fifteen (15) minutes."

Most impacted Galliard wells (MW-12, MW-22, MW-202DR, MW-304, MW-401D, MW-404DR, MW-505D, MW-600, MW-601 and MW-602) had a negative ORP while most unimpacted wells had a positive ORP. All impacted bedrock wells had a negative ORP. The data suggest that biodegradation of MGP-related organic constituents is consuming available oxygen and results in an anaerobic geochemical environment near impacted wells.

3.3.1.2 Nitrate

Nitrate concentrations ranged from not detected (mostly in impacted wells) to 9.8 mg/L (in MW-310SAP, an unimpacted well).

Nitrate was detected in groundwater samples collected from wells MW-401D and MW-401SAP, where only TCE concentrations exceeded the Type 1 RRS.

The overall lower nitrate concentrations observed in wells impacted by organic compounds, other than TCE, indicates the potential for biodegradation of benzene, toluene, ethylbenzene, and xylenes (BTEX) and SVOCs (i.e., non-chlorinated hydrocarbons) may be occurring at the Site through a nitrate reduction pathway.

3.3.1.3 Sulfate

Sulfate concentrations in alluvium and Galliard Formation ranged from non-detect in several monitoring wells to 140 mg/L in MW-401D. Concentrations of sulfate in Galliard monitoring wells were reported at lower concentrations in monitoring wells with detections of SVOCs and BTEX. The overall lower sulfate concentrations observed in wells impacted by BTEX and SVOCs may indicate the potential for biodegradation to occur through a sulfate reduction pathway within the overburden.

In the saprolite unit, the sulfate was not detected in MW-311, which is the only monitoring well with detectable concentrations of benzene. The range of sulfate concentrations in the saprolite monitoring wells may indicate the potential for biodegradation to occur through a sulfate reduction pathway.

Sulfate concentrations in bedrock wells impacted by BTEX and/or SVOCs above Type 1 RRS ranged from not detected in MW-318 to 6.7 mg/L in MW-503BR and from not detected in MW-309BR to 38 mg/L in MW-507BR. Concentrations of sulfate in bedrock wells do not appear to indicate evidence of biodegradation of dissolved organic COI through a sulfate reduction pathway.

3.3.1.4 Carbon Dioxide

Laboratory measurements of carbon dioxide ranged from 59.7 mg/L (MW-22) to 499 mg/L (MW-505D) in the Galliard Formation monitoring wells. Carbon dioxide was reported at elevated concentrations (>250 mg/L) in all Galliard Formation wells (MW-12, MW-304, and MW-505D) with BTEX detections.

In the saprolite, SVOC-impacted well MW-311, reported a concentration of 329 mg/L for carbon dioxide. Wells in the saprolite not impacted by SVOCs reported lower concentrations of carbon dioxide, ranging from 61.1 mg/L (MW-310SAP) to 108 mg/L (MW-214).

Laboratory measurements of carbon dioxide in bedrock wells ranged from not detected (MW-503BR) to 172 mg/L (MW-318) in wells impacted with BTEX and from not detected (MW-508BR) to 269 mg/L (MW-512BR) in wells with detections of BTEX. Concentrations of carbon dioxide in bedrock wells do not appear to indicate evidence of biodegradation.

Dissolved concentrations of carbon dioxide mostly show the potential for biodegradation via reduction of carbon dioxide to methane. In addition, elevated dissolved concentrations of carbon dioxide in impacted wells in the Galliard Formation and saprolite may be evidence that biodegradation is occurring with carbon dioxide as a final end product of aerobic biodegradation.

3.3.2 Biodegradation Byproducts

As described previously, the distribution of reduced metabolic byproducts at a site can also provide evidence of natural biodegradation processes. A description of the biodegradation byproducts that were measured during the January 2015 groundwater monitoring event is provided in the following sections.

3.3.2.1 Methane

Within the Galliard Formation wells, methane concentrations ranged from not detected (several wells) to 150 µg/L (MW-303) in no BTEX detections, and from 3,700 µg/L (MW-12) to 9,800 µg/L (MW-505D) in wells impacted by BTEX.

Methane concentrations were not detected in two of the three wells in unimpacted saprolite wells, while the groundwater sample collected from MW-311 (impacted) indicated a methane concentration of 410 µg/L.

Methane concentrations in bedrock wells impacted by BTEX range from 8 µg/L in MW-503BR to 980 µg/L in MW-509BR. Methane concentrations in non-BTEX impacted bedrock wells ranged from not detected (MW-309BR and MW-507BR) to 4,900 µg/L (MW-512BR). Methane concentrations were lower in bedrock wells reporting not detected results of BTEX, except for MW-512BR which has historically had BTEX detections and has low detected concentrations of SVOCs.

The overall distribution of methane is consistent with the plume of dissolved MGP-related organic constituents (i.e., organic COI other than TCE), suggesting that the biodegradation of these constituents at the Site includes a methanogenic metabolic pathway.

3.3.2.2 Ferrous Iron

Ferrous iron concentrations in the Galliard Formation ranged from not detected (< 0.100 mg/L) in several wells to 32.7 mg/L in MW-304. Bedrock concentrations for ferrous iron ranged from not detected (<0.100 mg/L) in several wells to 6.53 mg/L in MW-315. Concentrations of ferrous iron were generally higher in wells impacted by BTEX and SVOCs.

The overall greater number of impacted wells containing elevated concentrations of ferrous iron indicates that biodegradation of dissolved MGP-related organic COI may be occurring at the Site through an iron reduction pathway.

3.3.3 *Summary of Natural Attenuation Evaluation*

The observed distributions of DO, ORP, CO_2, nitrate, sulfate, ferrous iron, and methane correspond to the distributions of dissolved MGP-related organic COI, and are therefore indicative of natural biodegradation processes.
AGLC plans to discontinue sample collection of MNA parameters until the corrective actions performed under the VRP have been completed.

3.3.4 *Quality Assurance, Quality Control, and Data Validation*

All field QA/QC data, and at least 10 percent of the VOC, SVOC, and inorganic data presented in the analytical reports, were reviewed by ERM's data validation specialist. Laboratory analytical reports for all samples are provided in Appendix B, and the data validation reports for VOC, SVOC, and inorganic data are included in Appendix D. These data were reviewed in accordance with the USEPA Data Validation Standard Operating Procedures for Contract Laboratory Program Routine Analytical Services (USEPA, 2008/2011).

As shown in Appendix D, ERM's data validation specialist reviewed sample delivery groups 1501859, 1501895, 1501A32, 1501A82, 1501B40, and 1501N94. The following items were included in the data validation review:

- Surrogate recoveries,
- Relative percent difference (RPD) between primary/field duplicate samples,
- Field and laboratory blank contamination,
- Holding times, sample receipt conditions, dilution factors, chains of custody,
- Trip blanks, and
- Sample duplicates.

As shown in Appendix D, the duplicate sample results received from the laboratory correlated well with those from parent samples collected during the January 2015 event; of a total of seventy-seven (77) RPD calculations, three calculations showed differences exceeding 30 percent between parent and duplicate samples. Each of the three exceedances occurred in sample MW-12-20150114-01. The analysis for oxygen in sample MW-12-20150114-01, one of the three analytes showing a differences of greater than 30 percent between parent and duplicate samples, was flagged as being outside of the fifteen-minute hold time for analysis under the reporting method. Other analytes with calculated differences in MW-12-20150114-01 exceeding 30 percent RPD between parent and duplicate samples include pyrene and acenaphthylene.

Three MS/MSD sample sets were collected and analyzed as part of the laboratory analytical batch QC (MW-207-20150129-01, MW-401-201501SAP-01, and MW-309-20150109-01). The data validation review (Appendix D) includes a detailed discussion of sample integrity.

As noted in Appendix D, the holding time of fifteen minutes was exceeded for all samples submitted for oxygen analysis to AES.

Following the January groundwater sampling event, QA/QC of the purge logs indicated that four wells (MW-207, MW-307D, MW-309BR, and MW-401SAP were incorrectly purged and either insufficient volume was removed or parameter were not stabilized prior to sample collection. Results for samples were invalidated and not included in the report but are included in the laboratory reports. The wells were resampled on January 29, 2015 and the results included in the report.

4.0 DATA COMPARISON AND SUMMARY

AGLC performed an empirical evaluation of the groundwater data collected from the beginning of the corrective action groundwater monitoring and evaluation program (2001) through present (January 2015) and compared the most recent data to the historic program dataset to determine if there were any trends toward improvement or degradation of groundwater quality.

Data comparison discussion for COI focus on benzene (the primary VOC contaminant), naphthalene (the primary SVOC contaminant), and TCE (the only chlorinated VOC COI).

Results of data queries are presented as historical data summary tables presented in Appendix E. Graphs reflecting temporal concentration changes of benzene and naphthalene are presented in Appendix F. Graphs were created for wells with historical detections of benzene and naphthalene.

4.1 ALLUVIUM WELLS

Based on the evaluation of dissolved-phase constituents in the alluvium wells during this monitoring period, no discernable groundwater plume exists in the alluvium aquifer. However, reported concentrations for benzene exceeded Type 1 RRS at MW-501S (35 µg/L) for the first time since the well was installed prior to the February 2007 sampling event. MW-501S will continue to be evaluated to assess concentration trends at this location.

4.2 GALLIARD WELLS

Data collected during the January 2015 monitoring event indicate the following:

- Naphthalene and benzene continue to be below their respective Type 1 RRS in Galliard Formation monitoring wells west of the Third Level Canal and east of King Street with the exception of MW-304.(Figure 3-6). The benzene concentration reported for MW-304 (27 µg/L) continues a decreasing concentration trend since the January 2010 concentration (800 µg/L). Although the naphthalene concentration was higher in January 2015 (27 µg/L) than in the July 2014 sampling event (12 µg/L), the overall trend is still decreasing.

- The extent of benzene and naphthalene concentrations reported to exceed the Type 1 RRS in the Galliard Formation north of the Site appears similar to those seen in recent (after January 2011) monitoring events. MW-603

continues to be the northern most impacted well and was not sampled in January 2015 due to the presence of DNAPL during gauging. DNAPL (1.45 feet) was detected using an interface probe while gauging well MW-603 during the January 2015 sampling event (Table 3-1). DNAPL was previous reported in MW-603 during the July 2013, January and July 2014 sampling events.

- MW-505D is located along the southern edge of the naphthalene plume. Detections of naphthalene at MW-505D were first reported in July 2012. The naphthalene concentration high was reported in July 2013 (870 µg/L). Since July 2012, an increase in methane concentrations along with a decrease in carbon dioxide concentrations and a drop in DO show potential for biodegradation to be occurring (Appendix E). Naphthalene concentrations were reported during January 2015 (4.2 µg/L) at a concentration below Type 1 RRS (20 µg/L) for the first time since January 2012.

- Concentrations of benzene and naphthalene remain highest in groundwater samples collected from the northeast corner of the southern parcel (MW-12), city ROW south of Block A (MW-600), and the western portion of Block E (MW-601). Groundwater samples collected from the Galliard monitoring wells MW-12, MW-600, and MW-601 report concentrations of benzene at 3,600 µg/L, 25,000 µg/L, and 6,900 µg/L, respectively; and naphthalene concentrations at 4,900 µg/L, 5,400 µg/L, and 6,500 µg/L, respectively (Figure 3-6).

- Groundwater samples collected from MW-21 and MW-401D reported concentrations of TCE above the Type 1 RRS (5 µg/L) at 18 µg/L and 18 µg/L, respectively. TCE has previously been detected in these wells and is not an MGP-related COI.

4.3 SAPROLITE WELLS

Six (6) saprolite monitoring wells were sampled during the January 2015 monitoring event. VOC concentrations exceeding Type 1 RRS were reported in two groundwater samples, benzene in sample MW-311 (370 µg/L) and TCE in sample MW-401SAP (20 µg/L). The January 2015 sample results from MW-311 had increased concentrations of benzene (370 µg/L) and naphthalene (560 µg/L) compared to recent events. However, concentrations remain well below historic highs at this location (Appendix F).

4.4 TRANSITION ZONE WELLS

Naphthalene was the only COI reported above Type 1 RRS in the transition zone monitoring well, MW-306TZ, sampled in January 2015. Naphthalene was reported in the groundwater sample collected from MW-306TZ at 300 µg/L. This concentration shows a continued decline from reported concentrations in February 2007 (6,800 µg/L) and January 2010 (4,800 µg/L). No other detections of COI were reported above their respective Type 1 RRS.

4.5 BEDROCK WELLS

Data collected during the January 2015 monitoring event indicate the following:

- Elevated concentrations of benzene and naphthalene continue to be present in the area northeast of the Northern Parcel near MW-307BR. Stable concentration trends of benzene and naphthalene continue to be observed at MW-307BR since pumping began the well.

- The highest concentrations of benzene were reported in MW-500BR located south of Northern Parcel on the southern side of the canal. Benzene concentrations appear to be trending upwards at this location (Appendix F).

- MW-319 continues to delineate Type 1 RRS exceedances in bedrock groundwater to the northeast. No COI were detected above Type 1 RRS in groundwater samples collected from MW-319.

- Bedrock well MW-315 delineates Type 1 RRS exceedances to the northwest. Bedrock well MW-507BR delineates the extent of naphthalene impacts in bedrock to the south-southwest in Block J, while bedrock well MW-508BR delineates the extent of naphthalene in bedrock to the southeast. Benzene and naphthalene were not detected in MW-507BR, MW-508BR, or MW-513BR during the January 2015 sampling event.

5.0 PERFORMANCE AND OPERATIONS OF BEDROCK GROUNDWATER EXTRACTION SYSTEM

Bedrock monitoring wells MW-307BR and MW-308BR were converted to groundwater extraction wells in 2006. The groundwater extraction and treatment system has been continuously operated since start up on November 30, 2006 with the exception of temporary shutdowns due to routine maintenance activities. MW-307BR and MW-308BR continue to be sampled through the extraction system as part of semiannual monitoring, but are no longer gauged. MW-308BR was sampled by use of a peristaltic pump during the January 2015 sampling event as the pump in the recovery well was damaged and not operational during the sampling event.

This section describes operations and maintenance (O&M) activities that were performed on the bedrock groundwater extraction and treatment system at the Site from September 1, 2015 through April 1, 2015. The program includes ongoing evaluation of the hydraulic containment induced by the groundwater extraction system, recommendations for continued monitoring, and corrective actions for operational issues. System performance in removing impacted mass during this period is also evaluated.

5.1 PERFORMANCE AND OPERATIONS

Effluent samples are collected monthly for the permitted discharge requirements, with additional analyses run on a quarterly basis as set forth by the City of Augusta. Discharge Monitoring Reports are submitted monthly to the City of Augusta Pretreatment Coordinator in accordance with permit requirements. Analytical results of samples collected between September 2014 and April 2015 are summarized in Table 5-1. There were no exceedances of the permit effluent limitations.

The treatment system has been running consistently since it was turned on (November 30, 2006), with only intermittent periods of shut down due routine repairs and maintenance. During this operational period (September 1, 2014 through April 3, 2015), the extraction system was shut down between September 22, 2014 – October 10, 2014 and December 29, 2014 – January 30, 2015 for carbon replacement (Table 5-2). During restart of the system on January 30, 2015, the groundwater pump connected to MW-308BR was found to be damaged. The system is currently operating with the use of MW-307BR only.

The total volume of groundwater extracted during this period of groundwater extraction was 1,445,752 gallons (630,506 gallons from MW-307BR and 815,246 gallons from MW-308BR) (Table 5-3). Activated carbon was changed out in

September 2014 and January 2015 to ensure optimal system operation and compliance with discharge requirements.

5.2 *MASS REDUCTION CALCULATIONS*

The total mass of benzene and naphthalene removed from bedrock groundwater during the period of system operation beginning September 1, 2014 and running through March 31, 2015 was calculated by multiplying the total volume extracted from the system by the concentration of benzene and naphthalene detected in each extraction well, where: *Mass (kilograms) = volume extracted (gallons) x concentration (µg/L).* The total calculated mass of benzene and naphthalene extracted from MW-307BR during this period was 28.64 kilograms and 19.33 kilograms, respectively. Similarly, the total mass of benzene and naphthalene extracted from MW-308BR was 20.37 kilograms and 10.49 kilograms, respectively. The input parameters for the mass reduction calculations are presented in Table 5-3. These calculations will continue to be performed during each monitoring period. Graphs showing the trends of the mass removal are provided in Appendix G.

6.0 CONCLUSIONS

The following conclusions are derived from the data and analyses presented in this report:

- The only exceedance of organic COI in alluvium monitoring wells sampled in January 2015 was for benzene in MW-501S. The benzene exceedance in MW-501S was the first since installation of the well. Benzene will continue to be monitored at this location.

- Arsenic in MW-408S and cadmium in MW-501S were the only inorganic COI reported to exceed Type 1 RRS in alluvium monitoring wells.

- The distribution of dissolved organic COI is generally consistent with previous events and provides continued evidence that the Galliard and bedrock plumes are stable.

- Six (6) wells in the Galliard Formation (MW-12, MW-21, MW-304, MW-401D, MW-600, and MW-601) exceeded RRS for select organic COI. The sole RRS exceedance in MW-21 (located approximately 1300 feet east of the Northern Parcel) was TCE, which is not an MGP-related constituent.

- Selenium (MW-207), cadmium (MW-401D), and arsenic (MW-408DR) were the only inorganic COI exceeding Type 1 RRS in Galliard groundwater samples during the January 2015 sampling event.

- DNAPL was observed in three wells (MW-205, MW-502D, and MW-603), located within the Galliard groundwater plume during the January 2015 sampling event, and these wells were not sampled.

- Organic COI concentrations exceeding Type 1 RRS were reported in two groundwater samples collected from wells installed in the saprolite unit, benzene and naphthalene in sample MW-311 and TCE in sample MW-401SAP. Benzene and naphthalene concentrations remain well below historic highs in MW-311 (Appendix F).

- Nickel was reported in MW-306SAP and MW-310SAP in excess of the RRS. No other inorganic COI exceeded RRS in January 2015.

- The groundwater sample collected from MW-306TZ in July 2014 exceeded the Type 1 RRS for naphthalene only. There were no other RRS exceedances in transition zone wells sampled during this event.

- Benzene was the only VOC that exceeded Type 1 RRS in the following bedrock wells: MW-318, MW-503BR, MW-509BR, MW-510BR, and MW-511BR. Benzene and ethylbenzene exceeded Type 1 RRS in the following

bedrock wells: MW-213, MW-307BR, and MW-500BR. Benzene, ethylbenzene, and toluene exceedances were reported in MW-308BR.

- One or more SVOCs were detected in eight (8) bedrock monitoring wells in excess of RRS.

- Cadmium exceeded Type 1 RRS in well MW-325. There were no other inorganic COI exceedances during the January 2015 sampling event.

- Removal of contaminant mass has continued since the bedrock extraction and treatment system began operating in November 2006. The cumulative mass of benzene removed by the system since operation began totals 755.27 kilograms. The cumulative mass of naphthalene removed by the system since operation began totals 466.09 kilograms.

- AGLC proposes discontinuing MNA sampling until the corrective action has been completed.

The next semiannual groundwater monitoring event will be performed in July 2015 and the 18th Semiannual Corrective Action Effectiveness Report will be submitted as an appendix to a Semiannual Status Report in the VRP.

Notes:

ft AMSL - feet above mean sea level
ft bgs - feet below ground surface
II - double casing well
III - triple casing well
PVC - polyvinyl chloride
SS - stainless steel
Only active monitoring wells are included in this table.
DDSP - depth discrete sampling port
* MW-5 destroyed during Canal Authority's path improvement along canal

Table 2-2
Monitoring Well Construction Summary
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Monitoring Well ID	Date Installed	Well Type	Well Materials	Ground Surface Elevation (ft AMSL)	Top of Casing Elevation (ft AMSL)	Screened Interval (ft bgs)
Saprolite Monitoring Wells						
MW-214	12/7/1995	II	PVC	130.60	129.65	52.6 - 56.6
MW-306SAP	11/6/1998	DDSP	PVC	132.08	131.92	30.5 - 31.5

MW-511BR	9/9/2008	III	PVC	131.20	130.82	56 - 76
MW-512BR	8/29/2008	III	PVC	132.00	131.70	64 - 84
MW-513BR	10/20/2010	III	PVC	132.40	132.03	51.5 - 82

Notes:

ft AMSL - feet above mean sea level
ft bgs - feet below ground surface
II - double casing well
III - triple casing well
PVC - polyvinyl chloride
SS - stainless steel
Only exisitng monitoring wells are included in this table.
DDSP - depth discrete sampling port

Table 2-3
Site-Specific Constituents of Interest and Monitored Natural Attenuation Parameters
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Volatile Organic Compounds (VOCs), (SW-846 Method 8260B)		
Acetone	Ethylbenzene	Trichloroethylene
Benzene	Methylene Chloride	Xylenes (total)
Carbon Disulfide	Toluene	
Semivolatile Organic Compounds (SVOCs), (SW-846 Method 8270C)		
Acenaphthene	Benzo(g,h,i)perylene	Indeno(1,2,3-cd)pyrene
Acenaphthylene	Benzo(k)fluoranthene	Naphthalene
Anthracene	Chrysene	Phenanthrene
Benzo(a)anthracene	Dibenzo(a,h)anthracene	Pyrene
Benzo(a)pyrene	Fluoranthene	
Benzo(b)fluoranthene	Fluorene	
Inorganics (SW-846 Methods 6010B, 7470A, 6020, and 9010/9012)		
Antimony	Copper	Thallium
Arsenic	Cyanide	Vanadium
Barium	Lead	Zinc
Beryllium	Mercury	
Cadmium	Nickel	
Chromium	Selenium	
Monitored Natural Attenuation Parameters		
Dissolved Gases (O_2, CO_2, Methane)	Ferrous Iron	Sulfate
	Nitrate

Notes:
N = Normal sample
DUP = Duplicate sample
RRS = Risk Reduction Standard
BOLD=exceeds laboratory detection limit
Analyte concentration exceeds the Type 1 RRS
Detection limit exceeds the Type 1 RRS
-- = Not Analyzed

GROUND WATER SAMPLING LOG SHEET

Client: AGL
Site/Location: Augusta, GA
Project No.:

Sampling Date: 1/15/15
Sampler's Name: 12 Mayette. A. Neal

Well ID: MW-307BR
Total Depth (ft)[1]: —
Depth to Water (ft): —
Well Diameter (in): —
Well Volume (gal) = 0.041d²h: —
d = well diameter (inches) h = length of water column (feet)
Well Condition: Good

Pump Type/Model: Recovery Well
Tubing Material: N/A
Pump Intake Depth (ft): N/A
Start/Stop Purge Time: 1540 1550
Purge Rate (L/min)[2]: ~50
Total Purge Volume (L): —

Sample Collection Time: 1540
Sample Purge Rate (L/min)[3]: —
Sample ID: MW-307BR-20150115-01
QA/QC Collected? — Dup-4-20150115-01
QA/QC I.D. Dup 4-20150115-01
Laboratory Analyses:

Sampling Method (check all that apply): ☐ soda straw (VOCs) ☐ vacuum jug (SVOCs) ☒ pump head discharge (Inorganics including cyanide)
☐ Bladder pump = pump discharge (all analytes) ☐ Bailer (only used if necessary)

Time	Temp. (°C)	Spec. Cond. (mS/cm)	DO (mg/L)	pH (SU)	ORP (mV)	Turbidity (NTUs)	Purge Volume (L)	H_2O Depth (ft)	Notes (Water clarity, odor, purge rate, issues with pump/well/weather/etc.)
N/A	N/A	N/A	N/A	N/A	N/A	—	—	—	No parameters Recorded.
Stabilizing Criteria[5]	+/- 1°C	+/- 3%	+/- 10% (see note below)[7]	+/- 0.1 unit	+/- 10 mV (see note below)[8]	+/- 10% or <10 NTUs	(see note below)[4]	(see note below)[6]	

(1) - Do not measure depth to bottom of well until after purging and sampling to reduce resuspending fines that may be resting on the well bottom.
(2) - Purge rate to be 0.5 lpm or less.
(3) - Sampling rate to be 0.25 lpm or less.
(4) - Field parameter measurements to be recorded every 3 to 5 minutes.
(5) - Stabilization criteria based on three most recent consecutive measurements.
(6) - Monitor DTW every 5 min. Well drawdown to be 0.3 ft or less. Purge/sampling rate to be lowered as necessary to keep drawdown below 0.3 ft.
(7) - DO is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.
(8) - ORP is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.

X 11 Bottles

(1) - Do not measure depth to bottom of well until after purging and sampling to reduce resuspending fines that may be resting on the well bottom.
(2) - Purge rate to be 0.5 lpm or less.
(3) - Sampling rate to be 0.25 lpm or less.
(4) - Field parameter measurements to be recorded every 3 to 5 minutes.
(5) - Stabilization criteria based on three most recent consecutive measurements.
(6) - Monitor DTW every 5 min. Well drawdown to be 0.3 ft or less. Purge/sampling rate to be lowered as necessary to keep drawdown below 0.3 ft.
(7) - DO is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.
(8) - ORP is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.

(1) - Do not measure depth to bottom of well until after purging and sampling to reduce resuspending fines that may be resting on the well bottom.
(2) - Purge rate to be 0.5 lpm or less.
(3) - Sampling rate to be 0.25 lpm or less.
(4) - Field parameter measurements to be recorded every 3 to 5 minutes.
(5) - Stabilization criteria based on three most recent consecutive measurements.
(6) - Monitor DTW every 5 min. Well drawdown to be 0.3 ft or less. Purge/sampling rate to be lowered as necessary to keep drawdown below 0.3 ft.
(7) - DO is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.
(8) - ORP is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.

RE: AGLC Augusta

Dear Greg Jirak: Order No: 1501859

Analytical Environmental Services, Inc. received 7 samples on 1/13/2015 12:02:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client ERM-SE Work Order Number 1501859

Checklist completed by Ioana Pacurar 1/14/15
Signature Date

Carrier name: FedEx __ UPS __ Courier ✓ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.1°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ +1D 1/14 No ✓

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by David

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGLC Augusta Effluent

Dear Greg Jirak: Order No: 1501895

Analytical Environmental Services, Inc. received 22 samples on 1/14/2015 11:51:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

PROJECT INFORMATION

PROJECT NAME: AALC Augusta

PROJECT #: 0230712.52

SITE ADDRESS: 812 8th St Augusta, GA 30901

SEND REPORT TO: sreagin-irale@erm.com

INVOICE TO: (IF DIFFERENT FROM ABOVE)

QUOTE #: PO#:

RECEIPT

Total # of Containers: 64

Turnaround Time Request
- (●) Standard 5 Business Days
- ( ) 2 Business Day Rush
- ( ) Next Business Day Rush
- ( ) Same Day Rush (auth req.)
- ( ) Other

STATE PROGRAM (if any):

E-mail? (Y)/N; Fax? Y/N

DATA PACKAGE: I II III IV

SPECIAL INSTRUCTIONS/COMMENTS:

SHIPMENT METHOD

OUT / / VIA:

IN / / VIA:

CLIENT FedEx UPS MAIL (COURIER)

GREYHOUND OTHER

SAMPLES RECEIVED AFTER 3PM OR ON SATURDAY ARE CONSIDERED RECEIVED THE NEXT BUSINESS DAY. IF TURNAROUND TIME IS NOT INDICATED, AES WILL PROCEED WITH STANDARD TAT OF SAMPLES.
SAMPLES ARE DISPOSED 30 DAYS AFTER REPORT COMPLETION UNLESS OTHER ARRANGEMENTS ARE MADE.

MATRIX CODES: A = Air GW = Groundwater SE = Sediment SO = Soil SW = Surface Water W = Water (Blanks) DW = Drinking Water (Blanks) O = Other (specify) WW = Waste Water

PRESERVATIVE CODES: H+1 = Hydrochloric acid + ice I = Ice only N = Nitric acid S+I = Sulfuric acid + ice S/M+I = Sodium Bisulfate/Methanol + ice O = Other (specify) NA = None

White Copy - Original; Yellow Copy - Client

Client: ERM-Southeast
Project: AGLC Augusta Effluent
Lab ID: 1501895

Case Narrative

Sample Receiving Nonconformance:

Samples for Dissolved oxygen analysis by Method SM4500-O-G were received and analyzed outside Method specified holding time of “immediate or 15 minutes”.

Ferrous Iron by SM3500Fe-B:

Method 3500Fe-B as listed in Standard Methods for the Examination of Water and Wastewater 22nd Edition is applicable for analyzing Ferrous Iron in the field. All G fraction samples were analyzed in the laboratory which is a deviation from the method.

Sample ID "DUP-02-20150113-01" is reporting with an H-Flag since there is no collection time on the COC.

PAH Analysis by Method 8270D SIM:

Due to sample matrix, samples 1501895-006B, -009B required dilution during preparation and/or analysis resulting in elevated reporting limits.

Sample/Cooler Receipt Checklist

Client ERM-SE Work Order Number 1501895

Checklist completed by Signature Iana Paewar Date 1/14/15

Carrier name: FedEx __ UPS __ Courier ✓ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.1°C Cooler #2 3.2°C Cooler #3 3.5°C Cooler #4 3.1°C Cooler#5 3.4°C Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No ✓ MM 1/15/15

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ MM 1/15/15 No ✓

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes __ No ✓ Not Applicable __

Adjusted? Iana Checked by Dawn

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

FAX: (404) 745-0103

RE: AGLC Augusta

Dear Greg Jirak: Order No: 1501A32

Analytical Environmental Services, Inc. received 22 samples on 1/15/2015 11:57:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample ID "TB-02" was listed on the COC, but was not received. Andreas Shoredits was notified on 1/16/15.

Samples for Dissolved oxygen analysis by Method SM4500-O-G were received and analyzed outside Method specified holding time of “immediate or 15 minutes”.

Ferrous Iron by SM3500Fe-B:

Method 3500Fe-B as listed in Standard Methods for the Examination of Water and Wastewater 22nd Edition is applicable for analyzing Ferrous Iron in the field. F fraction samples were analyzed in the laboratory which is a deviation from the method.

Volatiles Organic Compounds Analysis by Method 8260B:

Due to sample matrix, samples 1501A32-004A, -005A, & -008A required dilution during preparation and analysis resulting in elevated reporting limits.

PAH Analysis by Method 8270D SIM:

Due to sample matrix, sample 1501A32-014C required dilution during preparation and/or analysis resulting in elevated reporting limits.

Sample "MW-319-20150115-01" was not analyzed for MS/MSD per Donald Dowling on 1/20/15.

Sample ID "DUP-03-20150114-01" is reporting with an H-Flag since there is no collection time on the COC.

Sample/Cooler Receipt Checklist

Client ERM-SE Work Order Number 1501A32

Checklist completed by Jaime Pacuar 1/16/15
Signature Date

Carrier name: FedEx __ UPS __ Courier ✓ Client __ US Mail __ Other _____

Shipping container/cooler in good condition?	Yes ✓	No __	Not Present __
Custody seals intact on shipping container/cooler?	Yes ✓	No __	Not Present __
Custody seals intact on sample bottles?	Yes __	No __	Not Present ✓
Container/Temp Blank temperature in compliance? (0°≤6°C)*	Yes ✓	No __	

Cooler #1 3.1°C Cooler #2 3.2°C Cooler #3 3.4°C Cooler #4 3.1°C Cooler#5 3.5°C Cooler #6 _____

Chain of custody present?	Yes ✓	No __
Chain of custody signed when relinquished and received?	Yes ✓	No __
Chain of custody agrees with sample labels?	Yes __	No ✓
Samples in proper container/bottle?	Yes ✓	No __
Sample containers intact?	Yes ✓	No __
Sufficient sample volume for indicated test?	Yes ✓	No __
All samples received within holding time?	Yes ✓	No __
Was TAT marked on the COC?	Yes ✓	No __
Proceed with Standard TAT as per project history?	Yes __	No __ Not Applicable ✓
Water - VOA vials have zero headspace?	No VOA vials submitted __	Yes ✓ No __
Water - pH acceptable upon receipt?	Yes ✓	No __ Not Applicable __

Adjusted? _____ Checked by Fayaz

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

TEL: (678) 486-2700
FAX: (404) 745-0103

RE: AGLC Augusta

Dear Greg Jirak: Order No: 1501A82

Analytical Environmental Services, Inc. received 10 samples on 1/15/2015 4:30:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Samples for Dissolved oxygen analysis by Method SM4500-O-G were received and analyzed outside Method specified holding time of “immediate or 15 minutes”.

Ferrous Iron by SM3500Fe-B:

Method 3500Fe-B as listed in Standard Methods for the Examination of Water and Wastewater 22nd Edition is applicable for analyzing Ferrous Iron in the field. F fraction samples were analyzed in the laboratory which is a deviation from the method.

Sample/Cooler Receipt Checklist

Client ERM-SE Work Order Number 1501A82

Checklist completed by Joana Pacurar 1/15/15
Signature Date

Carrier name: FedEx __ UPS __ Courier ✓ Client __ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.1°C Cooler #2 3.2°C Cooler #3 3.5°C Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by Dawn

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

FAX: (404) 745-0103

RE: AGLC Augusta

Dear Greg Jirak: Order No: 1501B40

Analytical Environmental Services, Inc. received 5 samples on 1/16/2015 11:55:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample containers were not received for MNA analysis for samples "MW-307BR-20150115-01 and DUP-4-20150115-01." Per Andreas Shoredits via phone on 1/16/15 samples for MNA analysis were not collected.

Samples for Dissolved oxygen analysis by Method SM4500-O-G were received and analyzed outside Method specified holding time of “immediate or 15 minutes”.

Ferrous Iron by SM3500Fe-B:

Method 3500Fe-B as listed in Standard Methods for the Examination of Water and Wastewater 22nd Edition is applicable for analyzing Ferrous Iron in the field. F fraction samples were analyzed in the laboratory which is a deviation from the method.

Volatiles Organic Compounds Analysis by Method 8260B:

Due to sample matrix, samples 1501B40-003A, & -004A required dilution during preparation and/or analysis resulting in elevated reporting limits.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1501B40

Checklist completed by [signature] 1/16/15
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.4°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes __ No ✓

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by [signature]

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGLC Augusta

Dear Greg Jirak: Order No: 1501N94

Analytical Environmental Services, Inc. received 8 samples on 1/30/2015 11:02:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample Receiving Nonconformance:

Samples for Dissolved Oxygen analysis by Method SM4500-O-G were received and analyzed outside of the method specified holding time of “immediate or 15 minutes”.

Methane analysis was not listed on the COC but was reported per project requirements for samples 1501N94-003, -007, and -008.

Volatile Organic Compounds Analysis by Method 8260B:

Due to sample matrix, samples 1501N94-002A and -004A required dilution during preparation and/or analysis resulting in elevated reporting limits.

Ferrous Iron by SM3500Fe-B:

Method 3500Fe-B as listed in Standard Methods for the Examination of Water and Wastewater 22nd Edition is applicable for analyzing Ferrous Iron in the field. Samples requiring Ferrous Iron were analyzed in the laboratory which is a deviation from the method.

Sample/Cooler Receipt Checklist

Client EAM Work Order Number 1501N94

Checklist completed by [signature] 11/30/15
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.1° Cooler #2 3.9° Cooler #3 3.8 Cooler #4 3.6' Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by MS

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGLC Augusta Effluent

Dear Greg Jirak: Order No: 1409143

Analytical Environmental Services, Inc. received 3 samples on 9/3/2014 12:33:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGLC Augusta Effluent

Dear Greg Jirak: Order No: 1410982

Analytical Environmental Services, Inc. received 3 samples on 10/10/2014 11:05:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGL Augusta

Dear Greg Jirak: Order No: 1411157

Analytical Environmental Services, Inc. received 3 samples on 11/4/2014 1:30:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1411157

Checklist completed by [signature] 11/4/14
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (4°C±2)* Yes ✓ No __

Cooler #1 3.2 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes X JB 11/4/14 No ✓

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by JB

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGLC Effluent

Dear Greg Jirak: Order No: 1412749

Analytical Environmental Services, Inc. received 3 samples on December 9, 2014 11:55 am for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

RE: AGLC Augusta Effluent

Dear Greg Jirak: Order No: 1502417

Analytical Environmental Services, Inc. received 3 samples on February 5, 2015 2:50 pm for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client ERM-SE Work Order Number 1502417

Checklist completed by Ioana Paeurar 2/5/15
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes ✓ No __

Cooler #1 3.1 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes __ No ✓

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: AGLC Augusta Effluent

Dear Greg Jirak: Order No: 1503488

Analytical Environmental Services, Inc. received 3 samples on 3/6/2015 10:44:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Method 6010B was listed on the Chain of Custody for metals analysis. Samples were analyzed by method 200.7 per history.

pH Analysis by Method SM4500 H+ B:

Sample for pH analysis by Method SM4500 H+ B was received and analyzed outside of the holding time requirement of "immediate or 15 minutes".

Sample/Cooler Receipt Checklist

Client ERM Work Order Number 1503488

Checklist completed by [signature] 3/6/15
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client / US Mail __ Other _____

Shipping container/cooler in good condition? Yes / No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present /

Custody seals intact on sample bottles? Yes __ No __ Not Present /

Container/Temp Blank temperature in compliance? (0°≤6°C)* Yes / No __

Cooler #1 3.2 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes / No __

Chain of custody signed when relinquished and received? Yes / No __

Chain of custody agrees with sample labels? Yes / No __

Samples in proper container/bottle? Yes / No __

Sample containers intact? Yes / No __

Sufficient sample volume for indicated test? Yes / No __

All samples received within holding time? Yes X JB 3/6/15 No __

Was TAT marked on the COC? Yes / No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable /

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes / No __

Water - pH acceptable upon receipt? Yes / No __ Not Applicable __

Adjusted? _____ Checked by JB

Sample Condition: Good / Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No /

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

FAX: (404) 745-0103

RE: AGL Augusta

Dear Greg Jirak: Order No: 1504239

Analytical Environmental Services, Inc. received 3 samples on 4/3/2015 10:35:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/14-06/30/15.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Case Narrative

Sample Receiving Nonconformance:

Sample for pH analysis by Method SM4500 H+ B was received and analyzed outside of the method specified holding time of immediate or 15 minutes.

Sample for Barium analysis was not received and was not listed on the Chain of Custody (COC) for sample "Effluent Grab"; however, Barium is usually reported per project history. Per Greg Jirak 4/3/2015, sample needed for Barium analysis was split and preserved from the unpreserved sample that was received for pH analysis. Chemical preservatives were added to meet method specified pH requirements for the requested test methods.

Adjusted? MJ Checked by Tanya

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

*Bedrock porosity range taken from Applied Hydrogeology 4th Ed., Fetter, 2001
Multiple bedrock and Galliard gradients are presented from different areas of the site.
Porosities used in velocity calcuations are average porosities from RETEC, 2003 Remedial Investigation
Vs=Ki/n
where:
Vs=seepage velocity (velocity)
K=horizontal hydraulic conductivity
i=horizontal hydraulic gradient (gradient)
n=porosity

ERM Analytical Data Validation Checklist

Project Name: AGLC/Augusta	Laboratory: Analytical Environmental Services, Inc.
Project Reference: 0230712	Sample Matrix: Aqueous
ERM Project Phase Number: 054	1/12/2015
Date Validated: April 28, 2015	Sample End Date: 1/29/2015

Sample Analyzed: At least ten percent (10%) of the samples collected were chosen for validation. The following samples within were validated. For a full list of the samples collected, see the sample submittal summary above.

DUP-01-20150113-01	MW-306TZ-20150113-01	DUP-4-20150115-01	MW-307BR-20150115-01
DUP-02-20150113-01	MW-315-20150113-01	DUP-05-20150129-01	MW-308BR-20150129-01
DUP-03-20150114-01	MW-12-20150114-01	DUP-06-20150129-01	MW-401SAP-20150129-01

Parameters Analyzed: Volatile Organic Compounds by SW-5030B method 8260B, CH_4 by RSK method RSK-175, O_2 by E360.1, CO_2 by SM4500, Semivolatile Organic Compounds by SW-846 method 8270D, Total ICP Metals (Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, V, and Zn) by SW-3010A Method 6010C, Total Mercury (Hg) by method SW7470A, Total Cyanide by method SM4500 CN-C E, Nitrate and sulfate by Method 9056, and Ferrous Iron (Fe^{2+}) by Standard Method SM 3500-Fe-B.

Laboratory Project IDs: 1407C32, 1407D48, 1407E29, and 1407F77

PRECISION, ACCURACY, METHOD CONFORMANCE, AND COMPLETENESS ASSESSMENT

Precision:	**X**	Acceptable		Unacceptable	TN	Initials

Comments: Laboratory precision was evaluated using laboratory control samples (LCSs), laboratory duplicates, and matrix spike duplicates (MSDs). Field sampling precision was evaluated using field duplicates. Evaluation of duplicates was done using the Relative Percent Difference (RPD). The RPD is defined as the difference between two duplicate sample results divided by the mean, and expressed as a percent. Overall, laboratory and field sampling precision were acceptable.

Accuracy:	**X**	Acceptable		Unacceptable	TN	Initials

Comments: Accuracy is a measure of the system bias. Laboratory accuracy was evaluated using blanks, matrix spikes (MSs), LCSs, and surrogate recoveries. Overall, laboratory accuracy was acceptable.

Method Compliance:	**X**	Acceptable		Unacceptable	TN	Initials

Comments: Method compliance was evaluated using holding times, internal standard recoveries, and surrogate recoveries. Overall method compliance was acceptable.

Completeness:	**X**	Acceptable		Unacceptable	TN	Initials

Comments: Completeness is a percentage expression of the ratio of total acceptable data points to the total possible data points. No data points were rejected; all data are usable with some usable with qualification. For the sample data validated, no data points were rejected. The data set was 100% complete.

ERM Analytical Data Validation Checklist (Continued)

EVALUATION CRITERIA CHECK						
Data validation flags used in this review only include those used by the laboratory: BRL Below Reporting Limit. Indicates the analyte was analyzed for but not detected. H Sample was prepped or analyzed beyond the specified hold time **Only bolded comments required qualification.** The other comments are of interest, but qualification of the results was not necessary.						
1. Did the laboratory identify any nonconformances related to	**X**	Yes		No	TN	Initials
Explanation: The laboratory identified the following nonconformance in the case narratives for the samples validated. Samples 1501895-006B, -009B; 1501A32-004A, -005A, -008A; 1501A32-014C; 1501B40-003A, -004A; 1501N94-002A and -004A required dilution during preparation and/or analysis resulting in elevated reporting limits. Samples for Dissolved Oxygen were received and analyzed outside holding time of "immediate or 15 minutes." Duplicate samples were analyzed with an H-Flag due to no collection times listed on COCs (withholding collection times was intentional). For all Method 3500Fe-B applicable for analyzing Ferrous Iron in the field: samples requiring Ferrous Iron were analyzed in the laboratory which is a deviation from the standard field anaysis method.						
2. Were samples Chain-of Custody (COC) forms complete?	**X**	Yes		No	TN	Initials
Comments: An extra set of Trip Blank VOA bottles were received along with the samples collected on 7/16/2014; these bottles were not listed on the COC. Sample containers were not received for MNA analysis for samples "MW-307BR-20150115-01 and DUP-4-20150115-01. Methane analysis was not listed on the COC but was reported per project requirements for samples 1501N94-003, -007, and -008.						
3. Were all the analyses requested for the samples on the COCs completed by the laboratory?	**X**	Yes		No	TN	Initials
Comments: All requested COC analyses were completed by the laboratory except for TB-02 canceled by ERM on 1/16/2015. Methane analysis was not on the COC but was reported for samples 1501N94-003, -007, and -008. Sample "MW-319-20150115-01" was not analyzed for MS/MSD per ERM on 1/20/15.						
4. Were samples received in good condition and at appropriate temperature?	**X**	Yes		No	TN	Initials
Comments: Samples were received in good condition and temperatures ranging from 3.1 to 3.9 degrees C.						
5. Were the requested analytical methods in compliance with WP/QAPP, permit, or COC?	**X**	Yes		No	TN	Initials
Comments: Requested analytical methods were in compliance with COC forms. Additionally, the test results in the validated report meet all NELAP requirements for parameters for which accreditation is required or available.						
6. Were detection limits in accordance with WP/QAPP, permit, or method?	**X**	Yes		No	TN	Initials
Comments: Results were reported down to the practical quantitation limits.						
7. Do the laboratory reports include only those constituents requested to be reported for a specific analytical method?	**X**	Yes		No	TN	Initials
Comments: The laboratory reported the requested constituents.						

ERM Analytical Data Validation Checklist (Continued)

8. Were the sample holding times met?		Yes	**X**	No	TN	Initials
Comments: Dissolved oxygen (DO) by Method 360.1. This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. Certain samples for ferrous iron were analyzed outside of the specified 24 hour hold time by Standard Method SM 3500.						
9. Were correct concentration units reported?	**X**	Yes		No	TN	Initials
Comments: Organic results were reported in µg/L. ICP metals and general chemistry results were reported in mg/L.						
10. Were the reporting requirements for flagged data met?	**X**	Yes		No	TN	Initials
Comments: The reporting requirements for flagged data were met. Data validation qualifiers supersede laboratory flags.						
11. Were laboratory blank samples free of target analyte contamination?	**X**	Yes		No	TN	Initials
Comments: The lab blanks were free of target analyte contamination						
12. Were trip blank, field blank, and/or equipment blanks free of target analytes	**X**	Yes		No	TN	Initials
Comments: Trip blanks were free of target analytes.						
13. Were instrument calibrations within method control limits?	**X**	Yes		No	TN	Initials
Comments: Initial and continuing calibrations were within required method criteria for the target analytes.						
14. Were surrogate recoveries within control limits?	**X**	Yes		No	TN	Initials
Comments: All surrogate recoveries were within laboratory QC limits.						
15. Were laboratory control sample recoveries within control limits?	**X**	Yes		No	TN	Initials
Comments: All LCS recoveries outside control limits are listed in question 1 - the data have been reported and qualified.						
16. Were matrix spike recoveries within control limits?	**X**	Yes		No	TN	Initials
Comments: All of the MS/MSD and matrix interference checks were within the laboratory QC/advisory limits for all target compounds except for those listed in question 1.						
17. Were duplicate RPDs and/or serial dilution %Ds within control limits?		Yes	**X**	No	TN	Initials
Comments: RPDs for MS/MSDs, laboratory duplicate samples and LCS/LCSDs met QC criteria for all target compounds/analytes for the samples validated except where noted for sample MW-12-20150114-01.						
18. Were organic system performance criteria met?	**X**	Yes		No	TN	Initials
Comments: All GC/MS internal standards were within method criteria for the samples validated.						
19. Were internal standards within method criteria for GS/MS sample analyses?	**X**	Yes		No	TN	Initials
Comments: All GC/MS internal standards were within method criteria for the samples validated.						
20. Were inorganic system performance criteria met?	**X**	Yes		No	TN	Initials
Comments: Inorganic system performance criteria were met.						

ERM Analytical Data Validation Checklist (Continued)

21. Were blind field duplicates collected? If so, discuss the precision (RPD) of the results.		**X**	Yes		No	TN	Initials
Duplicate Sample No.	DUP-01-20150113-01	Primary Sample No.		MW-306TZ-20150113-01			
Duplicate Sample No.	DUP-02-20150113-01	Primary Sample No.		MW-315-20150113-01

Comments: Results for primary and field duplicate samples were nondetect for those constituent pairs with an NC in the RPD column in the following tables. RPD's greater than 30% are highlighted because this variation is greater than the advisory limit.							
22. Were qualitative criteria for organic target analyte identification met?		**X**	Yes		No	TN	Initials
Comments: All qualitative criteria for organic target analyte identification were met.							
23. Were 100% of the EDD concentrations and reporting limits compared to the hardcopy data reports?		**X**	Yes		No	TN	Initials

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
< - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
**: Resampled in August 2007 for VOCs only
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
** - Resampled in August 2007 for VOCs only
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
** - Resampled in August 2007 for VOCs only
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:

-- - Not analyzed
* - Not a HSRA regulated compound
** - Not sampled due to DNAPL
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
** - Resampled in August 2007 for VOCs only
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:

-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - *Not analyzed*
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Orqanic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - in-situ chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected data reiected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank

B = Analyte was found in the blank and sample
D = Surrogate or matrix spike recoveries were not obtained due to dilution of extract
F = MS or MSD exceeds the control limits
H = Sample was prepped or analyzed beyond specified holding time
* = LCS or LCSD exeeds the control limits

JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Soike samole recoverv outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected: data reiected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
< - Analyte not detected at referenced detection limit

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
** - Sample not collected due to DNAPL
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Appendix E-1
Summary of Historical Groundwater Sampling Data - Alluvium, Galliard, and Saprolite Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank
** Monitoring well had NAPL detected

JM (Organic) - Estimated analyte concentration; spike sample recovery outside control limits
M (Organic) - Spike sample recovery outside control limits
N - Spike sample recovery outside of control limits
R - Sample data results rejected due to deficiencies in the ability to meet quality control standards
RRS - Risk Reduction Standard
<, U - Analyte not detected at referenced detection limit
UJ - Analyte not detected; low method bias and/or matrix interference
UN - Analyte not detected; spiked sample recovery outside of control limits
UR - Analyte not detected; data rejected
UWN - Analyte not detected; post digestion spike and spike sample recovery outside control limits

Summary of Historical Groundwater Sampling Data – Transition Zone and Bedrock Monitoring Wells

Appendix E2

May 29, 2015
Project No. 0280918
AGL Resources

Environmental Resources Management
3200 Windy Hill Rd. Suite 1500W
Atlanta, GA 30339
(678) 486-2700

Appendix E-2
Summary of Historical Groundwater Sampling Data - Transition Zone and Bedrock Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
** - Resampled in August 2007 for VOCs only
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded for sample
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded for sample
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank

Appendix E-2
Summary of Historical Groundwater Sampling Data - Transition Zone and Bedrock Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded for sample
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank

Appendix E-2
Summary of Historical Groundwater Sampling Data - Transition Zone and Bedrock Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia

Notes:
-- - Not analyzed
* - Not a HSRA regulated compound
B (Inorganics) - Estimated analyte concentration
Bold - analyte detected
Bold and shaded - Analyte concentration exceeds the Type 1 RRS
D - Analyte concentration reported from secondary dilution
DB - Analyte concentration reported from secondary dilution; analyte detected in method blank
H - Holding time exceeded for sample
ISCO - *in-situ* chemical oxidation
J - Estimated analyte concentration
JB (Organic) - Estimated analyte concentration; analyte detected in method blank

Appendix E-2
Summary of Historical Groundwater Sampling Data - Transition Zone and Bedrock Monitoring Wells
January 2001 through January 2015
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Augusta, Georgia
