Subject: Transmittal of Electronic Version of
Voluntary Remediation Program Compliance Status Report
Former Manufactured Gas Plant Site Macon, Georgia
HSI #10511

I have enclosed electronic versions of Transmittal of Electronic version Voluntary Remediation Program Compliance Status Report Former Manufactured Gas Plant Site Macon, Georgia HSI #10511 pdf files on Compact Disc to accompany the hard copy report. This certification states that the electronic copy is complete, identical to the paper copy and virus free.

I, Holly H. McDonald, on August 20, 2018 made a complete electronic copy of the following document:
Transmittal of Electronic Version of the Submittal of the
Voluntary Remediation Program Compliance Status Report
Former Manufactured Gas Plant Site Macon, Georgia
HSI #10511
then confirmed that the electronic copies did not contain a virus utilizing Symantec antivirus software.

You can contact me at 678.486.2700 with any questions or comments.

Best regards,

Holly H. McDonald

Subject: **Voluntary Remediation Program Compliance Status Report**
Atlanta Gas Light Company
Former Manufactured Gas Plant Site
Macon, Georgia
HSI #10511

Dear Mr. Brownlee,

Enclosed please find one hardcopy and two electronic copies (on CDs) of the Voluntary Remediation Program Compliance Status Report (VRP CSR) for the Atlanta Gas Light Company (AGLC) former manufactured gas plant site located in Macon, Georgia (the "Site"). Please note that AGLC has had several inquiries regarding redevelopment plans for several properties on the Site. Considering this, AGLC would like to respectfully request an accelerated review and approval of the VRP CSR and Site closure so that we can move forward with Site restoration activities (such as well abandonment) as expeditiously as possible.

Please feel free to contact me at (404) 584-3719 or e-mail at gcorbett@southernco.com with any questions or comments on this submittal.

Sincerely,

Greg Corbett, P.E.
Environmental Services Director

STATEMENT OF FINDINGS

This Voluntary Remediation Program (VRP) Compliance Status Report (CSR) (collectively, VRP CSR) is submitted by Atlanta Gas Light Company (AGLC) and Georgia Power Company (GPC) covering two former manufactured gas plant (MGP) sites located in Macon, Bibb County, Georgia, that are both included as site number 10511 (the Site) on the Georgia Environmental Protection Division (EPD) Hazardous Site Inventory (HSI). The two MGP facilities are referenced in this VRP CSR as the Mulberry Street MGP and the Western Portion MGP.

The VRP CSR was prepared by Environmental Resources Management (ERM) on behalf of AGLC and GPC to satisfy the requirements of the Georgia VRP Act and Consent Orders #EPD-VRP-012 and #EPD-HSR-227. This CSR demonstrates that the Site is in compliance with applicable provisions of the VRP and summarizes the various stages of investigation and corrective action completed at the Site, focusing on those completed since the submittal of the 2004 CSR. Where appropriate, this VRP CSR refers to the March 2000 CSR prepared by Williams Environmental Services, Inc. (Williams, 2000) and the January 2004 CSR prepared by The RETEC Group Inc. (as revised March 2004, RETEC, 2004a) and the certifications of compliance made therein.

In summary, soil, groundwater, sediment, and surface water samples from all phases of investigation were analyzed for Site constituents of interest (COI) and the results of these analyses were used to determine the extent of the constituents associated with former MGP operations. Results of the dozens of investigations, studies, and assessments completed at the Site since 1986 were used to design the corrective actions described in Corrective Action Plan (CAP) documents, Corrective Action Plan Addenda (CAP-A) documents and various work plans prepared since 2000, and the 2014 Voluntary Investigation and Remediation Plan (VIRP) approved by EPD in 2015.

The remediation plan included in the VIRP was designed to mitigate the potential for receptor exposure to residual MGP impacts in soil and groundwater at the Site through the use of engineering and institutional controls. In accordance with the VIRP, unsaturated soils with MGP impacts were excavated and transported off-site, and in situ solidification (ISS) was completed to address MGP impacts in saturated soils and groundwater. Institutional controls in the form of Uniform Environmental Covenants (UECs) restricting land use, groundwater use and/or subsurface disturbance at parcels with impacts from former MGP operations or where ISS engineering controls remain in place will be executed on parcels in accordance with the Georgia Uniform Environmental Covenants Act, OCGA 44-16-1.

Soil

An evaluation of the results of all investigation and corrective actions performed to date on Site soil indicates that soils have been delineated to residential Type 1 risk reduction standards (RRS) or background levels determined in accordance with Hazardous Site Response Act (HSRA) Rules and VRP Act (VRPA) Rules. Soil at all parcels impacted by former MGP operations are either in compliance with default and/or site-specific RRS determined in accordance with HSRA Rules or comply with cleanup standards pursuant to the execution of UECs restricting subsurface disturbance and/or restricting land use of parcels to non-residential

use. Therefore, soil at all properties is in compliance with standards determined in accordance with the VRP. No further investigation or corrective action of soil is warranted.

Groundwater

The extent of MGP-related COI impacts in shallow alluvial groundwater and bedrock groundwater have been delineated to HSRA Type 1 RRS. Shallow alluvial groundwater is in compliance with residential RRS with the exception of an isolated area where the groundwater pathway will be controlled through the execution of UECs restricting the use of groundwater. Bedrock groundwater is in compliance in accordance with the VRP through standards which are protective of potential human and ecological receptors. UECs to prohibit groundwater use will be executed for parcels where residual impacts remain in alluvial and bedrock groundwater for long-term control of potential exposure pathways.

Data collected at the Site over a period of approximately 20 years provides substantial evidence that residual impacts in groundwater does not present a risk to human health and the environment as evidenced by:

- the residual dissolved phase plume in alluvial groundwater is stable as evidenced by:
    - data from nearly twenty years of groundwater monitoring demonstrates that natural attenuation is occurring resulting in a degradation of COI;
    - the effectiveness of corrective actions of source materials including soil excavation and ISS in 2002, 2009 and 2015 has resulted in reduction of COI concentrations and the extent of the plume;
    - detected concentrations of COI in alluvial groundwater are isolated to a small area west of Terminal Avenue within the Macon-Bibb County ROW and on Norfolk Southern active rail line property; and
    - with the exception of the area noted in the previous bullet, concentrations of COI in alluvial groundwater are below residential HSRA RRS rendering the exposure pathway for alluvial groundwater incomplete for the vast majority of the Site.
- the residual impacts in bedrock groundwater are stable as evidenced by:
    - the extent is known, delineated and has not migrated in approximately twenty years of continuous monitoring;
    - as demonstrated by two decades of data, DNAPL and dissolved phase COI are stable and not migrating at steady-state conditions, a condition that is expected to continue based on corrective actions performed to remove source areas, natural attenuation, physical properties of DNAPL, and bedrock hydrogeological studies which have shown no potential for mobility, and
    - further, the bedrock hydrogeological setting (fracture size and type and bedrock competency) provides an impediment to the movement of groundwater and more importantly, impacts in groundwater and therefore does not present a risk to any potential receptors.

Therefore, groundwater at the Macon MGP site is in compliance as determined in accordance with the VRP. No further investigation or corrective action of groundwater is warranted.

Surface Water and Sediment

Surface water and sediments of the Ocmulgee River were previously addressed in the 2004 CSR. Copies of the approval letters for the Sediment Remediation Closure Report and the subsequent Scour Protection Placement Completion Report are included in Appendix A. Monitoring since the 2004 certification of compliance for surface water and sediment has confirmed that the remedy remains effective. Residual impacts in sediments do not pose a risk to potential human or ecological receptors and surface water has not been impacted by former MGP operations. Therefore, no further investigation or corrective action of surface water or sediments related to the Ocmulgee River is warranted.

CERTIFICATION OF COMPLIANCE WITH VRP STANDARDS

I certify under penalty of law that this report and all attachments were prepared under my direction in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Based on my review of the findings of this report with respect to the risk reduction standards of the Rules for Hazardous Site Response, Rule 391-3-19-.07, I have determined that soils not previously certified for this site are in compliance with VRP cleanup standards for soil for regulated substances associated with releases from this site. I have also determined that groundwater associated with this site complies with the purposes, provisions, and policies of the Voluntary Remediation Program Act through the use of restrictive covenants to be placed on the property.

August 24, 2018

1.0 INTRODUCTION

This VRP CSR is submitted by AGLC and GPC for HSI Site number 10511 (the "Site"). For the purposes of this document, the term "Site" includes the portion of AGLC's contiguous property and any non-AGLC owned parcels impacted above applicable cleanup standards by the former MGP operations. The Site location is shown on Figure 1-1 and an aerial photograph of Site and vicinity in shown on Figure 1-2.

1.1 Purpose

This VRP CSR was prepared by Environmental Resources Management (ERM) on behalf of AGLC and GPC to satisfy the requirements of the VRP and Consent Order EPD-VRP-12 for the purpose of delisting the Site from the HSI. Documents previously submitted to and reviewed by EPD confirm the compliance status of sediment and surface water of the Ocmulgee River and soil on portions of the Site with applicable cleanup standards. This VRP CSR demonstrates the compliance status of all portions of the Site with applicable cleanup criteria pursuant to the VRP. This document also contains a summary of investigations and EPD-approved corrective action activities that have been completed at the Site in support of the compliance determination. Data from CAP and CAP-A reports, basis of design work plans (BDWP), Remedial Action Completion Reports (RACR) and Corrective Action Completion Reports (CACR) and CSRs previously submitted to EPD are incorporated by reference in this VRP CSR.

This VRP CSR demonstrates the horizontal and vertical delineation of MGP-related constituents of interest (COI) in soil on properties that were not certified for soil or groundwater compliance in the 2004 CSR (RETEC, 2004a), and documents compliance of those properties with applicable soil standards. This VRP CSR also summarizes data demonstrating the horizontal and vertical delineation of MGP-related COI and reiterates compliance status for soil and sediment on those parcels previously certified in the 2004 CSR. In addition, this VRP CSR demonstrates the delineation and compliance of groundwater at the Site in accordance with the VRP. VRP qualifying properties, adjoining properties and property ownership information is shown on Figure 1-3. Tax parcels and property ownership are also identified in Table 1-1.

1.2 Regulatory Background

Investigation activities associated with the Mulberry Street former MGP operations began in 1986. The portion of the Site where the Mulberry Street former MGP operated is shown on Figure 1-2. The Site was listed on the HSI as site number 10511, on July 24, 1998. Pursuant to HSRA, AGLC and EPD entered into Consent Order EPD-HSR-227 on July 11, 2000 (the "HSRA Consent Order").

To comply with the HSRA Consent Order, the Macon Site Soil and Groundwater CAP ([2001 CAP], ThermoRetec, 2001) proposed corrective actions consisting of soil excavation of unsaturated zone soils and in situ solidification (ISS) of media below the water table. The 2001 CAP focused on the Mulberry Street MGP, as the existence of a second former MGP in the Western Portion (Figure 1-2) was unknown at that time. Therefore, the original CSR submitted for the Site in 2004 (RETEC, 2004a), focused on the compliance status of parcels associated with the Mulberry Street MGP following completion of the excavation and ISS activities in 2002. Parcels with MGP-related soil impacts associated with the Mulberry Street former MGP were

certified in the 2004 CSR as compliant with residential or non-residential RRS for soil or groundwater, as applicable, in compliance with HSRA. Compliance status of soil at these parcels is summarized on Figure 1-4 and in Table 1-2. The EPD-approved RRS for soil at the Macon Site, including EPD-approved background concentrations for COI based on a previous study (Appendix J of the 2000 CSR) are shown in Table 1-3. Compliance details and certification of sediments of the Ocmulgee River (upper and lower outfall) with Type 5 RRS and/or standards established in the EPD-approved CAP for Sediments in the Ocmulgee River (RETEC, 2001) were also included in the 2004 CSR. A copy of the 2004 Certification of Compliance with RRS submitted in the 2004 CSR is included in Appendix A.

Post-remedy compliance groundwater monitoring activities identified continuing groundwater impacts. Approaches to address remaining COI in alluvial groundwater outside the footprint of previous corrective actions in the Mulberry Street MGP area, COI in alluvial groundwater in the Western Portion MGP area, and approaches to address COI in bedrock groundwater were proposed in the Groundwater Corrective Action Plan Addendum (GW CAP-A; RETEC, 2006). The 2006 GW CAP-A provided results of soil and groundwater investigations and pilot test data from activities completed after submittal of the 2004 CSR to support the proposed activities. Corrective actions proposed in the 2006 GW CAP-A to treat alluvial groundwater in the Western Portion MGP area were implemented in 2007. A Focused Feasibility Study for the Alluvium in the Area Downgradient of the ISS Mass (FFS for the ADGISSM; ENSR, 2008) was submitted in 2008 to outline a second phase of ISS activities beyond the 2002 ISS footprint to bring alluvial groundwater in the Mulberry Street MGP area into compliance. The additional ISS work was completed from September 2009 through January 2010, followed by post-remedy compliance groundwater monitoring.

In correspondence dated January 17, 2012, EPD requested submittal of a CAP-A to address remaining COI in alluvial groundwater at the Western Portion former MGP and bedrock groundwater impacts east of the Mulberry Street former MGP. The Western Portion and MW-101 Area Groundwater CAP-A (ERM, 2014a) was submitted to EPD on February 18, 2014 in accordance with the schedule established by EPD. The 2014 CAP-A proposed soil excavation and ISS as the selected corrective actions for the alluvial impacts at the Western Portion MGP.

During a meeting between EPD and AGLC personnel in July 2014, it was agreed that the Macon MGP Site was a candidate for entry into the VRP and subsequently entered into EPD Consent Order EPD-VRP-12 (the “VRP Consent Order”). The VRP Application and VIRP were then submitted to EPD in October 2014 (ERM, 2014b). The Western Portion 2014 CAP-A was included in the VIRP as Appendix C. Qualifying properties in the VRP Application are shown on Figure 1-3. Qualifying properties are parcels and Macon-Bibb County right-of-way (ROW) areas associated with impacts from the Western Portion former MGP operations requiring corrective action as presented in the VIRP, and parcels and ROW areas associated with impacts from the Mulberry Street former MGP operations not previously certified to HSRA RRS in the 2004 CSR. The VRP Application was approved by EPD on May 21, 2015, and the VIRP was approved by EPD on May 26, 2015.

1.3 Document Organization

This CSR is organized into the following sections:

- Section 1.0 gives an introduction.
- Section 2.0 provides Site background and history, including a description of the former MGP operations, a summary of investigations completed prior to submittal of the 2004 CSR, the list of COIs resulting from MGP releases at the Site, and potential sources.
- Section 3.0 presents the Conceptual Site Model (CSM). The CSM includes the general scope of Remedial Investigations (i.e. investigations completed since 2004), Site characteristics, extent of COI, and fate and transport mechanisms.
- Section 4.0 presents a summary of soil investigations completed at the Site to achieve horizontal and vertical delineation MGP impacts.
- Section 5.0 presents a summary of groundwater investigations completed at the Site to achieve horizontal and vertical delineation of MGP impacts.
- Section 6.0 presents soil and groundwater compliance with cleanup goals. Section 6.0 also includes a point of exposure (POE) evaluation to assess the potential for residual groundwater COI concentrations to adversely impact potential receptors. The evaluation demonstrates that residual COI in groundwater do not present a risk at the potential POE, which is located approximately 1,000 ft from the Site. COI concentrations would have to be multiple orders of magnitude higher than concentrations present anywhere at the Site to potentially present a risk.
- Section 7.0 presents a summary of potential exposure pathways and potential sensitive receptors, and overall status of Site compliance with applicable cleanup standards.
- Section 8.0 provides a summary and conclusions regarding the Site.
- Section 9.0 includes the references cited in this document.

2.0 SITE BACKGROUND

2.1 Site Location and Features

The Site is located in Macon, Bibb County, Georgia, with geographic coordinates for the approximate center at 32º 50'03.04" Northern Latitude and 83º 37'17.66" Western Longitude (United States Geological Survey [USGS] Topographic Quadrangle, Macon East, 1985). Releases of COI at the Site resulted from historical operations of two former MGP facilities that date back to the 1800s. The Mulberry Street MGP has been the subject of numerous investigations and corrective actions since the 1980's. The Mulberry Street MGP was situated on land bordered by 6th Street, Walnut Street, 7th Street and Mulberry Street (Figure 1-2 and Figure 2-1).

A second former MGP, the Western Portion former MGP, was located along Terminal Avenue on property currently owned by AGLC and extending onto Macon-Bibb County ROW areas, bounded to the south by 6th Street, to the west by an undeveloped parcel currently owned by Prodigy Holdings, LLC, to the north by Terminal Avenue and to the east by Walnut Street (Figure 1-2 and Figure 2-1). Investigations focused on the Western Portion MGP began in 2005.

In addition to the property surrounding the two former MGPs, the Site includes Central City Park (CCP) owned by Macon-Bibb County, ROW portions of Terminal Avenue, 6th Street, Mulberry Street, Walnut Street, and 7th Street owned by the Macon-Bibb County, and railroad ROW areas owned by Norfolk Southern and CSX Transportation (Table 1-1 and Figure 1-3). The current land use for all developed parcels comprising the Site and adjacent parcels is commercial/industrial (i.e., non-residential).

2.2 General Manufactured Gas Plant History

MGPs commonly operated in the 1800s through the 1950s for producing manufactured gas using coal gas processes, water gas/carbureted gas processes, and/or oil gas processes. The gas was primarily used for lighting and heating. The coal gas process involved the carbonization of coal in retorts (ovens) that produced gas consisting of hydrocarbon elements of the coal. The water gas process involved heating coke or coal in a generator, and subsequently injecting steam into the heated vessel that produced gas consisting of hydrogen and carbon monoxide. The carbureting process further included the injection and cracking of oil, creating a gas with hydrocarbon elements and a higher British thermal unit (BTU) content. The oil gas process involved injecting oil into a heated vessel, producing a gas consisting of the hydrocarbon elements of the oil. Each of these processes resulted in the generation of residual material such as tars, liquors, sludges, coal fragments, and gas purifying wastes. This residual material includes by-product like material (BPLM), commonly described as oil-like material (OLM) or tar-like material (TLM) residue, and non-aqueous phase liquid (NAPL).

2.2.1 Mulberry Street MGP Site

The 2000 CSR (Williams, 2000) included a detailed summary of former operations at the Mulberry Street MGP Site and surrounding properties as determined by review of Sanborn Fire Insurance maps (1884, 1889,1895, 1908, 1920, 1924, 1951, and 1969; Appendix A of the 2000 CSR), historical photographs, and aerial photographs (1920, 1949, and 1950). A 1930 appraisal

of the facility (Appendix B of the 2000 CSR) was also used to compile an operational history of the former MGP.

Historical documentation indicates that all three gas generating processes discussed above were utilized at the Mulberry Street MGP over the course of its operational history, which began in the mid-1850s and continued for nearly 100 years. Structures formerly located on the property included three gas holders, four tar wells, several purifying tanks, and various oil and crude oil tanks (RETEC, 2001). The locations of former MGP structures are shown on Figure 2-2.

All buildings and surficial equipment shown on Figure 2-2 were removed between 1924 and 1951 with the exception of the Purifier House, which was used as a workshop until it and its subsurface structures were removed in 2001. Detailed information on former operations and removal of MGP structures can be found in the 2000 CSR, the 2001 CAP and the 2004 CSR.

2.2.2 Western Portion MGP Site

A detailed description of former operations and associated structures at the Western Portion MGP is unavailable because the history of operations predates typical historical records (e.g., Browns Directory). However, an artist rendering of Macon in 1872 depicts a two-holder gas plant located northwest of 6th Street where Terminal Avenue is currently located. The Western Portion MGP is estimated to have operated from at least 1872 based on the artist rendering (Figure 2-3), to some time before 1884 based on the absence of the MGP plant on the 1884 Sanborn fire insurance map, which is the first available fire insurance map for the area.

Observations made during the excavation of test pits in 2008 in the Western Portion MGP area revealed the presence of brick and wood fibers potentially associated with MGP structures. Results of forensic analyses performed on samples collected during the August 2009 Supplemental Site Characterization (SSCR; ECM, 2009) indicated that the impacts were related to an MGP operation involving pyrolysis of wood resins, which was different from historical operations performed at the Mulberry Street MGP where the carbureted water gas process involved pyrolysis of coal. As documented in the CACR (ERM, 2016a), brick walls and the brick bottom of a gas holder were encountered on the property between Terminal Avenue and 6th Street, west of the intersection of 6th Street and Mulberry Street during excavation activities completed in the Western Portion. The walls and bottom of the holder and surrounding soils were excavated and removed as part of corrective action activities.

2.3 Previous Investigations

Assessment of soil and groundwater at the Mulberry Street MGP began in 1986. Activities included geophysical exploration, test pit excavation and the collection of soil and groundwater samples for laboratory analysis. Additional work completed in 1990-1991 included a review of available historical information (including Sanborn maps), completion of 22 soil borings for visual observations for residual BPLM, soil sample collection for laboratory analysis, installation of 6 groundwater monitoring wells, collection and laboratory analysis of groundwater samples, slug testing of monitoring wells, and a limited survey of potential human and environmental receptors (LAW, 1991a; LAW 1991b; LAW 1992).

Eighty-six soil borings, 19 groundwater monitoring wells, and 5 structure wells were installed between December 1997 and February 1998 as part of an environmental assessment to define the horizontal and vertical extent of COI in soil and groundwater and investigate for the potential presence of NAPL (Williams, 1998). Source material in the form of TML and OLM was observed in subsurface former MGP structures on the Mulberry Street MGP property during the environmental assessment conducted from December 1997 to February 1998 (Williams, 1998). Monitoring wells were installed downgradient of the former structures to monitor for potential NAPL, and the structure wells (Figure 2-2) were installed to allow for the measurement and collection of residual NAPL. No measurable NAPL was observed in the monitoring wells. Measurable amounts of NAPL were present in structure wells SW-1 and SW-2 (less than 1 foot), and TLM was identified in SW-4 (less than 0.5 foot).

Investigations conducted at the Mulberry Street MPG portion of the Site between March 1999 and February 2000 included completion of more than 100 soil borings for visual observations and laboratory analysis; installation of 10 groundwater monitoring wells; and geophysical investigations of bedrock conditions. These investigations were conducted as part of the environmental assessment completed by Williams (RETEC, 2004a). Investigation methods and results were reported in the 2000 CSR. Soil samples were collected for visual observation of BPLM, field screening for the presence of VOCs using closed headspace procedures with a flame ionization detected (FID) or photoionization detector (PID), and for laboratory analysis for COI. From 1999 to 2000 over 100 additional borings were completed for soil sample collection, visual observation, field screening and laboratory analysis during the Compliance Status Investigation completed by Williams (Williams, 2000; RETEC, 2004a). A total of 86 soil borings were completed after submittal of the 2001 Soil and GW CAP, most as part of a source delineation investigation completed between April 16, 2001 and June 1, 2001. Details of activities, including drilling methods, soil sample collection and handling and boring logs were included in the Source Delineation Investigation Report (ThermoRetec, 2001).

Details of these investigations were previously submitted to EPD in various reports (LAW, 1991a; LAW, 1991b; Williams, 2000; RETEC, 2000; RETEC, 2001; RETEC, 2004a; RETEC, 2004c; RETEC, 2004d). These reports include information regarding rationale for boring locations, drilling logs, soil screening and collection methods, borehole abandonment techniques, sample handling and preservation techniques, decontamination procedures and laboratory methods. Therefore, a discussion of the methods and procedures used during these investigations has not been included in this report. These investigation and characterization activities were used to delineate COI in soil and groundwater and to design corrective actions to bring the Site into compliance with applicable standards.

2.4 Site-Specific Constituents of Interest

Releases at MGP sites in general involve tar, oil, slag, coal fragments, ash and associated sludges that are complex mixtures of different SVOCs, lesser amounts of phenolics and VOCs, and some inorganic compounds such as various metals and cyanide. The ash and slag are considered to be essentially inert materials, as the organic constituents are burned off in the process of producing gas. The Gas Research Institute (Management of Manufactured Gas Plant Sites, Volume I, Wastes and Constituents of Interest, October 1987 and later revisions) identifies a list of chemicals present at most MGP sites. The list of MGP-related Site-specific

COI addressed in this VRP CSR were developed based on the Gas Research Institute list plus compounds detected during the Preliminary Assessment (LAW, 1991a) and Site Inspection (LAW, 1992) above the applicable HSRA notification concentrations in soils or above background levels in groundwater. In correspondence dated January 17, 2012, EPD requested that COI listed in the 2014 CAP-A match those presented in the 2004 CSR. Site-specific COI, consisting of VOCs, SVOCs and inorganic compounds, are presented in Table 2-1. Natural attenuation (NA) parameters (Table 2-1) have also been collected at the Site to assess groundwater conditions and evaluate degradation of COI.

2.5 Source of Release

2.5.1 Mulberry Street MGP Site

Former MGP structures and associated subsurface remnants were identified and documented in the 1991 Preliminary Assessment (PA; LAW, 1991a), the Site Inspection (SI; LAW, 1991b), and Environmental Assessment Report (EA; Williams, 1998) and included Gas Holders 1, 2, and 3; Tar Wells 1, 2, and 3; the Tar and Liquor Well (Tar Well No. 4); and the Purifying Room/Exhaust and Motor Room (Figure 2-2).

Other MGP structures, equipment, or storage areas were identified from the 1930 appraisal and Sanborn maps, including oil tanks, a coal trestle, a carbonizing plant, a fuel/water gas room, a coke shaker and conveyor, crude oil tanks, a meter house, additional tar wells and tar kettles, an oxide-drying platform, and purifiers.

Six surface soil samples were collected in October 1991 (LAW, 1991a) near former Gas Holders 1 and 2 and former Tar Wells 2 and 3. Compounds associated with MGP operations, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals were detected at all 6 locations. All of the potential sources listed above, including those investigated in 1991, could have contributed to the release of regulated substances, but the extent of each source's contribution is uncertain. Extensive subsurface investigations completed at the Site have provided sufficient data to define the extent of MGP-related impacts to soil and groundwater from each of these potential sources.

2.5.2 Western Portion MGP Site

Information on the type and location of plant structures at the Western Portion MGP is limited, as the only available depiction is the 1872 artist rendering showing 2 gas holders, where Terminal Avenue is currently located (Figure 2-3). Operations at the plant appear to have ceased prior to 1884 based on the absence of the former gas holders from the first Sanborn Map published in that year. Investigation of the area northwest of 6th Street began in 2005. In 2007, soil and groundwater impacts requiring additional investigation were identified during the demolition of structures on the property northwest of the intersection of 6th Street and Mulberry Street. Data collected during investigation and delineation activities completed between 2007 and 2013 indicated impacts to soil and groundwater from the Western Portion MGP on portions of properties presently owned by AGLC, Norfolk Southern, Prodigy Holdings LLC, and the Macon-Bibb County ROW areas (Figure 1-3).

Although identification of specific potential sources at the Western Portion MGP is not possible due to sparsity of historical information, extensive subsurface investigations have provided

sufficient data to define the extent of MGP-related impacts to soil and groundwater from former operations.

3.0 CONCEPTUAL SITE MODEL

This section presents a brief description of the remedial investigations and delineation of Site COI completed since submittal of the 2004 CSR, and presents the CSM, including the Site geologic and hydrogeologic setting, and aquifer characteristics. This section also presents a summary of the geologic conditions that govern the distribution of dense NAPL (DNAPL) in bedrock fractures and preclude DNAPL migration beyond the isolated area where currently present.

As shown on Figure 1-4 and discussed in Section 1.2, soils at numerous parcels and in ROW areas were certified in the 2004 CSR and those certifications remain applicable. As such, the data presented in this section and in Section 4.0 are specific to areas not certified in 2004, and detail the activities completed to investigate and bring these areas into compliance.

Information pertaining to the corrective actions completed between 2000 and submittal of the 2004 CSR (Figure 3-1) and the 2004 certification of parcels as shown on Figure 1-4 and provided in Appendix A can be found in the 2004 CSR. Information pertaining to CSM development can be found in the 2004 CSR, the 2008 Focused Feasibility Study (FFS) for Alluvium in the Area Downgradient of the ISS Mass, the VIRP and VRP Semiannual Progress Reports.

3.1 Remedial Investigations Since 2004

This section briefly describes both delineation sampling and post-corrective action confirmation sampling performed at the Site to the extent needed to certify MGP COI-impacted parcels that were not certified in the 2004 CSR. The discussion is divided into the MW-101 area, the Western Portion former MGP and the ADGISSM based on differences in the dates of discovery, investigation and corrective action (Figure 3-1). Field methods and quality assurance/quality control (QA/QC) procedures were performed in accordance with U.S. EPA's Standard Operating Procedures during the investigations, as documented in reports previously submitted to EPD, including the 2006 GW CAP-A, 2008 RACR for Bedrock Groundwater, the 2008 FFS for ADGISSM, the 2014 CAP-A and the 2014 VIRP.

3.1.1 MW-101 Area

Groundwater monitoring completed from 2002 through 2004 in the Mulberry Street MGP area indicated the need for additional investigation and corrective action near MW-101, cross-gradient of the 2002 ISS (Figure 2-1). In July 2004, soil borings were completed in the MW-101 area for visual inspection for residual MGP-impacts, and to install injection and observation wells for pilot testing of an *in-situ* remedy. Testing to evaluate the effectiveness of an oxygen diffusion technology (iSOC®) to promote biodegradation of COI in the alluvial aquifer at MW-101 was initiated in July 2004 (Figure 3-1). Testing continued in the MW-101 area until February 2005, when concentrations of dissolved COI were reduced to below laboratory detection limits.

Minimal TLM was observed in 2 additional borings completed in the MW-101 area in November 2005. To aggressively treat the minimal TLM in the saturated zone, the 2006 GW CAP-A recommended ISCO. Implementation of the recommendations in the 2006 GW CAP-A were suspended when the Western Portion MGP was discovered, and groundwater monitoring in the

MW-101 was suspended until 2009. The 2011 Focused Feasibility Study – Western Portion and MW-101 Area (ECM, 2011) presented ISS as the recommended remedy for the MW-101 area; however, as detailed in the 2014 VIRP (Appendix C), groundwater monitoring results since 2013 showed natural attenuation of dissolved phase COI to be occurring in the area, as evidenced by decreasing concentrations at MW-101 and a lack of COI detections at well locations less than 100 feet downgradient of MW-101. As the MW-101 area is within the Type 5 property boundary already certified in the 2004 CSR and groundwater use at the property is already restricted through the execution of UECs, the 2014 VIRP recommended continued monitoring of groundwater at MW-101 to confirm lack of COI migration to downgradient wells and continued attenuation of COI at MW-101.

3.1.2 Western Portion MGP

This section briefly describes soil investigation activities performed since February 2005 in the Western Portion MGP area (Figure 1-2 and Figure 3-1) to the extent needed to provide evidence of the horizontal and vertical delineation of COI in unsaturated soil at parcels impacted by Western Portion former MGP operations.

Groundwater monitoring conducted following completion of the 2002 ISS indicated the need for additional investigation and corrective action in the area upgradient of the ISS, near MW-09 at the intersection of 6th Street and Mulberry Street (Figure 2-1). The Pilot Test Work Plan (PTWP; RETEC, 2004e) outlined plans to evaluate the effectiveness of remediation using either iSOC® or ISCO in the MW-09 area. Pilot testing of iSOC® was conducted in 2005 (Figure 3-1). Results indicated that residual impacts in the saturated zone near MW-09 were not amenable to aerobic bioremediation (RETEC, 2006). Soil investigations completed from November 2005 through March 2006 along Mulberry Street, 6th Street and on parcels west of 6th Street indicated MGP-impacts (primarily TLM) were more extensive than previously thought, and ultimately led to the identification of the Western Portion MGP.

Subsequently, the GW CAP-A recommended additional investigation near MW-09 to further characterize the extent of impacts and evaluate remedial options. The recommended investigation began in August 2006. ISCO injections were implemented in 2007 in accordance with recommendations in the GW CAP-A (Figure 3-1) but were suspended in December 2007 due to the need for additional delineation of residual BPLM in the unsaturated and saturated zones. Additional investigations were completed in 2008, which included test pit excavations to further identify impacts.

In August 2009, 41 soil borings were completed in the Western Portion MGP area. Forensic fingerprint sample analyses indicated the impacts in the area were MGP-related but were from operations different from those performed at the Mulberry Street MGP (ECM, 2011). An additional 20 soil borings and 11 groundwater monitoring wells were completed in 2010 (ECM, 2011) to provide data for a remedial alternatives evaluation. In 2013, over 100 soil borings were advanced to complete the delineation of COI in surface and subsurface soil and evaluate compliance of unsaturated soil with RRS (ERM, 2014a).

In summary, the conclusion from these investigations was that additional corrective action beyond that already completed in the Western Portion MGP area, as documented in the Western Portion and MW-101 Area Groundwater CAP-A (ERM, 2014a), was required. The

proposed remedy included excavation of unsaturated soils and ISS of saturated soils to address MGP source materials below the water table. A summary of the corrective action completed in the Western Portion was included in Appendix A of the 2nd Semiannual VRP Progress Report (ERM, 2016b). Compliance of soil and groundwater in this area is summarized in Section 6.0 and certifications are included in this report.

3.1.3 Area Downgradient of the ISS Mass

The main objective of investigation in the ADGISSM was to identify impacts in the saturated alluvium identified during the implementation of the bedrock remedy in this area as documented in the Remedial Action Completion Report for Bedrock Groundwater (AECOM, 2008). The investigation data was used to design an appropriate remedy for soil and groundwater and assess the area for any unsaturated zone impacts not addressed during soil excavation in the area in 2002.

Between November 2006 and May 2007, a total of 25 soil borings were completed in the ADGISSM. Details of the investigations, including boring locations, borehole drilling techniques, unsaturated zone soil collection methods, field screening of soil with a PID for the presence of organic vapors, and visual observations of soil samples were submitted to EPD in the FFS for the Alluvium in the ADGISSM (ENSR, 2008) and the Remedial Action Completion Report for the Area Downgradient of the ISS Mass (RACR; AECOM, 2010). In summary, visual observations and field screening using a PID did not indicate MGP-impacts in the unsaturated zone; therefore, no soil samples were collected from the vadose zone for laboratory analysis.

In 2009, soil excavation and ISS activities were completed in the ADGISSM to address residual MGP-related TLM in saturated soil and associated groundwater impacts (AECOM, 2010). Soil used to backfill the footprint of the 2009 ISS mass included soil previously excavated within the ADGISSM to allow for ISS, supplemented with imported backfill. Backfill soil was tested prior to use at the Site. Laboratory analyses showed reported concentrations for all analytes tested in the backfill were below Type 2 RRS approved by EPD for the Site.

The ADGISSM is located within the boundaries of a parcel currently owned by the Macon-Bibb County Urban Development Authority, which was certified in the 2004 CSR to HSRA Type 5 RRS. No vadose zone soil impacts were observed during the 2006-2007 investigations, nor during the implementation of corrective actions to address saturated zone impacts in 2009, and backfill materials are in compliance with Type 2 RRS. As such, soils in the ADGISSM remain in compliance with the RRS pursuant to HSRA.

3.1.4 Macon Iron & Paper Stock Company

Twelve soil borings were completed at the former Macon Iron and Paper Stock Company (MI&P) as due diligence samples in March 2013 using direct push technology (DPT; Figure 3-2). A surface soil sample (0-2 feet below ground surface; ft bgs) and a subsurface sample were collected at each location for laboratory analysis. Sample handling, field screening, logging and laboratory analytical methods were consistent with those discussed above. Analytical results for MGP-related VOCs, SVOCs and metals are summarized in Table 3-1. Soil boring logs and laboratory reports are included in Appendix B.

Sample results indicate that detected concentrations of VOCs, SVOCs and metals were all below even Type 1 RRS as calculated pursuant to HSRA except for benzene at 2 locations (DDSB-8 and DDSB-10; Table 3-1). Although benzene was not detected at DDSB-9, the laboratory detection limit for benzene for this sample (2.8 mg/kg) was above the HSRA Type 1 RRS (0.50 mg/kg). Likewise, although chloromethane was not detected at DDSB-8, the laboratory detection limit for chloromethane for this sample (0.095 mg/kg) was above the HSRA Type 1 RRS (0.04 mg/kg).

3.2 Physical Setting

The Site topography ranges between elevations 285 to 330 ft above mean sea level (ft AMSL; United States Geological Survey [USGS] Topographic Map Macon West and Macon East, Georgia; Figure 1-1). Land use for parcels that comprise the Site and adjoining properties is industrial/ commercial. An active Norfolk Southern rail line is located northwest of the Site, across Terminal Avenue. Properties owned by Norfolk Southern and CSX Transportation, which include active rail lines, are located north and south of the intersection of Walnut Street and 7th Street to the east of the former Mulberry Street MGP. CCP is located east of these rail lines. The Ocmulgee River flows northwest to southeast in this area of Macon and is approximately 1,000 ft north-northeast of the Site at the closest point.

3.2.1 Regional Geology and Hydrogeology

The Site is located in the Coastal Plain physiographic province of Georgia, which in Bibb County is divided into three distinct regions that include the Sand Hills, Red Hills and Tifton Upland (Clark and Zisa, 1976). The Site lies within the Sand Hills region which is characterized by light-colored sands and clays of Late Cretaceous age that slope gently towards the southeast (Husted et. al. 1978; Legrand 1962; RETEC 2006). The Site is underlain by up to 40 ft of Pleistocene- to recent-age alluvial deposits described as unsorted sand, gravel, and clay (RETEC, 2006; ENSR, 2008).

Below the alluvial deposits, the Late Eocene upper sand member of the Barnwell red sands grade downward into interbedded yellow sand and clay (Husted et. al., 1978). The Cretaceous-age Tuscaloosa Formation lies unconformably below the Barnwell Formation and consists of fine- to coarse-grained, subangular, micaceous, arkosic sands that are interbedded with gray to green, locally iron-stained kaolinitic, micaceous sandy clays (Legrand, 1956; Husted et. al. 1978). The base of the Tuscaloosa in this area dips slightly to the southeast and lies unconformably above Pre-Cambrian and older Paleozoic crystalline bedrock that includes mica schist, felsic gneiss and schist, and granite and granite gneiss (Couch et. al., 1996).

Sand and gravel deposits within the alluvium are the most permeable geologic deposits in the vicinity of the Site. Recharge to the Tuscaloosa formation occurs in outcrop areas west of the Ocmulgee River, and groundwater in the alluvium and Tuscaloosa is expected to discharge into the Ocmulgee River (ENSR, 2008). The Paleozoic-aged and older igneous and metamorphic rocks, and associated saprolite generally exhibit low transmissivities.

3.2.2 Site Geology

Numerous investigations completed at the Site identified geologic units consisting of fill material; unconsolidated alluvial deposits; sandy clays of the Tuscaloosa Formation; a clayey to silty

saprolite; and a granitic gneiss bedrock (Williams, 2000; RETEC, 2006). Throughout most of the Site, the fill material is comprised of a combination of sand, silt, clay, and gravel and is encountered from the ground surface to depths ranging from approximately 0.2 to 15 ft below ground surface (ft bgs).

The alluvial deposits underlying the fill material generally grade downward from sandy clays and clayey sands, to silty sands, further to sands and gravelly sands (RETEC, 2006). The alluvial sands and gravels have been subdivided into upper, middle, and lower sands and gravels (ENSR, 2008).

The alluvial deposits overlie the Cretaceous-age Tuscaloosa Formation (where present) and the older, underlying saprolite. The Tuscaloosa Formation is generally found west and north of Sixth Street and tapers off in the western/northwestern portion of the Mulberry Street MGP Site, consistent with the orientation of the overlying beds. The Tuscaloosa is encountered from 5 to 23 ft bgs and thickness ranges from approximately 3.5 to 11 ft. (ENSR, 2008).

The base of the Tuscaloosa formation lies unconformably above a saprolite unit. Saprolite, a product of rock decomposition that is formed through in situ chemical weathering, is characteristic of the region (Pavich, 1996). It is characterized by the presence of relict structures present in the original unweathered rock and exhibits the original rock makeup. The saprolite encountered at the Site is generally a clayey silt characterized by relict foliation and structures associated with the parent igneous and metamorphic rock. The thickness of the saprolite at the Site ranges from approximately 6.5 to 30 ft (RETEC, 2006; ENSR, 2008).

The saprolite at the Site is not considered to be a porous media due to the documented limited number of fractures observed during subsurface investigations. The decomposition of granitic gneiss, abundant in both muscovite and biotite mica, has formed sheet silicates that weather readily into clays. The resulting saprolite has a low flow capacity with low permeability and little to no secondary porosity (RETEC, 2006; ENSR, 2008; ECM, 2011). The saprolite contact, as determined from review of historic boring logs and cross-sections, generally dips downward from southwest to northeast (Figure 3-3). The thickness of saprolite across the Site ranges from 30 ft in the western portion of the Site to approximately 6.5 ft west of the intersection of Walnut and 7th Streets. Saprolite thickness in the vicinity of this intersection is observed to generally be consistent at approximately 6.5 ft (RETEC, 2006; ECM, 2011; ERM, 2011).

The underlying bedrock consists of a granitic gneiss containing both open and fused fractures that diminish with depth (RETEC, 2006). A downhole geophysical study was performed by COLOG in bedrock groundwater monitoring wells MW-12DD, MW-22D, MW-23D and MW-24D in 1999 (Appendix E of the 2000 CSR). In June 2005, COLOG performed geophysical logging in ten well boreholes at the Site (RETEC, 2006, Appendix D). The results of the geophysical logging demonstrated that the fractures vary in aperture and dip angles range from 10 to 85 degrees from horizontal. Bedrock fractures demonstrate a primary fracture orientation to the east and southeast and flow lines are generally parallel to fracture orientations (Figure 3-3). Topographic changes in the top of bedrock at the Site generally mimic top of saprolite topographic changes in the vicinity of the intersection of Walnut and 7th Streets where saprolite thickness is approximately uniform, so that top of saprolite contours noted on Figure 3-3 in this area denote approximate elevation variations in the top of bedrock. As such, top of saprolite “low” and “high” areas indicate corresponding top of bedrock lows and highs.

Detailed information on the Site geology was obtained from several phases of CSR and supplemental investigations. These data were used to generate conceptual geologic cross section views of the Site's subsurface stratigraphy. Cross sections that depict the geology of the Site before soil excavation and ISS in the ADGISSM and Western Portion area were provided in previous CSRs (RETEC, 2004a). These cross sections have been updated to reflect the change in geology due to soil removal activities and replacement of impacted soil with clean, fill material. Geologic cross-sections (A-A', B-B', C-C', D-D') illustrating the current Site geology and hydrogeological conditions are presented in Figures 3-4 through 3-6.

Groundwater is present in portions of the fill material, the alluvium, the Tuscaloosa Formation, saprolite and bedrock. Groundwater is typically first encountered at a depth ranging from 6-20 ft bgs. During Site restoration activities following the 2002, 2009 and 2015 soil excavation and ISS actions, excavated areas of the Site were backfilled with either imported backfill material consisting primarily of clays, silty clays and sandy clays, and/or excavated soil tested for compliance with reuse criteria. The material placed in the excavated areas was compacted to at least 95 percent compaction, resulting in a low permeability.

3.2.3 Site Hydrogeology

3.2.3.1 Alluvium Hydrogeology

The alluvium groundwater monitoring network at the Site consists of 29 wells completed in the shallow alluvium and 3 wells, identified as intermediate wells, completed deeper in the alluvium (Table 3-2). The most recent groundwater level gauging event at the Site was completed on February 19, 2018 (Table 3-3). As shown on Figure 3-7, alluvial groundwater flow direction observed during the February 2018 event is in an easterly direction, towards the Ocmulgee River. Hydraulic conductivity in the alluvium at the Site is estimated to be 1.68 x 10-3 centimeters per second (cm/sec; RETEC, 2006), or 4.76 ft/day. Since 2006, the hydraulic conductivity and effective porosity reported in the 2006 CAP-A have been used to estimate groundwater seepage velocity. Seepage velocity in the alluvial aquifer for the February 19, 2018 event was estimated from the product of hydraulic conductivity (K) and horizontal hydraulic gradient (i), divided by effective porosity (ne). Based on these parameters, the February 2018 alluvial seepage velocity is approximately 1.1 ft/day in the western portion of the Site and approximately 0.26 ft/day in the eastern portion (see Table 3-4 for seepage velocity calculations and Appendix C for gradient calculations). The calculated approximate seepage velocities are consistent with those previously-reported to EPD in semiannual groundwater monitoring reports.

3.2.3.2 Bedrock Hydrogeology

The bedrock groundwater monitoring network at the Site consists of 34 wells, of which 4 wells are completed at depths of greater than 70 ft bgs to provide vertical delineation data and are identified as deep bedrock wells (Table 3-5). Groundwater levels at bedrock groundwater monitoring well locations were most recently gauged on February 19, 2018 (Table 3-6). Figure 3-3 shows the hydraulic potential in shallow bedrock wells for February 19, 2018. DNAPL was detected at MW-111D and MW-309D in February 2018, consistent with previous events. Observed DNAPL thickness where present is noted in Table 3-5.

Groundwater occurrence and movement within fractured bedrock aquifers is controlled by a combination of hydraulic gradients, fracture orientations and fracture connectivity. As shown on Figure 3-8, the hydraulic potential in bedrock decreases across the Site from approximately west to east-southeast. The observed drop in hydraulic potential combined with evidence of the orientation of bedrock fractures (Figure 3-2) indicates that movement of groundwater in the bedrock aquifer is primarily to the east/southeast towards the Ocmulgee River. Since fractured bedrock aquifers are inherently anisotropic and heterogeneous, calculation of seepage velocity may not be representative using bulk porosity estimates. However, a range of porosity estimates may provide bounds on the estimated groundwater seepage velocity in the bedrock aquifer. Multiple seepage velocities are presented in Table 3-4 using porosity estimates from literature and by solving three-point problems for different areas of the Site using the February 2018 groundwater elevation measurements. The calculated range of seepage velocities in the bedrock aquifer in February 2018 at the western portion of the Site was between 0.08 and 6.17 ft/day, and between 0.05 and 3.63 ft/day in the eastern portion of the Site (see Appendix C for gradient calculations). The calculated approximate seepage velocities are consistent with those previously-reported to EPD in semiannual groundwater monitoring reports.

Measured hydraulic conductivity in bedrock aquifers varies from well to well based on the fracture network the individual borehole intersects. To get the most reasonable estimate of groundwater occurrence and movement in the aquifer, the best approach is to assess numerous wells, and to use more than one evaluation method. In an effort to more fully assess groundwater movement in the bedrock aquifer beyond the groundwater seepage velocities estimated above, the following paragraphs summarizes investigations at the Site to refine understanding of the bedrock aquifer fracture system and groundwater occurrence in bedrock fractures.

Extensive geophysical and aquifer testing has been performed at the Site to refine understanding of the fracture network and hydrogeological characteristics of the bedrock aquifer in the eastern area of the Site where MGP-related impacts are observed in bedrock groundwater. In summary, results of the testing demonstrate that bedrock beneath the Macon MGP Site contains a relatively small number of low-yielding fractures. Ambient groundwater flow rates in fractures under equilibrium conditions ranges from less than 0.0001 gallons per minute (gpm) to 0.0024 gpm. Therefore, unless water is pumped from the bedrock zone, the rate of flow in this zone is very low to almost no flow (RETEC, 2006). Details of bedrock groundwater level monitoring activities, aquifer characterization investigations and conclusions regarding potential for movement of groundwater in the bedrock aquifer are provided below.

Sustainable Yield Pumping Test

A sustainable yield pumping test performed in bedrock well MW-12D in October 2003 (Appendix M, RETEC, 2006) showed that steady-state equilibrium was achieved with a pump discharge rate of 0.5 gpm. Based on interpretation of the pumping test data, a hydraulic conductivity of 3.4E-06 cm/sec (9.6E-03 ft/day) was calculated for the pumping well (RETEC, 2006). The pumping test results demonstrate that the bedrock aquifer provides limited groundwater yield in the immediate vicinity of the Site.

Geophysical Logging

Data from downhole geophysical studies performed in four bedrock wells in November 1999 combined with core samples recovered during drilling operations were used to identify the strike and dip of a set of potentially water-producing fractures east of the Site. The results of this investigation were presented in Appendix E-5 of the 2000 CSR. Additional bedrock geophysical studies were completed in 2005 (RETEC, 2006 CAP-A) and included extensive downhole geophysical testing of ten bedrock wells, providing additional information on the strike and dip of potentially water-producing fractures.

Geophysical logging was performed at well locations in 1999 (Williams, 2000) and 2005 (RETEC, 2006). In regard to the pattern of water-bearing fractures at the Site, the 2005 results provided more substantial information than the 1999; therefore, that event is the focus of this section. Ten boreholes were assessed to determine fracture orientation and aperture. In addition, fracture density and ambient flow conditions were evaluated to determine location and capacity of water-bearing fractures. The results showed that the dominant water-bearing fracture or fractures at 90% of the well locations was, on average, within the top 28% of the open corehole interval, and that fracture aperture and density decreases with depth, signifying that the majority of groundwater movement in the bedrock is in the shallow portion of the aquifer.

Ambient flow testing in the coreholes (e.g., assessment of flow through fractures under static, non-pumping, steady-state conditions) identified only ambient horizontal flow as opposed to vertical flow. This observation indicates that there is little to no vertical hydraulic gradient in the wells, likely because there are fewer fractures at depth so coreholes were less likely to intersect a water-bearing fracture below the upper, shallow bedrock zone. Flow testing was also completed under pumping conditions to assess the impact of groundwater withdrawal on the capacity of water-bearing fractures.

The flow capacity of water-bearing fractures was evaluated and reported as an interval or fracture-specific hydraulic conductivity. A table summarizing the results of the study was included in the 2006 CAP-A, and is included in this VRP CSR as Table 3-7. As shown in the table, the fracture with the highest flow capacity under static conditions was observed at MW-113D near the top of the corehole at approximately 35 ft bgs (0.022 gpm). Wells were also tested under pumping conditions. The fracture with the highest flow capacity under pumping conditions (13.9 gpm) was IW-3, a well used during the 2004 ISCO injections (see Section 3.0) which was abandoned during the 2009 soil excavation and ISS activities as it was located within the footprint of the 2009 ISS mass.

Under ambient conditions, the average flow was 1.35 gpm, in contrast to under pumping conditions where the average flow rate for all wells was 123 gpm. The median rates under ambient and pumping conditions were 0.0009 gpm and 0.31 gpm, respectively.

The following conclusions are drawn from the study:

- In ten wells tested, only thirty-two water-bearing fractures or fracture zones were identified.
- The average length of the intervals where flow was detected in tested wells ranged from approximately 0.1 ft to 0.3 ft, with the exception of MW-110 and MW-111 where fracture zones with measured low were estimated to range from 0.1 to 0.6 ft.

- Groundwater movement in the bedrock aquifer occurs primarily in fractures in the upper portion of the bedrock zone, near the saprolite/bedrock interface.
- Fracture density and water-bearing capacity decreases with depth.
- The combined length of all intervals where flow was observed was approximately 5.6 ft, representing less than 1.5% of the total length of bedrock aquifer tested which was approximately 470 ft.
- Under ambient, non-pumping conditions, groundwater movement in the bedrock aquifer is little to none with a maximum flow rate of 0.002 gpm.

Pneumatic Slug Testing

Testing was completed in MW-110D, MW-111D, MW-200D, MW-207D and ISCO injection well IW-1 between November 2006 and February 2007. Hydraulic conductivity values from pneumatic slug testing ranged from 4.6E-04 to 9.2E-04 cm/sec (1.3 to 2.6 ft/day), with the exception of MW-110D which was 7.1E-03 cm/sec (20 ft/day). The higher value is likely due to a larger-aperture water-bearing fracture intersected by the well (ENSR, 2008).

In summary, there is little to no movement of groundwater in the bedrock aquifer under static conditions. In regard to fate and transport of dissolved phase COI, bedrock characterization activities at the Site show low potential for migration of COI in bedrock groundwater. This conclusion is supported by laboratory analytical data of groundwater samples collected at the Site for more than 20 years that shows that dissolved phase COI have not migrated more than 400 ft from the intersection of Walnut Street and 7th Street (see Section 6.4.1).

3.2.4 Distribution of DNAPL in Bedrock

DNAPL is present at the Site at bedrock monitoring wells MW-111D and MW-309D (Table 3-6). DNAPL was first observed at MW-111D in 2006 during groundwater extraction activities at the well completed as part of ISCO corrective actions. DNAPL has been detected at MW-309D since installation in 2013. Although DNAPL was not observed during installation of the well, it entered the well during well development as groundwater was pumped from the well. As noted in the VIRP and further discussed in subsequent VRP Progress Reports, DNAPL was observed during the installation of MW-305D, located east of the 2009 ISS along the eastern side of 7th Street, in 2013. The DNAPL was encountered at the top of bedrock, at the saprolite/bedrock interface at a depth of approximately 31 ft bgs at the MW-305D location. DNAPL has never been detected in MW-305D.

In 2007, in response to the detection of DNAPL at former MW-110D and at MW-111D, NAPL adsorbent (FLUTe) liners were inserted into select bedrock wells in order to investigate the presence of DNAPL and the location of NAPL-bearing fractures in the test wells if present. FLUTe work at well MW-200D (within the footprint of the 2009 ISS, subsequently abandoned prior to the ISS and replaced by existing MW-200DR) provided additional insight into the depth of the major BPLM-bearing fractures. At this well location, three fractures between approximately 27 to 33 ft bgs contained evidence of mobile DNAPL. At other wells where FLUTes were installed, the only evidence of DNAPL was noted as a few blebs in the liners at MW-201D at 29 ft. bgs and MW-110D at 33.7 ft. bgs.

As presented in the VRP 3rd Semiannual Progress Report (ERM, 2016c), DNAPL samples were collected from MW-111D and MW-309D for characterization, and the reported viscosities at 10°C were 347 and 350 millipascal-second (mPa-s), respectively. The viscosity of water at 10°C is approximately 1.3 mPa-s, significantly lower than the viscosity of the Macon MGP site DNAPL. Consequently, the high viscosity of the DNAPL limits mobility in the subsurface, so that distribution is not only controlled by the presence, orientation and connectivity of fractures and joints, but also by the aperture of the features (because migration will stop once the viscous forces [entrance pressures] are too high for the substance to enter an opening). Once entrance pressures are exceeded, the DNAPL will become immobile.

The occurrence of DNAPL in the shallow bedrock zone at MW-305D, MW-200DR and MW-111D and lack of DNAPL observations in deeper fractures at MW-305D demonstrates that the driving forces of DNAPL migration are not sufficient for DNAPL to migrate vertically to deeper fractures in the bedrock. As originally presented to EPD in Figure 3-6 of the 2004 CSR and included herein as Figure 3-2, top of saprolite “low” areas, which mimic top of bedrock “low” areas, exist northeast of former Mulberry Street MGP property. Over the last 150 years (i.e., since operation of the MGPs and source release of DNAPL), data indicates that DNAPL has migrated along the saprolite/bedrock interface to these lower elevation saprolite and corresponding bedrock surface area lows. Groundwater monitoring well data shows that DNAPL has migrated a distance of approximately 75 ft from the former MGP property and pooled in the areas of saprolite and bedrock surface lows in the vicinity of MW-111D and MW-305D. The bedrock groundwater well network is robust in this area; the lack of DNAPL observation at nearby wells supports the conclusion that the horizontal migration of DNAPL is limited as it pools in areas of saprolite and bedrock surface lows. In addition, the absence of visual indicators of DNAPL at MW-309D during installation coupled with DNAPL entry to the well while pumping indicates that the DNAPL was immobile under ambient, non-pumping conditions and the extraction of groundwater from the well induced movement of the DNAPL to the well.

Vacuum enhanced fluid recovery (VEFR) events were completed at the Site over several years beginning in 2011 in an effort to evaluate the feasibility of removal of dense NAPL (DNAPL) from MW-111D and MW-302D. VEFR events were later discontinued based on evidence that they were causing destabilization and possible accelerated migration of dissolved phase COI. In a comment letter dated February 21, 2017, EPD concurred that VEFR events have not been effective in remediating DNAPL and that VEFR events could accelerate migration or destabilization of the dissolved phase plume.

The observed limited extent of DNAPL at the Site is consistent with the immobile nature of the DNAPL and the geologic setting. The extent of DNAPL in the bedrock setting at the Site is considered of limited consequence, based on the following Site-specific observations:

- The presence of DNAPL has been delineated at the Site;
- The DNAPL areal extent is limited to the bedrock surface low area near the intersection of Walnut and 7th Streets, and is present only within road ROWs adjacent to the Site;
- DNAPL has been removed, decontaminated, or immobilized to the extent practicable;
- The site geology (for example bedrock micro-fractures and bedrock topography) creates an impediment to migration of DNAPL;

- The maximum distance of DNAPL migration beyond the former MGP property boundary is approximately 75 ft, over approximately 150 years.

4.0 SOIL INVESTIGATION

The soil investigations summarized in Sections 2 and 3 provided the data required to delineate the vertical and horizontal extent of COI in soil at the Site. The EPD-approved RRS for the Macon Site, including EPD-approved background concentrations for COI based on a previous study (Appendix J of the 2000 CSR) are shown in Table 1-3. Soil delineation standards under the VRP are the HSRA Type 1 RRS. As a result of the numerous soil investigations completed at the Site, soil has been delineated to VRP standards protective of human health and the environment. Numerous previously-submitted reports provide extensive details of the various investigations completed to delineate COI in soil at the Site. The following sections provide the information required to demonstrate the achievement of delineation of soil to VRP standards. The following sections summarize the results of all soil delineation activities.

4.1 Horizontal and Vertical Extent of MGP Impacts and COI in Soil

4.1.1 Mulberry Street MGP Delineation of Residual MGP Impacts

The extent of visual observations of BPLM in soil and vertical and horizontal delineation of COI to EPD-approved background concentrations in the Mulberry Street former MGP portion of the Site were completed in 2002 and reported in the 2004 CSR. As noted in the 2004 CSR, AGLC previously obtained EPD's concurrence that concentrations of COI in the area (Figure 4-2 and 4-3 of the 2004 CSR) as "Former Iron & Paper Stock Company, Oil Company and Junkyard" are not related to the former MGP operations, and this area is not considered to be part of the Site.

As documented in the 2004 CSR, delineation of Site COI to background concentrations for parcels associated with the Mulberry Street MGP has been completed. Accordingly, VRP delineation requirements have already been met in the eastern portion of the Macon MGP Site.

4.1.2 Western Portion MGP Delineation of Residual MGP Impacts

Soil investigation activities described in detail in the 2014 VIRP and the 2016 CACR were performed to define the extent of site-specific COI exceeding EPD-approved background concentrations and applicable non-residential RRS at the Western Portion MGP section of the Site. Vertical and horizontal delineation of residual MGP impacts in unsaturated and saturated soil was demonstrated in the 2014 Western Portion CAP-A, which was included as Appendix C of the VIRP submitted in 2014. In summary, locations of observations of residual impacts are shown on Figure 4-1 and observation data are tabulated in Table 4-1. The limits of the 2015-2016 Western Portion ISS were determined in part on the extent of residual MGP impacts observed in unsaturated and saturated zones to ensure that corrective actions encompassed the entirety of the area of residual MGP-related impacts. Confirmation soil samples were collected during implementation of the soil excavation and ISS corrective measures outlined in the VIRP and completed in 2015-2016 to confirm compliance of soils remaining on VRP qualifying parcels with applicable RRS. Methods and results used to determine compliance with RRS have been provided in the CACR (ERM, 2016a).

4.1.2.1 Western Portion MGP Delineation of Volatile Organic Compounds

VOCs in soils in the Western Portion were delineated in 2013 to HSRA Type 1 RRS in accordance with VRP requirements. The locations of delineation borings (highlighted yellow) are shown on Figure 4-2 (surface soil to a depth of 2 ft bgs) and Figure 4-3 (subsurface soil, 2 ft bgs to water table), which demonstrate that VOCs in unsaturated soils are delineated horizontally and vertically. Analytical results for VOCs in surface soil (0-2 ft bgs) are included as Table 4-2. Results for VOCs in subsurface soils (from 2 ft bgs to top of the water table) are included as Table 4-3.

4.1.2.2 Western Portion MGP Delineation of Semi-Volatile Organic Compounds

SVOCs in soils in the Western Portion were delineated in 2013 to HSRA Type 1 RRS in accordance with VRP requirements. The locations of delineation borings are shown on Figure 4-4 (surface soil) and Figure 4-5 (subsurface soil), which demonstrate that SVOCs in unsaturated soils have been delineated horizontally and vertically. Analytical results for SVOCs in surface soil (0-2 ft bgs) are included as Table 4-4. Results for subsurface soils (from 2 ft bgs to top of the water table) are included as Table 4-5.

4.1.2.3 Western Portion MGP Delineation of Inorganic Compounds

Inorganic COI associated with the former MGP operations have been delineated to HSRA Type 1 RRS in the Western Portion MGP according to VRP requirements. The locations of delineation borings are shown on Figure 4-6 (surface soil) and Figure 4-7 (subsurface soil), which demonstrate that inorganic COI in unsaturated soils have been delineated horizontally and vertically. Analytical results for inorganic COI in surface soil (0-2 ft bgs) and subsurface soils (from 2 ft bgs to top of the water table) are included as Table 4-6 and Table 4-7.

5.0 GROUNDWATER INVESTIGATION

As a result of the numerous groundwater investigations completed at the Site since 2002, groundwater at the Site has been delineated to VRP standards protective of human health and the environment. Details of groundwater monitoring results have been extensively detailed in reports previously submitted to EPD. The following sections provide the information required to demonstrate the achievement of delineation to VRP Standards.

5.1 General Approach and Rationale

Objectives of groundwater investigations have been to define the horizontal and vertical extent of dissolved COI, collect sufficient data to support development of appropriate corrective actions and, following the extensive corrective actions conducted at the Site, to confirm that the Site meets applicable cleanup goals. The network of groundwater monitoring wells has been adapted over the course of numerous investigations and corrective actions in order to effectively determine groundwater flow and gradients across the Site to evaluate characteristics of COI plume migration and monitor groundwater conditions in on-site and off-site areas. The existing groundwater monitoring network is shown on Figure 2-1. Well construction information for alluvial groundwater and bedrock groundwater monitoring wells is displayed in Table 3-2 and Table 3-5, respectively. Boring logs and well construction diagrams for all Site wells have been provided to EPD in previously submitted reports.

5.2 Horizontal and Vertical Extent of Constituents of Interest in Groundwater

Delineation standards under the VRP allow for the delineation of COI to the default HSRA Type 1 (residential) RRS (Table 5-1). The most recent groundwater sampling event was completed in February 2018. All existing alluvial and bedrock groundwater monitoring wells were sampled for Site COI and NA parameters in February 2018, with the exception of MW-111D and MW-309D where DNAPL was observed at the time of the event. February 2018 analytical results for alluvial wells and bedrock wells are presented in Table 5-2 and Table 5-3, respectively. Groundwater sampling records for each well sampled are included in Appendix D. Laboratory analytical reports are included as Appendix E. Data validation information is included as Appendix F. A summary of historical groundwater analytical data for the Site COI and NA parameters collected for the groundwater monitoring program (since 2001) is provided as Appendix G.

The horizontal delineation of benzene and naphthalene in alluvial groundwater to HSRA Type 1 RRS is presented on Figure 5-1 and Figure 5-2. As shown in Table 5-2, no VOCs other than benzene are detected in alluvial wells above HSRA Type 1 RRS. Naphthalene was detected above HSRA Type 1 RRS at the same well locations with benzene exceedances above Type 1 RRS. Concentrations of benzo(a)anthracene and chrysene detected at MW-12IR and MW-205, and benzo(b)fluoranthracene at MW-21 are equal to or above the HSRA Type 1 RRS but below the HSRA Type 2 RRS. As none of these wells are perimeter locations, horizontal delineation to HSRA Type 1 RRS in alluvial groundwater for VOCs and SVOCs is complete based on non-detections at surrounding locations.

Cadmium was detected at two alluvial well locations and chromium at one location above the HSRA Type 1 RRS (Table 5-2). As no VOCs or SVOCs were detected at any of these three locations, and because the wells are in different areas of the Site with either no detection or detections below Type 1 RRS of cadmium and chromium at wells between these locations, the exceedances are isolated and may be indicative of natural occurrence of these constituents in the environment.

The horizontal delineation of benzene in bedrock groundwater to HSRA Type 1 RRS is presented in Figure 5-3. Benzene is detected at a concentration slightly above the HSRA Type 1 RRS at MW-308D. Benzene concentrations detected at MW-308D since 2015 show a decreasing trend (Appendix G). The well is located in Terminal Avenue near the Norfolk Southern rail line. Installation of additional bedrock wells to complete delineation is impracticable due to the adjacent, active Norfolk Southern rail line which limits ability to safely use a drill rig in the area, and the ISS mass north and east of the well. VOC and SVOC COI have never been detected above HSRA Type 1 RRS at MW-108D or MW-08D, which are located approximately 200 ft and 450 ft, respectively, east of MW-308D, in the direction of decreasing hydraulic potential. In addition, no other COI are detected at MW-308D above HSRA Type 1 RRS, indicating that all other Site COI are delineated in this area.

The only other VOC detected above HSRA Type 1 RRS is in bedrock groundwater is toluene, which was only detected at one location, MW-305D. Surrounding wells with no detections of toluene serve as delineation points and indicate the limited occurrence of toluene at MW-305D.

Naphthalene in bedrock groundwater has been horizontally delineated as shown on Figure 5-4. As noted in previous reports, no VOCs or SVOCs have ever been detected at perimeter monitoring wells MW-22D (monitored since 2005), MW-23D (monitored since 2003), MW-26D (monitored since 2004) or MW-27D (monitored since 2001). Also noted in previous reports, COI concentration detections and fluctuations occurring since 2014 at MW-24D appear to be the result of bedrock aquifer disturbances such as drilling and/or DNAPL recovery activities near the intersection of Walnut Street and 7th Street, which destabilize the plume. Data collected in 2016 and 2017 indicate that the time to reach steady-state conditions at MW-24D after a bedrock disturbance as described above is likely to be at least a year. The February 2018 detection of naphthalene at MW-24D appears to be a residual result of the most recently completed DNAPL recovery event at MW-111D and MW-309D, which was conducted in June 2016. Benzene was not detected at MW-24D, indicating the naphthalene detection is likely due to intra-well variability caused by the previous disturbance of static groundwater conditions and not indicative of plume migration.

Concentrations of benzo(a)anthracene and chrysene detected at MW-12DRR and MW-110D, and benzo(a)anthracene at MW-204D and MW-206D, are equal to or slightly above the HSRA Type 1 RRS. None of these wells are perimeter locations; therefore, delineation to HSRA Type 1 RRS for these compounds is complete by non-detections at surrounding locations. The only inorganic COI detected in bedrock groundwater samples above the HSRA Type 1 RRS is barium, with a single detection of cyanide that exceeded the Type 1 RRS (Table 5-2). Barium detections and the cyanide detection are limited to wells located near the intersection of Walnut Street and 7th Street where benzene and/or naphthalene also exceed Type 1 RRS. No inorganic COI are detected above HSRA Type 1 RRS in wells located in the Western Portion MGP area

nor in perimeter wells MW-22D, MW-23D, MW-26D and MW-27D, demonstrating delineation of inorganic COI. Deep bedrock monitoring wells MW-27DD and MW-205DD complete vertical delineation of VOCs, SVOCs and inorganic compounds.

Cross-sections showing horizontal and vertical delineation of all Site-related COI are included as Figure 3-3, Figure 3-4 and Figure 3-5.

6.0 COMPLIANCE WITH VRP STANDARDS

6.1 Soil Compliance – Mulberry Street MGP Area

All soils at the Site are in compliance with EPD-approved HSRA RRS cleanup standards or with VRP standards determined using exposure area averaging methods. The HSRA RRS and the VRP standards were calculated using EPD-approved methods and are protective of human health and the environment in accordance with requirements for delisting from the HSI. As noted in Section 1, soils impacted by former operations at the Mulberry Street MGP were certified as compliant with applicable RRS in the 2004 CSR (Table 1-2, Figure 1-4 and Appendix A). Numerous previously-submitted reports provide details of the completion of delineation and corrective actions in accordance with EPD-approved CAP, CAP-A or other basis of design documents and the 2004 CSR and the results of soil sampling demonstrating compliance of the certified parcels.

6.2 Soil Compliance – Western Portion MGP Area

The 2016 CACR presented the activities completed to address soils impacted by former Western Portion MGP operations. As demonstrated below, soil on parcels impacted by Western Portion MGP former operations is in compliance with HSRA RRS using either a point-by-point comparison, or by using an area averaging approach in accordance with the VRP, whereby the average concentration of any COI remaining in soil on an individual property after corrective action is at or below the RRS cleanup value. For the Site, the average concentration is defined as the 95% upper confidence limit (UCL) of the average utilizing ProUCL software. Both the point-by-point and area averaging methods for demonstrating compliance with cleanup standards are recognized and acceptable to EPD for certifying Site closure and delisting under the VRP. Figure 6-1 through Figure 6-3 show locations of the corrective actions completed at the Western Portion MGP. Corrective actions to bring soil into compliance with VRP standards by parcel are summarized below. Detailed information regarding rationale for design of the corrective actions, soil boring drilling logs, soil screening and collection methods, borehole abandonment techniques, sample handling and preservation techniques, decontamination procedures and laboratory methods are described in the 2014 VIRP and the 2016 CACR.

Excavation and ISS corrective actions in the Western Portion MGP began in May 2015 (Figure 3-1). Vadose zone soils that were impacted above established RRS or were observed to contain MGP-related BPLM were excavated for off-site disposal. The ISS treatment area encompassed the full horizontal and vertical extent of alluvial soils where MGP-derived BPLM was observed during previous investigations. The ISS mass extends at least 2 ft into the saprolite except in isolated areas where refusal was encountered at a depth estimated to be shallower than top of saprolite. In addition, three widths of ISS columns were installed around the perimeter of the ISS area, extending at least 5 ft into the saprolite, to increase the probability that the ISS was installed into competent material to eliminate potential for migration of COI. Excavation, ISS and restoration activities were completed in April 2016 (ERM, 2016a).

The horizontal and vertical extent of MGP impacts in soil and delineation of VOC, SVOC and inorganic COI in the Western Portion are shown on Figures 4-2 through 4-7, and laboratory analytical results are presented in Tables 4-2 through 4-7. These figures depict all boring

locations within the Western Portion corrective action area where soils were determined to be compliant with residential RRS calculated pursuant to HSRA for VOCs, SVOCs and inorganic compounds. The laboratory analytical results were used to identify areas where soil is in compliance with residential standards so that those soils could be stockpiled for reuse as backfill during Site restoration following implementation of excavation and ISS corrective actions proposed in the 2014 VIRP. Areas where COI in soil exceeded residential RRS were delineated and the soil excavation areas included in the planning of Western Portion corrective actions were designed to remove soils identified above residential RRS.

Confirmation soil samples were collected from excavation area sidewalls and floors during the 2015-2016 Western Portion corrective actions to verify limits of soil removal to achieve compliance. Excavation limits were expanded, and confirmation samples collected from the limits of the expanded excavation to confirm removal of soils with COI above applicable HSRA RRS, when additional excavation was deemed necessary. The 14 excavation areas were discussed in the CACR (ERM, 2016a). The excavation areas and locations of confirmation samples collected from sidewalls and floors are shown on Figures 6-1 through 6-3.

- Excavations completed from 0-2 ft bgs (Figure 6-1):
    - Areas 1 and 3 represent excavations completed to a depth of 2 ft bgs within the footprint of the ISS area. The majority of Area 2 was within the limits of the ISS, with a small portion extending beyond the footprint to the south, into the Macon-Bibb County ROW. Excavation areas 4 through 7 represent excavations completed to a depth of 2 ft bgs beyond the footprint of the ISS.
- Excavation completed from 2-6 ft bgs (Figure 6-2)
    - Excavation 8 was completed from 2 ft bgs to 6 ft bgs with small areas in the north (on AGLC property), in the south (Macon-Bibb County ROW) and southwest (AGLC property) beyond the ISS area. Excavation 9 was completed from 2 ft bgs to 6 ft bgs within the footprint of the ISS, and area 10 was completed from 2 ft bgs to 6 ft bgs beyond the ISS area.
- Excavations completed from 6 ft bgs to the water table (Figure 6-3):
    - Areas 11 through 14 were completed from 6 ft bgs to 10 ft bgs within the ISS footprint.

As shown on Figures 6-1, 6-2 and 6-3, soils were either excavated and transported off-site for disposal or were stockpiled for re-use as backfill.

6.2.1 Compliance of Backfill Soil with VRP Standards

Stockpiled soils on-Site that met standards were used for backfill for site restoration. These soils were sampled at a frequency of one sample per 250 cubic yards of soil to confirm that reused soils met applicable RRS. Details of the excavation activities and confirmation sampling were provided in the CACR. All stockpile soil used as backfill at the Site is in compliance with residential RRS.

A total of 62 soil samples were collected and analyzed for all Site COI; results are shown in Table 6-1. With the exception of benzo(a)pyrene, no COI were detected above HSRA

residential RRS (Type 1 and/or Type 2); therefore, backfill is in compliance with residential standards for all COI except benzo(a)pyrene using the point-by-point evaluation method.

Compliance of backfill soil with residential Type 1 and/or Type 2 RRS for benzo(a)pyrene was assessed using the area averaging method. The UCL (95% confidence interval) for benzo(a)pyrene for the soil samples was determined to be 0.543 µg/L, which is well below the HSRA Type 1 RRS of 1.64 µg/L. Therefore, backfill soil complies with VRP standards. Outputs from the UCL calculations are included as Appendix H.

6.2.2 Compliance of Norfolk Southern Property (West of Terminal Avenue) with VRP Standards

Locations of the 23 soil borings advanced on the Norfolk Southern property west of Terminal Avenue are shown on Figure 4-1. No BPLM impacts were observed in unsaturated soils collected from any of the 23 borings. Laboratory analytical results for unsaturated soil samples collected from borings SB-910 through SB-914 in March 2013 (ERM, 2014a) are presented in Tables 4-2 through 4-7. No VOCs, SVOCs or inorganic compounds in surface or subsurface samples were detected above the HSRA Type 4 (non-residential) RRS approved for the property. Compliance with Type 4 RRS is consistent with current and anticipated future use of this property.

An investigation completed in November 2013, described in detail in the 2016 VIRP, confirmed visual indication of MGP residual impacts in borings NS-1, NS-2, NS-3, NS-6 and NS-8 (Table 6-2 and Figure 4-1). Meetings with Norfolk Southern during the design phase of the Western Portion remedy led to the understanding that the “double main line” west of Terminal Avenue where MGP impacts were observed is critical to the Norfolk Southern operations. Since invasive remediation was not possible on the property, this area will be designated as in compliance with VRPA clean up criteria for soil through use of institutional controls.

Institutional controls, in the form of a UEC, will be used to prevent excavation below 2 ft bgs to mitigate potential exposure to residual MGP impacts in the saturated zone. Compliance status is shown on Figure 6-4.

6.2.3 Compliance of Prodigy Woodworks Sub-parcel of R081-0135 with VRP Standards

This parcel is owned by Prodigy Woodworks and was subdivided from Parcel No. R081-0076 and is located at 310 6th Street, adjacent to the southern corner of the intersection of Mulberry Street and 6th Street (Figure 1-3). The larger parcel from which R081-0135 was subdivided (previously OC-26-3A) was certified as complying with Type 2 RRS in the 2004 CSR, which was approved by EPD in a letter dated December 7, 2004; a copy of which is included in Appendix A. As summarized previously, additional soil investigations were completed on this property during the pre-design investigation to delineate the extent of potential residual MGP impacts beneath the building previously located on this parcel. Minimal, residual MGP impacts (BPLM stringers and blebs) have been identified in saturated subsurface soils beneath the new sub-parcel (Figure 4-1 and Table 4-1). Although no unsaturated soil impacts were identified at this parcel, as a conservative measure, institutional controls in the form of a UEC will be used to prevent groundwater extraction or use on the property. Currently, ground surface at the parcel is

concrete and the area is used as a parking lot. The anticipated long-term use of the parcel is for parking.

6.2.4 Compliance of Macon-Bibb County Right-of-Ways with VRP Standards

COI in unsaturated soil at the Macon-Bibb County parcel and within ROWs were delineated to HSRA Type 1 RRS prior to implementation of corrective actions in 2015 (Figures 4-2 through 4-7 and Tables 4-2 through 4-7). COI within the corrective action footprint that exceeded HSRA residential RRS (Type 1 and/or Type 2) were excavated and sent off-site for disposal during the remedial activities. Confirmation samples from excavation sidewalls and floors were collected and analyzed for COI to verify removal of soil above HSRA residential RRS. In instances where COI were detected in the confirmation sample above the target cleanup level, additional excavation was completed, and confirmation samples collected until laboratory analytical results showed compliance with RRS.

6.2.4.1 Surface Soil (0-2 ft bgs)

Excavation Area 6 and portions of Areas 1 and 2 were completed on Macon-Bibb County property (Figure 6-1). Within Area 6, the only COI detected above HSRA residential standards in surface soil during pre-design investigations were benzo(a)anthracene, benzo(a)pyrene, fluoranthene, antimony, arsenic, beryllium, copper and lead; therefore, confirmation samples from this excavation were analyzed for these COI. Confirmation samples within Areas 1 and 2 were analyzed for benzo(a)anthracene, benzo(a)pyrene and arsenic based on the pre-corrective action investigations. As discussed in the CACR, additional soil excavation was completed in 6th Street to address impacts observed while disconnecting a gas service line in corrective action area. Confirmation samples from this excavation were analyzed for all Site COI. Analytical results for surface soil confirmation samples collected from property owned by the Macon-Bibb County are included in Table 6-3.

Benzo(a)pyrene, arsenic and lead were the only COI detected in surface soil samples on Macon-Bibb County property that exceeded HSRA residential RRS. Statistical evaluation of the confirmation sample results shows that the UCL for benzo(a)pyrene (1.21 mg/kg) is below the HSRA residential standard (1.64 mg/kg). The UCL for arsenic (13.52 mg/kg) is below the HSRA residential standard (25 mg/kg), and the UCL for lead (219.9 mg/kg) is below the HSRA residential standard (400 mg/kg). Outputs for the UCL calculations are included as Appendix H.

6.2.4.2 Subsurface Soil (2 ft bgs to Water Table)

Locations of excavation confirmation samples on Macon-Bibb County property collected below 2 ft bgs are shown on Figures 6-2 and 6-3. Benzo(a)anthracene was the only COI detected above HSRA residential RRS during the pre-design investigations and was therefore the only COI analyzed in confirmation samples. The analyte was not detected above HSRA Type 1 RRS in any of the confirmation samples collected (Table 6-4).

6.2.4.3 Summary of Macon-Bibb County Right-of-Way Compliance

Utility corridors were constructed in Terminal Avenue, Mulberry Street and 6th Street for the benefit of the Macon-Bibb County by removing soil within the corridors to 10 ft below street grade. The corridors were backfilled with stockpiled soil, which is in compliance with residential

RRS (see Section 6.2.1). The Macon-Bibb County property complies with HSRA residential RRS for soil (Figure 6-4) and VRP standards for groundwater through execution of an environmental covenant to restrict groundwater use. The UECs will also include restrictions on excavation within the ISS footprint where applicable (Figure 6-4).

6.2.5 Compliance of AGLC Parcel with VRP Standards

COI in unsaturated soil at the AGLC parcel R073-0384 were delineated to HSRA Type 1 RRS prior to implementation of corrective actions initiated 2015. COI within the excavation that exceeded HSRA residential RRS (Type 1 or Type 2) were identified prior to implementation of corrective action and were sent off-site for disposal during the excavation activities. Confirmation samples from excavation sidewalls and floors were analyzed for COI that exceeded HSRA residential RRS. Surface and subsurface soils at the AGLC parcel are in compliance with HSRA residential RRS as detailed below.

6.2.5.1 Surface Soil (0-2 ft bgs)

Only benzene and chloromethane were detected above residential standards in borings on the former MI&P property in March 2013 (Table 3-1). Excavation Area 7 (Figure 6-1) was designed to address these COI. Confirmation sample results for Area 7 presented in Table 6-5 show that neither benzene nor chloromethane were detected in confirmation soil samples. As such, surface soil in the northern portion of the AGLC parcel is in compliance with residential standards as calculated under HSRA.

Benzo(a)anthracene, benzo(a)pyrene and arsenic were the only COI detected in surface soil samples collected from borings completed as part of remedial design investigations in the southern portion of the AGLC parcel that exceeded HSRA residential RRS. Excavation Areas 2 and 3 were designed to address these impacts (Figure 6-1). Confirmation sample results for Area 2 presented in Table 6-5 show benzo(a)anthracene and arsenic were not detected in any samples above HSRA residential criteria. Benzo(a)pyrene was detected in three samples above HSRA residential standards. The confirmation samples represent the extent of excavation and the concentration of benzo(a)pyrene that remains on the property beyond the excavation limits. ProUCL was used to statistically evaluate benzo(a)pyrene concentrations in the confirmation samples. The UCL for benzo(a)pyrene was determined to be 4.695 mg/kg, which is above residential RRS and below non-residential RRS. Outputs for the UCL calculations are included as Appendix H.

Based on investigations and corrective actions completed at the Site, benzo(a)pyrene is the only COI that potentially remains at the AGLC parcel in surface samples above residential standards as calculated under HSRA. The approximate area of the AGLC parcel is 2.73 acres, and can be divided into three subareas based on available data:

1. The northern subarea, approximately 1.87 acres (68.5% of total parcel area) is represented by data collected in March 2013 at DDSB locations. Benzo(a)pyrene results for surface soils collected in March 2013 from DDSB locations (Table 3-1) in the northern portion of the AGLC parcel (Figure 3-2) were statistically evaluated to establish a UCL representative of the area. The calculated UCL was 0.145 mg/kg, an order of magnitude below the residential RRS of 1.64 mg/kg (Appendix H).

2. A second subarea is within the ISS footprint, which was backfilled with stockpiled soil and represents approximately 0.45 acres (16.5% of total parcel area). As noted above, stockpiled soil is in compliance with residential RRS under HSRA for all COI.
3. The final subarea is the southern portion of the parcel where soil was not excavated and is represented by the confirmation soil samples collected for Area 2 as shown in Figure 6-1 (approximately 0.41 acres, or 15% of total area).

Using this data to represent the AGLC parcel in its entirety, a weighted average UCL for benzo(a)pyrene was calculated to assess compliance with residential RRS:

Area Description	Area (ac)	Benzo(a)pyrene UCL (mg/Kg)
Northern Subarea of Parcel	1.87	0.145
Backfill Area	0.45	0.543
Southern Subarea /Unexcavated Portion	0.41	4.695
Entire Parcel (UCL)	**2.73**	**0.894**
Type 1 RRS (under HSRA)		1.64
Parcel Compliant with Residential RRS?		**Yes**

6.2.5.2 Subsurface Soil (2 ft bgs to Water Table)

Subsurface soil on the AGLC parcel beyond the limits of excavation Areas 8, 9 and 10 (Figure 6-2 and 6-3) were determined to be in compliance with HSRA residential RRS during remedy pre-design investigations. Areas 8, 9 and 10 were designed to address detections of benzene, benzo(a)anthracene, arsenic and chromium in subsurface soil within the limits of excavation. Confirmation samples collected the excavation areas are present in Table 6-6 and locations are shown on Figure 6-2 and Figure 6-3. No COI were detected above HSRA residential RRS in subsurface samples.

6.2.5.3 Summary of AGLC Parcel Compliance

Surface and subsurface soils at the AGLC parcel (parcel no. R073-0384) are in compliance with residential RRS (Figure 6-4). Compliance has been demonstrated using point-by-point comparison of COI concentrations in soil to VRP standards except in the case of benzo(a)pyrene where exposure area averaging methods were used.

6.3 Groundwater Compliance with Site-Specific VRP Standards

The following sections summarize the compliance status of groundwater at the Macon Site. Alluvial groundwater and bedrock groundwater compliance are discussed separately as the location of residual COI impacts in alluvial groundwater only exists in the western portion of the

Site and residual COI impacts in bedrock groundwater exist in the eastern portion of the Site. Further, potential exposure pathways for alluvial groundwater and bedrock groundwater are different due to the depth of impacted groundwater, and the differences in aquifer characteristics that govern the applicability of potential pathways. Under the VRP, appropriate VRP standards to use for comparison to COI concentrations and/or the methods used to evaluate whether residual dissolved phase COI concentrations may pose an adverse risk to potential receptors is based on potentially complete exposure pathways.

6.3.1 Alluvial Groundwater Compliance

Alluvial groundwater at the Site is in compliance with HSRA Type 1 RRS with the exception of the limited area defined by groundwater monitoring wells AMW-14, AMW-15 and MW-205 where benzene and naphthalene were detected at levels above HSRA Type 1 RRS (Figure 5-1, Figure 5-2 and Table 5-2). Isolated detections of benzo(a)anthracene and chrysene at MW-12IR and MW-205, and benzo(b)fluoranthracene at MW-21 are equal to or above the HSRA Type 1 RRS but below the HSRA Type 2 RRS. Isolated detections of chromium at AMW-11 and cadmium at MW-11 and MW-28, as discussed in Section 5.2, exceed HSRA Type 1 and HSRA Type 2 RRS. However, as no VOCs or SVOCs were detected at any of these three locations, and because the wells are in different areas of the Site with either no detection or detections below Type 1 RRS of cadmium and chromium at wells between these locations, the exceedances are may be indicative of natural occurrence of the compounds in the environment and are not attributable to former MGP operations. As such, the only area of the Site where concentrations of MGP-related COI exist is the area adjacent to the western boundary of the Western Portion ISS on the Norfolk Southern property west of Terminal Avenue, and in the Macon-Bibb County ROW along Terminal Avenue adjacent to the Norfolk Southern parcel where corrective action could not be completed due to the active Norfolk Southern rail line (Figure 5-1 and Figure 5-2).

As discussed in Section 6.2.2, meetings with Norfolk Southern during the design phase of the Western Portion remedy led to the understanding that the “double main line” west of Terminal Avenue where MGP impacts were observed is critical to the Norfolk Southern operations and invasive remediation was not possible on the property. As such Norfolk Southern has agreed to restrict groundwater use in this area and the area will be designated as in compliance with VRP standards for groundwater through use of institutional controls. Macon-Bibb County has also agreed to restrict groundwater use in the ROW and the area will be designated as in compliance with VRP standards for groundwater through use of institutional controls.

6.3.1.1 Alluvial Groundwater Plume Stability and Natural Attenuation of Constituents of Interest

Alluvial groundwater COI plume stability and the extent to which aquifer conditions are conducive to NA were evaluated in order to assess the potential for impacts to alluvial groundwater to migrate beyond the limits of the groundwater use restrictions. In addition, the NA evaluation can be used to conservatively assess the potential for COI to persist at current locations at concentrations that may potentially pose an adverse risk of vapor intrusion at any future enclosed structures (although the construction of a structure on the Norfolk Southern rail line property or within the Macon-Bibb County ROW is highly unlikely). NA in an aquifer limits

the migration of dissolved phase COI and ultimately results in decreased COI concentrations as COI are naturally oxidized by microorganisms to innocuous end-products such as water and methane.

Snapshots of the distribution of dissolved phase COI (benzene and naphthalene, specifically) in alluvial groundwater in 2000-2001, 2013-2015 and the current, 2018 distribution are shown on figures in Appendix I. DNAPL has not been detected in alluvial wells; therefore, this plume stability demonstration focuses on dissolved phase COI. The figures provide a demonstration of how corrective actions have effectively been implemented to reduce the size of the dissolved phase plume. Additionally, the lack of migration from the source release areas to downgradient wells demonstrates the stability of the plume extent. In particular, benzene and naphthalene have been below Type 1 RRS in downgradient perimeter wells, and even at wells located between corrective action areas and the perimeter wells since 2000, as indicated by monitoring well locations highlighted in green.

As a threshold point, it is important to recognize that the releases at the Site are quite old, dating back a minimum of 80 years and likely more than 150 years. Despite the passage of many decades, the groundwater impacts have not spread more than a few hundred feet downgradient from the two MGPs, even before corrective action. Data collected at the Site over a period of approximately 20 years demonstrates clearly that:

- groundwater flow conditions in the alluvial aquifer have remained consistent over time (Figure 6-5);
- the alluvial groundwater monitoring network has been capable of detecting any potential migration from cross-gradient and downgradient flow;
- the plume is no longer migrating but, rather, has been shrinking since the first phase of soil excavation and ISS in 2002; and
- detected concentrations of COI are limited to a small, isolated area west of Terminal Avenue within the Macon-Bibb County ROW at Terminal Avenue and on Norfolk Southern property adjacent to an active rail line; and
- with the exception of the area noted in the previous bullet, all detected concentrations of COI in alluvial groundwater are below residential HSRA RRS rendering the exposure pathway for alluvial groundwater incomplete for the vast majority of the Site.

As discussed below, evaluation of NA parameters indicate that dissolved phase COI are unlikely to migrate beyond the current extent at AMW-14, AMW-15 and MW-205 due to the ongoing occurrence of natural biodegradation processes at the Site. These processes have been evaluated during numerous quarterly and semiannual groundwater monitoring events and reported in previously-submitted semiannual monitoring reports. As noted in the previous reports, the observed distributions of dissolved oxygen (DO), oxidation-reduction potential (ORP), nitrate, nitrogen, carbon dioxide, methane, iron, and ferrous iron appear to be related to the distributions of dissolved MGP-related organic COI and, therefore, provide evidence that natural biodegradation processes are occurring.

When DO is present in groundwater at sites impacted by non-chlorinated organic contaminants, microorganisms will preferentially use the oxygen as a terminal electron acceptor as they oxidize organic compounds to carbon dioxide and water. However, when oxygen is not present or has been consumed, microorganisms may use available alternative electron acceptors (nitrate, ferric iron, sulfate, manganese (IV), and carbon dioxide) to metabolize organic compounds. In the course of this process, electron acceptors are converted to their respective reduced forms (nitrite, ferrous iron, sulfide, manganese (II), and methane), which are then released as byproducts of the metabolic processes. Thus, measuring and comparing concentrations and distributions of electron acceptors and reduced metabolic byproducts to concentrations and distributions of organic constituents can reveal a pattern indicative of biodegradation activity.

Groundwater samples with elevated concentrations of organic COI and/or methane generally exhibited lower DO values as oxygen is consumed during biodegradation of organic compounds. Laboratory measurements of groundwater samples collected in February 2018 indicated the lowest concentration of DO was in the sample collected at MW-205 (1.6 mg/L; Table 5-2). DO measurements at AMW-14 and AMW-15 were 4.0 mg/L and 4.6 mg/L, respectively, which are each below the average DO measurement of 6.58 mg/L for samples collected in February 2018 (Table 5-2). Low ORP measurements, such as the measurement of -67.87 millivolts at MW-205, suggest that biodegradation of MGP-related organic constituents is consuming available oxygen which results in an anaerobic environment near the well.

Nitrate was not detected at AMW-14, AMW-15 or MW-205 (Table 5-2), suggesting that biodegradation of benzene and naphthalene at these locations may be occurring through a nitrate reduction pathway. Methane was detected at AMW-14, AMW-15 and MW-205, providing evidence that biodegradation is occurring via reduction of carbon dioxide to methane as methane in groundwater occurs exclusively as a by-product of the anaerobic biodegradation of organic compounds. Detection of ferrous iron at the three locations with benzene and naphthalene detections provides an indication that biodegradation of organic COI may also be occurring via the iron reduction pathway.

Historical and recent data indicate that biodegradation of MGP-related organic COI is naturally occurring at the Site and in this area in particular, such that these concentrations will continue to decline going forward. Based on consistency of past groundwater flow conditions which allows for prediction of the direction of any potential future plume migration, combined with evidence of historical plume shrinkage due to corrective actions and, to a lesser extent, ongoing NA processes, the data support that COI in alluvial groundwater in the restricted use areas will continue to decrease and will not migrate beyond the extent of these areas.

In summary, alluvial groundwater at the Site is in compliance with residential (Type 1 and/or Type 2) RRS, with the exception of an isolated area where institutional controls will be used to restrict groundwater use to achieve compliance in accordance with the VRP.

6.3.2 Bedrock Groundwater Compliance

Under the VRP, groundwater cleanup to the extent necessary to protect human health and the environment can be evaluated based on exposure of potential receptors via potentially complete exposure pathways. Per the VRP statute, groundwater compliance and delisting from the HSI

can be achieved by demonstrating that remaining dissolved phase concentrations will not exceed exposure-pathway specific standards at the identified point of exposure (POE) where a receptor could come into contact with remaining COI at concentrations that may pose a risk. The POE is defined in the VRP as the nearest of:

- closest existing downgradient drinking water supply well;
- likely nearest future location of a drinking water well where public water supply is not currently available and is not likely to be made available in the foreseeable future; or
- hypothetical point of drinking water exposure located at a distance of 1,000 ft downgradient from the delineated contamination.

There are no existing water supply wells within a 1,000 ft radius used for drinking water, or any other use. Public water is currently available to the area and will continue to be available in the future; therefore, evaluation based on current or future drinking water well installation is not applicable. The relevant POE therefore becomes a hypothetical well at a distance of 1,000 ft from the extent of COI impacts.

As shown on Figure 5-4 and 5-5 and noted in previous VRP Semiannual Progress Reports, detections of VOCs and SVOCs above laboratory detection limits are isolated to an area close to the Mulberry Street ISS mass, near the intersection of Walnut Street and 7th Street. Detections of VOCs and SVOCs do not extend more than 400 feet from MW-111D, a location where DNAPL has been observed since 2006. No COI have ever been detected at perimeter wells MW-22D, MW-23D, MW-26D or MW-27D (all located less than 1,000 ft from MW-111D), indicating that the area where dissolved phase COI are present is limited in extent and there is no migration of the dissolved phase plume at concentrations nearing HSRA Type 1 RRS beyond a distance of approximately 400 ft from MW-111D. In summary, data collected at the Site provides a demonstration that a hypothetical well located 1,000 ft from remaining dissolved phase MGP-impacts and residual DNAPL would not be impacted by COI above Type 1 RRS.

6.3.2.1 Bedrock Groundwater Plume Stability

An evaluation of historical dissolved phase COI and DNAPL distribution was conducted as part of a bedrock groundwater plume stability assessment to reasonably predict the potential for a hypothetical well to be impacted COI from former MGP operations in the future. Figures included as Appendix J present a history of the distribution of dissolved phase COI and DNAPL in bedrock groundwater. Snapshots of distribution of dissolved phase COI (benzene and naphthalene, specifically) in bedrock groundwater in 2000-2002, 2013-2015 and 2018 are shown. The figures provide a demonstration of the lack of migration of COI and limited occurrence of DNAPL during approximately 20 years of groundwater monitoring. Benzene and naphthalene detections in groundwater have been and continue to be limited to the east corner of the 2009 ISS and have not extended more than 400 ft from MW-111D, and DNAPL has never been detected at a distance of more than approximately 75 ft east of the 2009 ISS.

Benzene and naphthalene concentrations detected in bedrock perimeter wells and other bedrock wells located between the perimeter wells and the area of corrective actions completed since 2000 have been, and remain, below Type 1 RRS for approximately 20 years, as indicated by monitoring well locations highlighted in green (Appendix J). A conceptual model of the

conditions at the intersection of Walnut Street and 7th Street, where residual impacts exist in bedrock groundwater, is shown in Figure 6-6. Data collected at the Site over a period of approximately 20 years provides substantial evidence that:

- the plume extent is known, delineated and has not migrated in approximately twenty years of continuous monitoring;
- DNAPL and dissolved phase COI are stable and not migrating, a condition that is expected to continue based on corrective actions performed to remove source areas, natural attenuation, physical properties of DNAPL, and bedrock hydrogeological studies which have shown no potential for mobility, and
- Further, the bedrock hydrogeological setting (fracture size and type and bedrock competency) provides an impediment to the movement of impacts in groundwater and therefore does not present a risk to any potential receptors.

In summary, no migration of dissolved phase COI is expected beyond the current extent based on the long history of available sampling data. Further, the area of DNAPL impact is in a steady state with no further migration expected.

6.3.2.2 Bedrock Groundwater Point of Exposure Evaluation

There are no drinking water wells located within 1,000 ft of the Macon Site, and based on land use in the area, the availability of public water, and the low yield of the bedrock aquifer, installation of a well in the area is highly improbable. Evaluation of all potentially complete pathways whereby a receptor may come into contact with dissolved phase COI or DNAPL indicates that the most likely, reasonable POE is the Ocmulgee River. The Ocmulgee River is located approximately 1,000 ft from the Site and is the likely discharge point for groundwater in the area, acting as a barrier to migration of dissolved phase COI. As such, the Ocmulgee River will be considered as the most likely POE for the purpose of evaluating protection of human health and the environment and status of groundwater compliance with the VRP.

At the closest point, the Ocmulgee River is located approximately 1,000 ft northeast of the Site (Figure 1-1). Hydraulic potential in bedrock groundwater is towards the Ocmulgee River (Figure 3-7). Thus, as a conservative exercise, a calculation was performed to determine the concentration of each detected COI in groundwater beneath the Site that could potentially result in groundwater concentrations at the point of discharge to the river in exceedance of drinking water standards, which are even more conservative than applicable In Stream Water Quality Standards. As shown in Table 6-7, the resulting concentrations are orders of magnitude higher than the highest concentrations present anywhere at the Site. Ocmulgee River surface water gauge information used in the calculations is included as Appendix K.

In summary, there are numerous bedrock groundwater monitoring wells located between the Site and the Ocmulgee River that have never had a detection of COI above laboratory detection limits and/or above Type 1 RRS (MW-22D, MW-23D, MW-113D, MW-112D, MW-27D, MW-26D). Data from years of groundwater monitoring at the Site demonstrate that dissolved phase COI are isolated to one localized area of the Site and are unlikely to migrate beyond 400 ft from that area. The POE evaluation shows that even under extreme circumstances (modeling using

very conservative inputs and assumptions), the residual dissolved phase impacts in bedrock at the Site do not pose a risk to a potential receptor at the groundwater POE.

6.4 Summary of Soil and Groundwater Compliance Status

As a result of the numerous corrective actions completed at the Site since 2002, soil at all parcels comprising the Macon Site are in compliance with residential or non-residential HSRA RRS, as applicable to current and future property use or in compliance with VRP standards using engineering and/or institutional controls. Groundwater at the Site is either in compliance with HSRA Type 1 RRS, in compliance with VRP requirements through the execution of UECs or is in compliance with VRP requirements based on cleanup standards demonstrated to be protective of human health and the environment.

7.0 EXPOSURE ASSESSMENT

No complete pathways exist at the Site that would result in receptor exposure to Site COI above concentrations protective of human health or the environment. Land use surrounding the Site is primarily industrial/commercial. VRP qualifying properties associated with former operation of MGPs at the Site consist of undeveloped parcels, Macon-Bibb County ROWs and active rail lines. Investigations and corrective actions were previously completed on several adjacent properties under the HSRA program, and certifications of compliance for soil at those properties were included in the 2004 CSR (Appendix A). Certifications of compliance for soil at remaining properties impacted by former MGP operations are included in this VRP CSR. Potential receptors were identified in the VIRP through the evaluation of potentially complete exposure pathways based on existing and potential future land use, and the physical setting of the Site. This Section provides an update of the exposure assessment provided in the VIRP based on current and anticipated Site conditions.

This section examines (a) whether individuals may be present on the subject properties, and are therefore identified as potential receptors, and (b) whether there is a reasonable likelihood for activities that can result in contact with environmental media containing site-related COI; i.e., potentially complete exposure pathways.

Potential receptors and their exposure pathways are identified in the VIRP based on current and reasonably anticipated, or covenant-defined, future land use and groundwater use. The first study to identify potential receptors was summarized in the 2000 CAP. The potential receptor survey included a land use survey, water well survey, and an evaluation of surface water flow/storm water runoff conditions. The water well survey was updated in the VIRP to reflect current information provided by the Macon Department of Public Health in September 2014.

7.1 Soil Pathway

The 2004 CSR included compliance certifications and supporting data for numerous properties, City ROWs and CCP. The current and expected future use of these areas was re-assessed as part of the VRP CSR process. The standards used to certify the properties per current and expected future use remain applicable; surface and subsurface soils have been addressed to the extent necessary to be protective of human health and environment and no future action is required. Compliance status of soil at properties certified in the 2004 CSR is shown on Figure 1-4.

Surface and subsurface soil at parcels associated with the Western Portion MPG, including the City ROWs, are in compliance HSRA-calculated residential standards and land use restrictions (i.e., institutional controls limiting land use to nonresidential purposes only) are not needed to prevent unacceptable exposure to potential receptors, with two exceptions. Institutional controls are necessary for the Norfolk Southern Parcel and the sub-parcel at the corner of Mulberry Street and 6th Street (owned by Prodigy Woodworks), where corrective actions were not completed based on the property owners' desire to instead execute UECs to mitigate potential risk to any current or future receptors. Potential receptors at the Norfolk Southern property are authorized railroad personnel who perform track maintenance and inspection activities. Reported COI concentrations in the surface soil currently meet HSRA non-residential risk-based

standards, and Norfolk Southern intends to execute a covenant to limit disturbance of the soil (including surface and subsurface) to protect the integrity/safety of the rail line and limit interruption of rail service. With the execution of the UECs, pathways associated with potential exposure to COI in soil will be incomplete and the parcels will comply with requirements of the VRPA.

Institutional controls will be implemented at parcels where digging restrictions are required to maintain the integrity of ISS masses though execution of UECs. Compliance status of soil at properties associated with the former Western Portion MGP are shown on Figure 6-4.

7.2 Groundwater Pathway

Alluvial groundwater at the Site is in compliance with HSRA residential RRS with the exception of an isolated area on property owned by Norfolk Southern used as an active rail line, and the adjacent Macon-Bibb County ROW. The portion of the Norfolk Southern property with residual dissolved phase impacts was enrolled in the VPR in 2014 as a qualifying property with the Site, as impacts in the area where known but could not be addressed due to the rail line operations. Norfolk Southern intends to implement institutional controls on the property, including groundwater use restrictions and vapor mitigation measures if a building is constructed on the property in the future to mitigate the potential for the groundwater to indoor air pathway to be complete. The groundwater pathway will be addressed upon execution of the UEC. Likewise, UECs restricting groundwater use will be implemented for the portion of Terminal Avenue adjacent to the Norfolk Southern property where residual COI remain, to bring the impacted portion of Terminal Avenue into compliance with VRP standards.

Institutional controls will also be implemented at the Prodigy Woodworks sub-parcel property to restrict the use of groundwater and require vapor investigation and/or mitigation prior to any future construction. The property will comply with VRP standards upon execution of the UEC. Residual impacts in bedrock groundwater are delineated to HSRA residential Type 1 RRS and do not extend more than 400 ft from the Site despite many decades (and perhaps more than a century) passing since the inception of the release. The area with bedrock groundwater impacts consists primarily of Macon-Bibb County ROWs and rail road properties. Groundwater is not currently used as a water supply for industrial or drinking water purposes in the vicinity of the Macon former MGP Site. The Macon-Bibb County Water Department provides water to the area surrounding the Site. The public water system draws water from the Ocmulgee River at a location approximately 3 miles upstream from the Site, and the river is the only source of water for the Macon system (ERM, 2014b).

As noted in the VIRP, based on a search of United Stated Geological Survey records, information obtained from the Macon-Bibb County Health Department, there are no known water supply wells within 1,000 ft of the extent of known impacts in bedrock groundwater. A windshield survey completed in February 2018 around the Site did not identify any water supply wells located between the Site and the Ocmulgee River. Of the wells identified within a mile of the site (based on United States Geological Survey records and information obtained from the Macon-Bibb County Health Department) none are located downgradient of the Site between the Site and the Ocmulgee River (groundwater discharge point). Wells located upgradient, cross-gradient, or on the other side of the Ocmulgee River (which is believed to act as a hydraulic

boundary to groundwater flow) within a mile appear to be used solely for industrial use (e.g., process water, irrigation), with no public supply or domestic use identified.

It is unlikely that a well would be installed in this isolated area in the future as public water is available, and the bedrock zone is unsuitable for water supply as it naturally provides limited groundwater yield. Further, before a private water well can be installed in Bibb County, the property owner or authorized agent must first apply for a permit with the Environmental Health Department[1] which would be unlikely to receive County or City approval. As such, there are no current groundwater receptors and the potential future use of groundwater in the area is highly unlikely.

Data provided in this VRP CSR demonstrate that use of groundwater for any purpose in the vicinity of the Site is impracticable and the Macon-Bibb County would not permit the installation of a water supply well. Therefore, there are no current or reasonably conceivable pathways for a receptor to be exposed to groundwater. In any event, evaluation of the potential for residual dissolved phase COI or DNAPL in bedrock to adversely impact a hypothetical well located 1,000 ft from the Site shows that the POE would not be impacted. Therefore, dissolved COI and DNAPL remaining in place do not pose a risk to human health or the environment, no further evaluation is warranted, and bedrock groundwater is in compliance with requirements of the VRP. As a conservative measure, however, groundwater use restrictions will be implemented through the use of UECs on the parcels shown on Figure 7-1 and as indicated on the Compliance Certification included in this VRP CSR.

In summary, comparison of groundwater monitoring data to applicable VRP standards for groundwater do not indicate any concentrations of COI above the VRP standards. Therefore, no further investigation, monitoring, or remediation for groundwater is warranted.

7.3 Indoor Air

Vapor intrusion (VI) is a constituent transport process that can occur when vapors from subsurface sources form and migrate upwards toward overlying buildings. There are no buildings present on the parcels included as VRP qualifying properties. There are only two properties where residual impacts remain in the subsurface; the Norfolk Southern property where soil is in compliance with standards protective of construction workers (Type 4 RRS) and minor residual impacts remain in saturated soil and groundwater, and the Prodigy Woodworks parcel at the corner of Mulberry Street and 6th Street. UECs will be executed for both properties requiring an assessment for VI potential, or vapor mitigation measures during construction of any enclosed structure, thus addressing the vapor pathway in the event of future construction.

VI is not a concern for residual bedrock groundwater impacts near the intersection of Walnut Street and 7th Street, as documented in the correspondence from AGLC to EPD dated March 22, 2017. As stated in that correspondence, VOCs can only partition to the vadose zone from the shallowest groundwater zone present at a given site. There is no VI pathway from bedrock groundwater impacts to a structure, as the shallow groundwater functions as a clean “cap”,

[1] http://northcentralhealthdistrict.org/bibb-county-environmental-health-department/

preventing VOC partitioning from bedrock groundwater into the vapor phase. As such, the VI pathway is not a complete pathway for current or future land use.

7.4 Surface Water Pathway

Although groundwater in the alluvial and bedrock zones eventually flows to the Ocmulgee River, as explained above, existing groundwater data indicate that dissolved phase COI in groundwater are attenuating rapidly and evaluation of the plume indicates that COI from the Site would not reach the river at any concentration. COI are not being transported to surface water through overland flow/storm water runoff. As a conservative measure, the potential for dissolved phase COI to reach the Ocmulgee River at concentrations that may adversely affect surface water quality was evaluated. The evaluation showed that even using conservative assumptions, groundwater discharge to the river will not impact surface water quality. Therefore, the Ocmulgee River, and users of this resource, are not identified as receptors for site-related COI.

7.5 Covenants and Controls

UECs have been prepared in accordance with Georgia Rule 391-3-19-08(7), to prohibit activities that may substantially interfere with engineering controls (i.e., the ISS mass) in place on any property. UECs prohibiting activities that would result in exposure to residential individuals to soils beneath the upper 2 feet of soil that would result in exposure to regulated substances above applicable RRS or to allow for unacceptable risks of vapor intrusion will be executed for properties where ISS was completed in 2002, 2009 and 2015 to avoid interference with the control. As noted previously, UECs restricting groundwater use will be executed as proposed in Figure 7-1. Requirements for assessment of the potential for VI at a future structure on the Norfolk Southern property and the Prodigy Woodworks property will be included in the covenants.

A copy of the draft UECs for each parcel was submitted to EPD for approval prior to the submittal of this VRP CSR, and are also included as Appendix L. Comments have not been received from EPD as of the submittal date of this document.

8.0 SUMMARY AND CONCLUSIONS

Activities completed at the Macon former MGP Site since submittal of the 2000 CSR and the 2004 CSR to EPD have served to supplement the data collected since 1986 and confirm the understanding of Site conditions. The fundamental conclusions that are derived from these activities consist of the following:

- The impacts above background concentrations and/or HSRA-calculated Type 1 (residential) RRS in soil and groundwater at the Site have been delineated horizontally and vertically. Sediments in the Upper and Lower Outfalls of the Ocmulgee River have been delineated horizontally and vertically in compliance with sediment removal and clean-up goals in accordance with the standards established per the approved Corrective Action Plan for Sediments in the Ocmulgee River dated January 5, 2001.
- As a result of soil removal and ISS activities in 2002, 2009 and 2015, soils on all affected parcels, ROWs, railroad parcels, and CCP are in compliance with applicable cleanup standards for soil based on HSRA RRS. Certification pages are included in this report for parcels previously certified in the 2004 CSR (Appendix A), and for parcels where corrective actions were implemented in 2015 in accordance with the VIRP and as documented in the 2016 CACR.
- Sediment remediation was completed in 2002. The sediments in the Ocmulgee River are in compliance with sediment removal and clean-up goals in accordance with the standards established per the approved Corrective Action Plan for Sediments in the Ocmulgee River dated January 5, 2001, as documented in previous reports and correspondence (Appendix A). Testing of surface water collected from the Ocmulgee River indicates that the surface water has not been impacted by former MGP operations.
- Groundwater at the Site is in compliance with either HSRA Type 1 RRS or VRP standards and groundwater use restrictions for certain parcels will be implemented through use of environmental covenants.
    - the residual dissolved phase plume in alluvial groundwater is stable as evidenced by:
        - data from nearly twenty years of groundwater monitoring demonstrates that natural attenuation is occurring resulting in a degradation of COI;
        - the effectiveness of corrective actions of source materials including soil excavation and ISS in 2002, 2009 and 2015 has resulted in reduction of COI concentrations and the extent of the plume;
        - detected concentrations of COI are isolated to a small area west of Terminal Avenue within the Macon-Bibb County ROW and on Norfolk Southern active rail line property; and
        - with the exception of the area noted in the previous bullet, alluvial groundwater concentration are below residential HSRA RRS rendering the exposure pathway for alluvial groundwater incomplete for the vast majority of the Site.
    - the residual impacts in bedrock groundwater are stable as evidenced by:

    - the extent is known, delineated and has not migrated in approximately twenty years of continuous monitoring;
    - as demonstrated by two decades of data, DNAPL and dissolved phase COI are stable and not migrating, a condition that is expected to continue based on corrective actions performed to remove source areas, natural attenuation, physical properties of DNAPL, and bedrock hydrogeological studies which have shown no potential for mobility, and
    - further, the bedrock hydrogeological setting (fracture size and type and bedrock competency) provides an impediment to the movement of impacts in groundwater and therefore does not present a risk to any potential receptors.
- The existing groundwater monitoring network is robust, and the period of post-corrective action groundwater monitoring has demonstrated that groundwater flow at the Site is consistent in terms of flow direction and gradient.

Based on the conclusions of this VRP CSR and parcel certifications for all qualifying parcels, AGLC and GPC request EPD's concurrence, and requests that the Site be delisted from the HSI upon the execution and recording of UECs for relevant portions of the Site. The proposed UECs for the affected parcels are included in Appendix L.

Notes:
All concentrations reported in mg/Kg
-- Analyte not detected in sample; laboratory detection limit is less than Type 1 RRS
J = Result is less than the Reporting Limit of the analytical method but greater than or equal to the Method Detection Limit. The concentration shown is an approximate value.
NR = Not a HSRSA-regulated substance.
Bold - Greater than Type 1 (default, non-residential) risk reduction standard
Bold and highlighted = greater than Type 1

Notes:

ft AMSL - feet Above Mean Sea Level

ft BTOC - feet Below Top of Casing

All depths to water are listed in feet below top of casing (ft BTOC).

All casing and groundwater elevations are listed in feet above mean sea level (ft AMSL).

*Bedrock porosity range taken from Applied Hydrogeology 4th Ed.
Multiple bedrock gradients are presented from different areas of the site.
Alluvial porosity used in velocity calculation is from the FFS, 2008.

Vs=Ki/n
where:
Vs=seepage velocity (Velocity)
K=hydraulic conductivity
i=horizontal hydraulic gradient (Gradient)
n=porosity

Notes:

ft AMSL - feet Above Mean Sea Level

ft BTOC - feet Below Top of Casing

All depths to water are listed in feet below top of casing (ft BTOC).

All casing and groundwater elevations are listed in feet above mean sea level (ft AMSL).

DNAPL - Dense Non-Aqueous Phase Liquid

Table 3-7

Notes:
* Highest RRS equals Type 1 RRS; therefore, the cleanup goal becomes the Type 1 RRS for this chemical
ft AMSL - feet Above Mean Sea Level
RRS - Risk Reduction Standard
SU - Stamdard Units
µS/cm - microsiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolts
NTU - nephelometric turbidity units
N/A - RRS are not applicable to this parameter
Values are listed with the laboratory-reported number of significant figures, which varies between different constituents within the same groundwater sample, and between the same constituent in different wells.
Analyte concentration exceeds the Type 1 RRS
Analyte concentration exceeds the residential (Type 2) RRS

Table 5-3
Bedrock Groundwater Analytical Results
February 2018
Atlanta Gas Light Company
Former Manufactured Gas Plant
Macon, Georgia

Notes:
* Highest RRS equals Type 1 RRS; therefore, the cleanup goal becomes the Type 1 RRS for this chemical
ft AMSL - feet Above Mean Sea Level
RRS - Risk Reduction Standard
SU - Stamdard Units
µS/cm - microsiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolts
NTU - nephelometric turbidity units
N/A - RRS are not applicable to this parameter
Values are listed with the laboratory-reported number of significant figures, which varies between different constituents within the same groundwater sample, and between the same constituent in different wells.
Analyte concentration exceeds the Type 1 RRS
Analyte concentration exceeds the residential (Type 2) RRS

Notes:
* Highest RRS equals Type 1 RRS; therefore, the cleanup goal becomes the Type 1 RRS for this chemical
ft AMSL - feet Above Mean Sea Level
RRS - Risk Reduction Standard
SU - Stamdard Units
µS/cm - microsiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolts
NTU - nephelometric turbidity units
N/A - RRS are not applicable to this parameter
Values are listed with the laboratory-reported number of significant figures, which varies between different constituents within the
Analyte concentration exceeds the Type 1 RRS
Analyte concentration exceeds the residential (Type 2) RRS

Table 6-1

CERTIFICATION OF COMPLIANCE WITH RISK REDUCTION STANDARDS

I certify under penalty of law that this report and all attachments were prepared under my direction in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Based on my review of the findings of this report, the Fifth Quarterly Groundwater Monitoring Report, the Soil Remediation Closure Report for OU2 and OU4, and the Sediment Remediation Closure Report with respect to the risk reduction standards of the Rules for Hazardous Site Response, Rule 391-3-19-07, I have determined that the following properties (identified by Bibb County, Georgia, Tax Parcel ID numbers, if applicable, and as outlined in this report) are in compliance with the following respective risk reduction standards for soil and groundwater.

Certifications for Soil

The following properties are in compliance with Type 1 risk reduction standards for soil:

Parcel No. OC-27-1A
Parcel No. OC-28-1C
Parcel No. OC-107-1A

The following properties are in compliance with Type 2 risk reduction standards for soil:

Parcel No. OC-14-1A
Parcel No. OC-14-1AA
Parcel No. OC-26-3A
Parcel No. OC-107-1B
Portions of Railroad Switching Yard and Right-of-Way of CSX Transportation (leased by Georgia Central)

The following properties are in compliance with Type 3 risk reduction standards for soil:

Central City Park

The following properties are in compliance with Type 4 risk reduction standards for soil:

Parcel No. OC-15-5A
Parcel No. OC-26-7A
Parcel No. OC-26-8C
Parcel No. OC-107-2A
Parcel No. OC-107-3A
Sixth Street and Right-of-Ways between Walnut and Mulberry Streets
Seventh Street and Right-of-Ways between Walnut and Mulberry Streets
Mulberry Street and Right-of-Ways between Sixth and Seventh Streets
Walnut Street and Right-of-Ways between Sixth and Seventh Streets

The following properties are in compliance with Type 5 risk reduction standards for soil:

Parcel No. OC-15-1A
Parcel No. OC-15-4A
Parcel No. OC-15-6A

The soil impacts on the following parcels are not associated with the MGP operations (Soil and Groundwater Corrective Action Plan, RETEC, 2001):

Parcel No. OC-6-3A
Parcel No. OC-6-3B

The soil impacts on the following property are not in compliance with any risk reduction standards; however, the impacts are not considered associated with MGP operations:

Portions of Right-of-Way of Central of Georgia/Norfolk Southern Railroad

CERTIFICATION OF COMPLIANCE WITH RISK REDUCTION STANDARDS

Subject: Corrective Action Plan – Central City Park
Macon Former Manufactured Gas Plant Site, HSI # 10511

Dear Sirs:

The Georgia Environmental Protection Division (EPD) has completed its review of the Corrective Action Plan (CAP) received on November 28, 1999 for the soils in the Central City Park, which is part of the Macon Former Manufactured Gas Plant Site, submitted by the Atlanta Gas Light Company and Georgia Power Company. The plan is hereby approved, with the following stipulations:

1. As described in your December 30, 1999 letter, received January 4, 2000, the remediation goal will be the Type 3 risk reduction criteria defined in Section 391-3-19-.07(8)(d) of the Rules for Hazardous Site Response, which are more stringent then the Type 4 risk reduction criteria proposed in the CAP.

2. As noted in the CAP, the proposed work only addresses the soil contamination in Central City Park. The rest of the site, including the groundwater and the potential impacts to surface water, will be addressed under separate plans to be submitted at a later date.

Enclosed is the public notice that will run in the *Atlanta Journal Constitution* and *Macon Telegraph* indicating EPD's approval of the CAP. If you have any questions please contact Sarah Divakarla at (404) 657-8600.

Sincerely,

Jane Hendricks

PUBLIC NOTICE OF EPD'S CONCURRENCE WITH CORRECTIVE ACTION PLAN FOR SITE LISTED ON HAZARDOUS SITE INVENTORY

This public notice is to inform all interested parties that the Environmental Protection Division, Department of Natural Resources, State of Georgia (EPD) has completed its review of the corrective action plan submitted on November 28, 1999, by the Atlanta Gas Light Company and Georgia Power Company for the Central City Park portion of the Macon Manufactured Gas Plant Site. The Macon Manufactured Gas Plant Site is listed as No. 10511 on the Hazardous Sites Inventory. During this phase of the remediation project, the soils identified in the Central City Park that exceed the appropriate risk reduction standards will be removed and disposed of off site.

EPD concurs with the corrective action plan that addresses the first phase of an overall remedial strategy to clean-up the Macon Manufactured Gas Plant Site. A determination has not been made on the type of corrective action that will be appropriate for the rest of the Site.

Additional information about this site may be obtained by calling Sarah Divakarla of EPD at (404) 657-8600.

re: Corrective Action Plan for Sediments in the Ocmulgee River
Macon MGP Site, HSI # 10511

Dear Ms. Sitherwood:

The Georgia Environmental Protection Division (EPD) sent a conditional approval letter for the Corrective Action Plan for Sediments in the Ocmulgee River (CAP) on January 2, 2001. The conditions of that approval letter (meeting public participation requirements and receiving a 401 Water Certification) have been met. EPD received a revised CAP schedule on April 3, 2001 which was developed by Atlanta Gas Light Company (AGLC) following negotiations with the U.S. Army Corps of Engineers. The CAP and revised schedule, including the use of a temporary cofferdam for the upper outfall, are acceptable to EPD. The revised schedule and CAP are hereby approved and, according with Condition 4 of Consent Order EPD-HSR-227, are incorporated into the Order.

Enclosed is a copy of the public notice that EPD will run in the next publication of the *Atlanta Journal* Constitution and the *Macon Telegraph.* If you have any questions, please contact Sarah Divakarla at (404) 657-8600.

Sincerely,

Jane Hendricks

PUBLIC NOTICE OF EPD'S CONCURRENCE WITH CORRECTIVE ACTION PLAN FOR SITE LISTED ON HAZARDOUS SITE INVENTORY

This public notice is to inform all interested parties that the Environmental Protection Division, Department of Natural Resources, State of Georgia (EPD) has completed its review of the corrective action plan submitted on October 2, 2000 and revised on October 20, 2000, December 4, 2000 and April 3, 2001, by the Atlanta Gas Light Company and Georgia Power Company for the Ocmulgee River portion of the Macon Manufactured Gas Plant Site. The Macon Manufactured Gas Plant Site is listed as No. 10511 on the Hazardous Sites Inventory. During this phase of the remediation project, the contaminated sediments and source material identified in the Ocmulgee River that exceed ecological or human health cleanup levels will be removed and disposed of off-site. EPD concurs with this corrective action plan that addresses the sediment remediation as part of the overall remedial strategy to cleanup the Macon Manufactured Gas Plant Site.

Additional information about this site may be obtained by calling Sarah Divakarla of EPD at (404) 657-8600.

re: Approval of CAP Revision and Basis of Design Workplan
Macon MGP Site, HSI # 10511

Dear Ms. Sitherwood:

The Georgia Environmental Protection Division (EPD) has reviewed the revised Basis of Design Workplan (Workplan) submitted on January 6, 2001 as well as the proposed revisions to the Corrective Action Plan for Site Soil and Groundwater at the Macon MGP Site (CAP). The public notice period for the CAP revisions expired on February 11, 2002 and EPD did not receive any comments from the public. The revised Workplan and the proposed CAP changes are acceptable and are hereby approved by EPD.

In accordance with Condition 9 of Consent Order EPD-HSR-227, the revised plans are incorporated into the Order and must be implemented. If you have any questions, please contact Sarah Divakarla at (404) 657-8600.

Re: Sediment Remediation Closure Report
Upper and Lower Outfalls – Ocmulgee River
Macon MGP Site, HSI Site #10511

Dear Mr. Cleveland:

The Georgia Environmental Protection Division (EPD) has reviewed the Sediment Remediation Closure Report dated March 6, 2002 for the Upper and Lower Outfalls in the Ocmulgee River. EPD concurs that the remediation was generally completed in accordance with the approved corrective action plan for the sediment remediation. EPD did not generate a response earlier to this submittal because there were no deficiencies noted and the CAP is still active due to the on-going monitoring requirements. However, with this letter, we are acknowledging the closure report is complete and acceptable to EPD.

If you have any questions regarding this letter, please contact David Brownlee at (404) 657-8600.

Re: Harnco Parcel
Macon MGP Site, HSI # 10511

Dear Mr. Cleveland:

The Georgia Environmental Protection Division (EPD) has reviewed the November 26, 2004 correspondence regarding the Harnco parcel and the current status of its certification with regard to the risk reduction standards found in Section 391-3-19-.07 of the Rules for Hazardous Site Response (RRS). EPD concurs that the Harnco parcel, listed as Parcel No. OC-26-3A, meets the Type 2 RRS for soil. Currently, the parcel does not meet any RRS for groundwater. Investigation and remediation of the groundwater at the parcel will continue as part of AGLC's approved corrective action plan in accordance with Consent Order EPD-HSR-227.

If you have any questions, please contact David Brownlee at (404) 657-8600.

Re: Scour Protection Placement Completion Report
Upper and Lower Outfalls – Ocmulgee River
Macon MGP Site, HSI Site #10511

Dear Mr. Cleveland:

The Georgia Environmental Protection Division (EPD) has reviewed the Scour Protection Placement Completion Report dated July 9, 2004 for the Upper and Lower Outfalls in the Ocmulgee River. EPD concurs that the "armoring" of the river sediments was generally completed in accordance with the approved corrective action plan for the sediments. The new "As Built" baseline elevations contained in Figure 3 of the report will constitute the new baseline for further annual surveys and will be used to determine if additional corrective action is ever required.

If you have any questions regarding this letter, please contact David Brownlee at (404) 657-8600.

Narrative

CASE NARRATIVE

Client: ERM-Southeast, Inc.

Project: Macon MGP Due Diligence Soil MAR 2013

Report Number: 680-88244-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 03/12/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.8º C and 4.4º C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 03/14/2013 and analyzed on 03/26/2013.

Sample TRIP BLANK (LOT # 121212) (680-88244-1) was analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/15/2013.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS/LCSD associated with batch 270940 each had 3 analytes outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

The following compounds were outside control limits in the continuing calibration verification (CCV) associated with batch 270940: acetone. This compound is not classified as a Calibration Check Compound (CCCs) in the reference method, and the laboratory defaults to in-house and/or project-specific criteria for evaluation. There is insufficient holding time remaining for re-analysis; therefore, the data have been reported. The associated samples contained detections for the following analytes: acetone and 2-butanone.

The method blank for batch 270940 contained 1,2,4-trichlorobenzene above the method detection limit (MDL). This target analyte concentration was less than one-half the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 03/14/2013 and analyzed on

Job ID: 680-88244-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

03/22/2013.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 179951 had 3 analytes {Benzidine at 5%; Benzoic Acid at 0%; and Dinodeb at 39%} outside control limits, but within marginal exceedence; therefore, corrective action was not performed. These results have been reported and qualified. DDSB-2-0-2-20130312-01 (680-88244-2), DDSB-2-9-11-20130312-01 (680-88244-3)

The continuing calibration verification (CCVIS) associated with batch 500-180723/2 recovered above the upper control limit for Di-n-octyl phthalate at 29.2%D. The samples associated with this CCVIS were non-detects for this analyte; therefore, the data have been reported. DDSB-2-0-2-20130312-01 (680-88244-2), DDSB-2-9-11-20130312-01 (680-88244-3)

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

ORGANOCHLORINE PESTICIDES

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for organochlorine pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 03/15/2013 and analyzed on 03/26/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The following sample was diluted due to the abundance of non-target analytes: DDSB-2-0-2-20130312-01 (680-88244-2). Elevated reporting limits (RLs) are provided.

The matrix spike and matrix spike recoveries for batch 179990 exceeded control limits due to sample matrix interferences which required sample dilution. The associated laboratory control sample (LCS) met acceptance criteria.DDSB-2-0-2-20130312-01 (680-88244-2)

TCX surrogate recovery for the following matrix spike duplicate sample was outside control limits: DDSB-2-0-2-20130312-01 (680-88244-2). Evidence of matrix interference is present; therefore, re-extraction and re-analysis was not performed.

The continuing calibration verifications (CCVs) for analytical batch 180839 were low and exceeded control criteria for Chlordane, Toxaphene, and Methoxychlor. This failure most likely occurred due to sample matrix of another sample not associated with this job. The ending CCVs were in control for mentioned analytes and target compounds were not detected in these samples, therefore, sample results were reported.DDSB-2-0-2-20130312-01 (680-88244-2), DDSB-2-9-11-20130312-01 (680-88244-3)

The ending continuing calibration verification (CCV) for Heptachlor associated with batch 180839 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. DDSB-2-0-2-20130312-01 (680-88244-2), DDSB-2-9-11-20130312-01 (680-88244-3)

Sample DDSB-2-0-2-20130312-01 (680-88244-2)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 03/15/2013 and analyzed on 03/20/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

Job ID: 680-88244-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

ORGANOPHOSPHORUS PESTICIDES

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for organophosphorus pesticides in accordance with EPA SW-846 Method 8141A. The samples were prepared on 03/16/2013 and analyzed on 04/01/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 640-100242 and 640-100288. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15 %D.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 640-100242 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria. sAMPLE 680-88244-B2 was used for the MS/MSD.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/14/2013 and analyzed on 03/19/2013.

The serial dilution performed for the following sample(s) associated with batch 680-269345 was outside control limits for iron, vanadium, and zinc: (680-88237-1 SD)

Due to the high concentration of alumium, barium, calcium, potassium, magnesium, lead, vanadium, and zinc, the matrix spike / matrix spike duplicate (MS/MSD) for batch 680-269345 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-269345 were outside control limits for chromium, calcium, manganese, and antimony. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) precision for batch 680-269345 was outside control limits for barium, calcium, magnesium, antimony, and zinc. Non-homogeneity of the sample matrix is suspected.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 03/13/2013 and analyzed on 03/19/2013.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 03/14/2013 and analyzed on

Job ID: 680-88244-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

03/15/2013.

The matrix spike (MS) recovery for batch 269575 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The following sample(s) was diluted due to the nature of the sample matrix: (680-87989-4 DU), (680-87989-4 PDS), LCBSBDD0001-ISE (680-87989-4). Elevated reporting limits (RLs) are provided.

No other difficulties were encountered during the hexavalent chromium analyses.

All other quality control parameters were within the acceptance limits.

TOTAL CYANIDE

Samples DDSB-2-0-2-20130312-01 (680-88244-2) and DDSB-2-9-11-20130312-01 (680-88244-3) were analyzed for total and amenable cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 03/13/2013.

No difficulties were encountered during the cyanide analyses.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD exceeds the control limits

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F	MS or MSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits
F	RPD of the MS and MSD exceeds the control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

CASE NARRATIVE

Client: ERM-Southeast, Inc.

Project: Macon MGP Due Diligence Soil MAR 2013

Report Number: 680-88289-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 03/13/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 5 coolers at receipt time were 4.0º C, 4.0º C, 4.1º C, 4.2º C and 4.2º C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 03/18/2013 and analyzed on 03/19/2013, 03/20/2013 and 03/22/2013.

Samples TRIP BLANK (680-88289-14), TRIP BLANK (680-88289-28) and TRIP BLANK (680-88289-29) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/18/2013.

The method blank for batch 269749 contained 1,2,3 + 1,2,4-trichlorobenzene and n-butylbenzene above the method detection limit (MDL). This target analyte concentration was less than one-half the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized.

The LCS/LCSD associated with batch 270151 had up to 2 analytes outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

The LCS associated with batch 270405 had 1 analyte outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

No other difficulties were encountered during the volatiles analyses.

Job ID: 680-88289-2 (Continued)

Laboratory: TestAmerica Savannah (Continued)

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 03/15/2013 and analyzed on 03/22/2013, 03/23/2013 and 03/25/2013.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 179992 had 1 analyte {Benzidine at 6%} outside control limits, but within marginal exceedence; therefore, corrective action was not performed. These results have been reported and qualified. DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-5-0-2-20130313-01 (680-88289-27)

The reference method specifies +/- 30 second retention time difference between the midpoint in the initial calibration (ICAL) and the continuing calibration verification (CCV). The CCV's and samples run on instrument CMS23 exceeded these criteria: DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-5-0-2-20130313-01 (680-88289-27). This retention time shift is due to normal and reasonable column maintenance and does affect the instrument's chromatography resolution, sensitivity, or identification of target analytes. System retention times have been updated for proper analyte identification.

The continuing calibration verification (CCV) associated with batch 500-180723/2 recovered above the upper control limit for Di-n-octyl phthalate at 29.9%D. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Sample DDSB-10-0-2-20130312-01 (680-88289-21)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

ORGANOCHLORINE PESTICIDES

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for organochlorine pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 03/15/2013 and analyzed on 03/26/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The continuing calibration verifications (CCVs) for analytical batch 180839 were low and exceeded control criteria for Chlordane, Toxaphene, and Methoxychlor. This failure most likely occurred due to sample matrix of another sample not associated with this job. The ending CCVs were in control for mentioned analytes and target compounds were not detected in these samples, therefore, sample results were reported.DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-11-0-2-20130312-01 (680-88289-19),

Job ID: 680-88289-2 (Continued)

Laboratory: TestAmerica Savannah (Continued)

DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16)

The following samples were diluted due to the abundance of non-target analytes: DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-12-0-2-20130312-01 (680-88289-15). Elevated reporting limits (RLs) are provided.

TCX or DCB surrogate recovery for the following samples were outside control limits: DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-3-12-14-20130313-01 (680-88289-26). Evidence of matrix interference is present; therefore, re-extraction and re-analysis was not performed.

The ending continuing calibration verification (CCV) for analytical batch 180839 on the confirmation column (Rtx-Clp) exceeded control criteria for 4,4'-DDD. No further action taken since primary column was in control and 4,4-DD was just out (15.1%D).DDSB-5-0-2-20130313-01 (680-88289-27)

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 180839. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15%D. Compounds affected: Heptachlor and Toxaphene (peaks 4 and 5).DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-5-0-2-20130313-01 (680-88289-27)

Samples DDSB-12-0-2-20130312-01 (680-88289-15)[10X], DDSB-11-0-2-20130312-01 (680-88289-19)[10X] and DDSB-10-0-2-20130312-01 (680-88289-21)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 03/15/2013 and analyzed on 03/20/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

TCX recovery for the following sample was outside control limits: DDSB-3-12-14-20130313-01 (680-88289-26). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No other difficulties were encountered during the PCBs analyses.

All other quality control parameters were within the acceptance limits.

ORGANOPHOSPHORUS PESTICIDES

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for organophosphorus pesticides in accordance with EPA SW-846 Method 8141A. The samples were prepared on 03/16/2013 and analyzed

Job ID: 680-88289-2 (Continued)

Laboratory: TestAmerica Savannah (Continued)

on 04/01/2013 and 04/02/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 640-100242 and 640-100288. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15 %D.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 640-100242 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria. sAMPLE 680-88244-B2 was used for the MS/MSD.

No difficulties were encountered during the pesticides analyses.

All quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/15/2013 and 03/17/2013 and analyzed on 03/18/2013 and 03/19/2013.

The post digestion spike % recovery for zinc associated with batch 680-269660 was outside of control limits.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-269660 were outside control limits for chromium, sodium, antimony, thallium, potassium, and vanadium. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Due to the high concentration of aluminum, barium, calcium, iron, magnesium, manganese, lead, and zinc, the matrix spike / matrix spike duplicate (MS/MSD) for batch 680-269660 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Due to the high concentration of aluminum, barium, calcium, chromium, copper, iron, manganese, lead, vanadium, and zinc, the matrix spike / matrix spike duplicate (MS/MSD) for batch 680-269487 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-269487 were outside control limits for arsenic, magnesium, and antimony. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) precision for batch 680-269487 was outside control limits for chromium. Non-homogeneity of the sample matrix is suspected.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for total

mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 03/14/2013 and analyzed on 03/15/2013 and 03/16/2013.

Sample DDSB-11-0-2-20130312-01 (680-88289-19)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 03/14/2013, 03/15/2013 and 03/18/2013 and analyzed on 03/15/2013, 03/16/2013 and 03/20/2013.

The matrix spike (MS) recovery for batch 269575 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The matrix spike (MS) recovery for batch 269645 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

To verify the absence of an interference, EPA Method 7196A requires the sample to be diluted until the post digestive spike (PDS) recovery is within 85-115%. For this reason, the following sample(s) was diluted: (680-88273-9 DU), SIA4BT5-08A (0-2') (680-88273-9). Elevated reporting limits (RLs) are provided.

The matrix spike (MS) recoveries for batch 269690 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the hexavalent chromium analyses.

All other quality control parameters were within the acceptance limits.

TOTAL CYANIDE

Samples DDSB-12-0-2-20130312-01 (680-88289-15), DDSB-12-12-13-20130312-01 (680-88289-16), DDSB-1-0-2-20130312-01 (680-88289-17), DDSB-1-12-13-20130312-01 (680-88289-18), DDSB-11-0-2-20130312-01 (680-88289-19), DDSB-11-12-14-20130312-01 (680-88289-20), DDSB-10-0-2-20130312-01 (680-88289-21), DDSB-10-12-14-20130312-01 (680-88289-22), DDSB-4-0-2-20130313-01 (680-88289-23), DDSB-4-12-14-20130313-01 (680-88289-24), DDSB-3-0-2-20130313-01 (680-88289-25), DDSB-3-12-14-20130313-01 (680-88289-26) and DDSB-5-0-2-20130313-01 (680-88289-27) were analyzed for total and amenable cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared on 03/14/2013 and analyzed on 03/15/2013.

Cyanide, Total exceeded the recovery criteria low for the MSD of sample 680-88289-30 in batch 680-269516.

No other difficulties were encountered during the cyanide analyses.

All other quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD exceeds the control limits
*	RPD of the LCS and LCSD exceeds the control limits

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD exceeds the control limits

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

CASE NARRATIVE

Client: ERM-Southeast, Inc.

Project: Macon MGP Due Diligence Soil MAR 2013

Report Number: 680-88339-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 03/14/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 0.4º C, 2.4º C, 2.4º C, 2.6º C, 3.2º C and 4.2º C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 03/20/2013 and analyzed on 03/20/2013 and 03/21/2013.

Samples TRIP BLANK (680-88339-1) and TB-05-20130314-01 (680-88339-5) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/28/2013.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS/LCSD associated with batch 270151 had up to 2 analytes outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

The method blank for batch 270346 contained napthalene and 1,24,-trichlorobenzene above the method detection limit (MDL). This target analyte concentration was less than one-half the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 03/18/2013 and analyzed on 03/25/2013.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 18202 had 3 analytes {Benzidine at 6%; Benzoic Acid at 0%; and Dinoseb at 45%} outside control limits, but within marginal exceedence; therefore, corrective action was not performed. These results have been

Job ID: 680-88339-2 (Continued)

Laboratory: TestAmerica Savannah (Continued)

reported and qualified. DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3), DDSB-6-16-20-10-20130314-01 (680-88339-4)

The reference method specifies +/- 30 second retention time difference between the midpoint in the initial calibration (ICAL) and the continuing calibration verification (CCV). The CCV's and samples run on instrument CMS23 exceeded these criteria: DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3), DDSB-6-16-20-10-20130314-01 (680-88339-4). This retention time shift is due to normal and reasonable column maintenance and does affect the instrument's chromatography resolution, sensitivity, or identification of target analytes. System tetention times have been updated for proper analyte identification.DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3), DDSB-6-16-20-10-20130314-01 (680-88339-4)

The continuing calibration verification (CCV) associated with batch 500-180723/2 recovered above the upper control limit for Di-n-octyl phthalate at 29.2%D. The continuing calibration verification (CCV) associated with batch 500-180871/2 recovered above the upper control limit for Di-n-octyl phthalate at 28.5%D and Pentachlorophenol at 25.3%D. The samples associated with these CCV's were non-detects for the affected analytes; therefore, the data have been reported. DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3), DDSB-6-16-20-10-20130314-01 (680-88339-4)

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

ORGANOCHLORINE PESTICIDES

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for organochlorine pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 03/19/2013 and analyzed on 03/21/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 180355. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15%D. Compounds affected: Toxaphene (peaks 4 and 5), Heptachlor, 4,4'-DDT, and Methoxychlor.DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3), DDSB-6-16-20-10-20130314-01 (680-88339-4)

No difficulties were encountered during the pesticides analyses.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 03/19/2013 and analyzed on 03/20/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

ORGANOPHOSPHORUS PESTICIDES

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for organophosphorus pesticides in accordance with EPA SW-846 Method 8141A. The samples were prepared on 03/18/2013 and analyzed on 04/01/2013.

Job ID: 680-88339-2 (Continued)

Laboratory: TestAmerica Savannah (Continued)

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 640-100242 and 640-100288. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15 %D.

The one set of matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 640-100288 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria. Sample 680-88399B2 was used for the MS/MSD.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/18/2013 and analyzed on 03/19/2013.

The serial dilution performed for the following sample(s) associated with batch 680-269729 was outside control limits for aluminum, barium, calcium, iron, magneseium, manganese, lead, vanadium, and zinc: (680-88339-7 SD)

Due to the high concentration of aluminum, barium, calcium, iron, manganese, lead, andzinc, the matrix spike / matrix spike duplicate (MS/MSD) for batch 680-269729 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-269729 were outside control limits for arsenic, copper, antimony, thallium, and vanadium. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) precision for batch 680-269729 was outside control limits for copper, lead, antimony and zinc. Non-homogeneity of the sample matrix is suspected.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 03/18/2013 and 03/21/2013 and analyzed on 03/20/2013 and 03/22/2013.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-269698 were outside control limits for mercury. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the mercury analyses.

All other quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 03/18/2013 and analyzed on 03/20/2013.

Job ID: 680-88339-2 (Continued)

Laboratory: TestAmerica Savannah (Continued)

To verify the absence of an interference, EPA Method 7196A requires the sample to be diluted until the post digestive spike (PDS) recovery is within 85-115%. For this reason, the following sample(s) was diluted: (680-88273-9 DU), SIA4BT5-08A (0-2') (680-88273-9). Elevated reporting limits (RLs) are provided.

The matrix spike (MS) recoveries for batch 269690 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the hexavalent chromium analyses.

All other quality control parameters were within the acceptance limits.

TOTAL CYANIDE

Samples DDSB-5-8-10-20130314-01 (680-88339-2), DDSB-6-0-2-10-20130314-01 (680-88339-3) and DDSB-6-16-20-10-20130314-01 (680-88339-4) were analyzed for total and amenable cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 03/18/2013.

No difficulties were encountered during the cyanide analyses.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F	RPD of the MS and MSD exceeds the control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

CASE NARRATIVE

Client: ERM-Southeast, Inc.

Project: Macon MGP Due Diligence Soil MAR 2013

Report Number: 680-88399-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 03/15/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 0.6 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 03/21/2013 and analyzed on 03/23/2013 and 03/24/2013.

Sample TB-01-20130314-01 (680-88399-1) was analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/19/2013.

The method blank for batch 270459 contained napthalene above the method detection limit (MDL). This target analyte concentration was less than one-half the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 03/18/2013 and analyzed on 03/25/2013 and 03/28/2013.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 18202 had 3 analytes {Benzidine at 6%; Benzoic Acid at 0%; and Dinoseb at 45%} outside control limits, but within marginal exceedence; therefore, corrective action was not performed. These results have been reported and qualified. DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6), DDSB-9-10-12-20130314-01 (680-88399-7)

Job ID: 680-88399-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

The reference method specifies +/- 30 second retention time difference between the midpoint in the initial calibration (ICAL) and the continuing calibration verification (CCV). The CCV's and samples run on instrument CMS23 exceeded these criteria: DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6), DDSB-9-10-12-20130314-01 (680-88399-7). This retention time shift is due to normal and reasonable column maintenance and does affect the instrument's chromatography resolution, sensitivity, or identification of target analytes. System tetention times have been updated for proper analyte identification.DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6), DDSB-9-10-12-20130314-01 (680-88399-7)

The continuing calibration verification (CCV) associated with batch 500-180723/2 recovered above the upper control limit for Di-n-octyl phthalate at 29.2%D. The continuing calibration verification (CCV) associated with batch 500-180871/2 recovered above the upper control limit for Di-n-octyl phthalate at 28.5%D and Pentachlorophenol at 25.3%D. The continuing calibration verification (CCV) associated with batch 500-181265/2 recovered above the upper control limit for Pentachlorophenol at 22.9%D.The samples associated with these CCV's were non-detects for the affected analytes; therefore, the data have been reported. DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6), DDSB-9-10-12-20130314-01 (680-88399-7)

Samples DDSB-8-0-2-20130314-01 (680-88399-4)[5X] and DDSB-9-0-2-20130314-01 (680-88399-6)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

ORGANOCHLORINE PESTICIDES

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for organochlorine pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 03/18/2013 and analyzed on 03/20/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The following samples were diluted due to the abundance of non-target analytes: DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-9-0-2-20130314-01 (680-88399-6), DDSB-9-10-12-20130314-01 (680-88399-7). Elevated reporting limits (RLs) are provided.

TCX and/or DCB surrogate recovery for the following samples were outside control limits: DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-9-0-2-20130314-01 (680-88399-6). Evidence of matrix interference is present; therefore, re-extraction and re-analysis was not performed.

Numerous matrix spike and matrix spike duplicate recoveries for batch 180211 were outside control limits due to sample matrix interferences which required sample dilution. The associated laboratory control sample (LCS) met acceptance criteria.DDSB-8-0-2-20130314-01 (680-88399-4)

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 180355. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15%D. Compounds affected: Heptachlor, Toxaphene (peaks 4 and 5), and Chlordane (peaks 3 and 5).DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6), DDSB-9-10-12-20130314-01 (680-88399-7)

Samples DDSB-8-0-2-20130314-01 (680-88399-4)[10X], DDSB-9-0-2-20130314-01 (680-88399-6)[10X] and DDSB-9-10-12-20130314-01 (680-88399-7)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Job ID: 680-88399-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 03/18/2013 and analyzed on 03/20/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

ORGANOPHOSPHORUS PESTICIDES

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for organophosphorus pesticides in accordance with EPA SW-846 Method 8141A. The samples were prepared on 03/18/2013 and analyzed on 04/01/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The grand mean exception, as outlined in EPA Method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 640-100242 and 640-100288. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15 %D.

The one set of matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 640-100288 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria. Sample 680-88399B2 was used for the MS/MSD.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/20/2013 and 03/21/2013 and analyzed on 03/21/2013 and 03/22/2013.

The following samples were digested at a reduced sample weight due to a vigorous reaction with the hydrogen peroxide additon during initial digestion: DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-9-0-2-20130314-01 (680-88399-6).

Due to the high concentration of aluminum and iron, the matrix spike / matrix spike duplicate (MS/MSD) for batch 680-269986 be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-269986 were outside control limits for silver, calcium, potassium, magnesium, manganese, thallium, vanadium, barium, chromium, copper, lead, antimony, and zinc. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Job ID: 680-88399-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

The matrix spike / matrix spike duplicate (MS/MSD) precision for batch 680-269986 was outside control limits for alumium, barium, calcium, chromium, iron, lead, vanadium, and zinc. Non-homogeneity of the sample matrix is suspected.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 03/18/2013 and 03/21/2013 and analyzed on 03/20/2013 and 03/22/2013.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 03/18/2013 and analyzed on 03/20/2013.

To verify the absence of an interference, EPA Method 7196A requires the sample to be diluted until the post digestive spike (PDS) recovery is within 85-115%. For this reason, the following sample(s) was diluted: (680-88273-9 DU), SIA4BT5-08A (0-2') (680-88273-9). Elevated reporting limits (RLs) are provided.

The matrix spike (MS) recoveries for batch 269690 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the hexavalent chromium analyses.

All other quality control parameters were within the acceptance limits.

TOTAL CYANIDE

Samples DDSB-7-0-2-20130314-01 (680-88399-2), DDSB-7-11-13-20130314-01 (680-88399-3), DDSB-8-0-2-20130314-01 (680-88399-4), DDSB-8-8-11-20130314-01 (680-88399-5), DDSB-9-0-2-20130314-01 (680-88399-6) and DDSB-9-10-12-20130314-01 (680-88399-7) were analyzed for total and amenable cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared on 03/20/2013 and analyzed on 03/21/2013.

No difficulties were encountered during the cyanide analyses.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F	MS or MSD exceeds the control limits
F	RPD of the MS and MSD exceeds the control limits
X	Surrogate is outside control limits
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	0.6 C
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

CASE NARRATIVE

Client: ERM-Southeast, Inc.

Project: Macon MGP Due Diligence AQ APR 2013

Report Number: 680-89383-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 04/16/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.0 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDMW-1-20130415-01 (680-89383-1), DDMW-2-20130415-01 (680-89383-2) and TB-01-20130415-01 (ATL-143) (680-89383-3) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/17/2013.

The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 273341 exceeded control limits for bromomethane.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/22/2013 and analyzed on 04/25/2013.

The continuing calibration verifications (CCV's) for Aramite associated with batches 500-183989/5 and 184148/4 recovered above the upper control limit. The samples associated with these CCV's were non-detects for the affected analytes; therefore, the data have been reported. DDMW-1-20130415-01 (680-89383-1), DDMW-2-20130415-01 (680-89383-2)

Internal standard (ISTD) responses for some CCV's were outside of acceptance limits: DDMW-1-20130415-01 (680-89383-1), DDMW-2-20130415-01 (680-89383-2). The affected samples were not re-analyzed due to CCV recoveries meeting control limits.

The initial calibration verification (ICV) for analytical batch 500-183587/13 and 14 was outside control criteria for Benzoic acid, 4-Chloroaniline, 3 & 4 Methylphenol, and Phenol. The affected samples were non detects for these analytes. The data have been qualified and reported.DDMW-1-20130415-01 (680-89383-1), DDMW-2-20130415-01 (680-89383-2)

Job ID: 680-89383-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

No difficulties were encountered during the semivolatiles analyses.

All quality control parameters were within the acceptance limits.

CHLORINATED PESTICIDES

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for chlorinated pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared on 04/19/2013 and analyzed on 04/22/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The continuing calibration verification (CCV) for Chlordane (technical) peak 3 and peak 5 and 4,4'-DDD associated with batch 183728 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. DDMW-1-20130415-01 (680-89383-1), DDMW-2-20130415-01 (680-89383-2)

No difficulties were encountered during the pesticides analyses.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 04/19/2013 and analyzed on 04/23/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

ORGANOPHOSPHORUS PESTICIDES

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for organophosphorus pesticides in accordance with EPA SW-846 Method 8141A. The samples were prepared on 04/18/2013 and analyzed on 04/22/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for batch 640-101150 exceeded control limits for the following analyte: epn. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

The laboratory control sample and the laboratory control sample duplicate (LCS/LCSD) for batch 640-101150 exceeded control limits for the following analyte(s): dichlorvos, demeton-o. dichlorvos, demeton-o has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Only batch precision exceeded control limits for dichlorvos. These results have been reported and qualified.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

METALS (ICPMS)

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for Metals (ICPMS) in accordance with EPA SW-846 Method 6020A. The samples were prepared on 04/18/2013 and 04/22/2013 and analyzed on 04/21/2013 and 04/25/2013.

Job ID: 680-89383-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for barium, magnesium and antimony in batch 273513 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Due to the high concentration of calcium, sodium and strontium, the matrix spike / matrix spike duplicate (MS/MSD) for batch 273513 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-273985 were outside control limits for silver. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 7196A. The samples were analyzed on 04/16/2013.

No difficulties were encountered during the hexavalent chromium analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/17/2013 and analyzed on 04/18/2013.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

TOTAL CYANIDE

Samples DDMW-1-20130415-01 (680-89383-1) and DDMW-2-20130415-01 (680-89383-2) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 04/18/2013.

No difficulties were encountered during the cyanide analyses.

All quality control parameters were within the acceptance limits.

No analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	RPD of the LCS and LCSD exceeds the control limits

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	RPD of the LCS and LCSD exceeds the control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.0 C
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	Insufficient volume received for MS/MSD.
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

CASE NARRATIVE

Client: ERM-Southeast, Inc.

Project: Macon MGP Due Diligence AQ APR 2013

Report Number: 680-89352-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 04/15/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 0.9 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01 (680-89352-2) and TB-01-20130415-01 (680-89352-3) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/24/2013.

No difficulties were encountered during the volatiles analyses.

All quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/18/2013 and 04/25/2013 and analyzed on 04/24/2013 and 04/25/2013.

Three surrogate recoveries for the following sample were outside control limits: DDMW-3-20130415-01 (680-89352-1). Re-extraction was performed outside of holding time with acceptable results. Both sets of data have been reported.

One base surrogate and one acid surrogate failed to meet control limits for the following sample DDMW-4-20130415-01 (680-89352-2). All surrogate recoveries were greater than 10%. No further action was required.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 4 analytes to recover outside criteria for this method when a full list spike is utilized. The LCS/LCSD associated with batch 184113 had 1 known poor performing analytes outside control limits: Benzidine @ 7% and 9% (limits are 10-100%); therefore, corrective action was not performed. These results have been reported and qualified. DDMW-3-20130415-01 (680-89352-1)

The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batches 183383 and 184113 recovered outside control limits for Benzoic acid and Benzidine.DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01

Job ID: 680-89352-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

(680-89352-2)

The initial calibration verification (ICV) for analytical batch 500-183587/13 and 14 was outside control criteria for Benzoic acid, 4-Chloroaniline, 3 & 4 Methylphenol, and Phenol. The affected samples were non detects for these analytes. The data have been qualified and reported.DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01 (680-89352-2)

The continuing calibration verifications (CCV's) for Aramite associated with batches 500-183989/5 and 184148/4 recovered above the upper control limit. The samples associated with these CCV's were non-detects for the affected analytes; therefore, the data have been reported. DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01 (680-89352-2)

Internal standard (ISTD) responses for some CCV's were outside of acceptance limits: DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01 (680-89352-2). The affected samples were not re-analyzed due to CCV recoveries meeting control limits.

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

CHLORINATED PESTICIDES

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for chlorinated pesticides in accordance with EPA SW-846 Method 8081A. The samples were prepared and analyzed on 04/18/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The laboratory control sample (LCS) for batch 183366 exceeded control limits for the following analytes: Hepatachlor. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01 (680-89352-2)

The continuing calibration verification (CCV) for Heptachlor associated with batch 183459 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported. DDMW-3-20130415-01 (680-89352-1), DDMW-4-20130415-01 (680-89352-2)

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 04/18/2013 and analyzed on 04/19/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

No difficulties were encountered during the PCBs analyses.

All quality control parameters were within the acceptance limits.

ORGANOPHOSPHORUS PESTICIDES

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for organophosphorus pesticides in accordance with EPA SW-846 Method 8141A. The samples were prepared on 04/18/2013 and analyzed on 04/22/2013.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for batch 640-101150 exceeded control limits for

Job ID: 680-89352-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

the following analyte: epn. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

The laboratory control sample and the laboratory control sample duplicate (LCS/LCSD) for batch 640-101150 exceeded control limits for the following analyte(s): dichlorvos, demeton-o. dichlorvos, demeton-o has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Only batch precision exceeded control limits for dichlorvos. These results have been reported and qualified.

No other difficulties were encountered during the pesticides analyses.

All other quality control parameters were within the acceptance limits.

METALS (ICPMS)

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for Metals (ICPMS) in accordance with EPA SW-846 Method 6020A. The samples were prepared on 04/18/2013 and 04/22/2013 and analyzed on 04/21/2013 and 04/25/2013.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for barium, magnesium and antimony in batch 273513 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Due to the high concentration of calcium, sodium and strontium, the matrix spike / matrix spike duplicate (MS/MSD) for batch 273513 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 680-273985 were outside control limits for silver. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 7196A. The samples were analyzed on 04/16/2013.

Sample DDMW-4-20130415-01 (680-89352-2)[5X] required dilution prior to analysis due to the nature of the sample matrix: DDMW-4-20130415-01 (680-89352-2). Elevated reporting limits (RLs) are provided.

No difficulties were encountered during the hexavalent chromium analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/16/2013 and analyzed on 04/17/2013.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

TOTAL CYANIDE

Samples DDMW-3-20130415-01 (680-89352-1) and DDMW-4-20130415-01 (680-89352-2) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 04/19/2013.

No difficulties were encountered during the cyanide analyses.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate is outside control limits
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
*	RPD of the LCS and LCSD exceeds the control limits
H	Sample was prepped or analyzed beyond the specified holding time
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	RPD of the LCS and LCSD exceeds the control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Stabilizing Criteria[e]	+/- 1°C	+/- 3%	+/- 10% (see note below)[g]	+/- 0.1 unit	+/- 10 mV (see note below)[h]	<10 NTUs OR +/- 10%	(see note below)[d]	(see note below)[f]	T.D. =

(a) - Do not measure depth to bottom of well until after purging and sampling to reduce resuspending fines that may be resting on the well bottom
(b) - Purge rate to be 0.5 lpm or less
(c) - Sampling rate to be 0.25 lpm or less
(d) - Field parameter measurements to be recorded every 3 to 5 minutes
(e) - Stabilization criteria based on three most recent consecutive measurements
(f) - Monitor DTW every 5 min. Well drawdown to be 0.3 ft or less since initial reading. Purge/sampling rate to be lowered as necessary to keep drawdown below 0.3 ft before switching to three well volume method
(g) - DO is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure
(h) - ORP is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.

* d = well diameter (inches); h = length of water column (feet)

PARAMETERS ARE STABLE, WELL CAN BE SAMPLED									
Stabilizing Criteria[e]	+/- ✓ 1°C	21.7 +/- ✓ 3%	+/- 10% (see note below)[g]	+/- ✓ 0.1 unit	+/- 10 mV (see note below)[h]	<10 NTUs OR +/- 10% ✓	(see note below)[d] ✓	(see note below)[f] ✓	

(a) - Do not measure depth to bottom of well until after purging and sampling to reduce resuspending fines that may be resting on the well bottom

(b) - Purge rate to be 0.5 lpm or less

(c) - Sampling rate to be 0.25 lpm or less

(d) - Field parameter measurements to be recorded every 3 to 5 minutes

(e) - Stabilization criteria based on three most recent consecutive measurements

(f) - Monitor DTW every 5 min. Well drawdown to be 0.3 ft or less since ititial reading. Purge/sampling rate to be lowered as necessary to keep drawdown below 0.3 ft before switching to three well volume method

(g) - DO is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure

(h) - ORP is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.

* d = well diameter (inches); h = length of water column (feet)

MW-102-20180222-01

1210

Product Name: Low-Flow System

Date: 2018-02-22 12:37:21

Project Information:		Pump Information:	
Operator Name	Hannah Beaugh	Pump Model/Type	Alexis Peristaltic
Company Name	ERM	Tubing Type	LDPE
Project Name	AGL Macon GW	Tubing Diameter	0.17 in
Site Name	AGL - Macon	Tubing Length	28 ft
Latitude	0º 0' 0"		
Longitude	0º 0' 0"		
Sonde SN	513028		
Turbidity Make/Model	LaMotte 2020we	Pump placement from TOC	18 ft

Well Information:		Pumping Information:	
Well ID	MW-103	Final Pumping Rate	100 mL/min
Well diameter	2 in	Total System Volume	0.2149758 L
Well Total Depth	20 ft	Calculated Sample Rate	300 sec
Screen Length	10 ft	Stabilization Drawdown	0.96 in
Depth to Water	15.23 ft	Total Volume Pumped	6.5 L

Low-Flow Sampling Stabilization Summary

	Time	Elapsed	Temp C	pH	SpCond µS/cm	Turb NTU	DTW ft	RDO mg/L	ORP mV
Stabilization			+/- 1	+/- 0.1	+/- 3%	+/- 10		+/- 10%	+/- 100

PARAMETERS ARE STABLE, WELL CAN BE SAMPLED									
Stabilizing Criteria[e]	+/- 1°C ✓	17.7 +/- 3% ✓	+/- 10% (see note below)[g]	+/- 0.1 unit ✓	+/- 10 mV (see note below)[h] ✓	<10 NTUs OR +/- 10% ✓	(see note below)[d]	(see note below)[f] ✓	

(a) - Do not measure depth to bottom of well until after purging and sampling to reduce resuspending fines that may be resting on the well bottom
(b) - Purge rate to be 0.5 lpm or less
(c) - Sampling rate to be 0.25 lpm or less
(d) - Field parameter measurements to be recorded every 3 to 5 minutes
(e) - Stabilization criteria based on three most recent consecutive measurements
(f) - Monitor DTW every 5 min. Well drawdown to be 0.3 ft or less since ititial reading. Purge/sampling rate to be lowered as necessary to keep drawdown below 0.3 ft before switching to three well volume method
(g) - DO is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure
(h) - ORP is not a stabilization criterion for the "Groundwater sampling" SESD Standard Operating Procedure.

* d = well diameter (inches); h = length of water column (feet)

Product Name: Low-Flow System

Date: 2018-02-22 09:47:00

Project Information:		Pump Information:	
Operator Name	Markevious Thomas	Pump Model/Type	Alexis Peristaltic
Company Name	ERM	Tubing Type	LDPE
Project Name	AGL Macon GW	Tubing Diameter	.17 in
Site Name	AGL - Macon	Tubing Length	50 ft
Latitude	0º 0' 0"		
Longitude	0º 0' 0"		
Sonde SN	463072		
Turbidity Make/Model	LaMotte 2020we	Pump placement from TOC	40 ft

Well Information:		Pumping Information:	
Well ID	MW-207**D**	Final Pumping Rate	100 mL/min
Well diameter	4 in	Total System Volume	0.3131711 L
Well Total Depth	46.5 ft	Calculated Sample Rate	300 sec
Screen Length	12.5 ft	Stabilization Drawdown	3.6 in
Depth to Water	6.91 ft	Total Volume Pumped	3.5 L

Low-Flow Sampling Stabilization Summary
