H&P Project: AG052511-10
Client Project: Winter - Fashion Care

Dear Mr. Jim Fineis:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 25-May-11 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody

Unless otherwise noted, all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Janis Villarreal
Laboratory Director

Notes and Definitions

QL-1H	The LCS and/or LCSD recoveries fell above the established control specifications for this analyte. Any result for this compound is qualified and should be considered baised high.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Laboratory in conformance with the Environmental Laboratory Accreditation Program (CA) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste for the following methods:

Certificate# 2741, 2743, 2579, 2754 & 2740 approved for EPA 8260 and LUFT GC/MS
Certificate# 2742, 2745, & 2741 approved for LUFT
Certificate# 2745 & 2742 approved for EPA 418.1

H&P Mobile Geochemistry, Inc. is approved as an Environmental Laboratory in conformance with the National Environmental Accreditation Conference Standards for the category Environmental Analysis Air and Emissions for the following analytes and methods:

1,2,4-Trichlorobenzene by EPA TO-15 & TO-14A
Hexachlorobutadiene by EPA TO-15 & TO-14A
1,2,4-Trimethylbenzene by EPA TO -14A
1,2-Dichlorobenzene by EPA TO-15 & TO-14A
1,3,5-Trimethylbenzene by EPA TO -14A
1,4-Dichlorobenzene by EPA TO-15 & TO-14A
Benzene by EPA TO-15 & TO-14A
Chlorobenzene by EPA TO-15 & TO-14A
Ethyl benzene by EPA TO-15 & TO-14A
Styrene by EPA TO-15 & TO-14A
Toluene by EPA TO-15 & TO-14A
Total Xylenes by EPA TO-15 & TO-14A
1,1,1-Trichloroethane by EPA TO-15 & TO-14A
1,1,2,2-Tetrachloroethane by EPA TO-15 & TO-14A
1,1,2-Trichloroethane by EPA TO-15 & TO-14A
1,1-Dichloroethane by EPA TO-15 & TO-14A
1,1-Dichloroethene by EPA TO-15 & TO-14A
1,2-Dichloroethane by EPA TO-15 & TO-14A
1,2-Dichloropropane by EPA TO-15 & TO-14A
Bromoform by EPA TO-15
Bromomethane by EPA TO-15 & TO-14A
Carbon tetrachloride by EPA TO-15 & TO-14A
Chloroethane by EPA TO-15
Chloroform by EPA TO-15 & TO-14A
Chloromethane by EPA TO-15 & TO-14A
cis-1,2-Dichloroethene by EPA TO-15
cis-1,2-Dichloropropene by EPA TO-15 & TO-14A
Methylene chloride by EPA TO -15 & TO-14A
Tetrachloroethane by EPA TO-15 & TO-14A
trans-1,2-Dichloroethene by EPA TO-15
trans-1,2-Dichloropropene by EPA TO-15 & TO-14A
Trichloroethene by EPA TO-15 & TO-14A
Vinyl chloride by EPA TO -15 & TO-14A
2-Butanone by EPA TO-15
4-Methyl-2-Pentanone by EPA TO-15
Hexane by EPA TO-15
Methyl tert-butyl ether by EPA TO-15
Vinyl acetate by EPA TO-15

This certification applies to samples analyzed in summa canisters.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 11/21/2014 9:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Air - GC/MS VOA
Method(s) TO 14A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted.

Detection Summary

Client: Woodard & Curran Inc
Project/Site: Fashion Care - 226203.00

TestAmerica Job ID: 140-2355-1

Client Sample ID: SV-1 — Lab Sample ID: 140-2355-1

No Detections.

Client Sample ID: SV-2 — Lab Sample ID: 140-2355-2

No Detections.

Client Sample ID: SV-3 — Lab Sample ID: 140-2355-3

No Detections.

This Detection Summary does not include radiochemical test results.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	N/A	This is checked in the lab.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	N/A	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

Subject: Injection Summary
Fashion Care Cleaners
2211 Savoy Drive
Chamblee, Dekalb County, Georgia

Site Description:

The site is an active dry cleaners that has had multiple releases of tetrachloroethene (PCE) into the soil and groundwater. In addition, a BTEX plume from a release at the gas station next door has migrated onto this site and co-mingled with the PCE plume. We treated an area of approximately 2,800 square feet that covered both inside and outside of the building to treat around the source area. The purpose of this treatment was to lower detectable PCE in the soil.

Injection Well Installation:

Prior to the installation of the injection wells, **Exo Tech** contacted the Utility Protection Center (UPC) to locate the utilities outside of the building. Since we were not sure what was underneath the building, all of the wells inside of the building were hand augered by **Exo Tech**. A total of -7- one inch injection wells were installed outside of the building and a total of -14- one inch injection wells were installed inside of the building. These wells were installed to a depth of 12 feet below ground surface (bgs). In addition, -3- shallow injection wells were installed inside the building to better cover the source area. These wells were installed to 2 feet bgs in order to treat the soil just underneath the slab. See attached map for numbering and placement of wells. All of the injection wells were constructed in a similar fashion. See attached diagrams for injection well construction details.

Injection summary:

See attached Table 1 for the injection summary.

The injections went well as there was only one occurrence of minimal daylighting (IW-5) and no prolonged injection times at any of the wells.

EXO TECH, INC.
Chemical Oxidation and Environmental Remediation

Office: 770-564-1444/Fax: 770-923-1166

Treatment Summary:

Injection dates:	3/18/09 - 3/19/09
Total number of wells injected into:	24
Total weight of Persulfate injected:	4,840 lbs.
Total weight of Chelated Iron injected:	66 lbs.
Total volume of solution injected:	2,200 gals.

Recommendations:

Exo Tech recommends the collection of confirmatory groundwater samples approximately 30-60 days following the last date of injection (2/26/2009).

Please contact us if you have questions or need further information. Thank you for the opportunity to serve your need on this project.

Sincerely,

Brett Ellington
Chemical Engineer

WINTER ENVIRONMENTAL

September 10, 2009

Mr. Jason Metzger
Compliance Officer – Environmental Engineer
Georgia Environmental Protection Division
Hazardous Sites Response Program
2 Martin Luther King, Jr. Drive, SE
Atlanta, GA 30334

Subject: Project Status Update - Fashion Care/Executive Care Site, HSI No. 10786
2211 Savoy Drive, Chamblee, DeKalb County, Georgia
Winter Environmental Project No. 08096

Dear Mr. Metzger:

This correspondence is to update the Georgia Environmental Protection Division (EPD) Hazardous Sites Response (HSRA) Program on the progress of corrective action and additional assessment efforts conducted at the Fashion Care/Executive Care HSRA Site (the Site) by the John F. Rowan, Sr. Item IV Trust (the Trust). In addition, a list of tasks to be executed and a corresponding updated schedule for these tasks is also included.

Prior to Winter Environmental's involvement, several phases of soil investigation had been conducted at the Site by Epic Consulting, Inc. of Atlanta, Georgia (Epic). The Epic soil investigations were conducted in August 2006 and April 2007. The focus of Epic's investigations was to define the extent of HSRA regulated chemicals in soil above non-residential risk reduction standards (RRS) at the Site. Petroleum constituents associated with historical releases from the adjacent Former E-Z Serve Underground Storage Tank (UST) site (UST Facility I.D. No. 900341*1) were also identified in soil and groundwater on the Site above applicable Georgia UST Program Threshold Levels. Investigation and remediation of the adjacent release of petroleum is being conducted separately by the UST Program through the GUST Trust Fund.

On May 31, 2007, Epic submitted a Revised Corrective Action Plan (CAP) to the HSRA Program, proposing *in situ* chemical oxidation of chlorinated solvent impacted soil at the Fashion Care Site. This revised CAP was approved by the HSRA Program in correspondence dated December 28, 2007 with a number of conditions (the CAP Approval Letter). Primary among these was the recommendation by the HSRA Program that a remediation process be utilized that would address both impacted soil and groundwater at the Site, and a reminder that chlorinated solvent groundwater impacts had neither been delineated nor addressed in the May 31, 2007 Revised CAP.

REVISED REMEDIATION STRATEGY

The Trust placed Winter Environmental under contract to move forward with implementation of the CAP, with a focus on addressing both soil and groundwater impacts at the Site. The remedial method

main: 404.588.3300
fax: 404.223.6251
3350 Green Pointe Parkway
Suite 200
Norcross, Georgia 30092
www.winter-environmental.com

proposed for soil in the approved CAP has continued to be the remedial method of choice. However, the groundwater impacts identified at the Site to date indicate that other remedial methods should be examined for this media.

The current remediation strategy is to address the soil/source material first. After the source for the groundwater impacts has been attenuated, a method for addressing the remaining dissolved phase constituents will be determined and implemented with the approval of the EPD. Wherever possible and practicable, methods will be chosen for continued soil/source material remediation that will also begin to reduce the groundwater impacts.

SUMMARY OF ADDITIONAL ASSESSMENTS CONDUCTED TO SINCE EPIC-APRIL 2007

Winter Environmental has conducted two additional assessment sampling events since the April 2007 Epic assessment, in September 2008 and December 2008. The scope and findings of the assessments are discussed below.

September 2008 Assessment

In September 2008, Winter Environmental conducted additional fieldwork to delineate the extent of dissolved phase constituents in groundwater, collect soil samples at two specific locations requested by the EPD in its CAP Approval Letter, and collect surface water samples from the adjacent downgradient stream.

Six shallow monitoring wells (FMW-1 through FMW-6) were installed and sampled, and one monitoring well (SB-26) previously installed by Epic inside the drycleaner was sampled. Six existing monitoring wells (MW-2R, MW-9R, MW-11 MW-13, MW-14 and MW-23D) previously installed in connection with the investigation of the adjacent Former E-Z Serve UST site were also sampled. These monitoring wells are shown on Figure 1, in Attachment A. All samples were analyzed for volatile organic compounds (VOCs). Groundwater samples were also collected from FMW-1 through FMW-6 to establish general aquifer chemistry baseline conditions prior to conducting soil/source material remediation. Three surface water samples were also collected for VOCs and water chemistry analysis from the stream downgradient on the adjacent properties at three locations (SW-1 through SW-3) as shown on Figure 1.

As requested in EPD's CAP Approval Letter, soil samples were also collected from 0.0 to 2.0 feet inside the building, beneath the slab, where the previous drycleaning machine was once located (SB-27), and from three sample intervals to the top of the water table just outside the south corner of the building at sample location FMW-4. The soil samples were analyzed for VOCs. A sample was also collected from SB-27, the area of highest impacts, for a bench treatability analysis for chemical oxidation remediation of the soil/source material using sodium persulfate. The soil sample locations are shown on Figure 1.

The groundwater analytical results from the September 2008 sampling event are presented in Table 1, in Attachment B. Also presented in Table 1 are the analytical results from groundwater sampling conducted by Stantec, the EPD UST Program assessment contractor, in June 2008, as part of the Former E-Z Serve UST site assessment. This data was provided to Winter Environmental by Stantec as part of an effort to share information, to better understand the impact of petroleum releases from the former E-Z Serve on the Site. As shown on Figure 1, using tetrachloroethene (PCE) as an indicator parameter, horizontal delineation was not achieved downgradient to the south, and side-gradient to the west and northwest during this sampling event. Vertical delineation also was not achieved. The sample collected

from the existing deep well, MW-23D, screened at the top of bedrock from 50 to 55 feet below ground surface, contained drycleaning constituents above non-residential RRS. Groundwater and surface water general aquifer chemistry baseline data acquired from the sampling event are presented in Table 2.

Surface water analytical results are presented on Table 1. No VOCs were detected in surface water downgradient of the Site.

Soil sample results for the Epic investigations and the samples collected in September 2008 are presented in Table 3. VOCs in soil samples collected from FMW-4, outside the south corner of the building, were all below non-residential RRS. The shallow soil sample collected from the area of the former drycleaning machine at SB-27 contained PCE at 18.0 mg/kg, above non-residential RRS as expected and comparable to soil concentrations identified by Epic. Based upon the Epic and Winter Environmental data, Winter Environmental consulted with EPD, and proceeded with the remediation of this media. Figure 1 shows the area of soil above non-residential RRS using PCE as an indicator parameter.

A complete round of water table elevation measurements were collected from all the monitoring wells across the Fashion Care and EZ-Serve sites. The water table elevation measurements are presented in Table 4. Based on this data, groundwater flows from the northeast to the south-southwest across both properties. The September 2008 water table data, presented on Figure 2, however, showed an unusual mounding of groundwater beneath the drycleaner. Monitoring wells in the area were measured again and confirmed this anomaly. The extended distribution of dissolved phase impacts discovered, in conjunction with the mounding water table beneath the building, indicated a source of infiltrating water. The potable water line for the facility runs from North Peachtree Road into the back of the building and was suspected to have a leak based upon the data. The water line was pressure tested and was found to be tight.

December 2008 Assessment

In December 2008, Winter Environmental conducted additional fieldwork to delineate the extent of dissolved phase constituents in groundwater to the south, west and northwest. Five additional shallow monitoring wells were installed (FWM-7 through FMW-11). As shown on Figure 3 and in Table 1, horizontal delineation was achieved to the northwest and west; however, it was not achieved to the southwest and southeast. Additional delineation is anticipated in these directions with the addition of three shallow monitoring wells, and vertically with the installation of a downgradient, Type III, bedrock monitoring well.

Another complete round of water table elevation measurements were collected from all the monitoring wells across the Fashion Care and EZ-Serve sites. The water table elevation measurements are presented in Table 4. As in September 2008, groundwater flow was from the northeast to the south-southwest across both properties, as shown on Figure 4. The data continued to confirm the presence of the unusual mounding of groundwater beneath the drycleaner and a source of the mounding water and broad distribution of dissolved constituents continued to be sought.

Further Inspection of the drycleaning facility revealed a 4 foot by 4 foot by 6 to 8 foot deep concrete sump inside the rear of the drycleaner covered by a metal plate. The sump was within the area of groundwater mounding and received the wastewater discharge from all sinks, washing machines and various piping within the drycleaning facility, except the bathroom. The sump acts as a sediment trap

prior to the wastewater discharging to the sanitary sewer system behind the building. The sump smelled of drycleaning fluid and a water sample was collected from the sump for analysis of PCE and TCE. Laboratory analysis of the sample confirmed the presence of PCE at a concentration of 0.701 mg/L and TCE at 0.0108 mg/L, indicating that dry cleaning solvent-impacted water was being discharged to the sump. The laboratory report for the sump sample is in Attachment C.

A leak test of the sump concluded that the sump was leaking, confirming that the leaking sump was a source of the groundwater mounding beneath the building. The Trust had a contractor reseal the sump by relining the bottom and sides up to the point of discharge with new concrete prior to it being returned to service.

Further investigation of the current dry cleaner's waste disposal practices indicated that the required waste disposal records and operational compliance documents were not being properly maintained on site. In addition, the PCE waste fluid evaporator system associated with the drycleaning machine was not operating and appeared to have not been operational for some time although it was filled with PCE waste fluid. At the time of the inspection, several open containers of liquid PCE waste materials were also present inside the facility. The drycleaner was ordered to properly record future disposal of any drycleaning waste generated, repair the PCE waste fluid evaporator system and to take steps to replace the PCE-based drycleaning machine with a non-PCE fluid drycleaning machine. The PCE-based drycleaning machine was replaced with a non-PCE fluid drycleaning machine in May 2009.

SOIL/SOURCE MATERIAL REMEDIATION

Following the completion of the treatability study, the design for the soil/source material chemical oxidation remediation was finalized. The treatability study report prepared by ExoTech, Inc. of Lilburn, Georgia is included as Attachment D. An Underground Injection Permit was obtained from the EPD; UIC Permit #393. A copy of the permit is included as Attachment E. A total of 21 soil injection wells were installed in and around the area to be treated using sodium persulfate. The location of the injection wells relative to the impacted soil area is shown on Figure 5. The injection event was conducted on March 18 and March 19, 2009, injecting 4,480 lbs of sodium persulfate activated with 66 lbs of chelated iron, using 2,200 gallons of mixture. Attachment F is an Injection Summary report prepared by ExoTech, Inc.

On May 8, 2009 and May 18, 2009, soil remediation confirmation samples were collected following the soil chemical injection event. Soil samples were collected from nine sample locations, SB-28 through SB-36, as requested by the EPD. The boring locations are shown on Figure 6. Samples were collected from three intervals from each boring using DPT or hand-driven methods; 0 to 2 feet bgs, approximately midway to the water table, and from the approximate two foot interval immediately above the water table. The confirmation soil sample laboratory results are presented in Table 5. The post-chemical oxidation sample results showed concentrations with little or no reduction, and some cases significantly higher concentrations of constituents than the pre-remediation design concentrations. Previously, the highest concentration of PCE in soil, 18.0 mg/kg, was in SB-27 at 0 to 2 feet bgs, immediately beneath the historical source, the old PCE drycleaner machine. PCE concentrations in the post-remediation samples were higher on average at all locations than seen in the 2006 and 2007 Epic data, with concentrations up to 3,800 mg/kg at SB-32, 6 to 8 feet bgs. TCE and cis-1,2-dichloroethene were also found above non-residential RRS at higher concentrations than had been seen in previous soil samples collected at the Site. Non-residential RRS exceedances of one or more of these constituents were found

in all but one of the confirmation sample locations, SB-29. These higher concentrations appear to be the result of the continued release of hazardous substances by the current drycleaning operator. Further releases have been prevented by the removal of the PCE drycleaning equipment from the Site.

PROPOSED NEXT STEPS

The following is a list of the various tasks to be conducted in chronological order based upon the information presented above. The list is not intended to be inclusive of all activities to be conducted to bring the Fashion Care Site into compliance with HSRA RRS.

1. Determine if additional soil sampling is needed to supplement the soil confirmation data, to evaluate the proper next step for soil remediation.
2. Collection of sample(s) for a new laboratory treatability study with the higher contaminant concentrations to evaluate requirements for additional chemical oxidation.
3. Evaluate other remedial methods for soil impacts at the Site, to determine if chemical oxidation remains the most effective and economically feasible method of soil remediation.
4. Another round of surface water samples will be collected and analyzed for VOCs. This will be done to ensure that there are no current impacts to the downgradient stream on the adjacent property. The stream is the most likely point of exposure and the receptor for impacted groundwater from the Site.
5. Additional groundwater delineation will be conducted to the southwest and southeast with the installation of three additional shallow monitoring wells, and vertically with the installation of a downgradient, Type III, bedrock monitoring well.

Winter Environmental will verbally communicate with the EPD and submit a project update to the EPD following the completion of Steps 1 through 4 above. The schedule for additional groundwater delineation, Step 5, is currently anticipated to occur as part of the evaluation of groundwater remedial options following completion of the soil remediation, unless surface water sampling indicates the downgradient stream has been impacted. A revised, estimated project schedule is included as Attachment G.

Based upon the data presented in this project update the current drycleaners should also be considered a responsible party at the Site. The Trust is actively seeking participation of the current drycleaner and other responsible parties to bring the Site into compliance with HSRA RRS. We request that the EPD contact the current drycleaner to require its participation in the ongoing work at the Site. The contact information for the current drycleaner is:

Moon Ho Kwak
2211A Savoy Drive
Chamblee, Georgia 30341

In addition, EPD contacted several of the former dry cleaning operators in 2006, requesting submittal of a CSR or CAP for the Site. The Trust has also made efforts to contact and demand the participation of these parties. To date, however, none of these former dry cleaning parties has agreed to participate in the ongoing investigation and corrective action at the Site. We request that EPD again contact these parties to demand their participation in the ongoing work, and if necessary, place these individuals and businesses under an Administrative Order compelling their participation. Identification and contact information for the parties we have thus far been able to identify and locate is provided as Attachment H.

The laboratory data sheets for the data collected to date by Winter Environmental and the data provided to Winter Environmental by Stantec, contractor for the EPD UST Program, is included on CD as Attachment C.

Winter Environmental will proceed with the tasks outlined above on behalf of the Trust, and will continue to provide periodic updates to you as the project proceeds. Please contact me with any questions or comments you may have at (404) 965-3348, or by email at Ldiprima@winter-environmental.com.

Sincerely,

Leonard J. Diprima, Jr., P.G.
Senior Consultant

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 312101. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 312101 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Recipient of the Prestigious Small Business Administration Award of Excellence in 1994.
Certified and approved by numerous States and Agencies.
A Small Business and Minority Status Company that delivers SERVICE and QUALITY
Houston - Dallas - San Antonio - Austin - Tampa - Miami - Atlanta - Corpus Christi - Latin America

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL(PQL) and above the SQL(MDL).

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

* Outside XENCO'S scope of NELAC Accreditation

Fashion Care
Project Address: GA

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 312032. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 312032 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Recipient of the Prestigious Small Business Administration Award of Excellence in 1994.
Certified and approved by numerous States and Agencies.
A Small Business and Minority Status Company that delivers SERVICE and QUALITY

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL(PQL) and above the SQL(MDL).

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

* Outside XENCO'S scope of NELAC Accreditation

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 311894. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 311894 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Recipient of the Prestigious Small Business Administration Award of Excellence in 1994.
Certified and approved by numerous States and Agencies.

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL(PQL) and above the SQL(MDL).

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

Project Address: GA

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 312130. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 312130 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL(PQL) and above the SQL(MDL).

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

* Outside XENCO'S scope of NELAC Accreditation

Sample Receipt Checklist

#1	Temperature of cooler?			2	°C
#2	Shipping container in good condition?	YES	No	None	
#3	Samples received on ice?	YES	No	N/A	Blue/Water
#4	Custody Seals intact on shipping container/ cooler?	Yes	No	N/A	
#5	Custody Seals intact on sample bottles/ container?	Yes	No	N/A	
#6	Chain of Custody present?	YES	No		
#7	Sample instructions complete of Chain of Custody?	YES	No		
#8	Any missing/extra samples?	Yes	NO		
#9	Chain of Custody signed when relinquished/ received?	YES	No		
#10	Chain of Custody agrees with sample label(s)?	YES	No		
#11	Container label(s) legible and intact?	YES	No		
#12	Sample matrix/ properties agree with Chain of Custody?	YES	No		
#13	Samples in proper container/ bottle?	YES	No		
#14	Samples properly preserved?	YES	No	N/A	
#15	Sample container(s) intact?	YES	No		
#16	Sufficient sample amount for indicated test(s)?	YES	No		
#17	All samples received within sufficient hold time?	YES	No		
#18	Subcontract of sample(s)?	Yes	NO		
#19	VOC samples have zero headspace?	YES	No	N/A

Project Address: GA

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 319251. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 319251 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 319343. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 319343 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Project Name: ***Fashion Care***

Project ID:	*08096*	*Report Date:*	*17-DEC-08*
Work Order Number:	*319343*	*Date Received:*	*03-DEC-08*

Project Manager's Notations:

1) The Inorganic Anions by EPA 300 analysis was performed by Xenco Laboratories - Houston facility.

David C. Fuller
Project Manager

Winter Environmental, Norcross, GA

Fashion Care

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

RE: N. Peachtree GUST EZ Serve 8102

Order No.: 0806534

Dear Trina Barron:

Analytical Environmental Services, Inc. received 32 samples on 6/9/2008 12:50:00 PM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
-AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 94 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Justin Sasser
Project Manager
Revision: Per Client request, VOC select list has been updated

Lab Order: 0806534

CASE NARRATIVE

Three sets of Trip Blanks were provided. Trip Blanks were logged in as Trip Blank 1, Trip Blank 2, and Trip Blank 3 and analyzed at no cost to the client.

Volatile Organic Compounds Analysis by Method 8260B:

Benzene and Toluene values for the QC samples 0806534-024AMS/MSD are "E" qualified indicating estimated values over linear calibration range due to the level of target analyte present in the unspiked sample.

Tetrachloroethene and Trichloroethene values for sample 0806534-011A are "E" qualified indicating estimated values over linear calibration range. Sample was not diluted and reanalyzed due to analytes not being evaluated at the time of analysis

Acetone and 2-Butanone values for sample 0806534-024A are "E" qualified indicating estimated values over linear calibration range. Sample was not diluted and reanalyzed due to analytes not being evaluated at the time of analysis

cis-1,2-Dichloroethene value for sample 0806534-028A is "E" qualified indicating an estimated value over linear calibration range. Sample was not diluted further and reanalyzed due to analyte not being evaluated at the time of analysis

The reporting limit for Tetrachloroethene on samples 0806534-019A (13 µg/L), -020A (9 µg/L), and -025A (6 µg/L) are elevated due to contamination and analyte not being evaluated at the time of analysis.

Semivolatile Organic Compounds Analysis by Method 8270C:

LCS-100447 recovery for Acenaphthylene was outside control limits biased high. Target analyte was not detected in the analytical samples and data is reportable with high bias.

Project Address: Georgia

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 323304. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 323304 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Recipient of the Prestigious Small Business Administration Award of Excellence in 1994.
Certified and approved by numerous States and Agencies.

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

***** Outside XENCO's scope of NELAC Accreditation.

*** Poor recoveries due to dilution

Surrogate Recovery [D] = 100 * A / B

All results are based on MDL and validated for QC purposes.

Form 2 - Surrogate Recoveries

Project Name: Fashion Care Chamblee

Work Orders : 323304, **Project ID:** 08096

Lab Batch #: 747668 **Sample:** 523669-1-BKS / BKS **Batch:** 1 **Matrix:** Water

Units: ug/L

Select VOCs by SW-846 8260B Analytes	SURROGATE RECOVERY STUDY Amount Found [A]	True Amount [B]	Recovery %R [D]	Control Limits %R	Flags
1,2-Dichloroethane-D4	50.65	50.00	101	53-159	
4-Bromofluorobenzene	49.42	50.00	99	30-186	
Toluene-D8	49.58	50.00	99	70-130	

Lab Batch #: 747668 **Sample:** 523669-1-BLK / BLK **Batch:** 1 **Matrix:** Water

Units: ug/L

Select VOCs by SW-846 8260B Analytes	SURROGATE RECOVERY STUDY Amount Found [A]	True Amount [B]	Recovery %R [D]	Control Limits %R	Flags
1,2-Dichloroethane-D4	50.75	50.00	102	53-159	
4-Bromofluorobenzene	50.25	50.00	101	30-186	
Toluene-D8	49.34	50.00	99	70-130	

** Surrogates outside limits; data and surrogates confirmed by reanalysis

*** Poor recoveries due to dilution

Surrogate Recovery [D] = 100 * A / B

All results are based on MDL and validated for QC purposes.

Blank Spike Recovery

Project Name: Fashion Care Chamblee

Work Order #: 323304 **Project ID:** 08096

Lab Batch #: 747668 **Sample:** 523669-1-BKS **Matrix:** Water

Date Analyzed: 01/27/2009 **Date Prepared:** 01/27/2009 **Analyst:** ANI

Reporting Units: ug/L **Batch #:** 1 **BLANK /BLANK SPIKE RECOVERY STUDY**

Project Address: Georgia

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 332267. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 332267 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

BRL Below Reporting Limit.

RL Reporting Limit

***** Outside XENCO's scope of NELAC Accreditation.

Prelogin/Nonconformance Report- Sample Log-In

Client: Winter Env.

Date/ Time: 5/8/09 1650

Lab ID # : 332267

Initials: AH

Sample Receipt Checklist

#1	Temperature of cooler?			4.3 °c	
#2	Shipping container in good condition?	YES	No	None	
#3	Samples received on ice?	YES	No	N/A	Blue/Water
#4	Custody Seals intact on shipping container/ cooler?	Yes	No	N/A	
#5	Custody Seals intact on sample bottles/ container?	Yes	No	N/A	
#6	Chain of Custody present?	YES	No		
#7	Sample instructions complete of Chain of Custody?	YES	No		
#8	Any missing/extra samples?	Yes	NO		
#9	Chain of Custody signed when relinquished/ received?	YES	No		
#10	Chain of Custody agrees with sample label(s)?	YES	No		
#11	Container label(s) legible and intact?	YES	No		
#12	Sample matrix/ properties agree with Chain of Custody?	YES	No		
#13	Samples in proper container/ bottle?	YES	No		
#14	Samples properly preserved?	YES	No	N/A	
#15	Sample container(s) intact?	YES	No		
#16	Sufficient sample amount for indicated test(s)?	YES	No		
#17	All samples received within sufficient hold time?	YES	No		
#18	Subcontract of sample(s)?	Yes	NO		
#19	VOC samples have zero headspace?	YES	No	N/A

Len Diprima:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 333113. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 333113 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

David C. Fuller
Project Manager

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

BRL Below Reporting Limit.

RL Reporting Limit

***** Outside XENCO's scope of NELAC Accreditation.

Norcross, Georgia 30092

Subject: Treatability Study Summary
Fashion Care Cleaners
2211 Savoy Drive
Chamblee, Dekalb County, Georgia

A treatability study was done in order to determine the oxidant mix, volume, and dosing to best suit the site characteristics. In this case, tests with sodium persulfate activated with chelated iron (FeEDTA) were conducted. The oxidant mixes were evaluated based on the following criteria:

- contaminant species
- soil oxidant demand
- total oxidant demand
- contaminant oxidation
- lifetime in the subsurface
- oxidation speed

Samples of soil were taken from MW-1 and a groundwater sample was taken from MW-4 which were thought to be the areas with the highest concentrations of PCE. The soil had levels of PCE at 5,280 ppb, TCE at 13,280 ppb, cis 1,2-DCE at 48,480 ppb and vinyl chloride at 3,200 ppb. The groundwater showed levels of PCE at 5,160 ppb, TCE at 440 ppb, cis 1,2-DCE at 896 ppb and vinyl chloride was non-detect. The samples were treated with a 30% solution by weight of sodium persulfate that was activated with FE EDTA (chelated iron). After two weeks, the levels of the soil decreased to non-detect for PCE, TCE, cis 1,2-DCE and vinyl chloride. The groundwater sample levels went to 651 ppb for PCE, 662 ppb for TCE, 1,250 ppb for cis 1,2-DCE and 5.5 ppb for vinyl chloride. After four weeks of treatment, the levels of PCE, TCE, cis 1,2-DCE and vinyl chloride all went to non-detect in the groundwater sample.

EXOTECH, INC.
Chemical Oxidation and Environmental Remediation

Office: 770-564-1444/Fax: 770-923-1166

Based on the treatability testing, site information and our experience, it was decided to use an oxidant blend that consisted of a 28% solution of sodium persulfate by weight. In the field this would be equivalent to four bags of sodium persulfate per one hundred gallons of water. We would use chelated iron as the activator as it showed to be effective with the samples. Based on our observations during drilling and the well locations, it was further decided to inject 100 gallons of oxidant blend into each well. Parameters would be taken during the injections to make sure that this volume would give us the appropriate radius of influence we needed based on the well spacing.

Please contact us if you have questions or need further information. Thank you for the opportunity to serve your need on this project.

Sincerely,

Brett Ellington
Chemical Engineer

RE: Underground Injection Control Permit #393 for Injection of Sodium Persulfate, Fashion Care/Executive Care Dry Cleaners Site located in Chamblee, Georgia (HSI #10786).

Dear Ms. Kittrell:

Enclosed is Underground Injection Control (UIC) Permit #393 for the Fashion Care/Executive Care Dry Cleaners site located in Chamblee, Georgia. This UIC permit allows Item IV Trust U/W John F. Rowan to utilize injection of sodium persulfate through twenty (20) injection wells to assist with the remediation of soil and ground water contaminated with chlorinated solvents at this site for up to five (5) years. The UIC permit states two (2) standard conditions and seven (7) additional conditions in the attachment.

If you have any questions about the permit, please contact Mr. Bijan Rahbar, UIC Coordinator, at (404) 656-3229.

Sincerely,

Carol A. Couch
Director

INJECTION WELL OPERATING PERMIT

PERMIT NUMBER: #393 **DATE ISSUED: January 23, 2009**

FACILITY DATA: **INJECTION WELL TYPE: CLASS V (type 5X26)**

FACILITY: Fashion Care/Executive Care
Dry Cleaners Site
2211 Savoy Road
Chamblee, Georgia
Dekalb County

OPERATOR: Item IV Trust U/W
John F. Rowan
Ms. Nan Kittrell, Representative
1270 Hestertown Road
Madison, GA 30650

LOCATION: Lat: 33° 55' 08.75"N
Long: 84° 17' 52.83"W

EPD-HSI #10786

In accordance with the provisions of the Georgia Rules for Underground Injection Control, Chapter 391-3-6-.13, as amended 2001, this permit is issued for the operation of the herein described injection system. This permit is effective immediately, unless appealed within thirty (30) days after its issuance and is conditioned upon the following:

1) The Permittee's continued compliance with the Georgia Rules for Underground Injection Control, Chapter 391-3-6-.13, the Georgia Rules for Water Quality Control (Revised) and the Georgia Rules for Safe Drinking Water (Revised); and

2) The Permittee's continued compliance with the Permittee's approved injection operation plan that is part of the approved Corrective Action Plan for this site, along with provisions of officially approved plan amendments, if any.

Additional conditions 1 through 7 are attached hereto.

This permit is issued in accordance with the application and supplemental information received on January 8, 2009. The injection operation plan was approved on January 23, 2009, and is based on the statements and supporting data entered herein or attached thereto, all of which are filed with the Environmental Protection Division of the Georgia Department of Natural Resources and hereby made a part of this permit.

This permit is subject to revocation for noncompliance with aforementioned conditions.
This permit expires on **January 23, 2014,** unless previously terminated.

Carol A. Couch, Director, Environmental Protection Division
Georgia Department of Natural Resources

Additional Conditions, UIC Permit #393, January 23, 2009, cont.

INJECTION WELL OPERATING PERMIT
ADDITIONAL CONDITIONS

1. Permit Conditions.

   a. This permit is not transferable until any new operator shall agree in writing to all permit conditions. Any new operator also shall provide the Environmental Protection Division (Division) with appropriate documentation that they have adequate financial assurances to plug all existing Class V wells.

   b. If Item IV Trust U/W John F. Rowan (Operator) wishes to continue an activity regulated by this permit after the expiration of the permit, the Operator must apply for and obtain a new permit.

   c. The Operator shall report any instances of noncompliance with permit conditions to the Division in writing within five (5) working days of such noncompliance, and shall take all reasonable steps to minimize the impact on the environment resulting from noncompliance with this permit and the Georgia Rules for Underground Injection Control.

   d. The Operator shall notify the Division of any proposed changes to the performance of the sodium persulfate injection system in writing at least thirty (30) days prior to the change.

   e. All reports submitted to the Division shall be signed and stamped by a Georgia Registered Professional Engineer or Professional Geologist.

   f. All analyses shall be performed by a laboratory approved or accredited by EPD in accordance with the Georgia Rules for Commercial Laboratory Accreditation, Chapter 391-3-26.

2. System Parameters.

   a. This permit is issued to the Operator for the purpose of operating a sodium persulfate injection system at the above referenced site to aid in remediation of soil and ground water contaminated with chlorinated solvents.

   b. Number of Class V injection wells: twenty.

   c. Injected fluid: sodium persulfate.

   d. Maximum injection volume per well: 100 gallons of liquid/day (gpd)/well.
   Maximum total system injection volume: 2,000 gpd.

   e. Maximum daily average injection pressure (at well head): gravity.

Additional Conditions, UIC Permit #393, January 23, 2009, cont.

3. Monitoring and Reporting Requirements.

   a. The Operator shall report to the Underground Injection Control Program of the Division the number and exact location of all Class V injection wells it installs or plugs on a quarterly basis. The reports are to be submitted to the UIC Program in accordance with the reporting schedule stipulated by the Hazardous Waste Management Branch.

   b. The Operator shall submit to the Division for its approval, a detailed schematic diagram and location map on any Class V injection well that is different in construction from the specifications contained in the UIC permit application, no later than 45 days prior to installation of the injection well. The Operator cannot install such a well until it receives approval from the Division.

   c. The Operator shall submit to the UIC Program one (1) copy of any report regarding this site that the Operator is required to submit to the Hazardous Waste Management Branch.

   d. The Operator shall submit to the UIC Program an annual report that will contain the following information.

      1. Status of the injection system operation;

      2. Results of any ground-water sampling and analyses;

      3. Results of any soil sampling and analyses;

      4. An evaluation of the plume movement through the ground water, if any;

      5. Comparisons of analyses to determine any changes in pollutant concentrations.

   The annual reports will be provided to the UIC Program in accordance with the schedule stipulated by the Hazardous Waste Management Branch.

4. Emergency Situations.

   a. The Operator is to immediately notify the Division of any emergency situation that affects the injection system and describe the remedial activity that the Operator is utilizing to correct the situation.

   b. The Operator is to immediately notify the Division when the emergency situation ceases to exist.

5. The Operator shall grant the Division permission to enter the facility property to conduct inspections of the injection system.

Additional Conditions, UIC Permit #388, December 19, 2008, cont.

6. The Operator shall maintain a copy of this permit at the facility site.

7. The Operator shall, upon termination of the injection of the sodium persulfate through twenty Class V injection wells at this site, properly plug and abandon all Class V wells constructed on this site in accordance with EPD's *Manual for Groundwater Monitoring* (September 1991) and notify the division within thirty (30) days of such termination and abandonment.

Subject: Injection Summary
Fashion Care Cleaners
2211 Savoy Drive
Chamblee, Dekalb County, Georgia

Site Description:

The site is an active dry cleaners that has had multiple releases of tetrachloroethene (PCE) into the soil and groundwater. In addition, a BTEX plume from a release at the gas station next door has migrated onto this site and co-mingled with the PCE plume. We treated an area of approximately 2,800 square feet that covered both inside and outside of the building to treat around the source area. The purpose of this treatment was to lower detectable PCE in the soil.

Injection Well Installation:

Prior to the installation of the injection wells, **Exo Tech** contacted the Utility Protection Center (UPC) to locate the utilities outside of the building. Since we were not sure what was underneath the building, all of the wells inside of the building were hand augered by **Exo Tech**. A total of -7- one inch injection wells were installed outside of the building and a total of -14- one inch injection wells were installed inside of the building. These wells were installed to a depth of 12 feet below ground surface (bgs). In addition, -3- shallow injection wells were installed inside the building to better cover the source area. These wells were installed to 2 feet bgs in order to treat the soil just underneath the slab. See attached map for numbering and placement of wells. All of the injection wells were constructed in a similar fashion. See attached diagrams for injection well construction details.

Injection summary:

See attached Table 1 for the injection summary.

The injections went well as there was only one occurrence of minimal daylighting (IW-5) and no prolonged injection times at any of the wells.

EXO TECH, INC.
Chemical Oxidation and Environmental Remediation

Office: 770-564-1444/Fax: 770-923-1166

Treatment Summary:

Injection dates:	3/18/09 - 3/19/09
Total number of wells injected into:	24
Total weight of Persulfate injected:	4,840 lbs.
Total weight of Chelated Iron injected:	66 lbs.
Total volume of solution injected:	2,200 gals.

Recommendations:

Exo Tech recommends the collection of confirmatory groundwater samples approximately 30-60 days following the last date of injection (2/26/2009).

Please contact us if you have questions or need further information. Thank you for the opportunity to serve your need on this project.

Subject: Treatability Study Summary
Fashion Care Cleaners
2211 Savoy Drive
Chamblee, Dekalb County, Georgia

A treatability study was done in order to determine the oxidant mix, volume, and dosing to best suit the site characteristics. In this case, tests with sodium persulfate activated with chelated iron (FeEDTA) were conducted. The oxidant mixes were evaluated based on the following criteria:

- contaminant species
- soil oxidant demand
- total oxidant demand
- contaminant oxidation
- lifetime in the subsurface
- oxidation speed

Samples of soil were taken from MW-1 and a groundwater sample was taken from MW-4 which were thought to be the areas with the highest concentrations of PCE. The soil had levels of PCE at 5,280 ppb, TCE at 13,280 ppb, cis 1,2-DCE at 48,480 ppb and vinyl chloride at 3,200 ppb. The groundwater showed levels of PCE at 5,160 ppb, TCE at 440 ppb, cis 1,2-DCE at 896 ppb and vinyl chloride was non-detect. The samples were treated with a 30% solution by weight of sodium persulfate that was activated with FE EDTA (chelated iron). After two weeks, the levels of the soil decreased to non-detect for PCE, TCE, cis 1,2-DCE and vinyl chloride. The groundwater sample levels went to 651 ppb for PCE, 662 ppb for TCE, 1,250 ppb for cis 1,2-DCE and 5.5 ppb for vinyl chloride. After four weeks of treatment, the levels of PCE, TCE, cis 1,2-DCE and vinyl chloride all went to non-detect in the groundwater sample.

EXOTECH, INC.
Chemical Oxidation and Environmental Remediation

Office: 770-564-1444/Fax: 770-923-1166

Based on the treatability testing, site information and our experience, it was decided to use an oxidant blend that consisted of a 28% solution of sodium persulfate by weight. In the field this would be equivalent to four bags of sodium persulfate per one hundred gallons of water. We would use chelated iron as the activator as it showed to be effective with the samples. Based on our observations during drilling and the well locations, it was further decided to inject 100 gallons of oxidant blend into each well. Parameters would be taken during the injections to make sure that this volume would give us the appropriate radius of influence we needed based on the well spacing.

Please contact us if you have questions or need further information. Thank you for the opportunity to serve your need on this project.

Sincerely,

Brett Ellington
Chemical Engineer

RE: Underground Injection Control Permit #393 for Injection of Sodium Persulfate, Fashion Care/Executive Care Dry Cleaners Site located in Chamblee, Georgia (HSI #10786).

Dear Ms. Kittrell:

Enclosed is Underground Injection Control (UIC) Permit #393 for the Fashion Care/Executive Care Dry Cleaners site located in Chamblee, Georgia. This UIC permit allows Item IV Trust U/W John F. Rowan to utilize injection of sodium persulfate through twenty (20) injection wells to assist with the remediation of soil and ground water contaminated with chlorinated solvents at this site for up to five (5) years. The UIC permit states two (2) standard conditions and seven (7) additional conditions in the attachment.

If you have any questions about the permit, please contact Mr. Bijan Rahbar, UIC Coordinator, at (404) 656-3229.

Sincerely,

Carol A. Couch
Director

INJECTION WELL OPERATING PERMIT

PERMIT NUMBER: #393 **DATE ISSUED: January 23, 2009**

FACILITY DATA: **INJECTION WELL TYPE: CLASS V (type 5X26)**

FACILITY: Fashion Care/Executive Care
Dry Cleaners Site
2211 Savoy Road
Chamblee, Georgia
Dekalb County

OPERATOR: Item IV Trust U/W
John F. Rowan
Ms. Nan Kittrell, Representative
1270 Hestertown Road
Madison, GA 30650

LOCATION: Lat: 33° 55' 08.75"N
Long: 84° 17' 52.83"W

EPD-HSI #10786

In accordance with the provisions of the Georgia Rules for Underground Injection Control, Chapter 391-3-6-.13, as amended 2001, this permit is issued for the operation of the herein described injection system. This permit is effective immediately, unless appealed within thirty (30) days after its issuance and is conditioned upon the following:

1) The Permittee's continued compliance with the Georgia Rules for Underground Injection Control, Chapter 391-3-6-.13, the Georgia Rules for Water Quality Control (Revised) and the Georgia Rules for Safe Drinking Water (Revised); and

2) The Permittee's continued compliance with the Permittee's approved injection operation plan that is part of the approved Corrective Action Plan for this site, along with provisions of officially approved plan amendments, if any.

Additional conditions 1 through 7 are attached hereto.

This permit is issued in accordance with the application and supplemental information received on January 8, 2009. The injection operation plan was approved on January 23, 2009, and is based on the statements and supporting data entered herein or attached thereto, all of which are filed with the Environmental Protection Division of the Georgia Department of Natural Resources and hereby made a part of this permit.

This permit is subject to revocation for noncompliance with aforementioned conditions.
This permit expires on **January 23, 2014,** unless previously terminated.

Carol A. Couch, Director, Environmental Protection Division
Georgia Department of Natural Resources

Additional Conditions, UIC Permit #393, January 23, 2009, cont.

INJECTION WELL OPERATING PERMIT
ADDITIONAL CONDITIONS

1. Permit Conditions.

   a. This permit is not transferable until any new operator shall agree in writing to all permit conditions. Any new operator also shall provide the Environmental Protection Division (Division) with appropriate documentation that they have adequate financial assurances to plug all existing Class V wells.

   b. If Item IV Trust U/W John F. Rowan (Operator) wishes to continue an activity regulated by this permit after the expiration of the permit, the Operator must apply for and obtain a new permit.

   c. The Operator shall report any instances of noncompliance with permit conditions to the Division in writing within five (5) working days of such noncompliance, and shall take all reasonable steps to minimize the impact on the environment resulting from noncompliance with this permit and the Georgia Rules for Underground Injection Control.

   d. The Operator shall notify the Division of any proposed changes to the performance of the sodium persulfate injection system in writing at least thirty (30) days prior to the change.

   e. All reports submitted to the Division shall be signed and stamped by a Georgia Registered Professional Engineer or Professional Geologist.

   f. All analyses shall be performed by a laboratory approved or accredited by EPD in accordance with the Georgia Rules for Commercial Laboratory Accreditation, Chapter 391-3-26.

2. System Parameters.

   a. This permit is issued to the Operator for the purpose of operating a sodium persulfate injection system at the above referenced site to aid in remediation of soil and ground water contaminated with chlorinated solvents.

   b. Number of Class V injection wells: twenty.

   c. Injected fluid: sodium persulfate.

   d. Maximum injection volume per well: 100 gallons of liquid/day (gpd)/well.
   Maximum total system injection volume: 2,000 gpd.

   e. Maximum daily average injection pressure (at well head): gravity.

Additional Conditions, UIC Permit #393, January 23, 2009, cont.

3. Monitoring and Reporting Requirements.

   a. The Operator shall report to the Underground Injection Control Program of the Division the number and exact location of all Class V injection wells it installs or plugs on a quarterly basis. The reports are to be submitted to the UIC Program in accordance with the reporting schedule stipulated by the Hazardous Waste Management Branch.

   b. The Operator shall submit to the Division for its approval, a detailed schematic diagram and location map on any Class V injection well that is different in construction from the specifications contained in the UIC permit application, no later than 45 days prior to installation of the injection well. The Operator cannot install such a well until it receives approval from the Division.

   c. The Operator shall submit to the UIC Program one (1) copy of any report regarding this site that the Operator is required to submit to the Hazardous Waste Management Branch.

   d. The Operator shall submit to the UIC Program an annual report that will contain the following information.

      1. Status of the injection system operation;

      2. Results of any ground-water sampling and analyses;

      3. Results of any soil sampling and analyses;

      4. An evaluation of the plume movement through the ground water, if any;

      5. Comparisons of analyses to determine any changes in pollutant concentrations.

   The annual reports will be provided to the UIC Program in accordance with the schedule stipulated by the Hazardous Waste Management Branch.

4. Emergency Situations.

   a. The Operator is to immediately notify the Division of any emergency situation that affects the injection system and describe the remedial activity that the Operator is utilizing to correct the situation.

   b. The Operator is to immediately notify the Division when the emergency situation ceases to exist.

5. The Operator shall grant the Division permission to enter the facility property to conduct inspections of the injection system.

Additional Conditions, UIC Permit #388, December 19, 2008, cont.

6. The Operator shall maintain a copy of this permit at the facility site.

7. The Operator shall, upon termination of the injection of the sodium persulfate through twenty Class V injection wells at this site, properly plug and abandon all Class V wells constructed on this site in accordance with EPD's *Manual for Groundwater Monitoring* (September 1991) and notify the division within thirty (30) days of such termination and abandonment.

1. INTRODUCTION

1.1 PROJECT BACKGROUND

This report details chemical fate and transport modeling for volatile organic compounds (VOCs) at the Fashion Care Voluntary Remediation Program (VRP) Site in Chamblee, Georgia. The Site area is depicted on Figure 1-1. This Site consists of an active dry cleaner and adjoining vacant space. Adjacent properties include a gas station/car wash, dental office, and various retail stores. All of these properties are located on the south side of I-285 and north of Nancy Creek and in total consist of approximately 12.3 acres of land. A dry-cleaning operation has been located at the Site since the buildings were constructed during the 1960's (Winter Environmental, 2010).The drycleaner location was the site of an historical release of tetrachloroethylene (PCE) that was subject to past corrective actions no longer on-going. Residual PCE and its daughter products are present in soil and groundwater and downgradient of the Site. The adjacent gas station was the site of a release of gasoline to the subsurface from underground storage tanks (UST) which comingled with the PCE plume at the Site (Winter Environmental, 2010).

Multiple phases of investigation by multiple contractors began with an investigation of Site soils in 2006. Additional investigation of Site soils occurred in 2007. A comprehensive investigation of Site soils, groundwater, and surface water began in 2008. Soil remediation efforts consisting of sodium persulfate injection in the presumed source area and sealing of potential pathways were conducted in 2009. Since that time, supplemental well installations, soil borings, and hydrogeological investigations have been conducted. This report summarizes pertinent information from the various investigations for the purposes of modeling fate and transport of Site-related constituents in groundwater and surface water.

1.2 REPORT ORGANIZATION

This report consists of a cursory review of project background data and site conceptual model in Section 2. Section 3 provides a discussion of the construction and benchmarking of the model used at the Site. Section 4 presents the results of the modeling. Section 5 provides a brief summary and recommendations for the Site based on the modeling efforts completed for the Site.

2. CONCEPTUAL SITE MODEL AND PROJECT DATA SUMMARY

This section discusses the conceptual site model (CSM) and project data used in the evaluation and fate and transport modeling of Site-related contaminants. The CSM is discussed in Section 2.1. Data used to support the modeling efforts is summarized in Section 2.2.

2.1 SITE CONCEPTUAL MODEL

The basic CSM for the Site is summarized in Figures 2-1a and 2-1b Figure 2-1a provides cross-section locations and the cross-sections are presented in Figure 2-1b. The residual Site-related VOCs in soil are depicted beneath the Fashion Care building and the paved area adjacent to the building. It has been conservatively assumed that this residual soil contamination is subjected to a limited amount (owing to the predominance of impervious surfaces in the area) of infiltration from the surface and from fluctuations in the water table that likely periodically wet portions of the soil column allowing dissolution to occur. This dissolves additional contaminants which then migrate within groundwater in the sandy silt and clayey silt perched atop the dry silt, ultimately discharging to Nancy Creek.

2.2 SITE DATA SUMMARY

The data used to construct and benchmark the fate and transport model for the Site comes from previous reports for the Site. The data pertinent to the modeling efforts for the Site are as follows:

- Hydrogeologic properties of the sandy silt/clayey silt;
- Overburden thickness above dense, dry silt;
- Groundwater levels across the Site,
- Nancy Creek surface water elevations and flow data (as available);
- The current distribution of VOCs in soil and groundwater across the Site.

Each of these data types and available information for the Site is summarized below.

2.2.1 Hydrogeologic Site Data

Surficial geology across the Site consists primarily of reddish-brown silt with varying minor amounts of sand and clay, overlying a grey to tan and grey silty sand to sandy silt with pebbles. This overlies a dense, dry silt of varying color present across the Site. The presence of the dense, dry silt across the Site was confirmed in November 2013 by advancing 10 borings (SB-37 through SB-46) across the Site to confirm the presence or absence of the dry silt, and utilizing existing borings that had been advanced deep enough to encounter the dry silt. Boring logs are provided in Appendix B.

The surficial saturated soil zone is divided into upper and lower water bearing zones, separated by the dense, dry silt indicated above. The thickness of the upper water bearing zone appears to be greater near Savoy Drive and thins as Nancy Creek is approached. This is based upon the evidence that the upper water bearing zone is thinner adjacent to Nancy Creek where saturated conditions are encountered in borings as shallow as 5 feet below grade and the dense dry silt is encountered at 8 to 16 feet below grade. The dry silt was encountered at deeper depths at the higher elevations around the Fashion Care building, at approximately 23 feet below ground surface (bgs). Toward Nancy Creek the dry silt was encountered at shallower depths ranging from 8 feet bgs (FMW-15) to 19 feet bgs (SB-46). The dry silt is very dense and in the majority of borings, drilling was terminated with DPT refusal due to the nature of the material. When slight pressure was applied to a core of the silt it crumbles into loose material, indicative of the

lack of moisture in the silt. To determine the general thickness of the layer to aid in planning the construction of a Type III monitoring well to be screened below the silt, one boring, SB-37, successfully penetrated the silt. The silt was found to be approximately 10 feet thick (23 feet bgs to 33 feet bgs) at that location. Based upon this data, the dense dry silt has been determined to act as a layer that retards the migration of groundwater from the upper water bearing zone to the lower water bearing zone in the Site area.

On April 22, 2014, an attempt was made to evaluate the lower water bearing zone below the dense, dry silt, and above the potential bedrock aquifer by installing a Type III double cased monitoring well (MW-18D) adjacent to FMW-5. This location was previously agreed to by EPD for installing a deep well to establish groundwater quality conditions beneath the dry silt. A pilot hole was first drilled to identify the top of and base of the dry silt to determine the placement of the outer casing for the deep monitoring well. As anticipated, the dense, dry silt was encountered at approximately 14 feet bgs, and water table aquifer conditions (upper water bearing zone) were encountered above the silt. However, bedrock was encountered immediately at the base of the dry silt at a depth of 33.5 feet bgs. A boring log is provided in Appendix B. As a result, the installation of the Type III well was aborted and EPD was notified of the conditions that were found. Based upon these findings, the following determinations were made:

- A Type III well could not be installed downgradient, and

- The water bearing zone present beneath the dry silt topographically upgradient near the Fashion Care building appears to pinch out moving toward Nancy Creek, with the dry silt resting upon bedrock.

It was also confirmed that the dry silt does not form the streambed of Nancy Creek adjacent to the Site. Based upon a stratigraphic assessment of the streambed, Nancy Creek in the area of the Site is still eroding through the silty sand/sandy silt overlying the dense dry silt. Woodard & Curran personnel completed hand auger explorations in Nancy Creek to investigate the creek bottom in the summer 2014. The objective of these explorations was to evaluate the potential for the creek to have eroded through the dry silt and expose bedrock in or immediately below the creek in the Site area. Locations were selected relative to the area where the groundwater plume enters the creek, and were the stream bottom was an erosional surface, not an area of sedimentation. This enabled accurate identification of the creek bed lithology. Two hand auger explorations were completed, CK-HA-1 and CK-HA-2. These locations are depicted in Figure 2-3. The CK-HA-1 location is in a bend of the creek adjacent to SB-41 and FMW-11. The CK-HA-2 location is located approximately 200 feet downstream of SB-43 and FMW-9. The hand augers penetrated to approximately 2.5 feet below the bed of the creek at which point the auger boring was terminated due to inability to further penetrate the creek bed. In both borings, grey, clayey silt was encountered. The grey clayey silt in CK-HA-1 was approximately 1.5 feet thick and was underlain by 0.5 feet of reddish-brown, poorly sorted, coarse sand and pebbles. In auger boring CK-HA-2, the grey, clayey silt, was encountered to a depth of 1.5 feet below the creek bottom at which point the boring was terminated. Based on comparison with the nearest soil borings, each boring terminated in the red to brown to grey silt located stratigraphically above the dense, dry silt which serves as the lower confining layer for the upper water bearing zone in which the contaminant plume migrates. Nancy Creek at the Site is located in the upper water bearing zone and has not eroded through the dense, dry silt, and does not intersect the bedrock. Appendix B provides the hand auger logs and correlation sections with adjacent borings. Photographs of the boring locations and lithology are also provided in Appendix B.

The groundwater gradients across the Site in the upper water bearing zone are based on water level monitoring completed during groundwater sampling mobilizations to the Site. Figure 2-2 provides a plot of groundwater potentiometric surface from the April 2014 monitoring round. The head during this sampling round varied across the Site between approximately 4 to 5 feet. The gradients appear to be steeper near the developed areas and flatten closer to Nancy Creek. The gradients vary between approximately 0.0056 ft/ft and 0.032 ft/ft based on elevations measured in April of 2014.

Hydrogeologic properties of interest for flow and transport modeling include hydraulic conductivity and effective porosity. The hydraulic conductivity values used in the modeling efforts for the Site were obtained from recently completed and previous slug testing performed on Site wells in the upper water bearing zone. Historic slug testing indicated that hydraulic conductivity at the Site ranges from approximately 10 to 27 ft/day. The more recent data indicated a range from 0.45 to 57 ft/day. The data from these slug tests are summarized in Table 2-1. Data and analyses are for slug tests completed in September of 2014 and are provided in Appendix A. Effective porosity for the Site is most likely dependent on the relative percentages of fines in the perched aquifer. There are no direct tests of effective porosity for the Site so an estimated effective porosity of 10% was assumed given the predominance of fines in the soil (Kresic, 1997).

The overburden thickness (upper water bearing zone) above dense, dry silt was mapped based on observations made in soil borings across the Site, and described above. The overburden thickness values assigned to each boring were then interpolated by kriging the values. The resulting thickness map is provided in Figure 2-3. The overburden thickness was subtracted from publicly available surface elevation data to obtain the bottom of the perched aquifer.

2.2.2 Surface Water Site Data and Recharge Estimates

Nancy Creek surface water elevations were taken from the data collected during Site groundwater monitoring. The differences between upstream station and downstream station elevations were used to model the surface water body and its relationship to the groundwater flow system. Surface water elevations, where available, are provided in Table 2-2 along with available groundwater elevations. The 7Q10 flow for the area where groundwater from the Site discharges to Nancy Creek has been calculated by the Georgia Environmental Protection Division (EPD) to be 3 cubic feet/second (CFS) (GAEPD, 2010).

Stream statistics from the United States Geological Survey (USGS) are available for Nancy Creek at Randall Mill Road (USGS Station ID 2336380) indicate a baseflow on the order of 10 to 18 CFS. The drainage basin size at the Randall Mill Road gauging station is approximately 34.8 square miles. This yields a general recharge range of between 2.6 to 4.1 inches/year. Another USGS station located closer to the site at Johnson Ferry Road (USGS Station ID 2336340) suggests a baseflow on the order of 3 to 6 CFS. Given the drainage basin size at this gauging station of approximately 17.8 square miles, the average recharge rate would be approximately 2.3 to 4.6 inches/year. Both ranges of numbers are in general agreement with each other despite the difference in drainage basin sizes and periods for gauging. Graphs showing the flows for these stations are provided in Appendix C.

2.2.3 Site VOC Concentrations

Site residual soil VOC concentrations used in the modeling efforts are based on soil data summarized in the report on soil remediation activities completed by Winter Environmental (May 2009). The average soil data was approximately 7.5 mg/kg over and area of approximately 2,100 square feet. The approximate depth to the water table in the source area is 7 feet. At an assumed soil density of 100 pounds per cubic foot, the approximate mass of PCE on soil in the source area is 5,020,860 milligrams or 5,020 grams.

The detection of VOCs in groundwater at the Site includes breakdown products of the degradation of PCE. These detected compounds include trichloroethylene (TCE), cis-1,2 dichlroethylene (cis-1,2 DCE), trans-1,2 dichlorethylene (trans-1,2 DCE), and vinyl chloride (VC). The presence of a gasoline station adjacent to the property and the associated hydrocarbons, benzene, toluene, ethylbenzene, and xylene (BTEX) indicates there is the potential for dechlorination of the PCE plume from comingling of this carbon rich source and may have set the stage for associated anaerobic conditions. The presence of higher quantities of DCE indicate that reductive dechlorination is likely occurring at the Site. The minimal detections of VC suggest that either the dechlorination stalls at the DCE stage or VC degradation occurs rapidly via another mechanism such as aerobic degradation. Other studies have indicated that VC can decay rapidly under aerobic conditions (Davis and Carpenter, 1990 and Singh et al., 2004).

Figure 2-4 depicts the total VOC plume in 2008 prior to remediation efforts. The plume extended from the source area near the Site building southward toward Nancy Creek. The plume bends to the west prior to reaching the creek. This bend is likely reflective of the plume encountering materials of greater transmissivity and the influence of the creek on groundwater flow patterns.

3. FLOW AND TRANSPORT MODELING

This section discusses the modeling of the soil to groundwater and groundwater flow and transport of Site related VOCs. Section 3.1 briefly describes the simplified modeling of the transfer of soil contamination to the groundwater flow system. Section 3.2 discusses the model selection, construction, and benchmarking of the groundwater flow model.

3.1 SOIL TO GROUNDWATER MODEL

For the purposes of modeling the transfer of contaminant mass to the groundwater system, a simple soil flushing calculation was used. Using the contaminant mass of 5,020,860 milligrams or 5,020 grams as estimated in Section 2.2, and an estimated infiltration rate of 1 inch/year applied over the approximate area of soil impact; the estimated time to reduce the contaminant levels to non-detect values is approximately seven years. The amount of soil contamination released to groundwater was then estimated for each year and used in step-wise fashion as the initial inputs to the contaminant transport model discussed in Section 3.2. Calculations regarding this estimation are provided in Appendix D. Adjustments were made during calibration to match observed conditions at downgradient wells.

3.2 GROUNDWATER FLOW AND TRANSPORT MODEL

The groundwater modeling of flow and contaminant transport for the Site is discussed in the following sections. Section 3.2.1 discusses the model code selection. Section 3.2.2 discusses the groundwater flow model construction, parameter selection, and benchmarking to Site observations. Section 3.2.3 discusses the contaminant transport model, parameter selection, and benchmarking to Site observations.

3.2.1 Computer Code Selection

The computer code used to simulate the flow of groundwater at the Site was MODFLOW 2000 (Harbaugh et al, 2000). MODFLOW is an industry standard code for modeling three dimensional groundwater flow and has various packages or modules to handle different aspects of groundwater flow. The computer code used to simulate contaminant transport was MT3DMS (Zheng and Wang, 1999). MT3DMS is a industry standard code for simulating transport of contaminants in three dimensions and uses the outputs from MODFLOW to calculate simulated transport in groundwater. Both codes were implemented using the commercially available Groundwater Vistas graphical user interface (GUI).

3.2.2 Groundwater Flow Model Construction

The construction of the groundwater flow model was based on available Site data for perched aquifer geometry, boundary conditions, and site specific parameters. The model grid and boundary conditions are indicated on Figure 3-1. The model grid was based on a nominal grid spacing of 20 feet by 20 feet. The grid was refined around the source area to a spacing of 10 feet by 10 feet. The boundary conditions used in the model included no-flow and river boundaries. The no-flow boundaries were assigned based on interpretation of presumed groundwater divides, based on surface topography or where the upper unit was assumed to be unsaturated at the higher elevations in the model space. Nancy Creek was simulated as a river boundary with elevation values assigned based on surface topography and measured differences in elevations at various Site surface water stations.

Aquifer geometry was assigned based on the depth to the top of the dry silt as discussed in Section 2. The upper limit of the aquifer surface was assumed to be the surface elevation. The bottom of the aquifer was computed by subtracting the overburden thickness from the surface elevation for the entire model space.

Hydraulic conductivity was varied based on Site values discussed in Section 2.2. Based on benchmarking to Site water levels, two conductivity values were used. A hydraulic conductivity of 0.8 feet/day was used for the majority of the model space and reflects a predominance of silt in much of the model area. A transition value of 6.3 feet/day was assigned to reflect sandier silt present between the sand observed in some Site wells/borings and the finer-grained silt. A higher conductivity value of 25 feet/day was assigned to an area near Nancy Creek. This was completed to better match the wider spacing of groundwater contours adjacent to the creek. The lower gradient in this area is indicative of more transmissive soils likely associated with the alluvium along the creek. The hand-augers completed in the creek suggest that the creek is eroding into the underlying silt. The higher conductivity materials adjacent to the creek may represent an area of past channel alluvium deposited in an area previously occupied by the creek. The distribution of conductivity values are presented in Figure 3-2. It is important to note that the hydraulic conductivity field provided in Figure 3-2 represents the final distributions of hydraulic conductivity after adjustments were made during calibration to achieve the best fit to site water level data. The adjustments made during calibration also provided the best match to plume extents. Plume modeling is discussed further in Section 3.2.4.

Recharge was assigned based on surface conditions in the area of the Site. Generally, paved areas were conservatively assigned a recharge rate of approximately 1 in/yr or less. Open spaces were set at approximately 4 in/year. Areas with depressions such as ditches and swales along the highways were assigned recharge rates of approximately 7 in/yr. These numbers reflect final adjustments to achieve calibration.

3.2.3 Flow Model Calibration

The groundwater flow model was calibrated to the average of groundwater elevations for the period of record collected at each well. These data were adjusted from the arbitrary Site datum to a representative elevation similar and consistent with the publicly available land surface elevation. This datum adjustment was made by computing the elevation difference between each average groundwater value from the surface water elevation at the surface water station SW-1 on March 19, 2010 (the most complete round of monitoring data for the Site), and then adding that difference to the elevation of SW-1 based on the digital elevation model (DEM). Table 2-1 provided the data for the average groundwater conditions and the adjustment to a site datum consistent with the DEM for the Site area.

Overall, the shape of the contours and the change in head across the Site in the model appears to mimic the observed change in heads and contour shapes. The groundwater model appears to be relatively well benchmarked against Site conditions. The change in modeled head across the Site is approximately 5 feet which agrees with Site observations and gradients similar for both the modeled and observed flow fields. Figure 3-3 depicts the benchmarked flow field. Figure 3-4 provides a graphic depicting modeled heads versus observed heads. The modeled graph depicts a line representing where data would fall if there were perfect agreement between modeled and observed heads. There is generally a good correlation between modeled and observed heads as indicated by the lack of scatter about the line. Table 3-1 provides the modeled versus observed heads as well as calibration statistics. The calibration statistics further indicate a good match in the modeled head data.

3.2.4 Contaminant Transport Modeling

Contaminant transport modeling was conducted in three distinct steps. The first step was to model distribution of total dissolved VOCs in the groundwater. The second step was to model the anticipated maximum concentration of PCE in the future, as this compound is the most prevalent compound at the Site with the lowest In-Stream Water Quality Standard (ISWQS). The third step was to evaluate the likely relative concentrations of the daughter products of PCE decay at the Site at the time of the maximum future PCE concentration and then compare these concentrations to the appropriate environmental standards.

For bench-marking simulations, the model assumes that source became active in the subsurface approximately 5 years after the Site began operation in 1968. The starting time for the simulation is therefore 1973. The source was

assumed constant until late 2008/early 2009 when the source remedy using sodium persulfate and chelated iron was implemented, and other sources of impacts were removed (PCE dry cleaner machine, lint sump cleaned and sealed). The flushing of Site soils as discussed in Section 3.1 was then used as the basis for adjusting source concentrations over time. Forward looking prediction of daughter products is discussed in Section 4.3.

3.2.4.1 Total VOC Plume Modeling

The total VOC plume modeling was conducted to evaluate the following:

1.) The expected maximum extent of the total plume in the aquifer ,

2.) The relevant environmental criteria against which to evaluate modeled future concentrations (i.e. surface water protection, drinking water, etc.);

3.) The adequacy of the existing monitoring network to effectively monitor anticipated changes, if any, in the plume distribution, and

4.) The potential for additional receptors to be impacted by the plume in the future.

The main parameters for varying in the contaminant transport model are the source distribution and concentration and the dispersivity values. The initial source area for the total VOC portion of the model was assigned based on observations of data. Source concentrations were varied between 5 mg/l and 86 mg/l in the area beneath the southern corner of the dry cleaning building. The overall initial average concentration in the source area was close to the 75 mg/L value for the area discussed in Sections 2.2.3 and 3.1. The source concentration was varied from these initial values in a stepwise fashion over 7 years until reaching an assumed, irreducible minimum of 1 mg/l in year seven. A graph depicting the final applied source concentrations versus the soil flushing estimated values is provided in Figure 3-5. .

Dispersivity values were initially assigned a value of 10 feet for longitudinal dispersivity, 1 foot for transverse dispersivity, and 0.01 feet for vertical dispersivity. During benchmarking, the values for dispersivity were adjusted to 30 feet, 2.5 feet, and 0.3 feet respectively for longitudinal, transverse, and vertical dispersivities.

In order to develop a model that yielded modeled data consistent with Site monitoring results, plume retardation was incorporated into the transport simulation. Retardation in the MT3D model is accomplished by incorporating soil adsorption. Adsorption is based on three parameters: K_{oc}, f_{oc}, and soil bulk density. The product of K_{oc} and f_{oc} is the transport parameter K_d or adsorption constant. Since there is not a specific K_{oc} value for total VOCs and the site specific f_{oc} may vary over a large range, the value for K_d was adjusted during calibration to achieve a suitable match to observed Site chemical data.

3.2.4.2 PCE Plume Modeling

The PCE plume was developed using the same basic dispersivity as was used in the total VOC transport model. The source terms were adjusted to reflect the portion of the total VOCs that are attributed to PCE in Site groundwater. The resulting source term for PCE was adjusted to have decay proportional to that used in the total VOC plume model.

The chemical specific adsorption on soils for PCE is based on values for K_{oc}, f_{oc}, and bulk density. The K_{oc} of 94.94 L/kg for PCE was obtained from Regional Screening Level (RSL) Chemical-specific Parameters Support Table, May 2014. The initial f_{oc} value for the Site soils was estimated at 0.002 mg/kg per guidance provided by the Georgia EPD. The value for f_{oc} was varied during the modeling in order to achieve a good fit to the available Site chemical data time series. The final calibrated foc value from the modeling was 0.00092 mg/kg.

3.2.4.3 Daughter Product Benchmarking and Prediction Modeling

The Site monitoring data include detectable concentrations of the breakdown of PCE into its various daughter products as discussed in Section 2.2.3. An initial BIOCHLOR22 model was completed to evaluate transport parameters for use in forward prediction. In order to understand the maximum expected concentration of each of the daughter products at the time of maximum PCE concentration, a second simulation using BIOCHLOR22 was performed. Chemical transport parameters were initially set at those used in the PCE modeling and adjusted during the benchmarking process discussed in Section 3.2.5.3. The discussion of forward prediction of daughter products in provided in Section 4.3.

3.2.5Contaminant Transport Model Benchmarking

Each stage of the contaminant transport modeling process underwent individual benchmarking to Site data. The discussion of the benchmarking for each step is provided in the sections below.

3.2.5.1 Total VOC Plume Benchmarking

The plume was generally well benchmarked against field measured values for VOCs in both the extent and shape of the plume. Figure 3-6 depicts the benchmarked plume distribution versus observed plume concentrations. As depicted, there is generally a good match with regard to plume shape and concentrations. The benchmarking of plume migration timing was accomplished by extracting modeled contaminant concentrations versus time, plotting them, and comparing them to actual values. Figure 3-7 a, b, and c depict the modeled concentration time-series data for wells FMW-4, FMW-6 and FMW-9.

3.2.5.2 PCE Plume Benchmarking

The plume was generally well benchmarked against field measured values for PCE in both the extent and shape of the plume. Figure 3-8 depicts the benchmarked plume distribution versus observed plume concentrations. As depicted, there is generally a good match with regard to plume shape and concentrations. The benchmarking of plume migration timing was accomplished by extracting modeled contaminant concentrations versus time, plotting them, and comparing them to actual values. Figure 3-9 a, b, and c depict the modeled concentration time-series data for wells FMW-4, FMW-6 and FMW-9. While some values are under-predicted, in general the order of magnitude of predictions is correct, as are the trends in concentrations relative to the well location within the plume.

3.2.5.3 Daughter Product Model Benchmarking

The first step in this process was to benchmark the simulation against Site VOC data. Initial transport parameters were set to match those of the three dimensional model simulation for PCE transport. Model parameters were then modified to achieve a match for each of the daughter products. The BIOCHLOR22 model is a two-dimensional spreadsheet based model and provides outputs depicting modeled versus actual concentrations for each of the daughter products in the decay chain. The calibrated parameters used in the BIOCHLOR simulation to achieve these matches are provided in Table 3-3. Some parameters are slightly different from the parameters used in the MT3D model. This is related to the ability of the MT3D to allow for heterogeneity in parameters that is not allowed in the BIOCHLOR model.

As an example, the hydraulic conductivity used in the BIOCHLOR model is a weighted average (based on flow path length through different materials) of the hydraulic conductivities used in the MT3D model. Essentially the flow path at the core of the plume travels approximately 190 feet in material of 25 feet/day conductivity and 87 feet in material with a conductivity of 6.3 feet/day. The weighted average yields approximately 19.13 feet/day or 0.0068 cm/sec.

Similarly, the dispersivity values were adjusted based on flow path lengths through differing materials to arrive at the value of 22 feet for dispersivity in the BIOCHLOR model.

Additionally, the BIOCHLOR model does not have the flexibility to allow for a time variant source component representative of source reduction measures as were performed at the site in the 2008 to 2009 timeframe. The source component therefore is different from that used in MT3D where the step-wise PCE source was used. In order to accommodate the BIOCHLOR model usage, a higher initial concentration of PCE was used and no source removal was accounted for as was done in the MT3D model where a time variant source concentration is allowed. Source dimensions were set at 15 feet of thickness and 25 feet of width. This is approximately equivalent to the cross-sectional area of the source used in the MT3D model. The source data were adjusted to match field observations. Initial source concentrations were set at close to the solubility limit for PCE as this was assumed at near solubility when first released to the subsurface. Since wells were not present on the site at that time (assumed to be 1973 as directed by EPD), the data were subsequently adjusted via trial and error. Other constituents (TCE, DCE, VC) were also arrived at by adjusting values until matching concentrations were achieved at the nearest source area well (FMW-4) and reasonable matches to wells further downgradient (FMW-6 and FMW-9) were achieved.

The parameters for the decay of the PCE to each of its daughter products generally conform to ranges presented in the BIOCHLOR modeling guidance document that accompanies the software. The one general exception to this is that the VC decay rate needed to be well above this range in order to match the observations at the Site. Sensitivity analyses around the VC decay rate are discussed further in the mixing zone calculations in Section 4.3. As demonstrated in Figure 3-10, the modeled values for PCE, TCE, DCE, and VC match the field data relatively well as indicated by the points in each graph lying reasonably close to the prediction line for the 41 years of the simulation from 1973 through 2014 when the benchmarking data were collected. The points on the graph represent FMW-4 (closest to y-axis), FMW-6 (intermediate distance), and FMW-9 (farthest from y-axis). BIOCHLOR screen captures for the benchmarking portion of the modeling are included in Appendix F. The forward-looking projections of PCE and its daughter products are discussed in Section 4.3.

4. PLUME SIMULATIONS AND SURFACE WATER MIXING CALCULATION

The benchmarked groundwater model was used to complete various simulations to evaluate plume stability and predicted future extents. Two types of simulations were performed, a steady-state simulation assuming soil remains an ongoing source at current concentrations and transient simulations assuming that soils flush in a stepwise fashion as discussed in Section 3.1.

4.1 TOTAL VOC PLUME DISTRIBUTION

The simulation of total VOC concentrations was run forward in time to evaluate the existing groundwater monitoring network distribution and the potential for influencing additional receptors. The projected maximum extent of the plume is depicted in Figure 4-1. This figure indicates that the existing monitoring network is adequate for plume monitoring as it would allow delineation and monitoring of the plume over time.

4.2 PCE PLUME DISTRIBUTION AND MAXIMUM STREAM VALUES

The maximum extent of the PCE plume is slightly less than that of the total VOC plume depicted in Figure 4-1. In order to understand the potential time-frame and concentration of the maximum discharge concentration of PCE into Nancy Creek, monitoring nodes were placed in the modeled creek at areas where the core of the modeled plume discharges to the creek. The modeled points are depicted on Figure 4-2 that depicts the maximum projected extents of the core of the plume in Nancy Creek. The modeled time-frame for the maximum extents is indicated on the graphic as potentially occurring at approximately 41 years from 2014. Additional graphics depicting plume development over time are provided in Appendix E and include predictions of plume extent in 2024, 2034, and 2044. These additional figures show the slow development of the plume in the interim time-period from 2014 to the maximum concentrations reaching the stream predicted to occur in 2052. These snapshots show that the plume does not expand substantially beyond the existing monitoring network. These figures further demonstrate that core of the plume degrades and slowly migrates toward Nancy Creek as it degrades.

Figure 4-3 depicts the maximum expected groundwater discharge concentration at two locations in the creek. The maximum predicted concentration of PCE entering Nancy Creek is approximately 2.42 mg/L. Smaller versions of these figures have also been placed on Figure 4-2 for reference. This predicted maximum concentration for PCE is used in later sections to evaluate the potential for exceedance of ISWQS.

4.3 PLUME DAUGHTER PRODUCT PREDICTION AT NANCY CREEK

The calibrated BIOCHLOR22 model was used to predict concentrations of daughter products at the maximum PCE concentration of approximately 2.42 ug/L at the stream. Since BIOCHLOR22 is a simple two-dimensional model assuming a uniform flow field, the maximum concentration at a given distance at given time is located along the centerline of a symmetrical plume. Since the plume at the Site is not a simple symmetrical plume in a uniform flow-field, the distance used for prediction of daughter products based on the time projection was the distance from the source area to Nancy Creak. To predict the concentrations of the daughter products at the maximum plume intersection with Nancy Creek a second BIOCHLOR22 model run was set up. The parameters for forward simulation were the calibrated values from the benchmarking BIOCHLOR22 runs discussed in Section 3.2.5.3. The only difference in the run was the initial concentration that was adjusted to be representative of the core of the plume after the remediation efforts that took place in 2008-2009. This is based on the assumption that the core of the plume is likely closer to Nancy Creek subsequent to the remediation efforts. The values for the initial concentration are indicated in Table 4-1 and represent the maximum detections in FMW-4 which were assumed to be representative of the core of the plume subsequent to source remediation activities. Appendix F also contains model setup and outputs from the BIOCHLOR22 forward-prediction model runs for reference. The projection was run 40 years into the future from 2012 which in turn corresponds to the expected year 2052 maximum for PCE from the MT3D model. Table 4-1

provides the predicted maximum concentrations of PCE and the concentrations of the following degradation daughter products: TCE, DCE, and VC.

4.4 SURFACE WATER MIXING CALCULATION

In order to evaluate the potential for PCE and its degradation products to be present in the stream above ISWQS, a groundwater to surface water mixing calculation was performed. The concentrations for PCE, TCE, DCE and VC in groundwater predicted in the previous sections were then blended based on modeled groundwater discharge and the volume of flow in Nancy Creek at the Site at 7Q10 conditions. Per correspondence from Georgia EPD dated December 2, 2010, the 7Q10 flow at the area of groundwater discharge is 3 cubic feet/second. The zone of mixing was calculated for the core of the plume and the maximum concentration was assumed as prevailing at each point in that area. This is a conservative assumption in that the concentration in the core of the plume where it intersects the stream would vary between 1 and a maximum of 2.42 mg/l according to the modeling. Therefore, the calculated amounts in the mixing zone represent the maximum value the concentration could be, but it is likely to be lower given the conservative assumption previously discussed.

The mixing zone calculation is as follows:

$$C_{SWVOC} = \frac{V_{gw}}{V_{gw} + V_{sw}} * C_{GWVOC}$$

where:

C_{SWVOC} = concentration of a particular VOC in surface water after mixing with groundwater containing that VOC discharges to the stream

V_{gw} = groundwater discharge volume (modeled value is 0.0019 cfs)

V_{sw} = surface water flow at 7Q10 (3 cfs for the Site)

C_{GWVOC} is the concentration in groundwater of the particular VOC being modeled

Table 4-1 provides the calculation of the concentration each VOC in surface water for the single point in the stream with the maximum predicted concentrations in groundwater and compares them to the Georgia EPD compound specific ISWQS.

As discussed in Section 3.2.5.3, VC decay rate needed to be set outside the general range of values for this parameter presented in the BIOCHLOR guidance manual. In order to understand the potential implications of this high rate of VC decay, a sensitivity analysis was conducted to see what the predicted VC values would be if the decay rate was set to zero. The resulting concentration for VC with VC decay rate of zero and the resulting mixing calculation is provided in Table 4-1. These results indicate that even if the VC decay were zero, the concentration of VC resulting from the mixing of plume water with surface water is still below the compound specific ISWQS for VC.

5. SUMMARY AND CONCLUSIONS

Based on the modeling exercises completed to date, the plume will likely remain stable or decrease over the next 60 years. The plume generally appears to migrate down the axis of the Nancy Creek Valley on the northern side of the creek. The overall plume distribution appears to be monitored adequately by the existing well network. Given these observations, the following conclusions/recommendations are made:

- The predicted plume footprint does not expand substantially beyond the existing monitoring well network as discussed in Section 4;
- As the source area is depleted, the center of maximum plume concentration will slowly migrate and continue to degrade as it migrates toward Nancy Creek;
- The maximum modeled concentration of PCE is predicted to discharge to Nancy Creek approximately 41 years after the source remediation effort conducted in 2008;
- Based on modeling, plume characteristics can be adequately monitored through annual or semi-annual sampling of FMW-6, FMW-9, and FMW-16;
- Mixing calculations for the predicted maximum concentrations of PCE and daughter products in Nancy Creek indicate that ISWQS will not be exceeded; and
- No other receptors for the groundwater plume are present within the existing or predicted footprint of the plume at the Site.

NOTES:

ft sd, feet relative to site datum.

ft toc, feet below top of casing.

MW-5, MW-6 and MW-7 do not exist

-, denotes no free-phase petroleum was found in the well

NT, measurement not taken

NI, Monitoring well not installed

Abandoned, Wells were abandoned by the EPD UST Program

Lost, Surface water guages lost to storm flow in Nancy Creek.

FMW-14, FMW-15, FMW-16 installed 5/27/10, 6/15/10 and 6/15/10, respectively.

Location:	2211 Savoy Drive, Chamblee, GA	Date Completed:	4/22/2014
Driller:	GeoLab	Field Oversight:	LJD
DTW:	7 ft. bgs	Final Depth:	33.5 ft. bgs

Depth (feet bgs)	Soil Classification	% Recovery	Sample No.	PID (ppm)	Well Completion	Remarks
0	Reddish-brown Silt, moist	20%	No samples collected	No readings collected	Type III well installation aborted	On 4/22/14 suspected bedrock on refusal at 33.5ft. bgs using solid-stem augers. Borehole temporarily abandoned using bentonite on 4/22/14. 4/24/14 returned with hollow-stem augers. Re-drilled borehole to refusal at 33.5 ft. bgs, used split-spoon to collect small sample of bedrock to confirm type of refusal, tremie-grouted boring with Portland-bentonite slurry to ensure good borehole seal.
5						
	Reddish-brown silty, fine to coarse SAND Wet	100%				
10	13 ft. color change to medium gray	100%				
15	Reddish-brown SILT, dense, moist	80%				
20	19.5 ft. Silt becoming dry, very dense	Solid stem augers required beginning at 20 ft. bgs due to DPT refusal. Down-pressure and cuttings used to identify lithology/lithologic changes.				
25						
30	Bedrock at 33.5 ft. immediately below SILT Mica-Garnet Greenschist

COMMITMENT & INTEGRITY DRIVE RESULTS

APPENDIX H – RISK REDUCTION STANDARD DERIVATIONS

March 29, 2012

Mr. Jason Metzger
Unit Coordinator – Environmental Engineer
Georgia Environmental Protection Division
Hazardous Sites Response Program/Voluntary Remediation Program
2 Martin Luther King, Jr. Drive, SE
Atlanta, GA 30334

Subject: Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011:
VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia

Dear Mr. Metzger:

On behalf of the John F. Rowan, Sr. Item IV Trust (Trust), Winter Environmental has addressed, and attached for your review, a number of the comments to the Voluntary Remediation Program (VRP) Reports submitted through December 2, 2011 regarding the Fashion Care/Executive Care VRP Site (HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia). The following comments have been addressed and should replace previous versions of the documents provided in the VRP Semiannual Status Report dated December 2, 2012.

Comment #1. The draft Uniform Environmental Covenants (UEC's) have been revised per comments received from the EPD on February 10, 2012. The revised UEC's are attached for your review. These covenants should replace the associated covenants in Appendix B of the VRP Semiannual Status Report dated December 2, 2012.

Comment #5. The Johnson & Ettinger (J&E) vapor models for parcel 18-343-13-001 (Georgia-Alabama Commercial Investments, LLC property) and 18-343-13-005 (Southern Automatic Company property) have been revised per your comments. The results indicate that both properties are below the Hazardous Site Response Act (HSRA) Rules threshold values. The revised models are attached for your review. These revised J&E vapor models should replace the J&E models in Appendix A of the VRP Semiannual Status Report dated December 2, 2012.

Comment #6. The summary tables and input parameters for the J&E models for parcels 18-343-13-001 and 18-343-13-005 have been revised and are attached for your review.

Comment #7. The Type 5 Risk Reduction Standards (RRS) for construction workers and utility workers have been revised in the attached UEC's, as have been the RRS derivation tables. There are very small differences in our calculations for tetrachloroethene and 1,1-dichloroethene that

3350 Green Pointe Parkway
Suite 200

Fax: 404.223.6251
www.winter-environmental.com
A division of
The Winter Construction Company

appear to be due to Excel rounding that could not be resolved. We have defaulted to the values for these constituents provided by EPD. The revised RRS derivation tables are attached for your review. These revised RRS should replace the RRS tables in Appendix D of the VRP Semiannual Status Report dated December 2, 2012.

Comment #8. The Type 5 RRS for 1,1-dichloroethene has been revised in the RRS derivation tables. The revised RRS derivation tables are attached for your review.

Comment #9. The chemical specific input parameters for 1,1-dichloroethene and cis-1,2-dichloroethene have been revised in the RRS derivation tables. The revised RRS derivation tables are attached for your review.

Also noted are Comments #2, #3 and #4 that will be addressed in future site investigation activities and Semiannual VRP Status Reports.

In addition to the responses provided by the Trust, the Trust requests that the EPD provide a property specific "Site Use and Non-Residential Soil RRS Monitoring Evaluation Form" for each Environmental Covenant presented for this site. This is needed prior to presenting the covenants for signature to the affected property owners.

Winter Environmental and the Trust await your review and reply to these items. The Trust would like to obtain executed UEC's from the surrounding property owners as soon as possible to continue to move forward with the VRP. Please contact me with any questions or comments you may have.

Sincerely,

Leonard J. Diprima, Jr., P.G.
Senior Consultant

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:	ASL Limited Partnership 1515 S. Federal Hwy. 300 Boca Raton, FL 33432-7451
Grantee/Holder:	<Company Name or individual(s)> <Mailing address>
Grantee/Entity with express power to enforce:	State of Georgia Department of Natural Resources Environmental Protection Division 2 Martin Luther King Jr. Drive, SE Suite 1152 East Tower Atlanta, GA 30334
Parties with interest in the Property:	<Company Name or individual(s)> <Mailing address>

Property:

The property subject to this Environmental Covenant is the ASL Limited Partnership Tract (hereinafter "Property"), located on the 4200 – 4300 Block of North Shallowford Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on October 12, 1982 from ARA Associates – Shangri-La, Ltd., a New Jersey limited partnership to ASL Limited Partnership recorded in Deed Book 4673, Page 272, DeKalb County Records. The area is located in Land Lot 334 of the 18th District of DeKalb County, Georgia. The property consists of approximately 10.45 acres of undeveloped property. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-333-02-023 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in

the following documents:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Vapor Intrusion Model - Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011: VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, dated March 14, 2012.

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Add Property Address here, or Owner Contact Information if undeveloped.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by ASL Limited Partnership, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride have been detected in groundwater beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater in Area D as shown on Figure 1 of the Property. Engineering controls required for the Property are the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures and any enclosed structures constructed within Area C and Area D as shown on Figure 1, unless updated vapor modeling approved by the EPD indicates vapor mitigation is unnecessary.. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, ASL Limited Partnership (hereinafter "ASL"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the

rules promulgated there under. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

ASL makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, ASL and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, ASL or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days of any subsurface site work in the environmentally impacted area shown on Figure 1 that would affect the Property. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-7 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (attached).

5. Activity and Use Limitation(s). The Property shall be used for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant, unless the requirements for residential use identified below are followed.

   A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures within Areas C and D indicated on attached Figure 1 until the HSRA regulated substances in groundwater at the Property reach HSRA RRS, or if vapor modeling of groundwater contamination indicates that a vapor mitigation is not required for enclosed structures and EPD concurs

with the vapor modeling results.

Residential use of the Property requires:

- Vapor mitigation measures approved by EPD installed on enclosed structures placed within Area C and Area D as shown on Figure 1; or
- Vapor modeling of groundwater contamination within Area C and Area D as shown on Figure 1 indicating that a vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results; and
- Groundwater use is prohibited, unless EPD concurs that groundwater is remediated to residential RRS.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Utility Worker & Construction Worker Protection. Levels of PCE have been identified in groundwater above 0.286 mg/L and 0.082 mg/L, the calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and utility workers, respectively. The area(s) with concentrations above Type 5 RRS levels is identified as Area D on Figure 1. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 6 above.

   The exposure duration assumed for a utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

8. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

9. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental

Covenant, and to inspect records that are related to the Corrective Action.

10. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

11. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

12. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

13. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lots 333 and 334 of the 18th District of DeKalb County, Georgia, and being more particularly described as follows:

Starting at an iron pin at the intersection of the North line of Land Lot 334 and the Nortwesterly side of North Peachtree Road (70 foot right-of-way), running thence South 15 degrees 26 minutes West along the Northwest side of North Peachtree Road, 117.62 feet; thence South 24 degrees 59 minutes West along siad right-of-way, 97.22 feet to a point; thence South 32 degrees 49 minutes West along said right-of-way, 97.52 feet to a point; thence running South 40 degrees 46 minutes West along said right-of-way, 97.55 feet to a point; running thence South 48 minutes 24 minutes West along said right-of-way 82.79 feet to a point; thence North 48 degrees 29 minutes West 157.2 feet to a point in Nancy Creek; thence North 88 degrees 44 minutes 30 seconds West 435.3 feet to a point; thence North 1 degree 15 minutes 30 seconds West 78 feet to a point in Nancy Creek; thence North 70 degrees 5 minutes 30 seconds West 80.10 feet to a point in Nancy Creek; thence South 62 degrees 24 minutes 30- seconds West 73.50 feet to a point in Nancy Creek; thence north 66 degrees 25 minutes 30 seconds West 158.30 feet to a point in Nancy Creek; thence North 78 degrees 16 minutes West 585.0 feet to a point in Nancy Creek; thence South 70 degrees 55 minutes West 138.50 feet to a point in Nancy Creek; thence South 34 degrees 5 minutes West 118.40 feet to a point in Nancy Creek; thence South 28 degrees 55 minutes East 35.0 feet to a point; thence South 61 degrees 5 minutes West 194.4 feet to a point on the Easterly right-of-way of North Shallowford Road, said road being an 80 foot right-of-way; thence North 29 degrees 30 minutes West 98.54 feet to a point; thence North 25 degrees 59 minutes 30 seconds West 255.67 feet to a point; thence South 89 degrees 49 minutes East 2175.67 feet to a point on the Northwesterly side of North Peachtree Road and the point of beginning.

Less and except all that tract or parcel of land lying and being in Land Lot 334 of the 18th District, DeKalb County, Georgia, conveyed from ASL Limited Partnership to Carlton G. Chapman on December 23, 1988, recorded in Deed Book 5689 page 052, DeKalb County Records, and being more particularly described as follows:

TO FIND THE TRUE POINT OF BEGINNING, commence at an iron pin set at the intersection of the north line of Land Lot 334 and the northwesterly right-of-way of North Peachtree Road; running thence south 15 degrees 12 minutes 04 seconds west along said right-of-way a distance of 116.74 feet to an iron pin set; running thence south 24 degrees 38 minutes 05 seconds west a distance of 60.00 feet to an iron pin set and the TRUE POINT OF BEGINNING; from the TRUE POINT OF BEGINNING run thence along the northwesterly right-of-way of North Peachtree Road, south 24 degrees 38 minutes 05 seconds west a distance of 37.22 feet to an iron pin set; thence continuing along said right-of-way south 32 degrees 28 minutes 05 seconds west a distance of 978.52 feet to a point; running thence south 40 degrees 03 minutes 05 seconds west a distance of 82.79 feet to an iron pin set; running thence north 48 degrees 49 minutes 55 seconds west a distance of 157.20 feet to an iron pin set; running thence north 00 degrees 07 minutes 01 seconds west a distance of 141.34 feet to an iron pin set; running thence north 89 degrees 50 minutes 05 seconds east a distance of 311.32 feet to an iron pin set and the TRUE POINT OF BEGINNING. Said tract containing 1.151 acres as shown by plat of survey for Carl Chapman, prepared by Quadra-Tech, Inc., dated December 12, 1986, being certified by Wallace Long Hambrick, Georgia Registered Land Surveyor No. 1375.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:	The Trust of John F. Rowan, Sr. Mrs. Catherine Norris, Representative P.O. Box 82 Rancho Santa Fe, CA 92067
Grantee/Holder:	<Company Name or individual(s)> <Mailing address>
Grantee/Entity with express power to enforce:	State of Georgia Department of Natural Resources Environmental Protection Division 2 Martin Luther King Jr. Drive, SE Suite 1152 East Tower Atlanta, GA 30334
Parties with interest in the Property:	<Company Name or individual(s)> <Mailing address>

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and a restaurant on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Point of Compliance Monitoring Plan (as referenced in Activity 4)

These documents are available at the following locations:

Fashion Care Cleaners
2211 Savoy Drive
Chamblee, GA

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by the Trust of John F. Rowan, Sr., its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil in Area B on Figure 1, and groundwater in Area D on Figure 1 of the Property. Engineering controls required for the Property are the maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area A on Figure 1, the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures on the Property and any enclosed structures constructed on the Property within the areas indicated on attached Figure 1 (Area A) and Figure 2 (Area C). These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-8 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (attached). In addition, an Annual Point of Compliance Monitoring Report. as specified in the EPD approved Point of Compliance Monitoring Plan, must be submitted to the EPD until point of compliance monitoring is deemed unnecessary by the EPD in accordance with the specifications set forth in the Point of Compliance Monitoring Plan.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless EPD concurs that soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained on existing structures and on any additional enclosed structures

constructed until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS, or vapor modeling of groundwater and soil contamination in the respective areas defined on Figure 1 and 2 indicate that vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. The concrete and asphalt covering Area A in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within this area be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area with soil concentrations above these levels is identified as Area B on Figure 1, attached.

Soil - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/kg)	Utility Worker Threshold Concentration (mg/kg)	Comments
PCE	142	1015	

The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area with groundwater concentrations above Type 5 RRS is identified as Area D on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

Groundwater - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.12	0.82	
Trichloroethene	0.006	0.041	
Cis-1,2-dichloroethene	2.6	18.0	This chemical was identified above the construction worker threshold only.
Trans-1,1-dichloroethene	0.174	1.24	
Vinyl chloride	0.27	0.097	

Prior to conducting construction or subsurface utility work that may result in exposure to soil or groundwater in the designated Type 5 areas, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted soil or groundwater performed in the execution of work should be done in accordance with Items 7 and 6 above, respectively.

The exposure duration assumed for a utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, uitility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminated the work exposure pathway.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Property:

The property subject to this Environmental Covenant is the Southern Automatic Company N. Peachtree Tract (hereinafter "Property"), located at 4306 N. Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 25, 1974 from Hoke A. Rowan, Jr. to Southern Automatic Company recorded in Deed Book 3267, Page 130, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.51 acres of property developed at the time of this covenant with a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-005 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Vapor Intrusion Model - Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011: VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, dated March 14, 2012.

Add Property Address here, or Owner Contact Information if undeveloped.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by Southern Automatic Company, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene and cis-1,2-dichloroethene have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater in designated area of the property. Engineering controls required for the Property are:

- The maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area A of Figure 1, and
- The implementation and maintenance of vapor mitigation measures beneath any enclosed structures constructed on the Property within Area C on attached Figure 2, unless updated vapor modeling approved by the EPD indicates vapor mitigation is unnecessary.

These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, Southern Automatic Company (hereinafter "Southern Automatic"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated there under. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

Southern Automatic makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Southern Automatic and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, Southern Automatic or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activityand/orUseLimitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. . The notice shall explicitly state the requirements of Activities 5-7 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (attached).

1. Activity and Use Limitation(s). The Property shall be used for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant, unless the requirements identified below are followed for residential use. Non-residential use requires:
   - A vapor mitigation system or barrier be installed and maintained with the construction of any enclosed structures within the impacted soil Area A as indicated on attached Figure 1 and impacted groundwater Area C as indicated on Figure 2, until the HSRA regulated substances in soil and groundwater at the Property reach non-residential HSRA RRS,; or
   - Vapor modeling of groundwater and/or soil contamination in the respective areas defined on Figure 1 and 2 indicate that a vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results; and
   - Groundwater use is prohibited (unless EPD concurs that groundwater is remediated to residential RRS).

Residential use of the Property requires:
- A vapor mitigation system or barrier be installed and maintained with the construction of any enclosed structures within the impacted groundwater Area C as indicated on Figure 2, until the HSRA regulated substances in groundwater at the Property reach non-residential HSRA RRS; or
- Vapor modeling of groundwater contamination indicates that a vapor mitigation is not required for enclosed structures in this area and EPD concurs with the vapor modeling results,; and
- No residential structures should be constructed over the impacted soil Area A as indicated on attached Figure 1 and the requirements defined in Section 6 (Soil Limitations) below must be adhered to, unless the soil is remediated to residential standards in this area; and
- Groundwater use is prohibited, unless EPD concurs that groundwater is remediated to residential RRS.

5. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

6. Soil Limitation. The concrete and asphalt covering the area designated as Area A in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

7. Utility Worker & Construction Worker Protection. Levels of the following HSRA regulated chemicals have been identified in groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers as indicated:

HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.12	0.82	
Trichloroethene	0.006	0.041	
Cis-1,2-dichloroethene	2.6	18.0	This chemical was identified above the construction worker threshold only.

The area(s) with concentrations above Type 5 RRS levels is identified as Area D on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 5 above.

The exposure duration assumed for utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in one year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

8. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

9. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

10. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

11. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

12. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any

respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

13. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

RepresentationsandWarranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 11 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

Exhibit A Legal
Description

Beginning at an iron pin on the south line of Land Lot 343, said point being south 89 degrees 53 minutes west 213.00 feet from the westerly right of way of North Peachtree Road, (70' R/W), thence south 89 degrees 53 minutes west 225.00 feet along the south line of Land Lot 343 to an iron pin, thence north 0 degrees 7 minutes west 316.8 feet to an iron pin on the southerly right of way of I-285, thence south 74 degrees 49 minutes east along the southerly right of way of I-285, 203.9 feet to an iron pin, thence south 15 degrees 11 minutes west 120.0 feet to a masonry nail, thence south 22 degrees 15 minutes east to the south line of Land Lot 343 and the point of beginning.

Revised Johnson & Ettinger Vapor Models

- Parcel 18-343-13-001 (Georgia-Alabama Commercial Investments, LLC property)
- Parcel 18-343-13-005 (Southern Automatic Company property)

WINTER ENVIRONMENTAL

INTRODUCTION

This technical summary describes a vapor intrusion analysis of volatile organic compound (VOC) plumes originating from the Fashion Care Dry Cleaner site located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HSI 10786), and from the release of gasoline from the gas station located on Georgia-Alabama Commercial Investments, LLC property. The Johnson & Ettinger transport model (J&E), release 3.1, obtained from the EPA download page and updated with the November 2011 Regional Screen Level Table (RSLT), was used to estimate the incremental cancer risk and Hazard Quotient from VOCs in groundwater at the Georgia-Alabama Commercial Investments, LLC property (EZ-Serve Gas Station), Tax Parcel 18-343-13-001. Table E-1 summarizes the J&E model inputs and cumulative incremental risk results for the EZ-Serve Gas Station resulting from vapor intrusion from groundwater impacts. For reference, both the J&E Model and RSLT can be obtained from the USEPA[1,2]. The following discussion is obtained directly from the J&E User's Guide:

This revised version of the User's Guide corresponds with the release of Version 3.1 of the Johnson and Ettinger (1991) model (J&E) spreadsheets for estimating subsurface vapor intrusion into buildings. Several things have changed within the models since Version 2 was released in December 2000 and since the original version was released in September 1998. The following represent the major changes in Version 3.1 to be consistent with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Quality from Groundwater and Soils dated November 25, 2002.

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the EZ-Serve Gas Station vapor intrusion analysis summarized in Table E-1 are discussed in the following:

Groundwater Concentration (EZ-Serve Gas Station): Shallow groundwater water concentration data obtained in March, 2010, was evaluated as the basis for estimating representative VOC concentrations in groundwater beneath the EZ-Serve Gas Station property. VOC concentrations

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm
[2] http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/pdf/resair_sl_table_run_NOV2011.pdf

from monitoring wells FMW-1 and MW-11 were averaged in order to provide a representative groundwater concentration scenario for this location. Several monitoring wells surrounding the EZ-Serve Gas Station have or had free product (petroleum) and did not provide representative (or any) chlorinated compound data. Results of individual VOC constituent risk used to determine the cumulative incremental cancer and Hazard Quotient risk for the EZ-Serve Gas Station are shown in Table E-2.

Soil Profile SCS Classifications: As shown in Table E-1, soil boring FMW-1 was used to obtain the depth to groundwater, the soil characterization at the groundwater interface (Silty Clay) and the vadose zone lithology (Sand). These data have some of the largest influence on model results for the GW-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent "exposure per unit volume" composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of VOC vapor intrusion was conducted for EZ-Serve Gas Station property using the standardized Johnson & Ettinger convection/diffusion model Vesion 3.1 (2004), and updated with the November 2011 RSLT. The groundwater VOC concentrations utilized summarized in Tables E-2.

The conclusion for the EZ-Serve Gas Station property vapor intrusion analysis is that the incremental cancer risk, as calculated using very conservative model input assumptions, is below the HSRA standard of one-per-hundred thousand, and the calculated Hazard Quotient is below the threshold of one (1.0).

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

INTRODUCTION

This technical summary describes a vapor intrusion analysis of volatile organic compounds (VOCs) into the structure at Parcel #18-343-13-005, Southern Automatic Company property (Dentist Office), located adjacent to the Fashion Care Dry Cleaner at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HSI 10786). The Johnson & Ettinger transport model (J&E), release 3.1, was obtained directly from the EPA download page and updated with values from the November 2011 Regional Screening Level Table (RSLT). Tetrachloroethylene was updated to match the February 10, 2012 update from EPA. The J&E Model was then used to estimate the incremental cancer risk and Hazard Quotient from all detected VOCs based on sub-foundation soil vapor sampling conducted on May 31, 2011. For reference, the J&E Model[1] and November 2011 RSLT[2] can be obtained from current USEPA Websites. The following discussion is obtained directly from the J&E User's Guide:

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

In addition to the finite and infinite source models referred to above, two models (are included) that allow the user to input empirical soil gas concentration and sampling depth information directly into the spreadsheets. These models will subsequently estimate the resulting steady-state indoor air concentrations and associated health risks.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the Dentist Office property vapor intrusion analysis, associated with Fashion Care site, are summarized in Table D-1 are discussed in the following:

Soil Vapor Concentration: Shallow soil gas VOC concentration data were obtained beneath the foundation slab of the Dentist Office building on March 31, 2011. Samples were obtained approximately four inches below the concrete floor at sample locations VS-1 and VS-2. All detected VOC concentrations from this event were used in the J&E calculation to obtain a cumulative risk factor for cancer and hazard. 4-Ethyltoluene was included in the model as

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm
[2] http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/index.htm

tert-butylbenzene since the J&E compound database (VLOOKUP) does not specifically include this gasoline-related hydrocarbon.

Soil Profile SCS Classifications: As shown in Table D-1, soil boring FMW-1 was used to obtain the soil characterization of the vadose zone lithology (primarily Sand immediately below the slab). Due to proximity to surface, these data have minimal influence on model results for the SG-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent "exposure per unit volume" composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of cumulative VOC vapor intrusion was conducted for the Dentist Office (Parcel #18-343-13-005 Southern Automatic Company Property), associated with the Fashion Care site, using the updated Johnson & Ettinger convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004). Two soil vapor samples collected directly beneath the floor were used to obtain data input for the soil gas screening model discussed previously. Individual VOC constituents used to calculate the cumulative risk factors are summarized in Table D-2.

Results from the vapor intrusion analysis indicate a cumulative human health risk below the HSRA standard of one incremental cancer in a population of 100,000, and below the Hazard Quotient threshold of 1.0. This calculation is performed under conservative exposure assumptions.

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

Notes:

1) Inhalation Unit Risk Factor (IUR) and Reference Concentration (RfC) from Regional Screening Table (November 2011).
2) 4-Ethyltoluene is not in J&E compound data and calculated as tert-butylbenzene.
3) Risk Factor calculated on the highest detection in either sample VS-1 or VS-2.
4) N/A for Cancer Risk Factor indicates compound has no inhalation cancer factor in RSLT.

Sourrce: Regional Secreening Level (RSL) Chemical-Specific Parameters Supporting Table November 2010. USEPA.

Derivation Of VF Values (Soil-to-Air Volatilization Factor):

$$VF(m^3/kg) = \frac{(LS \times V \times DH)}{A} \times \frac{(p \times a \times T)^{1/2}}{(2 \times D_{ei} \times E \times K_{as} \times 10^{-3}\ kg/g)}$$

where:

LS = length of side of contaminated area (m):	45
V = wind speed in mixing zone (m/s):	2.25
DH = diffusion height (m):	2
A = area of contamination (cm^2)	2.03E+07
p = pi:	3.14159265
a = (cm^2/s):	$(D_{ei} \times E)/(E + (rs \times ((1-E)/K_{as})))$
T = exposure interval (s), industrial:	7.88E+08
r_s = density of soil solids (g/cm^3):	2.65
OC = soil organic carbon content fraction (unitless):	0.02
D_{ei} = effective diffusivity (cm^2/s):	$D_i \times E^{0.33}$
D_i = molecular diffusivity (cm^2/s):	chemical-specific
E = total soil porosity (unitless):	0.35
K_{as} = soil/air partition coefficient (g soil/cm^3 air):	$(H/K_d) \times 41$
H = Henry's law constant (atm-m^3/mol):	chemical-specific
K_d = soil-water partition coefficient (cm^3/g):	$K_{oc} \times OC$
K_{oc} = organic carbon partition coefficient (cm^3/g):	chemical-specific
m = meter	
s = second	
cm = centimeter	
g = gram =	
atm-m3/mol = atmospheres-cubic meters per mole

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with O.C.G.A § 44-16-8(a).

Fee Owner of Property/Grantor:
The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
PO Box 197
Carmel Valley, CA 93924

Grantee/Holder:
The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
PO Box 197
Carmel Valley, CA 93924

Grantee/Entity with express power to enforce:
State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1456 East Tower
Atlanta, GA 30334

Parties with interest in the Property:
None

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property currently (2014) consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and restaurant space on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Point of Compliance Monitoring Plan, as Approved by EPD

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1054 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq.* by the Trust of John F. Rowan, Sr., its successors and assigns, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-Dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules",

respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil and groundwater in designated areas of the property. Engineering controls required for the Property include (1) maintenance of the concrete/asphalt cover over impacted soil and (2) implementation and maintenance of vapor mitigation measures for any existing enclosed structures on the Property and any future enclosed structures that may be constructed on the Property within the area indicated on attached Figures 1 and 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) and/or EPD vapor risk thresholds commensurate with the use of the Property. Accordingly, this Environmental Covenant imposes such limitations upon the use of the Property.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the Trust and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of the Holder, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, the Holder or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2 that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Periodic Reporting. The Owner shall inspect the property and applicable property instruments at *least annually* to ensure compliance with this document. Annually, by no later than December 31st following the effective date of this Environmental Covenant, the Owner shall submit to EPD an Annual Report as specified in the EPD approved Point of Compliance Monitoring Plan including: groundwater detection-monitoring report results, maintenance and inspection activities, certification of non-residential use of the Property, and documentation stating whether or not the activity and use limitations in this Environmental Covenant are being abided by. Groundwater detection-monitoring requirements may be discontinued in the future by approval of the EPD in accordance with the VRP requirements for the Property; however, the annual Site Use, Activity and Monitoring Form (Exhibit C) shall be completed and submitted to the EPD as long as the UEC is in effect.

   In addition, the annual Site Use, Activity and Monitoring Form shall include the results of a visual inspection of the adjacent Tax Parcel No. 18-333-02-023 for indications of the development or potential development of enclosed structures in the area of groundwater impacts associated with the release of drycleaner impacts from the Property. Should the visual inspection conclude the impacted area of parcel 18-333-02-023 may be developed with an enclosed structure(s) the holder of this UEC shall assess the potential for vapor intrusion with tools/methods approved by the Georgia EPD. Should it be concluded through these tools/methods that the potential risk is above then current Georgia EPD regulatory guidance/thresholds, the owner of the Property shall approach the owner of parcel 18-333-02-023 to mitigate the risk.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS and/or EPD vapor risk thresholds are met.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation is not necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated: PCE.

   The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers: PCE, trichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

   The areas with soil or groundwater concentrations above these levels is identified on the attached Figures 1 and 2, respectively. Prior to conducting construction or subsurface utility work that may result in exposure to soil or groundwater in the designated areas, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted soil or groundwater performed in the execution of work should be done in accordance with Items 7 and 6 above, respectively.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the Holder, the Owner shall allow authorized representatives of EPD and/or Holder the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) Holder, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq.*

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 11 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

Georgia Environmental Protection Division
Branch Chief
Land Protection Branch
2 Martin Luther King Jr. Drive SE
Suite 1054 East Tower
Atlanta, GA 30334

The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
PO Box 197
Carmel Valley, CA 93924

Grantor has caused this Environmental Covenant to be executed pursuant to The Georgia Uniform Environmental Covenants Act on the 1 day of April, 2014.

Exhibit A

Legal Description

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin; thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court.

Property Use	1	Has the property use changed, has construction work been implemented on the property, or have building permits been applied for?		
	1a	If yes to 1, was EPD notified at least 30 days in advance?		
	1b	If no to 1a, attach a written explanation.		
Exposure	2	Has subsurface site work been conducted in the areas of the property where soil and/or groundwater concentrations exceed residential cleanup standards (UEC - Figure 1 - Areas A and B and Figure 2 - Areas C and D)?		
	2a	If yes to 2, was EPD notified within 3 business days following the site work?		
	2b	Has groundwater extraction or use for non-remedial purposes occurred?		
	2c	If no to 2a or yes to 2b, attach a written explanation, including a description regarding whether the requirements of the uniform environmental covenant (UEC) were adhered to.		
Engineering Controls	3	Is the concrete/asphalt cover intact and of sufficient quality to prevent exposure to soil in the area of the property where soil concentrations exceed residential cleanup standards (UEC – Figure 1 - Areas A and B)?		
	3a	If no to 3, are corrective measures being taken? Notify EPD within 60 days of identification of damaged concrete/asphalt with a plan and schedule to repair. Please attach a written explanation.		
	3b	Have enclosed structures been installed on the property or existing structures modified in such a way as to change potential vapor intrusion assumptions?		
	3c	Is the vapor mitigation system on the existing structure operating consistently and being maintained?		
	3d	• If yes to 3b, have vapor intrusion mitigation measures been implemented? Please attach a written explanation. • If no to 3c, please attach a written explanation.		
Permanent Markers	4	Are the permanent markers that delineate the restricted areas in place and legible?		
	4a	If no to 4, attach a written explanation.		
Property Instruments	5	Do all leases or other property instruments for the site have the applicable UEC and deed notice language inserted into them.		
	5a	If no to 5, attach a written explanation.		
Inspection	6	Date of inspection:		
	6a	Name of inspector:		
	6b	Photographs showing current land use, engineering controls, and permanent markers (attached)		
Inspection Parcel # 18-333-02-023	7	Date of inspection:		
	7a	Name of inspector:		
	7b	Photographs showing current land use(attached).		
	7c	Are there indications of the development or potential development of enclosed structures in the area of groundwater impacts associated with the release of drycleaner impacts from Parcel No. 18-343-13-002? If so, notify EPD within 30 days with a plan to assess the potential for vapor intrusion in such structures.		

Certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:
Southern Automatic Company
Lenbrook
3747 Peachtree Rd. NE, Apt. 1623
Atlanta, Ga. 30319

Grantee/Holder:
The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
PO Box 197
Carmel Valley, Ca 93924

Grantee/Entity with express power to enforce:
State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite ~~1152~~ 1456 East Tower
Atlanta, GA 30334

Parties with interest in the Property:

- None at time of execution

Property:

The property subject to this Environmental Covenant is the Southern Automatic Company N. Peachtree Tract (hereinafter "Property"), located at 4306 N. Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 25, 1974 from Hoke A. Rowan, Jr. to Southern Automatic Company recorded in Deed Book 3267, Page 130, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.51 acres of property developed at the time of this covenant with a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-005 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following documents:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Vapor Intrusion Model - Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011: VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, dated March 29, 2012.

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program

M-F 8:00 AM to 4:30 PM excluding state holidays

Office of Rowan Randal K DDS
4306 N Peachtree Rd # B
Chamblee, GA 30341

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by Southern Automatic Company, its successors and assigns, The Trust of John F. Rowan, Sr. (herinafter "Trust"), and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene and cis-1,2-dichloroethene have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The engineering control required for the Property is the maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area A of Figure 1. The

institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater on the Property in Area D of Figure 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, Southern Automatic Company (hereinafter "Southern Automatic"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the Trust and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

Southern Automatic makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of the Trust, EPD, Southern Automatic and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, the Trust or its successors and assigns, Southern Automatic or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-8 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (~~attached~~ EXHIBIT C).

5. Activity and Use Limitation(s). The current use of the Property is non-residential as defined according to Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any future development of the property with enclosed structures, whether residential or non-residential as defined above shall require the following:

   - A vapor mitigation system or barrier be installed and maintained with the construction of any enclosed structures within the impacted soil Area A as indicated on attached Figure 1 and impacted groundwater Area D as indicated on Figure 2, until the HSRA regulated substances in soil and groundwater at the Property reach non-residential HSRA RRS; or vapor modeling of groundwater and/or soil contamination in Areas A and D on Figure 1 and 2, respectively, indicate that vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results; and
   - Groundwater use is prohibited (unless EPD concurs that groundwater is remediated to residential RRS).

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. The concrete and asphalt covering the area designated as Area A in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Soil removed from this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste), and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. Levels of the following HSRA regulated chemicals have been identified in groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers as indicated:

HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.12	0.82	
Trichloroethene	0.006	0.041	
Cis-1,2-dichloroethene	2.6	18.0	This chemical was identified above the construction worker threshold only.

The area with chemical concentrations in groundwater above Type 5 RRS levels is identified as Area D on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 6 above.

The exposure duration assumed for a utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, Area A in Figure 1 and Area C in Figure 2; should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/ Trust, the Owner shall allow authorized representatives of EPD and/or the Trust the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) the Trust, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

RepresentationsandWarranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 11 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

- Georgia Environmental Protection Division, Branch Chief, Land Protection Branch, 2 Martin Luther King Jr. Drive SE Suite 1454 East Tower, Atlanta, GA 30334.

- Southern Automatic Company, Lenbrook, 3747 Peachtree Rd. NE, Apt. 1623, Atlanta, GA 30319.

- The Trust of John F. Rowan, Sr., Attn. Mrs. Catherine Norris, Representative, PO Box 197, Carmel Valley, Ca 93924

Grantor has caused this Environmental Covenant to be executed pursuant to The Georgia Uniform Environmental Covenants Act, on the 24 day of July, 20 12.

Exhibit C
SITE USE, ACTIVITY, AND MONITORING EVALUATION FORM

Fashion Care/Executive Care Site, Parcel No. 18-343-13-005,
4306 N. Peachtree Road, Chamblee, DeKalb County, Georgia

TYPE	No.	CRITERIA RESPONSE	YES	NO
Property Use	1	Has the property use changed, has construction work been implemented on the property, or have building permits been applied for?		
	1a	If yes to 1, was EPD notified at least 30 days in advance?		
	1b	If no to 1a, attach a written explanation.		
Exposure	2	Has subsurface site work been conducted in the areas of the property where soil and/or groundwater concentrations exceed residential cleanup standards (UEC - Figure 1 - Area A and Figure 2 - Areas C and D)?		
	2a	If yes to 2, was EPD notified within 3 business days following the site work?		
	2b	Has groundwater extraction or use for non-remedial purposes occurred?		
	2c	If no to 2a or yes to 2b, attach a written explanation, including a description regarding whether the requirements of the uniform environmental covenant (UEC) were adhered to.		
Engineering Controls	3	Is the concrete/asphalt cover intact and of sufficient quality to prevent exposure to soil in the area of the property where soil concentrations exceed residential cleanup standards (UEC – Figure 1 - Area A)?		
	3a	If no to 3, are corrective measures being taken? Please attach a written explanation.		
	3b	Have enclosed structures been installed on the property or existing structures modified in such a way as to change potential vapor intrusion assumptions?		
	3c	If yes to 3b, have vapor intrusion mitigation measures been implemented? Please attach a written explanation		
Permanent Markers	4	Are the permanent markers that delineate the restricted areas in place and legible?		
	4a	If no to 4, attach a written explanation.		
Property Instruments	5	Do all leases or other property instruments for the site have the applicable UEC and deed notice language inserted into them.		
	5a	If no to 5, attach a written explanation.		
Inspection	6	Date of inspection:		
	6a	Name of inspector:		
	6b	Photographs showing current land use, engineering controls, and permanent markers (attached)

RE: Voluntary Remediation Program
Monitoring Plan
Fashion Care/Executive Care Site
HSI No. 10786
2211 Savoy Drive, Chamblee, Georgia
DeKalb County
Project No. 2015.0058.01

Dear Ms. Futch:

This Voluntary Remediation Program Monitoring Plan for the Fashion Care/Executive Care Site, HSI No. 10786, 2211 Savoy Drive, Chamblee, Georgia, DeKalb County; is being submitted on behalf of John F. Rowan, Sr. Item IV Trust. Assessment and corrective action has been conducted on this Site to bring it into compliance with the VRP, and documentation is provided in the VRP Compliance Status Report (CSR) dated April 7, 2014, submitted to the Georgia Environmental Protection Division. The VRP CSR petitions for removal of the Site from the HSI. This Monitoring Plan is to provide post-VRP CSR monitoring of select exposure pathways to confirm the conclusions drawn in the VRP CSR.

The substantive work described in this report was performed under the direction of Leonard J. Diprima, Jr., P.G. Please contact Mr. Diprima if you have any questions or comments regarding the information contained herein.

Sincerely,

UNITED CONSULTING

Leonard J. Diprima, Jr., P.G.

1.0 BACKGROUND

United Consulting has prepared this Voluntary Remediation Program (VRP) Monitoring Plan for the Fashion Care Site (Site/Fashion Care), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust), the previous owner of the property and responsible party under the VRP. At the time this Monitoring Plan was prepared, the Site remains listed on the HSI. The Site location is presented on Figure 1.

Figure 2 shows the Fashion Care property and surrounding properties. The Fashion Care/former Trust property currently has a single, one-story building that contains a dry cleaner on the west side with on-site cleaning, and a vacant space on the east side. A dry cleaner has been located in the building since the building was constructed in the 1960's. The east side of the building has contained various retail and restaurant businesses. The remainder of the property is paved with asphalt.

Parcel 18-343-13-005, street address 4306 North Peachtree Road, Chamblee, Georgia is immediately to the west, and is owned by Mr. H.A. Rowan of Southern Automatic Company. The property has a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. The remainder of the property is paved with asphalt.

Parcel 18-343-13-001, street address 4308 North Peachtree Road, Chamblee, Georgia is immediately to the east, and is owned by Mr. Marvin Hewatt of Georgia-Alabama Commercial Investments, LLC. The property has a single, one-story building that contains a gas station (UST Facility I.D. No. 900341*1; EZ-Serve Site). The remainder of the property is paved with asphalt and concrete.

Parcel 18-333-02-023, has no street address and is immediately to the east. It is owned by Asl Limited Partnership of Boca Raton, Florida; and is wooded, undeveloped property. The south side of the parcel is bordered by Nancy Creek.

A historical release of tetrachloroethene (PCE) and its degradation products to soil from dry cleaner operations conducted at the Fashion Care dry cleaner property was identified in 2004. As a result, a Hazardous Sites Response Act (HSRA) Program Release Notification was submitted to the Georgia Environmental Protection Division (EDP) HSRA Program on March 24, 2004. The EPD listed the property/Site on the Georgia HSI on July 29, 2004 for a release of regulated constituents to soil. On June 30, 2006 the EPD issued a HSRA CSR Call-in Letter to the Trust requiring the assessment of soil and groundwater related to the historical release. The constituents of interest (COI), established during the HSRA investigation and approved by the HSRA Program, and later by the VRP, are PCE and its regulated degradation constituents, and are listed in Table 1. Table 1 also provides a list of other constituents identified but not associated with the Fashion Care release.

During the course of addressing the release of dry cleaner constituents under the HSRA Program and VRP, the Trust (owner at the time) required the current dry cleaner tenant to discontinue the use of PCE in their operation and replaced the PCE dry cleaning machine in May 2009 with a non-chlorinated solvent based dry cleaning machine. No PCE remains on the Site and the last additional suspected source of release, a leaking sanitary sewer collection sump that was part of the original building construction in the rear of the building, has been twice cleaned and resealed.

On July 9, 2010 the Trust entered the Site into the VRP with the submittal of a VRP CAP, which was approved with comments by the EPD in December 2, 2010. Since EPD approval of the VRP CAP and entry into the VRP, site evaluation and corrective actions under the VRP have progressed steadily, and updates of the progress have been documented in Semiannual Status Reports beginning June 2, 2011 through the last report submitted December 19, 2014.

During the course of the HSRA and VRP assessments conducted for soil, groundwater, surface water, sediment and soil vapor; impacts associated with the release of PCE were identified on the following properties. Each of these properties was originally entered into the VRP as part of the Site as a "qualifying property", as defined by the Voluntary Remediation Program Act (Act).

- Fashion Care property, 2211 Savoy Drive, Chamblee, Georgia (Parcel 18-343-13-002) – Soil, groundwater and potential soil vapor impacts were identified.

- Southern Automatic Company property, 4306 North Peachtree Road, Chamblee, Georgia (Parcel 18-343-13-005) – Soil, groundwater and the potential for soil vapor impacts were identified.

- Asl Limited Partnership property, no street address and immediately to the east bordering Nancy Creek (Parcel 18-333-02-023) – Groundwater, surface water and the potential for soil vapor impacts were identified.

- Georgia-Alabama Commercial Investments, LLC property, 4308 North Peachtree Road, Chamblee, Georgia (Parcel 18-343-13-001) – Groundwater and the potential for soil vapor impacts were identified.

Each of these properties were also found to be impacted by a release of petroleum from gas station underground storage tank (UST) systems located on the Georgia-Alabama Commercial Investments, LLC property (UST Facility I.D. No. 900341*1; EZ-Serve Site). This petroleum release underwent remediation through the EPD Underground Storage Tank Management Program (UST Program) and received a "no further action required" status. A dual-phase extraction system was operated to recover free-phase gasoline on the property. The dissolved phase gasoline constituents have migrated off the property to the south and west. The remediation system was not designed to address the groundwater plume, and the plume of petroleum constituents has comingled with the dissolved-phase chlorinated solvent plume originating from the Trust property.

As part of the assessment of the release under the VRP, the horizontal and vertical extent of the soil impacts were delineated. Figure 3 shows the extent of impacted soil relative to Type 3/4 non-residential Risk Reduction Standards (RRS) and Type 5 RRS. The majority of soil above non-residential RRS is present beneath the concrete slab of the existing building and on the Fashion Care property. A small area of impacted soil is projected to be on the adjacent Southern Automatic Company property based upon the soil sample control. Soil impacts extend vertically to the water table in much of this area. The soil remedy established under the VRP is a Type 5 solution using engineering and institutional controls to mitigate the potential exposure pathways. The existing concrete building slab and surrounding asphalt paving provides a cap for the impacted soil, and the maintenance of the cap and health and safety requirements associated with future construction or utility work/worker exposure is assured through the use of Uniform Environmental Covenants (UECs) that have been established for the Fashion Care/Parcel #5 and Southern Automatic Company properties.

The horizontal and vertical extent of groundwater impacts from the dry cleaner release were delineated under the VRP. The most recent set of groundwater data collected from the Site was in April 2014, and is depicted on Figure 3 relative to Type 1 and 3 RRS and Type 5 RRS. The plume extends southwest from the Fashion Care property source area toward and intersecting with Nancy Creek bordering the Asl Limited Partnership property. Impacted groundwater is present on portions of the Fashion Care, Southern Automatic Company, Asl Limited Partnership and the Georgia-Alabama Commercial Investments properties. The plume was determined to be confined vertically to the water table aquifer, which is perched upon a dense, dry silt layer that is at least ten feet thick across the Site.

Numerous rounds of surface water samples were collected from Nancy Creek along the length of the groundwater plume's intersection with the creek. The COI have not been identified in any of the SW samples collected to date. In addition, sediment samples collected in this area also did not detect any of the COI.

The potential receptor for groundwater impacts is Nancy Creek. Due to the depth to groundwater across the Site, on average 10 feet or more below grade, direct contact by potential construction or utility workers was determined not to be a potential completed pathway for exposure. Surface water sampling and fate and transport modeling of the release have indicated that the groundwater plume is not predicted to be a potential completed pathway for exposure. This will be confirmed by the VRP Monitoring Program, and recalibration of the fate and transport model will be performed using the additional data collected. The proposed VRP Monitoring Program is presented below.

2.0 PREVIOUS FATE AND TRANSPORT MODELING

Contaminant transport modeling was conducted to evaluate the potential for additional exposure pathways to arise, and for known exposure pathways to become complete at levels that could impact potential receptors above regulatory limits. The known receptors are the portions of the properties that have been impacted by the migration of the groundwater contaminant plume, and Nancy Creek, which receives discharge from the plume. A detailed Contaminant Transport Modeling Report describing the contaminant transport modeling and findings was presented in the VRP Compliance Status Report dated April 7, 2015.

Contaminant transport was evaluated using the following steps:

- Modeling of the transfer of soil contamination to the groundwater flow system by modeling the transfer of contaminant mass to the groundwater system with a soil flushing calculation.

- Groundwater modeling of flow and contaminant transport for the Site. Three-dimensional groundwater flow was simulated using MODFLOW 2000 (Harbaugh et al, 2000).
- The computer code used to simulate contaminant transport was MT3DMS (Zheng and Wang, 1999). MT3DMS is a code for simulating transport of contaminants in three dimensions and uses the outputs from MODFLOW to calculate simulated transport in groundwater.

- Contaminant transport modeling was conducted in three distinct steps. The first step was to model distribution of total dissolved VOCs in the groundwater. The second step was to model the anticipated maximum concentration of PCE in the future, as this compound is the most prevalent compound at the Site with the lowest ISWQS. The third step was to evaluate the likely relative concentrations of the daughter products of PCE decay at the time of the maximum future PCE concentration at the Site, and then compare these concentrations to the appropriate environmental standards. In order to understand the maximum expected concentration of each of the daughter products at the time of maximum PCE concentration, a simulation using BIOCHLOR22 was performed.

- In order to evaluate the potential for PCE and/or its degradation products to be present in Nancy Creek above ISWQS, a groundwater to surface water mixing calculation was performed. The concentrations for PCE, TCE, DCE and VC in groundwater predicted in the previously modeled sections were then blended based on modeled groundwater discharge and the volume of flow in Nancy Creek at the Site at 7Q10 conditions.

Based on the modeling exercises completed, the plume will likely remain stable or decrease over the next 60 years. The plume generally appears to migrate down the axis of the Nancy Creek valley on the northern side of the creek. Generally, the overall plume distribution appears to be monitored adequately by the existing well network. Given these observations, the following conclusions/recommendations were made:

- The predicted plume footprint does not expand substantially beyond the existing monitoring well network;

- As the source area is depleted, the center of maximum plume concentration will slowly migrate and continue to degrade as it migrates toward Nancy Creek;

- The maximum modeled concentration of PCE is predicted to discharge to Nancy Creek approximately 41 years after the source remediation effort conducted in 2008;

- Mixing calculations for the predicted maximum concentrations of PCE and daughter products in Nancy Creek indicate that ISWQS will not be exceeded; and

- No other receptors for the groundwater plume are present within the existing or predicted footprint of the VOC plume at the Site.

The execution of this groundwater and surface water sampling plan, followed by an update of the fate and transport modeling using the additional data, will be used to confirm the exposure pathway predictions above.

3.0 MONITORING PLAN

Based upon the assessment and fate and transport modeling of the dry cleaner COI release on the Fashion Care property, it has been determined that groundwater and surface water monitoring should be conducted at the Site to confirm potential receptors identified during these activities will not be exposed to the COI in the future.

3.1 Groundwater and Surface Water Monitoring

In order to confirm the predicted exposure trends for the Site, a limited groundwater and surface water sampling plan is to be initiated, and the data acquired will be input into the contaminant transport model to confirm the current results.
Sampling will be conducted using the following network of existing monitoring wells and surface water locations for two consecutive annual sampling events. The locations are shown on Figure 4 and monitoring well construction logs are attached.

- Monitoring Wells: FMW-4, FMW-6, FMW-9, FMW-12, and FMW-16
- Surface Water Locations: SW-1, SW-2 and SW-3.

Samples will be collected for Target Compound List (TCL) volatile organic compounds (VOCs), and sample results will be evaluated for the site-specific VOC list previously approved under the VRP and provided in Table 1. At the conclusion of the second sampling event, the data acquired will be input into a fate and transport model to confirm the current results. Annual monitoring reports will be submitted to the EPD VRP. The second annual monitoring report will also present the results of the fate and transport modeling with recommendations based upon the results.
It is noted that should a detection of COI be found in surface water during the implementation of the VRP Monitoring Plan, the Surface Water Corrective Action Plan presented in the Semiannual Status Report dated July 2, 2014, and approved by the EPD, will be implemented. No constituents associated with the release of PCE at the Site have been identified in Nancy Creek to date.

The annual sampling events will be conducted in early December of each year, to begin the year this Plan is approved. December has been chosen based upon ease of accessibility to the monitoring well locations on the Asl Limited Partnership property due to heavy undergrowth. Reporting of the sampling results is presented in Section 3.3 below.

3.1.1 Groundwater Sampling

Monitoring wells FMW-4, FMW-6, FMW-9, FMW-12, and FMW-16, will be sampled for Target Compound List (TCL) volatile organic compounds (VOCs) and analyzed by Method 8260B. Prior to sampling, groundwater elevation measurements will be collected from all the monitoring wells on the Site. This data will be used to construct a potentiometric surface map of the water table (upper water bearing zone) representative of the sampling event.

Groundwater sampling was conducted in accordance with USEPA Region 4 Field Branches Quality System and Technical Procedures in effect at the time of sampling. Sampling will be conducted using a peristaltic pump and the low flow/low stress method. Field measurements of pH, conductivity, dissolved oxygen, oxidation-reduction potential and temperature will be collected until all parameters have stabilized within approximately 10 percent for three consecutive readings. When this stabilization point is reached, samples will be collected for TCL VOCs using the pipette method. A groundwater sampling data sheet will be completed for each monitoring well sampled to record the conditions under which the sampling was conducted, procedures followed, measurements recorded, and other pertinent information. The groundwater sampling data sheet will be provided in the Annual Report submitted to the EPD.

Groundwater samples will be secured in an ice-filled cooler and hand delivered to the laboratory for analysis. Laboratory work orders, and chain-of-custody documents, which include information on project name and number, sampler(s) signature, project manager's name, sample matrix, sample identification/station ID number, date and time of sample collection, total number of containers per sample station, requested analyses and number of containers per analyses per sample station, preservatives, and any other pertinent comments for the laboratory, will be placed within each cooler for delivery.

3.1.2 Surface Water Sampling

Surface Water Locations SW-1, SW-2 and SW-3, will be sampled for TCL VOCs and analyzed by Method 8260B. Three surface water sampling locations were established to consistently evaluate the effect of the groundwater plume intersecting Nancy Creek. The locations are shown on Figure 4 and are described as follows:

- SW-1, located upgradient and outside the area where the groundwater plume intersects Nancy Creek;

- SW-2, located downstream of SW-1 and within the area where the groundwater plume intersects Nancy Creek; and

- SW-3, located downstream of SW-2 and within the area of highest impacts where the groundwater plume intersects Nancy Creek.

Surface water elevation measurements will be collected at each sample location based on an established elevation reference point for each location. This data will be used in the construction of the potentiometric surface map representative of the sampling event.

The sampling will proceed from the downstream location to the upstream location. Sampling will be conducted using a pre-cleaned stream sampler that extends on a pole up to reach out into the stream, or other appropriate method. Samples will them be transferred to the sample containers (40 ml vials w/ preservative) provided by the laboratory. This will be done for safety reasons due to the height of the stream bank on the Asl Limited Partnership property side of the stream. The samples will be collected from mid-depth in the center of the stream. A surface water sampling

data sheet will be completed for each sample location to record the conditions under which the sampling was conducted, procedures followed, measurements recorded, and other pertinent information. The sampling data sheet will be provided in the Annual Report submitted to the EPD.

Surface water samples will be secured in an ice-filled cooler and hand delivered to the laboratory for analysis. Laboratory work orders and chain-of-custody documents, which include information on project name and number, sampler(s) signature, project manager's name, sample matrix, sample identification/station ID number, date and time of sample collection, total number of containers per sample station, requested analyses and number of containers per analyses per sample station, preservatives, and any other pertinent comments for the laboratory, will be placed within each cooler for delivery.

3.2 Fate and Transport Modeling

Contaminant transport modeling will be conducted after receiving the second annual round of groundwater and surface water sample results. Modeling will be conducted to evaluate the potential for additional exposure pathways to arise, and for known exposure pathways to become complete at levels that could impact potential receptors above regulatory limits. Modeling conducted in 2015 and provided in the VRP CSR dated April 7, 2015, indicated that no receptors would be impacted above regulatory limits. The known receptors are the portions of the properties that have been impacted by the migration of the groundwater contaminant plume and Nancy Creek, which receives discharge from the plume.

Contaminant transport will be evaluated using the following steps, or alternate method approved by the EPD in advance:

- Modeling of the transfer of soil contamination to the groundwater flow system by modeling the transfer of contaminant mass to the groundwater system with a soil flushing calculation.

- Groundwater modeling of flow and contaminant transport for the Site. Three-dimensional groundwater flow will be simulated using MODFLOW 2000 (Harbaugh et al, 2000) or current version.

- MT3DMS (Zheng and Wang, 1999) computer code will be used to simulate contaminant transport. MT3DMS is a code for simulating transport of contaminants in three dimensions and uses the outputs from MODFLOW to calculate simulated transport in groundwater.

- Contaminant transport modeling will be conducted in three distinct steps. The first step will model the distribution of total dissolved VOCs in the groundwater. The second step will model the anticipated maximum concentration of PCE in the future, as this compound is the most prevalent compound at the Site with the lowest ISWQS. The third step will evaluate the likely relative concentrations of the daughter products of PCE

decay at the time of the maximum future PCE concentration at the Site, and then compare these concentrations to the appropriate environmental standards. In order to understand the maximum expected concentration of each of the daughter products at the time of maximum PCE concentration, a simulation using BIOCHLOR22 will be performed.

- In order to evaluate the potential for PCE and or its degradation products to be present in Nancy Creek above ISWQS, a groundwater to surface water mixing calculation will be performed. The concentrations for PCE, TCE, DCE and VC in groundwater predicted in the previous modeled sections will be blended based on modeled groundwater discharge and the volume of flow in Nancy Creek at the Site at 7Q10 conditions.

Based on the modeling exercises completed, the plume will be evaluated relative to:

- The predicted plume's footprint potential to expand substantially beyond the existing monitoring well network;
- As the source area is depleted, will the plume continue to degrade as it migrates toward Nancy Creek;
- When the maximum modeled concentration of PCE is predicted to discharge to Nancy Creek;
- Based upon the mixing calculations for the predicted maximum concentrations of PCE and daughter products to enter Nancy Creek, will ISWQS be exceeded; and
- Are any other receptors for the groundwater plume present within the existing or predicted footprint of the VOC plume at the Site?

These results will then be compared to the modeling results provided in the Contaminant Transport Modeling Report in the VRP CSR dated April 7, 2015, to determine if the monitoring of the Site should be continued, or if a proposal should be provided to EPD to end the VRP Monitoring Plan.

3.3 Annual Reporting

Two annual reports will be prepared and submitted to the EPD following the annual sampling events. The first Annual Monitoring Report will be submitted within three weeks following receipt of the laboratory data report. The report will:

- Summarize the field activities conducted;
- Tabulate the current and previous sample results, and compare the results to applicable regulatory standards approved for the Site for groundwater and surface water;

- Present the current laboratory results on a Site map showing the extent of the groundwater plume and surface water detections relative to regulatory standards and provide maps from previous events;

- Present a current potentiometric surface map based upon the current sampling event measurements collected, and provide maps from previous events;

- Provide graphs of concentration vs. time of the current and previous results from individual monitoring wells sampled;

- Provide laboratory data reports and sampling data sheets completed for the sampling event; and

- Provide narrative that evaluates the information presented.

The second Annual Monitoring Report will be submitted within six weeks following receipt of the laboratory data report. The additional time will be utilized to conduct the fate and transport modeling described in Section 3.2. Fate and transport modeling will be conducted using the data acquired from the two annual sampling events. The report will include the same information provided in the first Annual Monitoring Report, and:

- Text, tables and figures that describe the fate and transport modeling of the data;

- Provide an evaluation of the modeling results relative to the previous modeling results conducted in 2014;

- Provide an evaluation of current and future exposure pathways as described in Section 3.2; and

- Provide a recommendation on ending or continuing the VRP Monitoring Plan based upon the results and evaluation of the past two years of data and fate and transport model predictions.

3.4 Termination of Plan

This VRP Monitoring Plan is currently scheduled to be implemented for a two-year period to confirm if the exposure pathway conclusions drawn in the VRP CSR submitted April 7, 2014 are confirmed. The full data set acquired during the two-year monitoring period will be evaluated as described in the previous Sections of this Plan. Based upon the results of this evaluation, a recommendation will be made to EPD to terminate this Plan and conclude that all activities for the Site under the VRP are complete, or to make alternative recommendations to further evaluate the exposure pathways.

Should the conclusions drawn in the Annual Monitoring Report submitted following the second annual sampling event confirm the exposure pathway evaluations presented in the VRP CSR, and the EPD agrees with this conclusion; all the monitoring wells remaining on the Site that are part of the VRP will be properly abandoned in accordance with EPD abandonment requirements in effect at that time. A letter report will be submitted to the EPD following abandonment to confirm that this task has been completed to conclude all Site activities.
