RE: Voluntary Remediation Program
Compliance Status Report
Fashion Care/Executive Care Site
HSI No. 10786
2211 Savoy Drive, Chamblee, Georgia
DeKalb County
Project No. 2015.0058.02

Dear Ms. Futch:

This Voluntary Remediation Program Compliance Status Report (CSR) for the Fashion Care/Executive Care Site, HSI No. 10786, 2211 Savoy Drive, Chamblee, Georgia, DeKalb County; is being submitted on behalf of John F. Rowan, Sr. Item IV Trust. Assessment and corrective action has been conducted on this site to bring it into compliance with the VRP, and subsequently, removal from the HSI.

The substantive work described in this report was performed under the direction of Leonard J. Diprima, Jr., P.G. Please contact Mr. Diprima if you have any questions or comments regarding the information contained herein.

Sincerely,

UNITED CONSULTING

Leonard J. Diprima, Jr., P.G.

1.0 INTRODUCTION

United Consulting has prepared this Voluntary Remediation Program (VRP) Compliance Status Report (CSR) for the Fashion Care/Executive Care Site (Site/Fashion Care), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust), the previous owner of the property and responsible party under the VRP. The Site location is presented on Figure 1.

Figure 2 shows the Fashion Care property and surrounding properties. The Fashion Care /former Trust property currently has a single, one-story building that contains a dry cleaner on the west side with on site cleaning, and a vacant space on the east side. A dry cleaner has been located in the building since the building was constructed in the 1960's. The east side of the building has contained various retail and restaurant businesses. The remainder of the property is paved with asphalt.

Parcel 18-343-13-005, street address 4306 North Peachtree Road, Chamblee, Georgia is immediately to the west, and is owned by Mr. H.A. Rowan of Southern Automatic Company. The property has a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. The remainder of the property is paved with asphalt.

Parcel 18-343-13-001, street address 4308 North Peachtree Road, Chamblee, Georgia is immediately to the east, is owned by Mr. Marvin Hewatt of Georgia-Alabama Commercial Investments, LLC. The property has a single, one-story building that contains a gas station (UST Facility I.D. No. 900341*1; EZ-Serve Site). The remainder of the property is paved with asphalt and concrete.

Parcel 18-333-02-023, has no street address and is immediately to the east. It is owned by Asl Limited Partnership of Boca Raton, Florida; and is wooded, undeveloped property. The south side of the parcel is bordered by Nancy Creek.

A historical release of tetrachloroethene (PCE) and its degradation products to soil from dry cleaner operations conducted at the Fashion Care dry cleaner property was identified in 2004. As a result, a Hazardous Sites Response Act (HSRA) Program Release Notification was submitted to the Georgia Environmental Protection Division (EDP) HSRA Program on March 24, 2004. The EPD listed the property/Site on the Georgia HSI on July 29, 2004 for a release of regulated constituents to soil. A copy of the HSI listing and the EPD HSI Listing Letter is in Appendix A. On June 30, 2006 the EPD issued a HSRA CSR Call-in Letter to the Trust requiring the assessment of soil and groundwater related to the historical release. A summary of assessment and remedial actions conducted by the Trust under the HSRA Program are summarized in Sections 7.0 and 8.0, respectively. The constituents of interest (COI) established during the HSRA investigation and approved by the HSRA Program, and later by the VRP, are PCE and its regulated degradation constituents and are listed in Table 1. Table 1 also provides a list of other constituents identified but not associated with the Fashion Care release.

During the course of addressing the release of dry cleaner constituents under the HSRA Program and VRP, the Trust (owner at the time) required the current dry cleaner tenant to discontinue the use of PCE in their operation and the PCE dry cleaning machine was replaced in May 2009 with a non-chlorinated solvent based dry cleaning machine. No PCE remains on the Site and the last additional suspected source of release, a leaking sanitary sewer collection sump that was part of the original building construction in the rear of the building, has been twice cleaned and resealed.

The HSRA Program on February 23, 2010 presented a proposed Consent Order to the Trust and requested a revised HSRA Corrective Action Plan (HSRA CAP). In response and in place of a revised HSRA CAP, on July 9, 2010 the Trust entered the Site into the VRP with the submittal of a VRP CAP (Appendix B), which was approved with comments by the EPD in two correspondences dated December 2, 2010 (Appendix A). Since EPD approval of the VRP CAP, and entry into the VRP, site evaluation and corrective actions under the VRP have progressed steadily and updates of the progress documented in Semiannual Status Reports beginning June 2, 2011 through the last report submitted December 19, 2014. The eight VRP Semiannual Status Reports previously submitted to the EPD are provided in Appendix B. A summary of the activities conducted under the VRP are presented in the Sections below.

During the course of the HSRA and VRP assessments conducted for soil, groundwater, surface water, sediment and soil vapor; impacts associated with the release of PCE were identified on the following properties. Each of these properties was originally entered into the VRP as part of the Site as a "qualifying property", as defined by the Voluntary Remediation Program Act (Act).

- Fashion Care property, 2211 Savoy Drive, Chamblee, Georgia (Parcel 18-343-13-002) – Soil, groundwater and potential soil vapor impacts were identified.

- Southern Automatic Company property, 4306 North Peachtree Road, Chamblee, Georgia (Parcel 18-343-13-005) – Soil, groundwater and the potential for soil vapor impacts were identified.

- Asl Limited Partnership property, no street address and immediately to the east bordering Nancy Creek (Parcel 18-333-02-023) – Groundwater, surface water and the potential for soil vapor impacts were identified.

- Georgia-Alabama Commercial Investments, LLC property, 4308 North Peachtree Road, Chamblee, Georgia (Parcel 18-343-13-001) – Groundwater and the potential for soil vapor impacts were identified.

Each of these properties were also found to be impacted by a release of petroleum from gas station underground storage tank (UST) systems located on the adjacent Georgia-Alabama Commercial Investments, LLC property (UST Facility I.D. No. 900341*1; EZ-Serve Site). This petroleum release underwent remediation through the EPD Underground Storage Tank Management Program (UST Program) and received a "No Further Action Required" status. A dual-phase extraction system was operated to recover free-phase gasoline on the property. The dissolved phase gasoline constituents have migrated off the property to the south and west. The

remediation system was not designed to address the groundwater plume, and the plume of petroleum constituents has comingled with the dissolved-phase chlorinated solvent plume originating from the Fashion Care property.

As part of the assessment of the release under the VRP, the horizontal and vertical extent of the soil impacts were delineated. Figure 3 shows the extent of impacted soil relative to Type 3/4 non-residential Risk Reduction Standards (RRS) and Type 5 RRS. The majority of soil above non-residential RRS is present beneath the concrete slab of the existing building and on the Fashion Care property. A small area of impacted soil is projected to be on the adjacent Southern Automatic Company property based upon the soil sample control. Soil impacts extend vertically to the water table in much of this area. The soil remedy established under the VRP is a Type 5 solution using engineering and institutional controls to mitigate the potential exposure pathways. The existing concrete building slab and surrounding asphalt paving provides a cap for the impacted soil, and the maintenance of the cap, and health and safety requirements associated with future construction or utility work/worker exposure is assured through the use of Uniform Environmental Covenants (UECs) that have been established for the Fashion Care and Southern Automatic Company properties.

The horizontal and vertical extent of groundwater impacts from the dry cleaner release have been delineated under the VRP. The most recent set of groundwater data collected from the Site was in April 2014 and is depicted on Figure 4 relative to Type 1 and 3 RRS and Type 5 RRS. The plume extends southwest from the Fashion Care property source area toward and intersecting with Nancy Creek bordering the Asl Limited Partnership property. Impacted groundwater is present on portions of the Fashion Care, Southern Automatic Company, Asl Limited Partnership and the Georgia-Alabama Commercial Investments properties. The plume was determined to be confined vertically to the water table aquifer which is perched upon a dense dry silt layer that is at least ten feet thick across the Site.

Numerous rounds of surface water samples were collected from Nancy Creek along the length of the groundwater plumes intersection with the creek. The COI have not been identified in any of the SW samples collected to date. In addition, sediment samples collected in this area also did not detect any of the COI.

The potential receptor for groundwater impacts is Nancy Creek. Due to the depth to groundwater across the Site, on average 10 feet or more below grade, direct contact by potential construction or utility workers was determined not to be a potential completed pathway for exposure. Surface water sampling and fate and transport modeling of the release have indicated that the groundwater plume is not predicted to be a potential completed pathway for exposure. This will be confirmed though a VRP Monitoring Plan and recalibration of the fate and transport model using the additional data collected. The proposed VRP Monitoring Plan is presented herein.

Soil and groundwater impacts were also determined to present a potential completed exposure pathway for soil vapor on some properties relative to current or future enclosed structures within the footprint of these impacts, which are currently the Fashion Care and Asl Limited Partnership properties. As a result, an active sub-slab vapor mitigation system was installed and is maintained beneath the existing building on the Fashion Care property. The assurance of the continued operation of the vapor mitigation system on the Fashion Care property is through the use of the UEC and annual submittal to the EPD of the completed Site Use, Activity, and Monitoring Evaluation Form.

The Asl Limited Partnership property currently has no structures within the current or predicted footprint of groundwater impacts. It was also determined that the construction of enclosed structures in this area are unlikely due to the following constraints: FEMA Flood Zone Restrictions, Stream Buffer requirements, the DeKalb County construction buffers associated with two active sanitary sewer lines that run through the affected portion of parcel, and the "Tf" soil designation as hydric soils in the impacted area associated with the regular flooding from Nancy Creek and potential wetlands designation. As a result, a UEC requiring vapor mitigation of structures was determined unnecessary, and potential future construction is monitored through the completion and annual submittal to EPD of the Fashion Care/Executive Care UEC Site Use, Activity, and Monitoring Evaluation Form.

All activities outlined in the July 9, 2010 VRP CAP, and other activities identified by the EPD as necessary during the CAP implementation, have been completed. Therefore, this VRP CSR and VRP Monitoring Plan have been submitted for review and approval by the EPD to remove the Site from the Georgia HSI.

2.0 VRP CHECKLIST

The original Voluntary Investigation and Remediation Plan Application Form and Checklist submitted in the July 9, 2010 VRP CAP has been updated and executed and is presented below. It should be noted that the Trust no longer owns the Fashion Care property (parcel 18-343-13-002). The property is now owned by Charles and Wendy Pero. The Pero's purchased the property on November 7, 2014, entering the property into the Georgia EPD Brownfield Program, and receiving a Limitation of Liability from Brownfield Program (Appendix A). Details associated with this transaction are in Section 13.0. The Trust still maintains responsibility for completing the VRP for the Site.

APPLICANT'S CERTIFICATION

In order to be considered a qualifying property for the VRP:
(1) The property must have a release of regulated substances into the environment;
(2) The property shall not be:
- **(A) Listed on the federal National Priorities List pursuant to the federal Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. Section 9601.**
- **(B) Currently undergoing response activities required by an order of the regional administrator of the federal Environmental Protection Agency; or**
- **(C) A facility required to have a permit under Code Section 12-8-66.**

(3) Qualifying the property under this part would not violate the terms and conditions under which the division operates and administers remedial programs by delegation or similar authorization from the United States Environmental Protection Agency.
(4) Any lien filed under subsection (e) of Code Section 12-8-96 or subsection (b) of Code Section 12-13-12 against the property shall be satisfied or settled and released by the director pursuant to Code Section 12-8-94 or Code Section 12-13-6.
In order to be considered a participant under the VRP:
- **(1) The participant must be the property owner of the voluntary remediation property or have express permission to enter another's property to perform corrective action.**
- **(2) The participant must not be in violation of any order, judgment, statute, rule, or regulation subject to the enforcement authority of the director. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to**

assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

I also certify that this property is eligible for the Voluntary Remediation Program (VRP) as defined in Code Section 12-8-105 and I am eligible as a participant as defined in Code Section 12-8-106.

ITEM #	DESCRIPTION OF REQUIREMENT	Location in VRP (i.e. pg., Table #, Figure #, etc.)	For EPD Comment Only (Leave Blank)
1.	**$5,000 APPLICATION FEE** IN THE FORM OF A CHECK PAYABLE TO THE GEORGIA DEPARTMENT OF NATURAL RESOURCES.	**Previously Submitted**	
2.	**WARRANTY DEED(S)** FOR QUALIFYING PROPERTY.	**Previously Submitted**	
3.	**TAX PLAT** OR OTHER FIGURE INCLUDING QUALIFYING PROPERTY BOUNDARIES, ABUTTING PROPERTIES, AND TAX PARCEL IDENTIFICATION NUMBER(S).	**Figure 2**	
4.	**ONE (1) PAPER COPY AND TWO (2) COMPACT DISC (CD) COPIES** OF THE VOLUNTARY REMEDIATION PLAN IN A SEARCHABLE PORTABLE DOCUMENT FORMAT (PDF).	**Previously Submitted**	
5.	The VRP participant's initial plan and application must include, using all reasonably available current information to the extent known at the time of application, a graphic three-dimensional preliminary conceptual site model (CSM) including a preliminary remediation plan with a table of delineation standards, brief supporting text, charts, and figures (no more than 10 pages, total) that illustrates the site's surface and subsurface setting, the known or suspected source(s) of contamination, how contamination might move within the environment, the potential human health and ecological receptors, and the complete or incomplete exposure pathways that may exist at the site; the preliminary CSM must be updated as the investigation and remediation progresses and an up-to-date CSM must be included in each semi-annual status report submitted to the director by the participant; a **PROJECTED MILESTONE SCHEDULE** for investigation and remediation of the site, and after enrollment as a participant, must update the schedule in each semi-annual status report to the director describing implementation of the plan during the preceding period. A Gantt chart format is preferred for the milestone schedule. The following four (4) generic milestones are required in all initial plans with the results reported in the participant's next applicable semi-annual reports to the director. The director may extend the time for or waive these or other milestones in the participant's plan where the director determines, based on a showing by the participant, that a longer time period is reasonably necessary:	**Completed**	
5.a.	Within the first 12 months after enrollment, the participant must complete horizontal delineation of the release and associated constituents of concern on property where access is available at the time of enrollment;	**Complete**	
5.b.	Within the first 24 months after enrollment, the participant must complete horizontal delineation of the release and associated constituents of concern extending onto property for which access was not available at the time of enrollment;	**Complete**	

We're here for you
UNITED CONSULTING

ISO 9001:2008 Certified

5.c.	Within 30 months after enrollment, the participant must update the site CSM to include vertical delineation, finalize the remediation plan and provide a preliminary cost estimate for implementation of remediation and associated continuing actions; and	**Complete**	
5.d.	Within 60 months after enrollment, the participant must submit the compliance status report required under the VRP, including the requisite certifications.	**Complete**	
6.	**SIGNED AND SEALED PE/PG CERTIFICATION AND SUPPORTING DOCUMENTATION:** "I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer/professional geologist who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances. Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division. **The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."** Leonard J. 3.0 CERTIFICATION OF COMPLIANCE

A Certification of Compliance for soil, certifying compliance with Type 5 RRS, was submitted by the Trust in a letter to EPD dated October 29, 2014 (Appendix A). The EPD approved the Certification of Compliance in the Brownfield LoL issued to Charles Pero, the new Fashion Care property owner, in correspondence dated December 3, 2014 (Appendix A).

4.0 SITE TOPOGRAPHY, GEOLOGY, HYDROGEOLOGY AND HYDROLOGY

Topography across the Site, based upon visual relief and survey elevations of soil borings and monitoring wells, slopes gently to the south-southwest from Savoy Drive (approximate elevation 936 ft. msl) to Nancy Creek (approximate elevation 921 ft. msl). The banks of Nancy Creek adjacent to the Site are near vertical, dropping approximately 10 to 12 feet to the normal water level. On the south side of Nancy Creek, across from the Site, the topography begins to immediately rise approximately 260 feet to a knoll.

Surficial geology across the Site consists primarily of reddish-brown silt with varying minor amounts of sand and clay, overlying a grey to tan and grey silty sand to sandy silt with pebbles; which overlies a dense, dry silt of varying color across the Site. The presence of the dense, dry silt across the Site was confirmed in November 2013 by advancing 10 borings (SB-37 through SB-46, Figure 5) across the site to confirm the presence or absence of the dry silt, and utilizing existing borings that had been advanced deep enough to encounter the dry silt. Boring logs are provided in Appendix C.

The saturated soil zone is divided into an upper and lower water bearing zone, separated by the dense, dry silt indicated above. The thickness of the upper water bearing zone is greater near Savoy Drive and thins as Nancy Creek is approached. This is based upon the evidence that the upper water bearing zone is thinner adjacent to Nancy Creek where saturated conditions are encountered in borings as shallow as 5 feet below grade and the dense dry silt is encountered at 8 to 16 feet below grade. The dry silt was encountered at deeper depths at the higher elevations around the Fashion Care building, at approximately 23 feet below ground surface (bgs). Toward the creek, the dry silt was encountered at shallower depths ranging from 8 feet bgs (FMW-15) to 19 feet bgs (SB-46). The dry silt is very dense and the majority of borings drilled into this layer terminated with DPT refusal due to the hard nature of the material. When slight pressure was applied to a core of the silt it would crumble into loose material, indicative of the lack of moisture in the silt. To determine the general thickness of the layer to aid in planning the construction of a Type III monitoring well to be screened below the silt, one boring, SB-37, successfully penetrated the silt. The silt was found to be approximately 10 feet thick (23 feet bgs to 33 feet bgs) at that location.

It should be noted that the dense dry silt does not form the streambed of Nancy Creek adjacent to the Site as originally theorized. Based upon stratigraphic assessment of the streambed conducted in September 2014, Nancy Creek in the area of the Site is still eroding through the silty sand/sandy silt overlying the dense dry silt.

On April 22, 2014, an attempt was made to evaluate the lower water bearing zone that was theorized to be present downgradient below the dense, dry silt, but above the potential bedrock aquifer by installing a Type III double cased monitoring well (MW-18D) adjacent to FMW-5. This location was previously agreed to by EPD for installing a deep well to establish groundwater quality conditions beneath the dry silt. A pilot hole was first drilled to identify the top of and base of the dry silt to determine the placement of the outer casing for the deep

monitoring well. As anticipated, the dry silt was encountered at approximately 14 feet bgs, and water table aquifer conditions were encountered above the silt. However, bedrock was encountered immediately at the base of the dry silt at a depth of 33.5 feet bgs. A boring log is provided in Appendix C. As a result, the installation of the Type III well was aborted and EPD was notified of the conditions that were found. Based upon these findings, the following determinations were made:

- A Type III well could not be installed downgradient; and
- The water bearing zone present beneath the dry silt topographically upgradient near the Fashion Care building, appears to pinch out moving toward Nancy Creek, with the dry silt resting upon bedrock.

Based upon discussions with EPD regarding the conditions found during the attempt to install the deep well, it was determined in consultation with the EPD that the lithology did not support the installation of a deep well. The information obtained from this attempted installation of the Type III monitoring well was used to finalize the conceptual site model for the Site. This activity is described in the VRP Semiannual Status Report dated July 2, 2014 in Appendix B.

Potentiometric surface maps have been constructed for the Site using the monitoring wells present on site during specific monitoring events. Potentiometric surface maps of the Site dated July 2012 and April 2014 are presented in Figures 6 and 7. Water table measurements collected during these events are presented in Table 2. The water table elevation during these most recent events has ranged from approximately 13.05 feet below grade (FMW-1) to approximately 8.45 feet below grade (FMW-13) near Nancy Creek. Monitoring well constructions logs are provided in Appendix C.

Slug tests were most recently conducted in monitoring wells FMW-1, FMW-5 and FMW-9 in September 2014 to determine hydraulic conductivity in the shallow water bearing zone. The hydraulic conductivity ranged from 0.45 feet per day (FMW-1, slug-out) to 57 feet per day (FMW-9, slug-in). Slug test data is presented in Appendix D. The hydraulic gradient across the site was calculated by performing three-point problems using water table measurements in wells from the April 2014 groundwater data map (Figure 4). The hydraulic gradient ranged from approximately 0.022 ft/ft in the northeast portion of the site using wells FMW-5, FMW-7 and SB-24, to approximately 0.004 ft/ft in the southwestern portion of the site using wells FMW-9, FMW-10 and FMW-16.

Surface water runoff across the Site in paved areas runs into various storm water drop inlets and is discharged at various points into Nancy Creek bordering the south side of the Site. Surface water on unpaved areas, such as the Asl Limited Partnership property, infiltrates or runs overland to Nancy Creek. Nancy Creek borders the south side of the Site and flows generally northeast to southwest in the immediate area.

5.0 CONCEPTUAL SITE MODEL

In accordance with the VRP, a Conceptual Site Model (CSM) of the Site was prepared and updated as additional information for the Site was acquired during the implementation of the VRP CAP. The intent of the CSM is to present a conceptual rendering of the geology, hydrogeology, hydrology, Site structures, surface coverings, and distribution of released constituents in the various media. This model is then used to determine the various contaminant pathways and receptors, and evaluate them relative to potential and completed exposure pathways.

The final CSM is presented in the following cross-sections:

- From the source area at the dry cleaner building, downgradient to Nancy Creek, including monitoring wells FMW-6 and FMW-9 (Cross-section A-A');
- Perpendicular to cross-section A-A' across the source area at the dry cleaner building (Cross-section B-B'); and
- Perpendicular to cross-section A-A' along Nancy Creek (Cross-section C-C').

The CSM cross-section locations are shown on Figure 8. Figure 9 presents the CSM cross sections A-A', B-B' and C-C' as noted above. The CSM represents data acquired during the course of installing borings and monitoring wells, soil sampling conducted, groundwater monitoring data acquired April 2014, and water table measurements collected April 28, 2014.
The various receptors and exposure pathways are discussed in Section 11.0.

6.0 ENVIRONMENTAL INVESTIGATIONS UNDER HSRA

Several phases of soil investigation were conducted under the HSRA Program at the Site. Initially, assessment was conducted by Epic Consulting, Inc. of Atlanta, Georgia (Epic). The Epic soil investigations were conducted in August 2006 and April 2007. The focus of Epic's investigations was to define the extent of HSRA regulated chemicals in soil above non-residential RRS. Petroleum constituents associated with historical releases from the adjacent Former E-Z Serve UST site were also identified in soil on the Site above applicable Georgia UST Program Threshold Levels.

On May 31, 2007, Epic submitted a Revised CAP to the HSRA Program, proposing in situ chemical oxidation of chlorinated solvent impacted soil at the Fashion Care Site. This revised HSRA CAP was approved by the HSRA Program in correspondence dated December 28, 2007 with a number of conditions. Primary among these was the recommendation by the HSRA Program that a remediation process be utilized that would address both impacted soil and groundwater at the Site, and a reminder that chlorinated solvent groundwater impacts had neither been delineated nor addressed in the May 31, 2007 Revised HSRA CAP.

The Trust placed Winter Environmental under contract to move forward with implementation of the HSRA CAP in 2008, with a focus on addressing both soil and groundwater impacts at the Site. Winter Environmental began defining the horizontal extent of the COI groundwater plume, conducted a soil chemical oxidation event to attempt to remediate soil impacts, and collected additional soil samples for delineation and to determine the effectiveness of the chemical oxidation event. Soil analytical data collected at the Site is presented in Table 3. All groundwater samples collected since 2008, and those collected by the UST Program for the adjacent UST site in 2008, are presented in Table 4. All surface water samples collected from Nancy Creek by Winter Environmental in 2008 and 2010 and by other consultants under the VRP are presented in Table 5. Sediment samples collected from Nancy Creek by Winter Environmental in 2010 are presented in Table 6. Soil sample locations collected under the HSRA Program are shown on Figures 3, 10 and 13. Groundwater, surface water and sediment sample locations for the Site are presented on Figure 12. Boring logs and monitoring well construction logs installed by Winter Environmental under the HSRA Program are in Appendix C. Previous data produced by Epic was presented to the HSRA Program in a May 31, 2007 Revised HSRA CAP. Sample collection logs and laboratory analytical data reports collected by Winter Environmental are provided in Appendix C and E, respectively.

7.0 CORRECTIVE ACTIONS UNDER HSRA

Winter Environmental implemented, with some EPD approved modifications, the soil remediation approved in the HSRA May 31, 2007 Revised CAP prepared by Epic. A treatability study was conducted for designing the remediation of soil above RRS using insitu chemical oxidation. A treatability study report was prepared by ExoTech, Inc. and is provided in Appendix F. Prior to the remediation event an Underground Injection Permit was obtained from the EPD; Underground Injection Permit #393. A total of 21 soil injection wells were installed in and around the impacted soil area that was to be treated using sodium persulfate. The location of the injection wells relative to the impacted soil area is shown on Figure 13. The injection event was conducted on March 18 and March 19, 2009, injecting 4,480 lbs of sodium persulfate activated with 66 lbs of chelated iron, using 2,200 gallons of mixture. An Injection Summary report was prepared by ExoTech, Inc. following the remediation event and is in Appendix F.

On May 8, 2009 and May 18, 2009, following the soil chemical injection event, soil remediation confirmation samples were collected. Soil samples were collected from nine sample locations, SB-28 through SB-36, as requested by the EPD. The confirmation sample locations are shown on Figure 13. Samples were collected from three intervals from each boring; 0 to 2 feet bgs, approximately midway to the water table, and from the approximate two foot interval immediately above the water table. The confirmation soil sample laboratory results are presented in Table 6. The post-chemical oxidation sample results showed concentrations with little or no reduction, and some cases significantly higher concentrations of constituents than the pre-remediation design concentrations. Previously, the highest concentration of PCE in soil, 18.0 mg/kg, was in SB-27 at 0 to 2 feet bgs, immediately beneath the historical source, the old PCE dry cleaning machine. PCE concentrations in the post-remediation samples were higher on average at all locations than seen in the 2006 and 2007 Epic data, with concentrations up to 3,800 mg/kg at SB-32, 6 to 8 feet bgs. Tetrachloroethene (TCE) and cis-1,2-dichloroethene were also found above non-residential RRS at higher concentrations than had been seen in previous soil samples collected at the Site. Non-residential RRS exceedances of one or more of these constituents were found in all but one of the confirmation sample locations, SB-29. These higher concentrations appeared to be the result of the continued release of hazardous substances by the current dry cleaning operations. Further releases were mitigated by the removal of the PCE dry cleaning equipment from the Site in May and sealing of the sanitary system sump in the rear of the building. No additional active soil remediation has been conducted at the Site. A summary of the soil remediation event was submitted to the EPD HSRA Program in correspondence dated September 10, 2009 (Appendix F).

No active groundwater remediation has been conducted at the Site.

8.0 VRP ENVIRONMENTAL INVESTIGATIONS

Upon entering the VRP some of the requirements under the VRP had been addressed, or partially addressed while under the HSRA Program. The Sections below describe additional activities conducted under the VRP to address the Program's additional requirements.

8.1 Dry Silt Borings

To refine the CSM, ten (10) additional soil borings were advanced across the Site in November 2013 using a direct-push drilling method (DPT). These borings, SB-37 through SB-46 shown on Figure 5, were advanced to confirm the consistent presence of the dense, dry silt across the site and to determine the thickness of this layer. Five (5) previous borings on the Site near Nancy Creek had encountered the dry silt: FMW-12, FMW-15, FMW-16, old FMW-17 (boring was advanced but well not installed) and FMW-17. These additional borings confirmed the presence of the dry silt across the Site. As anticipated, the dry silt was encountered at deeper depths at the higher elevations around the Fashion Care building, depths ranging from 23 feet bgs to 23.3 feet bgs. Toward Nancy Creek, as ground surface elevations get lower, the dry silt was encountered at shallower depths below grade ranging from 8 feet bgs (FMW-15) to 19 feet bgs (SB-46).

The SB-37 and SB-38 boring locations were selected to attempt to penetrate the dense dry silt to determine the general thickness of the layer to aid in planning the construction of a Type III monitoring well to be screened below the silt. These locations were selected because they were outside the area of dry cleaner impacts. The dry silt was successfully penetrated in boring SB-37 and was found to be approximately 10 feet thick (23 feet bgs to 33 feet bgs). The silt was not penetrated in SB-38 before drilling refusal. Approximately 5 feet of dry silt was encountered before refusal. Boring logs for SB-37 through SB-46 are in Appendix C. All borings were abandoned with hydrated bentonite to form a seal.

Additional details are presented in the Semiannual Status Report date December 6, 2013 in Appendix B.

8.2 Additional Groundwater Delieation

A total of twenty monitoring wells were installed in the upper water bearing zone on the Site during the groundwater investigations under the HSRA Program and VRP; FMW-1 through FMW-17, and SB-24, SB-25 and SB-26. The "FMW" monitoring wells were installed using dual, DPT/HSA drilling rigs. For each monitoring well DPT was used to collect continuous soil cores to determine lithology and the position of the water table. The monitoring wells were installed using 4.25-inch ID HSA's, and 2-inch ID PVC riser and 10 feet of 0.01-inch slotted 2-inch ID PVC screen. The screens were set to span the water table. Above grade, stick-up completions (locking steel protective casings) were used on the undeveloped ASL property, and flush-mount completions were used on the paved, developed properties. Each monitoring well was fitted with a locking well cap and a surrounding concrete pad.

The "SB" monitoring wells were installed inside the Fashion Care building using DPT methods with 1-inch ID PVC riser and 10 feet of 0.01-inch slotted 2-inch ID PVC screen. The screens were set to span the water table. Flush-mount completions were used.

In addition, more than twenty monitoring wells were also installed by the EPD UST Program during the investigation of the EZ-Serve UST investigation and remediation on the Georgia-Alabama Commercial Investment and Fashion Care properties. Up to twenty of these monitoring wells were utilized for collecting groundwater measurements and samples in 2008 and 2010 for the dry cleaner release assessment, until they were abandoned by the EPD UST Program. Data collected from these wells are presented in Table 4, along with data from monitoring wells installed by the Trust.

Soil boring logs for each monitoring well are in Appendix C. Monitoring well construction logs are also in Appendix C.

As part of the implementation of the VRP, and in accordance with EPD comments to the VRP CAP dated December 2, 2010 (Appendix A), additional horizontal delineation of the groundwater plume was conducted and installation of a Type III, double-cased monitoring well installation was attempted.

As shown on Figure 11, which presents groundwater data from the July 2012 sampling event and is provided in the VRP CAP, additional delineation was required to horizontally delineate vinyl chloride identified in monitoring well FMW-15. On March 28, 2013, monitoring well FMW-17 was installed to the northwest of FMW-15. A dual, DPT/ HSA drill rig was used to install the monitoring well. DPT was used to collect continuous soil cores to determine lithology and the position of the water table. The water table was encountered at approximately 7.5 feet bgs. A soil boring log for FMW-17 is in Appendix C. The monitoring well was installed using 4.25-inch ID HSA's. A 2-inch ID PVC monitoring well was installed using 10 feet of 0.01-inch slotted PVC screen and PVC riser. The screen was set at 3.5 to 13.5 feet bgs. A monitoring well construction log for FM-17 is in Appendix C.

Following well development, FMW-17 was sampled for Target Compound List (TCL) volatile organic compounds (VOCs). Groundwater sampling was conducted using a peristaltic pump and the USEPA low flow/low stress method. Field measurements of pH, conductivity, dissolved oxygen, oxidation-reduction potential and temperature were collected every five minutes until all parameters stabilized within approximately 10 percent for three consecutive readings. When this stabilization point was reached, samples were collected for TCL VOCs using the pipette method. A groundwater sampling data sheet for this sampling event is in Appendix C.

The groundwater sample was secured in an ice-filled cooler and hand delivered to AES for analysis. Laboratory work orders, and chain-of-custody documents, which included information on project name and number, sampler(s) signature, project manager's name, sample matrix, sample identification/station ID number, date and time of sample collection, total number of containers per sample station, requested analyses and number of containers per analyses per

sample station, preservatives, and any other pertinent comments for the laboratory, were placed within each cooler for delivery.

The laboratory results are presented in Table 4, and the laboratory data report is in Appendix E. No VOCs were detected above the laboratory practical quantitation limit (PQL). This completed the horizontal delineation of COI. Additional details are presented in the Semiannual Status Report dated December 6, 2013 in Appendix B.

In an attempt to: 1) determine if COI had migrated through the dense, dry silt underlying the Site, 2) vertically delineate COI in groundwater downgradient, and 3) further refine the CSM; an attempt was made to install a Type III double-cased monitoring well, MW-18D, at the location shown in Figure 14. The location of the deep well was identified through interaction with the EPD. The outer casing was to be set within the dense, dry silt sealing off the water table aquifer (uppermost water bearing zone), and the inner casing and well screen was to be set within the lower water bearing zone below the dry silt and above bedrock.

On April 22, 2014, a dual, DPT/HSA drilling rig was mobilized to the site to install the Type III double-cased monitoring well adjacent to FMW-5. A pilot hole was first drilled to identify the top of and base of the dry silt to determine the placement of the outer casing. As anticipated, the dry silt was encountered at approximately 14 feet bgs, and water table aquifer conditions were encountered above the silt. However, bedrock was encountered immediately at the base of the dry silt at a depth of 33.5 feet bgs. A boring log is provided in Appendix C. As a result, the installation of the Type III well was aborted and EPD was notified of the conditions that were found. Based upon these findings, the following determinations were made:

- A Type III well could not be installed downgradient; and

- The lower water bearing zone present beneath the dry silt topographically upgradient near the Fashion Care building appears to pinch out moving toward Nancy Creek, with the dry silt resting upon bedrock.

Based upon discussions with EPD regarding the conditions found during the attempt to install the deep well, it was determined in consultation with EPD that the lithology did not support the installation of a deep well in a downgradient position and additional attempts would not be conducted. The information obtained from this attempted installation was used to refine the CSM to evaluate potential exposure pathways. Additional details are presented in the Semiannual Status Report date July 2, 2014 in Appendix B.

8.3 Additional Rounds of Groundwater Sampling

Two rounds of groundwater samples have been completed for the Site since entering the VRP in 2010, and were presented in Semiannual Status Reports dated December 3, 2012 and July 2, 2014. The rounds were conducted in July 2012 and April 2014. Surface water samples were also collected as part of both events and are described below.

Winter Environmental conducted a round of groundwater and surface water sampling July 10 – 13, 2012 to reestablish baseline groundwater conditions and current surface water conditions for the Site. The previous full round of groundwater samples were collected in 2010. A total of 18 monitoring wells; FMW- 1 through FMW-16, SB-24 and SB-26; were sampled for TCL VOCs. FMW-17, northwest of FMW-10 had not been installed at that time. One blind duplicate groundwater sample was collected from monitoring well FMW-1. The monitoring well locations for this event are shown on Figure 11. Analysis of the samples was conducted by Method 8260B by AES. The groundwater sampling activities were conducted in accordance with the protocols specified in the EPA Region IV Field Branches Quality System and Technical Procedures in affect at the time.

Prior to beginning groundwater sampling, each monitoring well was opened and allowed to equilibrate prior to collecting groundwater elevation measurements. A water level indicator calibrated to 0.01 feet was used for water level measurements. At each well location, the depth to the water table was measured from the well top of casing and then sounded to determine the height of the water column, and to determine if the well was obstructed. The water level indicator was cleaned with isopropyl alcohol and rinsed with deionized water between monitoring wells. Water level measurements from this event are presented in Table 2, and a potentiometric surface map for the July 2012 sampling event is shown as Figure 6. Groundwater appeared to be mounding beneath the Fashion Care building as it was in 2008 prior to sealing the sump in the rear of the Fashion Care building. It was discovered in 2008 that the mounding was due to a leaking washing machine waste water sump located in the rear of the building. The sump was cleaned and resealed at that time. The sump was no longer suspected to be a source of contamination because the tenant installed a new non-PCE based dry cleaner machine to replace the previous PCE-based machine.

Groundwater sampling was conducted using a peristaltic pump and the USEPA low flow/low stress method. Field measurements of pH, conductivity, dissolved oxygen, oxidation-reduction potential and temperature were collected every five minutes until all parameters stabilized within approximately 10 percent for three consecutive readings. When this stabilization point was reached samples were collected for TCL VOCs using the pipette method.

Three, 1-inch diameter monitoring wells, SB-24, SB-25 and SB-26, are located inside the Fashion Care building. Monitoring well SB-25 purged dry and did not recover; therefore, no sample was collected. Monitoring wells SB-24 and SB-26 purged dry and were sampled when sufficient well recovery occurred. Monitoring well sampling forms from this event are in Appendix C.

Groundwater and surface water samples collected during the July 2012 sampling event were secured in ice-filled coolers and hand delivered to AES for analysis. Laboratory work orders, and chain-of-custody documents, which included information on project name and number, sampler(s) signature, project manager's name, sample matrix, sample identification/station ID number, date and time of sample collection, total number of containers per sample station, requested analyses and number of containers per analyses per sample station, preservatives, and any other pertinent comments for the laboratory, were placed within each cooler for delivery.

The results of the July 2012 groundwater sampling event are discussed in Section 10.3.

On April 28-29, 2014, a second round of water samples was collected to use as a current baseline for the contaminant fate and transport modeling. Ten monitoring wells and three surface water locations were sampled for TCL VOCs. The monitoring wells sampled were FMW-1, FMW-4, FMW-5, FMW-6, FMW-9, FMW-13, FMW-14, FMW-15, FMW-16 and FMW-17. Surface water samples were collected at locations SW-1 through SW-3. Sample locations for this event are shown on Figure 4. The field sampling activities were conducted in general accordance with the protocols specified in the EPA Region IV Field Branches Quality System and Technical Procedures in affect at the time. Monitoring well sampling logs from this event are in Appendix C.

Prior to collecting groundwater samples, a full round of groundwater elevation measurements were collected from all monitoring wells on the Site. These measurements were collected using an electronic water level probe, with measurements collected to the nearest hundredth of a foot. The water table elevation measurements are presented in Table 2. This data was used to construct a potentiometric surface map as shown in Figure 7. Based upon this potentiometric surface map groundwater flows to the south and west, consistent with historical data.

8.4 Surface Water Sampling

A total of twelve surface water sampling events have been conducted since 2008. The laboratory results of the surface water samples collected are described in Section 10.4.

Three surface water sampling locations were established to consistently evaluate the affect of the groundwater plume intersecting Nancy Creek. The locations are shown on Figure 12 and are described as follows:

- SW-1, located upgradient and outside the area where the groundwater plume intersects Nancy Creek;
- SW-2, located downstream of SW-1 and within the area where the groundwater plume intersects Nancy Creek; and
- SW-3, located downstream of SW-2 and within the area of highest impacts where the groundwater plume intersects Nancy Creek.

Eight surface water sampling events were conducted in accordance with EPD's VRP Comment Letter dated December 2, 2010, specifically comments regarding surface water, (Nos. 1-Bullet 4, 2 and 4). The events were conducted in October 2011 during a three week period. The first sequence of four consecutive events was obtained from October 6 through October 9, 2011. The second sequence of four events was taken from October 21 through October 24, 2011.

Surface water flow volume and VOCs were measured in Nancy Creek, downgradient of the Site, at three locations; upstream and two within the groundwater plume boundary. Previous surface water sampling events had not detected VOCs. The sampling and flow gauging was optimized for detection using sequential events at low flow conditions. The sampling effort was intended to definitively examine low flow (drought) surface water concentrations of VOCs resulting from Site groundwater discharging to Nancy Creek. The EPD requested that samples be collected during flow periods that were close to the 7Q10 value of 3 cubic feet per second, provided by EPD for the Site. Measurements were obtained using an electromagnetic flow meter with capability of measuring flow velocity from 0.01 to 20 feet per second. Stream flow during all the sampling events was well below the 7Q10 value. During the first series of sampling, October 6 through October 9, 2011, flow ranged from 0.09 to 0.52 cubic feet per second. During the second series of sampling, October 21 through October 24, 2011, flow ranged from 0.53 to 1.45 cubic feet per second.

No measurable precipitation was reported in the Nancy Creek watershed during the ten days prior to the first sequence, and drought conditions were reported by local weather forecasters. Based on USGS station data, light rain was recorded approximately two days prior to the second sampling sequence, October 21 – 24, and a gradual flow volume decline to dry condition was observed. Flow measurement decline in the second sequence was corroborated by the USGS stream flow data. Declining stream flow during the days after a rain event was expected to provide optimum conditions for detecting groundwater VOCs in Nancy Creek. Laboratory results from these sampling events are discussed in Section 10.4.

In July 2012 another round of surface water samples were collected. Sampling was conducted using a pre-cleaned stream sampler that extended on a pole up to a reach of 25 feet. This was used for safety reasons due to the height of the stream bank on the Fashion Care side of the stream. The samples were collected from mid-depth in the center of the stream. The water sample was then carefully transferred to appropriate sample vials for VOC analysis. Laboratory results from this sampling event are discussed in Section 10.4.

In April 2014 another round of surface water samples were collected. Sampling was conducted using a pre-cleaned stream sampler that extended on a pole up to a reach of 25 feet. The samples were collected from mid-depth in the center of the stream. The water sample was then carefully transferred to appropriate sample vials for VOC analysis. Laboratory results from this sampling event are discussed in Section 10.4.

8.5 Slug Tests

Two slug testing events have been conducted for the Site to assist the fate and transport modeling. Slug-in and slug-out tests were conducted in 2008 on monitoring wells FWM-4 and FMW-5, screened in the upper water bearing zone. The hydraulic conductivity ranged from 0.00011 feet per second (FMW-4, slug-out) to 0.00025 feet per second (FMW-5, slug-out). This data is provided in the revised Contaminant Transport Modeling Report in Appendix G, and in the initial Contaminant Transport Modeling Report presented in the Semiannual Status Report dated December 19, 2014.

Additional slug tests were conducted at the EPD's request in September 2014 to supplement the 2008 data. Slug-in and slug-out tests were conducted on monitoring wells FMW-1, FMW-5 and FMW-9 (screened in the upper water bearing zone) to provide a distribution of aquifer parameters along the flow path of the contaminant plume. Historic slug testing indicated that hydraulic conductivity at the Site ranges from approximately 10 to 27 ft/day. The more recent data indicated a range from 0.45 to 57 ft/day. The data from these slug tests are summarized in Table 2-1 in the revised Contaminant Transport Modeling Report in Appendix G. Data and analyses are for slug tests completed in September of 2014 are also provided in revised Contaminant Transport Modeling Report.

8.6 Vapor Intrusion Assessments

As part of the Type 5 remedy for soil on the Site, soil impacted with VOCs are left in place, capped beneath the concrete slab of the Fashion Care building and the surrounding asphalt. In addition, groundwater impacted with VOCs is present beneath the buildings on the Fashion Care property, the adjacent Georgia-Alabama Commercial Investments, LLC property and the Southern Automatic Company property. The potential for vapor intrusion associated with this distribution of VOCs was conducted for each of these properties. The field work and modeling efforts conducted for vapor pathway evaluation are discussed below. The pathway and receptor evaluations are further discussed in Section 11.0.

Fashion Care Property – Parcel 18-343-13-002

Due to the concentrations of VOCs beneath the Fashion Care building both in soil and groundwater, it was determined that a vapor mitigation system should be installed beneath the building to mitigate this potential exposure pathway, and assessment was conducted to design the system and is described below. This information was previously provided in the Semiannual Status Reports dated July 2, 2014 and December 19, 2014.

On June 4, 2014, Woodard and Curran performed testing to evaluate the potential radius of influence for a sub-slab depressurization system (SSDS). Testing was conducted by drawing a vacuum at previously installed shallow soil injection point IW-7, located near the center of the contaminant source area. The vacuum was induced by connecting a Shop-Vac to the IW-7 PVC riser, with the discharge hose running to the outside of the building. Three monitoring points were installed at distances of 7.5, 15, and 30 feet from IW-7 (Figure 15). The monitoring points were installed by drilling a small diameter hole in the floor, inserting a piece of polyethylene tubing, and sealing around the tubing with modeling clay. A pressure gauge (maximum pressure of 0.2 inches water) was then attached to the end of the tubing.

Once the monitoring points were installed, the pressure test was started by powering on the vacuum. Within five seconds, the pressure readings at both the 7.5 and 15-foot monitoring points reached the maximum value on the gauge. The pressure reading at the 30-foot monitoring point reached the maximum value within one minute. Based on these findings, it was determined that a single vapor extraction point would be sufficient for depressurizing the sub-slab beyond the limits of VOC impacts.

Accordingly, Woodard and Curran installed an SSDS on June 21 and 22, 2014. An extraction point was installed in the vicinity of IW-7 by coring an eight-inch hole through the floor, and removing soil to a total depth of 18 inches below the top of the floor slab. The hole was then backfilled with gravel to the bottom of the floor slab. A two-inch PVC riser protected by sections of steel rebar was placed inside the hole, and the hole was then sealed to the surface with cement. A rubber seal was placed on top of the gravel at the base of the slab to prevent the cement from entering into the gravel vapor sump. The two-inch riser was run to the roof support beams and then horizontally approximately 15 feet to and through a boarded-up window on the western wall of the building. The entire piping system was slightly sloped back towards the vapor sump to allow for condensate to drain back to the subsurface as necessary.

A radon removal fan (RadonAway model RP140) was mounted on the outside of the building, with the final discharge above the roof line. To power the fan, electric conduit was run from a nearby junction box, and the corresponding breaker in the electric panel was tagged to indicate the breaker should not be turned off. A U-tube manometer was mounted on the two-inch riser to provide a visual indication of system operation.

On June 22, 2014, the fan was turned on, and the manometer immediately registered a pressure reading of 0.2 inches water. This pressure reading was confirmed during a site visit 24 hours later to ensure the system was operating properly.

In November 2014, the EPD requested that additional vapor evaluation associated with the portion of the groundwater plume extending beneath the existing Fashion Care building, outside the area of soil impacts above non-residential RRS, be assessed relative to the potential for vapor intrusion. In addition, as part of this evaluation the vacant space on the east side of the building should be evaluated.

On November 19, 2014, Woodard & Curran performed sub-slab soil gas sampling at three locations within the vacant space on the east side of the building to be representative of conditions beneath the building outside of the area of influence of the previously installed vapor mitigation system. Sample locations are shown on Figure 15, and include one location near the front of the building and two locations near the rear of the building.

Samples were obtained by coring through the existing concrete floor slab to a depth of three inches below the concrete. The space between each vapor collection point and the surrounding concrete was sealed. The tightness of the seal was tested by placing a shroud over the sample point, filling the shroud with helium, and testing sub-slab vapors drawn from the sample point for the presence of helium. Polyethylene tubing was used to connect the sample points to laboratory-supplied six-liter SUMMA canisters. After purging the volume of air in the tubing, the canister was opened, and soil gas was collected at a maximum flow rate of 200 ml/minute. Collected soil gas samples were submitted to TestAmerica Laboratories in Knoxville, Tennessee for analysis by USEPA Method TO-15.

The analytical report for the soil gas samples is included in Appendix E. No analytes were detected in any of the three samples, indicating that groundwater impacts present beneath the building do not pose a vapor risk outside of the vapor mitigation system area of influence. Due to the presence of an approved cap over the source material and the discontinued use of PCE at the property, groundwater impacts are predicted to only diminish in the future and the risk associated with the vapor pathway will not increase.

Southern Automatic Company Property – Parcel 18-343-13-005

It was decided that sub-slab vapor samples should be collected from the building on the Southern Automatic Company property and these results used in evaluating the potential for vapor intrusion resulting from the adjacent dry cleaner release. Two sub-slab vapor samples were collected on May 19, 2011 by Atlas Geo-Sampling of Marietta, Georgia. The locations, VS-1 and VS-2, are shown on Figure 16. Sub-slab soil gas samples were obtained by coring through the existing concrete slab to a depth of three inches below the concrete. The space between each vapor collection point and the surrounding concrete was sealed. The tightness of the seal was tested by placing a shroud over the sample point, filling the shroud with helium, and testing sub-slab vapors drawn from the sample point for the presence of helium. Polyethylene tubing was used to connect the sample points to laboratory-supplied six-liter SUMMA canisters. After purging the volume of air in the tubing, the canister was opened, and soil gas was collected at a maximum flow rate of 200 ml/minute. Collected soil gas samples were submitted to H&P Mobile Geochemistry, Inc. in Carlsbad, California for analysis by USEPA Method TO-15. The laboratory results are provided in Appendix E. PCE was detected in both samples, and TCE was detected in sample VS-1, as shown in Table 7.

The J&E convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004) was run using the sub-slab data for this parcel to evaluate the risk of vapor intrusion and the results provided in the Semiannual Status Report dated December 2, 2011. Results from the model indicated an individual and cumulative human health risk below the HSRA standard of 10^{-5} cancer risk. The Hazard Quotient of 1 was not exceeded. Accordingly, based upon these results, it was confirmed that no vapor mitigation requirements were necessary for this parcel.

Asl Limited Partnership Property – Parcel 18-333-02-023

Vapor modeling using the J&E Vapor Model (1991) was conducted for the Asl Limited Partnership property and the modeling results provided in the Semiannual Status report dated June 2, 2011. The modeling was performed using the most recent round of groundwater data at the time, collected in May and June of 2010 and presented in the CAP. The results from the J&E model were used to evaluate the vapor intrusion pathway for the property.

The J&E model for the parcel was also run using only those constituents impacting groundwater as a result of the release of PCE from the Fashion Care Site, and not from the release of petroleum from the USTs on the Georgia-Alabama Commercial Investments, LLC property (parcel 18-343-13-001). None of the COI from the Site are present in soil on this parcel; therefore, only groundwater impacts were used as input data into J&E model. The results of the J&E model indicated that the dry cleaner constituents present in groundwater did not pose a vapor intrusion risk above the HSRA standard of 10^{-5} incremental cancer risk per constituent (Rules for Hazardous Waste Management, Chapter 391-3-19-.07 (10) (d)); however, the cumulative risk for multiple constituents did present a vapor intrusion potential above the HSRA standard of 10^{-5} incremental cancer risk. The Hazard Quotient of 1 was not exceeded. Accordingly, based upon the J&E model results, vapor mitigation had to be considered for this property.

The J&E convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004) was rerun for this parcel to evaluate the cumulative risk of vapor intrusion and the results provided in the Semiannual Status Report dated December 2, 2011. Modeling for this undeveloped, wooded parcel using groundwater water data obtained from monitoring wells FMW-5, FMW-6, FMW-11 (March 2010) and MW-14 (September 2008). This groundwater data was used to calculate VOC groundwater concentrations where a hypothetical structure would encounter vapor intrusion at a future date on the property. The area encompassed by these wells fairly represented a potential development area from a structure similar to the gas station located on the Georgia-Alabama Commercial Investments property. This area also emphasized the portion of the groundwater plume with significant PCE and TCE concentrations. The conclusion for this revised scenario for the parcel was the incremental cancer risk of 10^{-5} incremental cancer risk per constituent was exceeded. Accordingly, it was confirmed vapor mitigation must be considered for this property.

Georgia-Alabama Commercial Investments, LLC Property – Parcel 18-343-13-001

Vapor modeling using the J&E Vapor Model (1991) was conducted for the Georgia-Alabama Commercial Investments, LLC property and the modeling results provided in the Semiannual Status report dated June 2, 2011. The modeling was performed using the most recent round of groundwater data at the time, collected in May and June of 2010 and presented in the CAP. The results from the J&E model were used to evaluate the vapor intrusion pathway for the property.
The J&E model for the parcel was run using only those constituents impacting groundwater as a result of the release of tetrachloroethene (PCE) from the Fashion Care Site, and not from the release of petroleum from the USTs on this parcel. None of the COI from the Site are present in soil on this parcel; therefore, only groundwater impacts were used as input data into J&E. The results of the J&E indicated that the dry cleaner constituents present in groundwater did not pose a vapor intrusion risk above the HSRA standard (Rules for Hazardous Waste Management, Chapter 391-3-19-.07 (10)(d)) of 10^{-5} incremental cancer risk per constituent or cumulative risk for all constituents; nor did it exceed a Hazard Quotient of 1. Accordingly, based upon the J&E results, no vapor mitigation requirements were necessary for this parcel.

UNITED CONSULTING
ISO 9001:2008 Certified

The J&E convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004) was rerun for this parcel to evaluate the cumulative risk of vapor intrusion and the results provided in the Semiannual Status Report dated December 2, 2011. The modeling was performed using the groundwater data collected March, 2010, from monitoring wells FMW-1 and MW-11. VOC concentrations from monitoring wells FMW-1 and MW-11 were averaged in order to provide a representative groundwater concentration scenario for this location. Several monitoring wells surrounding the gas station at the time had free product (petroleum) and did not provide representative (or any) chlorinated compound data. Results from the vapor intrusion analysis indicated a cumulative human health risk below the HSRA standard of 10^{-5} incremental cancer risk per constituent or cumulative risk for all constituents; nor did it exceed a Hazard Quotient of 1. Accordingly, based upon these results, it was again confirmed that no vapor mitigation requirements were necessary for this parcel.

9.0 EXTENT OF SOIL, GROUNDWATER, SURFACE WATER, SEDIMENT AND VAPOR IMPACTS

COI from the release of PCE from the Fashion Care dry cleaner impacted, or had the potential to impact soil and groundwater in the area of the release, and surface water and sediment in nearby Nancy Creek. Also, soil vapor originating from impacts to soil and groundwater had the potential to impact receptors. Each of these media were assessed under the requirements of the HSRA Program initially, and completed under the VRP. The extent of impacts identified in each media is presented below.

9.1 Risk Reduction Standards for Soil and Groundwater, and Surface Water Standards

During the course of the HSRA, and later VRP investigation, HSRA residential (Type 1), non-residential (Type 3 and 4) and Type 5 (utility and construction worker protection) RRS for soil and groundwater were derived and approved by the EPD. The RRS are presented in the various data tables in this report, and derivations are provided in Appendix H. These standards were used to determine the limits of impacts from the dry cleaner release in soil, groundwater and sediment, and are presented in data tables for these media. These standards were then used to determine where potential exposure pathways existed or had the potential to exist, and what receptors were or could be impacted, and if the exposure pathway was complete and required corrective measures to protect human health or the environment.

Georgia In-Stream Water Quality Standards (ISWQS) were identified for evaluating surface water data collected from Nancy Creek.

9.2 Extent of COI in Soil

The estimated horizontal extent of soil impacts relative to VRP soil delineation criteria is presented on Figure 3. This figure is based upon the soil samples collected from the treated area following the soil remediation event conducted in 2008, and from soil samples collected by Epic outside the soil remediation event area. Soil impacts above the VRP delineation criteria used for this Site are limited to the Fashion Care and Southern Automatic Company properties. Shown on Figure 3 are the horizontal limits of non-residential RRS and Type 5 RRS exceedances. Again, the areas of exceedances are within the to the Fashion Care and Southern Automatic Company properties. Specifically, soil impacts above Type 5 RRS are contained beneath the Fashion Care concrete building slab, and the non-residential RRS exceedances that extend beyond the building slab are contained beneath the surrounding asphalt paving just outside the building. Impacts extend to the water table approximately 12 feet bgs. Soil analytical data upon which Figure 3 is based is presented in Table 3.

9.3 Extent of COI in Groundwater

Twenty monitoring wells were installed in the upper water bearing zone during the course of the HSRA and VRP assessments; FMW-1 through FMW-17, and SB-24, SB-25 and SB-26. In addition up to twenty monitoring wells installed as part of the EZ-Serve UST investigation and remediation on the Georgia-Alabama Commercial Investment and Fashion Care properties have been used to collect groundwater samples to delineate the extent of COI associated with the dry cleaner release. Groundwater samples have been collected in 2008, 2010, 2012, 2013 and 2014 during the HSRA Program and VRP assessments. The groundwater data from these events are presented in Table 4 and the laboratory report is provided in Appendix E.

April 2014 - Detected constituents are presented in Table 4, compared to HSRA Types 1/3 RRS and Type 5 RRS established for the site. The April 2014 data is also presented on Figure 4. The results from this round of groundwater samples is compared to historical rounds of groundwater data collected on the Site in Table 4. The current round of groundwater data was compared to the last round of sample data in 2012, and to historical data back to the initial sampling at each location. The results of these comparisons are as follows, starting with the most downgradient wells and working back toward the source of groundwater contamination at the Fashion Care building:

- Downgradient wells (furthest from source); FMW-10, FMW-13, FMW-14, FMW-15, FMW-16 and FMW-17: All constituents detected in these wells in 2012 have decreased in concentration in 2014 (FMW-10 was not sampled in April 2014). Constituents are all below standard detection limits in FMW-10, FMW-15, FMW-16 and FMW-17. All constituents in FMW-13 are below detection limits with the exception of tetrachloroethene (PCE), which has reduced in concentration since 2012, and remains above a Type 1/3 RRS but below a Type 5 RRS. All constituents in FMW-14 are below standard detection limits with the exception of cis-1,2-dichloroethene, which has reduced in concentration since 2012, and remains below all RRS. Graphs showing the concentrations versus time in monitoring wells FMW-13, FMW-14, FMW-15 and FMW-16 are shown as Figures 17a through 17d.

- Downgradient wells (nearer to source); FMW-4, FMW-5, FMW-6 and FMW-9: All constituents detected in these wells are relatively stable or are decreasing in concentration. Expected fluctuations in concentrations are observed in constituents undergoing the degradation process. Detected constituents in monitoring wells FMW-4 and FMW-6 are fluctuating slightly but are within the same order of magnitude in concentration. Constituents in monitoring well FMW-5 are all below detection limits, and are showing an overall decrease in concentration since sampling began at this location. Detected constituents in monitoring well FMW-9 are generally fluctuating within the same order of magnitude, with degradation constituents slightly rising in concentration. One new constituent was detected in FMW-4; 1,1,2-trichloroethane. This constituent was not seen in any other monitoring wells. Graphs showing the concentrations versus time in these monitoring wells are shown as Figures 17e through 17h.

- Peripheral and upgradient wells; FMW-1, FMW-2, FMW-3, FMW-7, FMW-8, FMW-11 and FMW-12: All of these peripheral and upgradient wells are below detection limits for all constituents or are decreasing in concentration since their initial sampling. Only FMW-1 was sampled in April 2014. A graph showing the concentrations versus time in monitoring well FMW-1 is shown as Figure 17i.

In summary, an evaluation of the overall current data set for groundwater indicates at this time the plume is shrinking at the downgradient edge, and remaining generally consistent in concentrations nearest the source as the parent constituent, PCE, progresses through the degradation process. This is likely the result of the removal of the original source of constituents; the PCE dry cleaning machine; the sealing of the lint sump at the rear of the building; the chemical oxidation treatment of soil in the source area conducted in March 2009 and maintaining an impervious cap over the remaining soil impacts.

9.4 Extent of COI in Surface Water

Twelve rounds of surface water samples have been collected from sample locations, SW-1, SW-2 and SW-3, between September 2008 and April of 2014 and the results are presented in Table 5. No Site COI have been detected above laboratory PQLs in any of the samples collected.

A low detection of chloromethane, 2 µg/L, was observed at the upstream sampling location (SW-1) on October 8, 2011and was attributed to an upstream source. Acetone was detected in all of the samples collected in four rounds of sampling conducted in October 2011. Because acetone was detected in the upstream sample during each event, it was also determined to originate from an up-stream source not associated with the Site. Notably, the trend in the acetone data appears to corroborate the expectation that declining stream flow subsequent to a rain event produces the optimum conditions for detecting VOCs discharging to surface water from groundwater.

In conclusion, surface water sampling conducted during both extreme low flow conditions and during post-rain groundwater discharge into Nancy Creek at the Site, did not detect VOCs associated with the Site during any of the sampling events. Details regarding the surface water sampling, including summary tables for flow and VOC concentrations, flow calculations have been presented in the VRP CAP, and the Semiannual Status Reports dated June 2, 2011, December 2, 2011, December 3, 2012 and July 2, 2014. Laboratory data reports are in Appendix E.

9.5 Extent of COI in Sediment

Sediment samples were collected by Winter Environmental at three locations shown on Figure 12 in May 2010; SD-3 upstream of the intersecting groundwater plume, SD-2 within the area where the groundwater plume intersects the creek, and SD-1 downstream of the area where the groundwater plume intersects the creek. Based upon the sediment samples collected in 2010, sediments are not being impacted above standard laboratory PQLs for COI as a result of the

We're here for you
UNITED CONSULTING
ISO 9001:2008 Certified

groundwater plume discharging to Nancy Creek. Table 6 presents the sediment analytical data. Laboratory data reports are in Appendix E.

9.6 Extent of COI in Soil Vapor

Dry cleaner COI were assumed to be present in soil vapor in the area of soil impacts beneath the Fashion Care property building and asphalt area. Soil vapor sampling was conducted beneath the building slab, above the area of COI impacts to groundwater, on the Southern Automatic Company property. PCE and TCE were identified in the soil vapor samples collected. COI in soil vapors were assumed to be present in areas of the ASL Limited Partners and Georgia-Alabama Commercial Investments properties where dry cleaner COI were present in groundwater. This data and these assumptions were used to evaluate the potential exposure pathway to indoor air on each of these properties.

10.0 EVALUATION OF EXPOSURE PATHWAYS AND POTENTIAL RECEPTORS

An evaluation of potential exposure pathways and receptors was conducted for the Site as required for the VRP. A CSM of the exposure pathways for the Site is discussed in Section 6.0, and is shown as Figure 9. The exposure pathways evaluated include:

- Potential exposure to COI in soil;
- Potential exposure to COI in groundwater;
- Potential exposure to COI in surface water;
- Potential exposure to COI in sediment; and
- Potential exposure to vapor-phase COI from impacted soil and groundwater.

It was concluded that the following exposure pathways were incomplete:

- Exposure to COI in soil due to the impacted soil area being covered by asphalt and concrete;
- Exposure to COI in groundwater because there are no groundwater users in the area overlying the groundwater plume;
- Exposure to COI in surface water because ten rounds of surface water samples have not detected COI, and fate and transport modeling predicts surface water will not be impacted by the groundwater plume above ISWQS; and
- Exposure to COI in sediment because sediments samples collected at the Site did not detect COI.

The exposure pathways and potential receptors associated with each of these media are discussed below.

10.1 Soil Exposure Pathways and Potential Receptors

It was determined that the exposure pathway for direct contact by human or environmental receptors with COI identified in soil on the Fashion Care and Southern Automatic Company property was currently incomplete due to the concrete building slab and surrounding asphalt that caps the area of contamination. It was determined that there was a potential exposure pathway for future subsurface utility and construction worker activities that could be conducted within the boundaries where COI in soil exceed site-specific Type 5 RRS. It was also determined that there

We're here for you
UNITED CONSULTING
ISO 9001:2008 Certified

was a potential risk to groundwater from the infiltration and leaching of COI from precipitation and surface water runoff through the impacted soil to groundwater if corrective measures were not implemented to mitigate this potential future pathway.

Due to the risks associated with this exposure pathway, corrective measures have been implemented to mitigate these potential exposure pathways. The corrective measures are described in Section 11 below.

10.2 Groundwater Exposure Pathways and Potential Receptors

It was determined that the direct exposure for groundwater use was not required to be evaluated for this Site, as the Site was not listed on the HSI for groundwater. However, a water supply survey was conducted for the Site. A detailed windshield survey was conducted by Winter Environmental within a 1-mile radius of the Site. No residences or businesses were identified using groundwater wells for potable, industrial or irrigation use. All potable water users appeared to be connected to the local water system through a water meter. In addition, the USGS groundwater well database was searched within a 1-mile radius of the Site and no wells were identified.

A May 19, 2004 EPD internal memorandum regarding a Field inspection of the Site was reviewed. The EPD Field Inspection conducted a well survey within a 3-mile radius of the Site and did not identify any groundwater use. It also stated that the EPD inquired with a DeKalb County building inspector, who stated that all residences in the area were on the DeKalb County water system. To update this information, Winter Environmental contacted DeKalb County who confirmed that all residences and businesses in the area remain on the DeKalb County water system. In addition, there are no public surface water intakes within 3 miles downgradient of the Site. Therefore, there are no complete or potential exposure pathways through groundwater or surface water use. The May 19, 2004 EPD internal memorandum and the USGS Well Inventory results are in Appendix A.

Indirect exposure pathways and receptors were evaluated relative to COI impacts in groundwater. The pathways examined included exposure by subsurface utility and construction worker activities, vapor exposure pathways originating from impacted groundwater, and exposure of surface waters (Nancy Creek) as a receiving water for impacted groundwater.
There is impacted groundwater on the Fashion Care and ASL Limited Partnership parcels above a Type 1, 3 and 4 RRS and areas where groundwater concentrations are currently or have the potential to be above Type 5 RRS established for utility and construction workers, as shown on Figure 4. Risks associated with exposure pathways on the Fashion Care property were addressed through corrective measures described in Section 11 below. Following a review of the historical depth to groundwater, it was determined in consultation with the EPD that the depth to groundwater on the ASL Limited Partnership parcel was deep enough that it did not pose a risk associated with a construction worker scenario.

The potential exposure pathway for a utility worker on the ASL Limited Partnership parcel was also examined. The depth to groundwater on this parcel was also deep enough that it did not

pose a risk associated with the average utility worker scenario. There are currently two existing sanitary sewer lines on the parcel that were also examined relative to potential exposure to impacted groundwater. As shown on Figure 18, the sanitary sewer lines do not currently lie in an area of the plume that is above a utility worker RRS; however, a scenario associated with a hypothetical future migration of the plume at concentrations above these RRS into this area was evaluated relative to utility worker exposure. Both sanitary sewer lines were sounded at manhole locations and the depths evaluated relative to the depth to groundwater in the areas of potential concern.

The base of the northernmost sanitary sewer line was found to be at a maximum depth of approximately 6.65 feet bgs. Compared to the depth to groundwater in the area of the plume of 11.3 feet bgs (based on FMW-5), it was determined in consultation with the EPD that this line does not present a risk to utility workers based upon depth of the line alone.

The southernmost sanitary sewer line was found to be at a depth of 14.5 feet bgs in the manhole to the west and 18 feet bgs in the manhole to the east near North Peachtree Road. Compared to the depth to groundwater in the area of the plume of 11.3 feet bgs (based on FMW-5), it was determined utility workers working on this line could reach impacted groundwater; however, based on the necessary depth for an excavation to reach this line and the PPE required by a utility worker to conduct work associated with the sanitary wastewater, an exposure pathway relative to impacted groundwater would not be complete. This evaluation was presented in the Semiannual Status Report dated June 3, 2013.

Impacted groundwater on the Fashion Care and ASL Limited Partnership parcels also required the evaluation of the potential for exposure through the vapor intrusion pathway. Again, risks associated with the exposure pathway on the Fashion Care property were addressed through corrective measures described in Section 11 below. Upon examination of the ASL Limited Partnership parcel relative to hindrances to potential development, the potential to develop enclosed structures on the portion of the parcel currently impacted and potentially impacted in the future by affected groundwater (approximately 2.61 acres) is severely limited, if not infeasible, due to a number of factors unrelated to the Fashion Care release. The factors include: FEMA Flood Zone Restrictions, stream buffer requirements, sewer easements in place, and the presence of hydric soil and potential wetlands. Details associated with these factors were provided to the EPD for consideration in the Semiannual Status Report dated June 3, 2013. The EPD, in correspondence dated November 13, 2013 (Appendix A) concurred that development was unlikely for this portion of the parcel, minimizing the potential vapor exposure pathway. The monitoring of this potential exposure pathway on the ASL Limited Partnership parcel was address through the use of UEC institutional controls included with the Fashion Care property and described in Section 11 below.

The exposure of surface waters (Nancy Creek) as a receiving water for impacted groundwater was evaluated through twelve rounds of surface water sampling and fate and transport modeling of the dry cleaner release, with Nancy Creek as the endpoint receptor. This is discussed in Section 11.3 below.

10.3 Surface Water Exposure Pathways and Potential Receptors

The exposure of surface waters (Nancy Creek) as a receiving water for impacted groundwater was evaluated through ten rounds of surface water sampling and fate and transport modeling of the dry cleaner release, with Nancy Creek as the endpoint receptor. Twelve rounds of surface water samples have been collected from sample locations, SW-1, SW-2 and SW-3, between September 2008 and April of 2014 and no Site COI have been detected above laboratory PQLs in any of the samples collected. This data support the conclusion that there is not currently a completed exposure pathways or impacted receptors as a result of the groundwater plume entering Nancy Creek.

Fate and transport modeling of the dry cleaner release, discussed in Section 13.1 below and presented in the revised Contaminant Transport Modeling Report in Appendix G, also has indicated that the groundwater plume is not predicted to be a potential completed pathway for exposure. This will be confirmed though a groundwater monitoring program and recalibration of the fate and transport model using the additional data collected.

10.4 Sediment Exposure Pathways and Potential Receptors

Sediment samples were collected and analyzed for TCL VOCs by Winter Environmental at three locations shown on Figure 12 in May 2010; SD-3, SD-2 and SD-1, as part of a pathway and receptor evaluation. No COI were detected above analytical PQL. Based upon these results it was determined that this exposure pathway is not complete.

10.5 Vapor Exposure Pathways and Potential Receptors

The potential exposure pathways and receptors for the vapor-phase COI from impacted soil and groundwater was evaluated for the four parcels comprising the Site. The results are summarized as follows:

- Fashion Care Property (Parcel 18-343-13-002): Due to the concentrations of VOCs beneath the Fashion Care building both in soil and groundwater, it was assumed that the vapor pathway was potentially complete. Therefore, because direct exposure corrective measures for these media called for these impacts to remain in place through the use of engineering and institutional controls, it was necessary for a vapor mitigation system to be installed beneath the building to mitigate the potential vapor exposure pathway. A SSDS system was installed and is operating beneath the Fashion Care building. Operation and maintenance of the system is address in the UEC for the property.

- Southern Automatic Company Property (Parcel 18-343-13-005): The vapor exposure pathways for structures on this parcel were evaluated through the use of sub-slab vapor samples and modeling the sample results using the J&E convection/diffusion model distributed by USEPA, Version 3.1 (2004). Results from the model indicated an individual and cumulative human health risk below the HSRA standard of 10^{-5} cancer

risk. The Hazard Quotient of 1 was not exceeded. Accordingly, based upon these results, it was confirmed that a vapor exposure pathway does not exist for this property.

- Asl Limited Partnership Property (Parcel 18-333-02-023): The vapor exposure pathway for this parcel was evaluated due to underlying groundwater impacts through the use of J&E Vapor Model (1991) and the J&E convection/diffusion model distributed by USEPA, Version 3.1 (2004). The results of the J&E Vapor Model (1991) indicated groundwater did not pose a vapor intrusion risk above the HSRA standard of 10^{-5} incremental cancer risk per constituent; however, the cumulative risk for multiple constituents did present a potential vapor intrusion risk above the HSRA standard of 10^{-5} cancer risk. The Hazard Quotient of 1 was not exceeded. The J&E convection/diffusion model distributed by USEPA, Version 3.1 (2004) was also run, and the incremental cancer risk of 10^{-5} per constituent was exceeded.

  Accordingly, based upon the results of these models, it was determined that that a potential vapor exposure pathway exists for this property. Because development of this parcel with enclosed structures is unlikely where groundwater impacts/vapor exposure risk exist, the monitoring of this potential exposure pathway on the parcel was addressed through the use of UEC institutional controls included with the Fashion Care property

- Georgia-Alabama Commercial Investments, LLC Property (Parcel 18-343-13-001): The vapor exposure pathway for this parcel was evaluated due to underlying groundwater impacts through the use of J&E Vapor Model (1991) and the J&E convection/diffusion model distributed by USEPA, Version 3.1 (2004). The results of the J&E Vapor Model (1991) indicated groundwater did not pose a vapor intrusion risk above the HSRA standard of 10^{-5} incremental cancer risk per constituent or the cumulative risk for multiple constituents. The Hazard Quotient of 1 was also not exceeded.

- The results of the J&E convection/diffusion model distributed by USEPA, Version 3.1 (2004) indicated an incremental cancer risk per constituent and a cumulative risk below the HSRA standard of 10^{-5}; nor did it exceed the Hazard Quotient of 1. Accordingly, based upon these results, it was confirmed that a vapor exposure pathway does not exist for this property.

11.0 VRP CORRECTIVE ACTIONS

11.1 Engineering Controls

Engineering controls were used as corrective action measures to mitigate exposure pathways for soil impacted by dry cleaner COI above non-residential and Type 5 RRS on the Fashion Care and Southern Automatic Company properties. Engineering controls were also used to mitigate the potential exposure pathway from soil vapor containing COI entering into the existing Fashion Care property building.

11.1.1 Soil Cap

Soil impacted above non-residential and Type 5 RRS on the Fashion Care and Southern Automatic Company properties is contained under the Fashion Care building slab and abutting asphalt paving. These materials have been designated as capping for these impacted soil mitigating the direct exposure pathway, and preventing infiltration and leaching of COI from precipitation and surface water runoff through the impacted soil to groundwater. Maintenance and recordkeeping associated with the cap is assured through the use of the institutional controls described below.

11.1.2 Vapor Mitigation System

The potential exposure pathway from soil vapor containing COI from impacted soil entering into the existing Fashion Care property building has been mitigated through the installation of an active SSDS.

An SSDS was installed on June 21 and 22, 2014. As shown on Figure 15, a vapor extraction sump was installed through the concrete slab in the vicinity of IW-7. The extraction point was connected through PVC piping to a radon removal fan (RadonAway model RP140) mounted on the outside of the building, with the final discharge above the roof line. To power the fan, electric conduit was run from a nearby junction box, and the corresponding breaker in the electric panel was tagged to indicate the breaker should not be turned off. A U-tube manometer was mounted on the two-inch riser to provide a visual indication of system operation.

On June 22, 2014, the fan was turned on and the manometer immediately registered a pressure reading of 0.2 inches water. This pressure reading was confirmed during a site visit 24 hours later to ensure the system was operating properly. Maintenance and recordkeeping associated with the SSDS is assured through the use of institutional controls described below.

The vapor assessment, design and installation of the SSDS were presented in Semiannual Status Reports dated July 2, 2014 and December 19, 2014.

11.2 Institutional Controls

Institutional controls through the use of UECs have been used to ensure the continued mitigation of corrective measures implemented on the following properties:

- Fashion Care property, 2211 Savoy Drive, Chamblee, Georgia (Parcel 18-343-13-002) – Soil, groundwater and potential soil vapor impacts were identified on this parcel. A UEC was implemented on this property to ensure the maintenance and recordkeeping associated with the corrective action implemented for soil and soil vapor impacts. This includes the soil cap and SSDS, the protection of future utility and construction workers that may work within the area of soil impacted with COI, and the proper handling and disposal of soil and groundwater impacted with COI that may be removed during such activities. A Site Use, Activity, And Monitoring Evaluation Form must be submitted annually to the EPD that documents continued implementation and maintenance of corrective measures implemented, and adherence to other UEC requirements.

  In addition, the Fashion Care UEC Site Use, Activity, And Monitoring Evaluation Form also ensures the monitoring of potential development on the Asl Limited Partnership property (Parcel 18-343-13-005) in the area of groundwater impacts. The use of this institutional control is further described below.

  The UEC for Fashion Care property was executed by the Trust on April 1, 2014. On May 27, 2014, the UEC was signed by the Director of the EPD. The UEC was recorded by the Clerk of the Superior Court of DeKalb County on June 5, 2014. Final details associated with the UEC were presented in Semiannual Status Report dated July 2, 2014. A copy of the UEC is in Appendix I.

- Southern Automatic Company property, 4306 North Peachtree Road, Chamblee, Georgia (Parcel 18-343-13-005) – Soil and groundwater impacts were identified on this parcel. A UEC was implemented on this property to ensure the maintenance and recordkeeping associated required corrective action for soil. This includes the soil cap, the protection of future utility and construction workers that may work within the area of soil impacted with COI, and the proper handling and disposal of soil and groundwater impacted with COI that may be removed during such activities. A Site Use, Activity, And Monitoring Evaluation Form must be submitted annually to the EPD that documents continued implementation and maintenance of corrective measures implemented, and adherence to other UEC requirements.

  The UEC for Southern Automatic Company property was executed by the owner on July 24, 2012. On May 27, 2014, the UEC was signed by the Director of the EPD. The UEC was recorded by the Clerk of the Superior Court of DeKalb County on June 5, 2014. Final details associated with the UEC were presented in Semiannual Status Report dated July 2, 2014. A copy of the UEC is in Appendix I.

- Asl Limited Partnership property, no street address and immediately to the east bordering Nancy Creek (Parcel 18-333-02-023) – Groundwater and the potential for soil vapor impacts were identified on this parcel. It was determined that it was highly unlikely that the property could be developed with enclosed structures due to development constraints. The EPD concurred in correspondence dated November 13, 2012, but required that this be monitored through the use of the Fashion Care UEC and Site Use, Activity, And Monitoring Evaluation Form that is submitted annually to the EPD. Details associated with this evaluation are presented in Semiannual Status Report dated June 2, 2013. A copy of the Fashion Care UEC is in Appendix I.

11.3 Parcels Not Requiring Engineering or Institutional Controls

No corrective measures were required for the Georgia-Alabama Commercial Investments, LLC property (Parcel 18-343-13-001) following the determination that the potential for soil vapor impacts from groundwater impacted with COI from the dry cleaner release did not pose a vapor intrusion risk to enclosed structures on the property. Details associated with this evaluation are presented in Semiannual Status Report dated December 2, 2011.

12.0 GROUNDWATER AND SURFACE WATER MONITORING PROGRAM

12.1 Fate and Transport of COI Modeling

Contaminant transport modeling was conducted to evaluate the potential for additional exposure pathways to arise, and for known exposure pathways to become complete at levels that could impact potential receptors above regulatory limits. The known receptors are the portions of the properties that have been impacted by the migration of the groundwater contaminant plume, and Nancy Creek that receives discharge from the plume.

Contaminant transport was evaluated using the following steps:

- Modeling of the transfer of soil contamination to the groundwater flow system by modeling the transfer of contaminant mass to the groundwater system with a soil flushing calculation.

- Groundwater modeling of flow and contaminant transport for the Site. Groundwater flow was simulated using MODFLOW 2000 (Harbaugh et al, 2000), modeling three dimensional groundwater flow.

- The computer code used to simulate contaminant transport was MT3DMS (Zheng and Wang, 1999). MT3DMS is a code for simulating transport of contaminants in three dimensions and uses the outputs from MODFLOW to calculate simulated transport in groundwater.

- Contaminant transport modeling was conducted in three distinct steps. The first step was to model distribution of total dissolved VOCs in the groundwater. The second step was to model the anticipated maximum concentration of PCE in the future, as this compound is the most prevalent compound at the Site with the lowest ISWQS. The third step was to evaluate the likely relative concentrations of the daughter products of PCE decay at the Site at the time of the maximum future PCE concentration, and then compare these concentrations to the appropriate environmental standards. In order to understand the maximum expected concentration of each of the daughter products at the time of maximum PCE concentration, a simulation using BIOCHLOR22 was performed.

- In order to evaluate the potential for PCE and or its degradation products to be present in Nancy Creek above ISWQS, a groundwater to surface water mixing calculation was performed. The concentrations for PCE, TCE, DCE and VC in groundwater predicted in the previous modeled sections were then blended based on modeled groundwater discharge and the volume of flow in Nancy Creek at the Site at 7Q10 conditions.

ISO 9001:2008 Certified

Based on the modeling exercises completed, the plume will likely remain stable or decrease over the next 60 years. The plume generally appears to migrate down the axis of the Nancy Creek valley on the northern side of the creek. Generally, the overall plume distribution appears to be monitored adequately by the existing well network. Given these observations, the following conclusions/recommendations are made:

- The predicted plume footprint does not expand substantially beyond the existing monitoring well network;
- As the source area is depleted, the center of maximum plume concentration will slowly migrate and continue to degrade as it migrates toward Nancy Creek;
- The maximum modeled concentration of PCE is predicted to discharge to Nancy Creek approximately 41 years after the source remediation effort conducted in 2008;
- Mixing calculations for the predicted maximum concentrations of PCE and daughter products in Nancy Creek indicate that ISWQS will not be exceeded; and
- No other receptors for the groundwater plume are present within the existing or predicted footprint of the VOC plume at the Site.

A detailed revised Contaminant Transport Modeling Report describing the contaminant transport modeling and findings is in Appendix G. A previous Contaminant Transport Modeling Report was provided to EPD in the Semiannual Status Report dated December 19, 2014.

12.2 Summary of Proposed Groundwater and Surface Water Monitoring Program

Based upon the results of the contaminant transport modeling with the current dataset and surface water sampling conducted to date, there will be no completed exposure pathways resulting from the migration and continued degradation of the groundwater plume. In order to confirm the predicted exposure trends for the Site, it is proposed that a limited groundwater and surface water sampling plan be initiated and the data acquired be input into the contaminant transport model to confirm the current results.

The outline of the monitoring plan would be to sample the following network of existing monitoring wells and surface water locations for two consecutive annual sampling events. The locations are shown on Figure 1 in the Contaminant Transport Modeling Report.

- Monitoring Wells: FMW-4, FMW-6, FMW-9, FMW-12, and FMW-16
- Surface Water Locations: SW-1, SW-2 and SW-3.

Samples would be analyzed for the site-specific VOC list previously approved under the VRP. At the conclusion of the second sampling event, the data acquired would be input into the contaminant transport model to confirm the current results. Annual monitoring reports would be submitted for each of these events. The second annual monitoring report would also present the results of the modeling with recommendations based upon the results.

The VRP Monitoring Plan is presented in Appendix J for EPD review and approval.

It is noted that should a detection of COI be found in surface water during the implementation of the VRP Monitoring Plan, the Surface Water Corrective Action Plan (Appendix B) presented in the Semiannual Status Report dated July 2, 2014, and approved by the EPD, will be implemented.

13.0 ENTRY OF PARCEL # 18-343-13-002 INTO THE GEORGIA BROWNFIELD PROGRAM

On October 31, 2014 the Fashion Care property, Tax Parcel # 18-343-13-002 (address 2211 Savoy Drive, Chamblee, DeKalb County, Georgia), was entered into the Georgia EPD Brownfield Program by the prospective purchaser, Charles and Wendy Pero. To enter the property into the Brownfield Program, a Prospective Purchaser Compliance Status Report (PPCSR (Appendix F)) was prepared entirely using data and information from documents submitted under the HSRA Program and VRP. A Limitation of Liability letter (LoL) was obtained from the EPD on December 3, 2014 and is provided in Appendix A. The LoL requires the new owner to adhere to the following conditions, as written:

1. The Peros must submit a notice of purchase of the above referenced property by no later than ten (10) days after closing to EPD. Please include documentation of the prohibition of the use of tetrachloroethene on the Property.

2. The Pero's will give any responsible party for groundwater contamination and/or EPD access to the subject property to perform groundwater sampling and to implement an EPD approved corrective action plan or work plan for groundwater.

3. The Pero's will ensure that the requirements of the Uniform Environmental Covenant (UEC) are abided by and that the required engineering controls are properly operated and maintained.

4. In the event that the Pero's wish to sell the subject property, the Pero's must provide fifteen (15) days notice to EPD of its intent to offer for sale the subject property or any portion thereof. All documents offering the subject property or portion of the subject property for sale will include a copy of the PPCSR, the UEC, any other documents required by the UEC or the Act, and a copy of this letter. EPD shall be provided with the name, address, phone number, and contact person for the new property owner(s) within ten (10) days of sale.

5. For the purpose of determining liability for continuing or future releases of regulated substances upon or from the properties, the background or baseline concentration for any and all releases will be based on the information provided in the PPCSR pursuant to Section 12-8-208(d) of the Act.

The Trust will continue to execute the requirements for the Site under the VRP until completion.

Of note, during the sale and acquisition process for the property it was determined that the previous approximate property boundaries depicted for this parcel in all HSRA Program and VRP documents were incorrect. Figure 19 shows the proper approximate property boundaries. The legal description used in all previous submittals is correct. The property boundaries in all figures presented in this VRP CSR have been corrected.

14.0 SUMMARY OF COMPLIANCE STATUS

This Voluntary Remediation Program Compliance Status Report for the Fashion Care Site, HSI No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, is submitted on behalf of the John F. Rowan, Sr. Item IV Trust (Trust), the previous owner of the property and responsible party under the VRP.

In addition to the Fashion Care property, the properties that have been impacted by the release of dry cleaner COI include:

- Parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia is immediately to the west, and owned by Mr. H.A. Rowan of Southern Automatic Company.

- Parcel 18-333-02-023, no street address, undeveloped and immediately to the east and owned by Asl Limited Partnership of Boca Raton, Florida.

- Parcel 18-343-13-001, 4308 North Peachtree Road, Chamblee, Georgia is immediately to the east, and owned by Mr. Marvin Hewatt of Georgia-Alabama Commercial Investments, LLC.

Each of these properties was originally entered into the VRP through the submittal of the CAP on July 9, 2010.

During the course of the addressing the release of dry cleaner constituents under the HSRA Program and VRP, the Trust (owner at the time) required the current dry cleaner tenant to discontinue the use of PCE in their operations and replaced the PCE dry cleaning machine with a non-chlorinated solvent based dry cleaning machine. No PCE remains on the Site and the last suspected source of release, a leaking sanitary sewer collection sump that was part of the original building construction in the rear of the building, has been twice cleaned and resealed. It was suspected that the tenant, based upon their housekeeping practices and samples collected from the sump, were improperly disposing of PCE impacted wastewater through the sump system.

Each of these properties was also found to be impacted by a release of petroleum from the petroleum UST systems located on the Georgia-Alabama Commercial Investments, LLC property (UST Facility I.D. No. 900341*1; EZ-Serve Site). This petroleum release underwent remediation through the EPD UST Program and received a “no further action required” status. The remediation system was not designed to address the groundwater plume, and the plume of petroleum constituents has comingled with the dissolved-phase chlorinated solvent plume originating from the Fashion Care property.

As part of the assessment of the release under the VRP, the horizontal and vertical extent of the soil impacts were delineated. Figure 3 shows the extent of impacted soil relative to Type 3 and 4 RRS and Type 5 RRS. The soil remedy implemented under the VRP is a Type 5 solution using engineering and institutional controls to mitigate the potential exposure pathway. The existing concrete building slab and surrounding asphalt paving provides a cap for the impacted soil, and

the maintenance of the cap, and health and safety requirements associated with future construction or utility work/worker exposure is assured through the use of UECs that have been established for the Fashion Care and Southern Automatic Company properties.

The horizontal and vertical extent of groundwater impacts from the dry cleaner release have been completed under the VRP. The most recent set of groundwater data collected from the Site was in April 2014 and is depicted on Figure 4 relative to Type 1 and 3 RRS and Type 5 RRS. The plume extends southwest from the Fashion Care property source area toward, and intersecting with, Nancy Creek bordering the Asl Limited Partnership property. Impacted groundwater is present on portions of the Fashion Care, Southern Automatic Company, Asl Limited Partnership and the Georgia-Alabama Commercial Investments properties. The plume was determined to be confined vertically to the water table aquifer (upper water bearing zone) which is perched upon a dense dry silt layer that is approximately ten feet thick at the Site.

Sediment samples collected from Nancy Creek on the Site did not detect any of the COI; therefore, sediment is in compliance with the VRP.

Twelve rounds of surface water samples have been collected from Nancy Creek since 2008 along the length of the groundwater plumes intersection with the creek. The COI have not been identified in any of the samples collected to date. The potential receptor for groundwater impacts is Nancy Creek. Due to the depth to groundwater across the Site, on average 10 feet or more below grade, direct contact by potential construction or utility workers was determined not to be a potential completed pathway for exposure. Surface water sampling and fate and transport modeling of the release have indicated that the groundwater plume is not predicted to be a potential completed pathway for exposure. Surface water is currently in compliance with the VRP and ISWQS. Future compliance will be evaluated through the VRP Monitoring Plan.

Soil and groundwater impacts were also determined to present a potential completed exposure pathway for soil vapor relative to current or future enclosed structures within the footprint of these impacts, which are currently present on the Fashion Care and Asl Limited Partnership properties. As a result, a SSDS was installed and is maintained beneath the existing building on the Fashion Care property to mitigate this exposure pathway. The assurance of the continued operation of the SSDS on the Fashion Care property is through the use of a UEC and annual submittal to the EPD of the Site Use, Activity, and Monitoring Evaluation Form. The vapor pathway is in compliance with the VRP on the Fashion Care property.

The Asl Limited Partnership property currently has no structures within the current or predicted footprint of groundwater impacts. It was also determined that the construction of enclosed structures in this area is unlikely due to constraints to development. As a result, a UEC requiring vapor mitigation of structures was determined unnecessary, and potential future construction is monitored through the annual submittal to EPD of the Fashion Care UEC Site Use, Activity, and Monitoring Evaluation Form. Though this measure, the vapor pathway is in compliance with the VRP on the Asl Limited Partnership property.

All activities outlined in the July 9, 2010 VRP CAP, and other activities identified as necessary during the CAP implementation, have been completed. Therefore, this VRP CSR and VRP Groundwater Monitoring Plan have been submitted for review and approval by the EPD to remove the Site from the Georgia HSI.

NOTES:

BOLD	Exceeds HSRA Type 3 RRS
BOLD	Exceeds HSRA Type 3 and 4 RRS
BOLD	Exceeds HSRA Type 3, 4 and 5 RRS
BOLD	Exceeds UST Program Soil Threshold Values

* The applicable UST Threshold Level is Table B, Lower Groundwater Pollution Susceptibility Area, ≤ 500 feet to a Surface Water Body.

NC Type 4 RRS not calculated

PRC Petroleum relalated constituents

** RRS is taken from EPD CAP approval letter dated December 28, 2007, table of approved RRS in Condition 8.

Table 3

RETURN RECEIPT REQUESTED

The Estate of John F. Rowan, Sr.
Ms. Nan Kittrell, Representative
1270 Hestertown Road
Madison, Georgia 30650

Re: HSI # 10786
Fashion Care/Executive Care
Chamblee, Dekalb County, Georgia

Dear Ms. Kittrell:

Because the Estate of John F. Rowan, Sr. is performing corrective action at the above referenced property in accordance with an approved corrective action plan, EPD is hereby reclassifying it from Class II to Class V and designating it as needing corrective action as provided for in Section 391-3-19-.06(6) of the Rules for Hazardous Site Response.

Within 45 days of this letter, you are required by Section 12-8-97(c) of the Hazardous Site Response Act to file an affidavit stating that your property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. This affidavit is to be filed with the clerk of the superior court of each county in which your property or any part thereof lies and recorded in the clerk's deed records pursuant to O.C.G.A. § 44-2-20 [full copy attached].

Section 12-8-97(f) of the Hazardous Site Response Act also requires that you place the following notice in any deed, mortgage, deed to secure debt, lease, rental agreement or other instrument given or caused to be given by the property owner which creates an interest in or grants a use of the property:

> "This property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this property. This notice is provided in compliance with the Georgia Hazardous Site Response Act."

Within 30 days of recording the affidavit, please send a copy of the receipt of the recorded affidavit to the Hazardous Sites Response Program, Georgia Environmental Protection Division, 2 Martin Luther King Jr. Drive, SE, Suite 1462, Atlanta, GA 30334.

Section 12-8-97(f) of the Hazardous Site Response Act provides that the requirements for property record notices at O.C.G.A. §12-8-97(b) & (c) shall be stayed by the filing of a petition for a hearing within 30 days of this letter.

EPD will also publish a notice in *The Champion Newspaper* and the *Atlanta Journal Constitution* no sooner than thirty days from the date of this letter announcing that your property has been designated as needing corrective action.

If you have any questions, please contact Jason Metzger at (404) 657-8600.

Sincerely,

Carol A. Couch, Ph.D.
Director

Item IV Trust U/W John F. Rowan
Ms. Nan Kittrell, Representative
1270 Hestertown Road
Madison, GA 30650

RE: Underground Injection Control Permit #393 for Injection of Sodium Persulfate, Fashion Care/Executive Care Dry Cleaners Site located in Chamblee, Georgia (HSI #10786).

Dear Ms. Kittrell:

Enclosed is Underground Injection Control (UIC) Permit #393 for the Fashion Care/Executive Care Dry Cleaners site located in Chamblee, Georgia. This UIC permit allows Item IV Trust U/W John F. Rowan to utilize injection of sodium persulfate through twenty (20) injection wells to assist with the remediation of soil and ground water contaminated with chlorinated solvents at this site for up to five (5) years. The UIC permit states two (2) standard conditions and seven (7) additional conditions in the attachment.

If you have any questions about the permit, please contact Mr. Bijan Rahbar, UIC Coordinator, at (404) 656-3229.

Sincerely,

Carol A. Couch
Director

INJECTION WELL OPERATING PERMIT

PERMIT NUMBER: #393 **DATE ISSUED: January 23, 2009**

FACILITY DATA: **INJECTION WELL TYPE: CLASS V (type 5X26)**

FACILITY: Fashion Care/Executive Care
Dry Cleaners Site
2211 Savoy Road
Chamblee, Georgia
Dekalb County

OPERATOR: Item IV Trust U/W
John F. Rowan
Ms. Nan Kittrell, Representative
1270 Hestertown Road
Madison, GA 30650

LOCATION: Lat: 33° 55' 08.75"N
Long: 84° 17' 52.83"W

EPD-HSI #10786

In accordance with the provisions of the Georgia Rules for Underground Injection Control, Chapter 391-3-6-.13, as amended 2001, this permit is issued for the operation of the herein described injection system. This permit is effective immediately, unless appealed within thirty (30) days after its issuance and is conditioned upon the following:

1) The Permittee's continued compliance with the Georgia Rules for Underground Injection Control, Chapter 391-3-6-.13, the Georgia Rules for Water Quality Control (Revised) and the Georgia Rules for Safe Drinking Water (Revised); and

2) The Permittee's continued compliance with the Permittee's approved injection operation plan that is part of the approved Corrective Action Plan for this site, along with provisions of officially approved plan amendments, if any.

Additional conditions 1 through 7 are attached hereto.

This permit is issued in accordance with the application and supplemental information received on January 8, 2009. The injection operation plan was approved on January 23, 2009, and is based on the statements and supporting data entered herein or attached thereto, all of which are filed with the Environmental Protection Division of the Georgia Department of Natural Resources and hereby made a part of this permit.

This permit is subject to revocation for noncompliance with aforementioned conditions.
This permit expires on **January 23, 2014,** unless previously terminated.

Carol A. Couch, Director, Environmental Protection Division
Georgia Department of Natural Resources

Additional Conditions, UIC Permit #393, January 23, 2009, cont.

INJECTION WELL OPERATING PERMIT
ADDITIONAL CONDITIONS

1. Permit Conditions.

   a. This permit is not transferable until any new operator shall agree in writing to all permit conditions. Any new operator also shall provide the Environmental Protection Division (Division) with appropriate documentation that they have adequate financial assurances to plug all existing Class V wells.

   b. If Item IV Trust U/W John F. Rowan (Operator) wishes to continue an activity regulated by this permit after the expiration of the permit, the Operator must apply for and obtain a new permit.

   c. The Operator shall report any instances of noncompliance with permit conditions to the Division in writing within five (5) working days of such noncompliance, and shall take all reasonable steps to minimize the impact on the environment resulting from noncompliance with this permit and the Georgia Rules for Underground Injection Control.

   d. The Operator shall notify the Division of any proposed changes to the performance of the sodium persulfate injection system in writing at least thirty (30) days prior to the change.

   e. All reports submitted to the Division shall be signed and stamped by a Georgia Registered Professional Engineer or Professional Geologist.

   f. All analyses shall be performed by a laboratory approved or accredited by EPD in accordance with the Georgia Rules for Commercial Laboratory Accreditation, Chapter 391-3-26.

2. System Parameters.

   a. This permit is issued to the Operator for the purpose of operating a sodium persulfate injection system at the above referenced site to aid in remediation of soil and ground water contaminated with chlorinated solvents.

   b. Number of Class V injection wells: twenty.

   c. Injected fluid: sodium persulfate.

   d. Maximum injection volume per well: 100 gallons of liquid/day (gpd)/well.
   Maximum total system injection volume: 2,000 gpd.

   e. Maximum daily average injection pressure (at well head): gravity.

Additional Conditions, UIC Permit #393, January 23, 2009, cont.

3. Monitoring and Reporting Requirements.

   a. The Operator shall report to the Underground Injection Control Program of the Division the number and exact location of all Class V injection wells it installs or plugs on a quarterly basis. The reports are to be submitted to the UIC Program in accordance with the reporting schedule stipulated by the Hazardous Waste Management Branch.

   b. The Operator shall submit to the Division for its approval, a detailed schematic diagram and location map on any Class V injection well that is different in construction from the specifications contained in the UIC permit application, no later than 45 days prior to installation of the injection well. The Operator cannot install such a well until it receives approval from the Division.

   c. The Operator shall submit to the UIC Program one (1) copy of any report regarding this site that the Operator is required to submit to the Hazardous Waste Management Branch.

   d. The Operator shall submit to the UIC Program an annual report that will contain the following information.

      1. Status of the injection system operation;

      2. Results of any ground-water sampling and analyses;

      3. Results of any soil sampling and analyses;

      4. An evaluation of the plume movement through the ground water, if any;

      5. Comparisons of analyses to determine any changes in pollutant concentrations.

   The annual reports will be provided to the UIC Program in accordance with the schedule stipulated by the Hazardous Waste Management Branch.

4. Emergency Situations.

   a. The Operator is to immediately notify the Division of any emergency situation that affects the injection system and describe the remedial activity that the Operator is utilizing to correct the situation.

   b. The Operator is to immediately notify the Division when the emergency situation ceases to exist.

5. The Operator shall grant the Division permission to enter the facility property to conduct inspections of the injection system.

Additional Conditions, UIC Permit #388, December 19, 2008, cont.

6. The Operator shall maintain a copy of this permit at the facility site.

7. The Operator shall, upon termination of the injection of the sodium persulfate through twenty Class V injection wells at this site, properly plug and abandon all Class V wells constructed on this site in accordance with EPD's *Manual for Groundwater Monitoring* (September 1991) and notify the division within thirty (30) days of such termination and abandonment.

Re: Voluntary Remediation Program Semi-Annual Status Report, December 2, 2011
Voluntary Remediation Program Semi-Annual Status Report, June 2, 2011
Voluntary Remediation Program Supplemental Report, June 29, 2011
Fashion Care/Executive Care Site, HSI No. 10786
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
Tax Parcel ID Nos. 18-343-13-002, 18-343-13-005, 18-343-13-001, & 18-333-02-023

Dear Ms. Norris:

The Georgia Environmental Protection Division (EPD) has reviewed the above-referenced reports submitted by Winter Environmental in accordance with the Voluntary Remediation Program Act (the Act) for the above-referenced properties. EPD offers the following comments which should be addressed pursuant to the Act:

1. EPD provided comments on the draft Uniform Environmental Covenants (UECs) via email on February 10, 2012. Although we believe these comments are complete, they may change as more information is gained regarding the site and the Act. The comments also assumed that the vapor intrusion evaluations are correct and that current concentrations will not be exceeded in the future. The comments below and the results of future modeling may initiate additional changes to the UECs.

2. The monitoring wells installed during the investigation and remediation of the former EZ Serve site (UST Facility ID No. 09000341) have been abandoned as described in the August 30, 2011 Completion Report for the facility. Many of those wells served as delineation wells up/side-gradient of the Fashion Care site, and do not need to be replaced. However, certain wells, such as MW-23D, provided important characterization and monitoring of the plume and will be necessary for model verification. In the next progress report, please include a schedule for replacement of MW-23D (provide a figure showing new location if appropriate) and any other wells needed to verify the model.

3. In future summaries of professional service hours billed, please separate the hours billed by the Professional Engineer/Geologist overseeing the project from support staff hours.

Vapor Intrusion Analysis

4. Section 3.4 of the December 2011 report notes that the vapor mitigation system for Parcel 18-343-13-002 has been designed and will be installed in 2012. The progress report that contains the as-built should also explain the rationale behind the design including any

testing, discuss the building parameters that will allow this design to function properly, and demonstrate that the restaurant space is also protected.

5. The toxicity and chemical-specific parameter values were not updated prior to running the Johnson & Ettinger model for some of the volatile substances in soil gas. These values should be consistent with the values provided in the most current version of the Regional Screening Levels Table (RSLT) available prior to submittal of the report [e.g., tetrachloroethylene (RfC), trichloroethylene (RfC and IUR), acetone (RfC), chloroform (RfC), etc.]. Parcel 18-222-02-023 does not require re-analysis since the results already recommend vapor intrusion remedial measures.

6. The summary table of parameters used in the vapor intrusion analysis contains an inadequate exposure frequency (EF) value of 30 days/yr. However, the models were run using an appropriate EF of 350 days/yr. Additionally, the input parameter for temperature designated in the user guidance for the southeastern region of the United States is 19.4°C. This is the recommended input value based on the average temperature of shallow groundwater for the southeastern region. This does not significantly impact the model results, but should be revised if the model is rerun.

Type 5 RRS Calculations

The Type 5 risk reduction standards (RRS) presented in Table 1 of Appendix D of the December 2011 report are hereby approved with the following revisions:

7. The toxicity values listed in Appendix D for cis-1,2-dichloroethylene (cis-1,2-DCE) and trichloroethylene (TCE) have been updated in the most current version of the RSLT. The toxicity values for tetrachloroethene (PCE) were updated in IRIS on February 10, 2012. The updated values are provided below for your convenience.

Regulated Substance	**RfD_o (mg/kg-d)**	**RfD_i (mg/kg-d)**	**SF_o $(mg/kg\text{-}d)^{-1}$**	**SF_i $(mg/kg\text{-}d)^{-1}$**
cis-1,2-DCE	2.0E-03 (IRIS)	NA	NA	NA
TCE	5.0E-04 (IRIS)	5.7E-04 (IRIS)	4.6E-02 (IRIS)	1.4E-02 (IRIS)
PCE	6.0E-03 (IRIS)	1.1E-02 (IRIS)	2.1E-03 (IRIS)	9.1E-04 (IRIS)

NA – No toxicity value available in RSLT

The resulting Type 5 RRS for the construction worker and utility worker are as follows:

Regulated Substance	**Construction Worker - Soil (mg/kg)**	**Utility Worker - Soil (mg/kg)**	**Construction Worker – Ground water (mg/L)**	**Utility Worker – Groundwater (mg/L)**
cis-1,2-DCE	619	4420	2.6	18
TCE	6.8	49	0.006	0.041
PCE	142	1015	0.12	0.82

8. The Type 5 soil RRS for 1,1-dichloroethene are incorrect even though the method and exposure assumptions used were correct. EPD derived a Type 5 soil RRS of 253 and 1,805 mg/kg for the construction worker and utility worker, respectively.

9. Minor changes have been made to the chemical-specific parameters for the following regulated substances. It should be noted that this does not impact any of the calculated volatilization factors in Appendix D, Table 4.

   - 1,1-Dichloroethene: Dia – 0.0863 cm^2/s; Henry's Law Constant– 0.0261 atm-m^3/mol
   - cis-1,2-Dichloroethene: Dia – 0.0884 cm^2/s; Koc – 39.6 L/kg

The John F. Rowan, Sr. Item IV Trust (Trust) must address these comments to EPD's satisfaction in order to demonstrate compliance with the provisions, purposes, standards and policies of the Act. EPD may, at its sole discretion, review and comment on documents submitted by the Trust. However, failure of EPD to respond to a submittal within any timeframe does not relieve the Trust from complying with the provisions, purposes, standards and policies of the Act.

Please address the above comments in subsequent semi-annual progress reports. EPD anticipates receipt of the next report by June 2, 2012. If you have any questions, please contact Jason Metzger at (404) 463-0530.

Sincerely,

David Brownlee

Re: Estate of John F. Rowan
HSRA Release Notification
Savoy Drive and North Peachtree Street
DHBB File No. 2818/001

Dear Messrs. Cash and Swanson:

Please be advised that we represent the Estate of Mr. John F. Rowan, the owner of the property which is the subject of this letter. The subject property is a dry cleaning facility located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia ("the Site"). The purpose of this letter is to report a release of hazardous substances pursuant to the Rules of the Department of Natural Resources, Chapter 391-3-19 ("the Rules"). This letter is also to inform the Environmental Protection Division ("EPD") that the release in question is subsumed by and co-mingled with a reported release from an active underground storage tank site.

2818-001\RAW\Corres\4522.wpd

Distances noted do not appear correct.

The Site was formerly owned by Business Associates, Inc., a Georgia corporation which was owned by Mr. John F. Rowan. Sadly, Mr. Rowan has passed away recently. The Executor of the Rowan Estate is Ms. Nan Kittrell. The Site is located approximately 100 feet southwest of the intersection of Savoy Drive and North Peachtree Road. Improvements on the Site consist of an approximately 30 year-old concrete block building and asphalt paved parking and driving surfaces. The building is approximately 5,700 square feet in size and is currently occupied by the dry cleaning business known as Executive Cleaners, a/k/a Fashion Care, and a restaurant known as Sun City. The dry cleaning facility located on the Site is a drop off location only. The Site is bordered on the north by the Savoy Drive right-of-way, on the south by overgrown fields, on the east by a retail gas station, and on the west by a restaurant and other commercial development.

In May of 2002, Branch Banking & Trust Company ("BB&T") hired Contour Engineering, Inc. ("Contour") to perform an initial Environmental Transaction Screen in anticipation of a possible purchase of the Site. Enclosed herewith is a copy of the Transaction Screen. To complete this Transaction Screen, Contour contracted with Environmental Data Resources ("EDR") to perform a review of available electronic databases of known environmental conditions for the Site vicinity. Several recognized environmental conditions were identified near the Site from the EDR report. EDR also performed a database search to determine the presence of any drinking water wells within one mile of the Site. No drinking water wells were identified in this search radius.

Is this direction & distance correct?

Several potential environmental sources of concern were located in close proximity to the Site. Most notably, Sunshine Cleaners, EPA ID Number GAD981233133, a former dry cleaning facility, was located approximately 100 feet southeast of the Site. Based upon surface topography, the groundwater flow from the Sunshine Cleaners' facility is westerly, toward the Site.

Adjacent to the Site is a retail petroleum fueling facility named E-Z Serve #8102 ("E-Z Serve"), EPD Facility ID #9000341. E-Z Serve is the source of a known release of petroleum contamination to the environment. The owner of the E-Z Serve location has acknowledged responsibility for the cleanup of this release in a Corrective Action Agreement ("CAA") entered into with the EPD in February, 2002. Enclosed is a copy of the CAA.

The closest potential environmental receptor of concern identified in the EDR report is the First Baptist Church of Atlanta, located approximately 350 feet northwest of the Site. This church, Facility Number 9044208, formerly contained two steel USTs with approximately 10,000 gallon capacity, which were used for the storage of petroleum products. The source of any contamination found on the church property is likely to be from these USTs.

Because of these identified sources of potential environmental concern, BB&T hired Contour to perform a limited Phase II Site Investigation ("the Phase II") on the Site. Enclosed herewith is a copy of the Phase II.

Contour collected two discrete samples from one direct-push soil boring and three direct push-groundwater samples in three separate locations. In addition, an existing groundwater monitoring well located on the Site was sampled. This well is associated with the remediation efforts taking place as a result of the E-Z Serve release. All samples were submitted for volatile organic compound ("VOC") analysis, EPA method 8260B.

The soil sample collected from soil boring one at 4-8 feet below ground surface ("bgs") contained concentrations of benzene, cis 1,2-dichloroethene, napthaline, styrene, tetrachloroethene, and toluene. See table entitled Soil Analytical Results, page 6 of the Phase II. The soil sample collected from soil boring one at 4-8 feet bgs contained detectable concentrations of VOCs, including vinyl chloride (57 µg/kg). Appendix One of the Rules lists the soil concentration that triggers notification for vinyl chloride to be 40 µg/kg.

The groundwater samples collected on the Site contained reportable levels of benzene, tetrachloroethene, trichloroethene, trans 1,2-dichloroethene, and vinyl chloride. See table entitled Summary of Groundwater Analytical Data, page 9 of the Phase II. Pursuant to the Rules, we are submitting this Release Notification to the EPD based upon the sampling results in the Phase II.

As part of the remediation of the adjacent E-Z Serve property, a groundwater monitoring well was installed on the Site. Business Associates, Inc. granted access to E-Z Serve's consultant, Handex of Georgia, Inc. ("Handex"), to enter the Site and install the monitoring well in an access agreement dated July 6, 2001. Samples collected from this

monitoring well contained high concentrations of petroleum hydrocarbons, along with chlorinated solvents. Neither our client, nor the operators of the Site, have ever utilized any petroleum hydrocarbons in business operations.

We have reviewed the proposed Corrective Action Plan - Part B ("CAP-B") for the E-Z Serve property prepared by Handex. Figure 15 of the CAP-B indicates that the groundwater beneath the Site flows from the E-Z Serve property directly onto our client's property. Enclosed herewith is a copy of the proposed CAP-B.

There is no evidence in the record that the Rowan Estate is responsible for any release of chlorinated solvents. Determination of the source of the solvent release will be extremely difficult because of the close proximity of known releases. Implementation of the CAP-B for the E-Z Serve property will adequately remediate any chlorinated solvents. Because of the high concentrations of petroleum hydrocarbons in the groundwater on the Site and, with the exception of one sample, the low concentrations of chlorinated solvents detected in the groundwater samples, any action taken to remove the petroleum contamination will concurrently remove the solvent contamination.

The costs for cleanup of the E-Z Serve property are being reimbursed by the Georgia Underground Storage Tank Trust Fund (the "GUST Fund"). We have been informed by Handex that the former owner of E-Z Serve has declared bankruptcy. We reviewed the EPD files, which indicate the new owner of the E-Z Serve property and USTs is Metro Atlanta Commercial Properties, LLC. The new owner has indicated on the notification documents that it meets all the requirements for financial responsibility and qualifications for the GUST Fund. Metro Atlanta Commercial Properties, LLC has acknowledged its responsibility to continue the remediation efforts begun by E-Z Serve by its acceptance of ownership of the USTs.

We request that you make a collective determination that no action is required under the Hazardous Site Response Act to remediate the contamination on the Site, because the Site will, by necessity, be remediated according to applicable UST regulations.

We represent another client which is similarly situated as E-Z Serve is in this situation (Happy Store 365, Facility ID #0600750). In that situation, an adjacent dry-cleaning facility released chlorinated solvents into the groundwater. This solvent plume

mixed with a petroleum release from our client's adjacent property. EPD elected not to take any action under HSRA to address the solvent contamination because the active petroleum remediation being undertaken by the adjacent landowner, by necessity, is remediating the chlorinated solvent contaminates. I will be pleased to discuss the parallels of these situations with you at your convenience. We will also be pleased to attend a meeting to discuss the overall situation with the two divisions of the EPD which you represent.

Please confirm your concurrence with our analysis. We are confident that EPD will work diligently with the new responsible party to ensure that this matter is resolved as efficiently as possible.

Sincerely,

Ed Hallman

MEMORANDUM

TO: David Brownlee

THRU: Dave Yardumian

FROM: Bob Pierce

RE: Fashion Care/Executive Care Property Field Inspection Report.

Date of Inspection: May 19, 2004

Accompanied by: Martha Pierce

Arrived at the Fashion Care property at 9:30 AM. The property is located at 2211 Savoy Drive, Chamblee, Dekalb County, Georgia. The name on the facility is now Clothing Care Cleaners. The following bound the site:

North:	Savoy Drive
South:	Nancy Creek
East:	North Peachtree Road
West:	China Express and Mad Italian Restaurants plus various businesses.

Site Characteristics

The site had no fencing around it. The company building was surrounded by an asphalt-paved parking lot. The asphalt was observed to be in good condition with only some minor cracks. The monitoring wells in Figure 2 (Site Plan) were observed to be at the locations marked in the Figure. All wells were flush mount. The Shell Gas Station on the figure is now a Mobile Station and the Texaco Gas Station is now a Shell Station.

Residential Property

The property is surrounded predominately by businesses and no residential property was observed within 300 feet of the site.

Nearest Well

A well survey revealed no well within 3 miles of the site. This area of north Dekalb County and adjacent Fulton County is highly developed with new strip malls, full size shopping malls (e.g., Perimeter Mall), high density and high-end homes, medical facilities (e.g., St Joseph's Medical Center), churches, schools and other new development. We conducted a house-to-house well survey in the vicinity of the reported J.S. Wooten domestic well location near the intersection of Tilly Mill and Womack Roads but could find no trace of it. Most of this area is occupied by Georgia Perimeter College (Dunwoody Campus), a private school (The Weber School) and new construction. We spoke with a Dekalb County building inspector working in the area and she knew of no wells in the area. We all concluded that if there had been a well in the area it had been removed by development. The inspector stated that all residences in the area were on Dekalb County water.

4306 N. Peachtree Road
Tax Parcel ID No. 18-343-13-005
Chamblee, DeKalb County, Georgia

Dear Ms. Norris:

The Georgia Environmental Protection Division (EPD) has approved the Uniform Environmental Covenants (UEC) submitted for the above-referenced properties, which are part of the Fashion Care/Executive Care Site. The fully executed originals are enclosed. Within thirty (30) days of receipt, these covenants are to be filed with the clerk of the Superior Court of DeKalb County and recorded in the clerk's deed records pursuant to O.C.G.A. 44-16-8.

Within thirty (30) days of recording, please submit a file-stamped copy of each covenant to EPD. The submittal should include a certification that the parties named in Item 11 of each covenant have also been sent a file-stamped copy. If you have any questions, please contact Robin Futch, PG, PMP of the Response and Remediation Program at (404) 657-8686.

Sincerely,

Judson H. Turner

Re: Fashion Care/Executive Care, HSI No. 10786
2211 Savoy Drive, Atlanta, Dekalb County, GA
Compliance Status Report Call-in

Dear Ms. Kittrell:

As a responsible party for the above referenced site, Section 391-3-19-.06(3)(a) of the Rules for Hazardous Site Response (Rules) requires that you submit a compliance status report and a compliance status certification that documents the current status of the site with regard to the risk reduction standards of Section 391-3-19-.07 of the Rules. A copy of those Rules is enclosed.

Section 391-3-19-.06(3)(a) of the Rules provides that the compliance status report and compliance status certification shall be submitted in accordance with a schedule to be determined by the Director. The Georgia Environmental Protection Division (EPD) requests that you submit the compliance status report and certification for the above referenced site by January 5, 2007. We are also requesting that all documents more than 25 pages in length be submitted as one paper copy, and two compact disc copies in Portable Document Format (PDF). Please find enclosed more information concerning the required format for compact disc copies of documents.

In lieu of submitting a compliance status report by January 5, 2007 that meets all of the requirements set forth in Section 391-3-19-.06(3) of the Rules, you have the option to first perform corrective action to bring the site into compliance with the risk reduction standards and then submit a final compliance status report during or following completion of corrective action. If you would like to pursue this option, please schedule a meeting with us by September 5, 2006 to discuss the submittal of a corrective action plan that would be submitted by April 5, 2007. The corrective action plan would have to:

- Describe the actions that will be taken to bring the site into compliance with the risk reduction standards and a schedule for implementation and completion of corrective action;
- Provide a description of all sources of releases of regulated substances as required by Section 391-3-19-.06(3)(b)(1) of the Rules;
- Define the extent of regulated substances in impacted media that exceed the risk reduction standards as provided for in Section 391-3-19-.06(3) of the Rules. Delineation of releases to background levels would not be necessary until submittal of the compliance status report;
- Describe any human or environmental receptors who may have been or could be potentially exposed to a release;

- Describe all properties which are part of the site including the address and location of the properties, its legal description, and the property owner's name, address, and telephone number;
- Include a summary of any previous actions taken to eliminate, control, or minimize any potential risk at the site; and
- Describe actions that will be taken to complete a compliance status report and a schedule for submittal.

Please be informed that under Section 391-3-19-.06(6)(c) of the Rules, the Director may designate this site as having a known release needing corrective action if you fail to submit the compliance status report or corrective action plan as requested by this letter. Please send us your written reply by September 5, 2006 and state whether you intend to submit the compliance status report or the corrective action plan by the date requested. If you do not intend to submit the compliance status report or the corrective action plan by the date requested, please state your basis for that decision. This site may also be designated as needing corrective action if you fail to respond by September 5, 2006, or if you respond by September 5, 2006 but fail to agree to submit the compliance status report by January 5, 2007 or the corrective action plan by April 5, 2007.

According to Section O.C.G.A. 12-8-92 of the Hazardous Site Response Act and Section 391-3-19-.02 of the Rules, a "responsible party" means: (a) the current owner or operator of a facility; (b) any person who at the time of disposal of a regulated substance owned or operated the facility where disposal occurred; (c) any person who arranged for the disposal or treatment of a regulated substance at the facility where disposal occurred or who arranged for transportation to the facility; and (d) any person who accepted a regulated substance for transport to said facility.

If you believe the EPD has incorrectly identified you as a responsible party at this site, please provide sufficient documentation to support that claim. In addition, I am also requesting that you help us identify any other persons or parties whom you believe to be described by Items (a) through (d) of the previous paragraph, to describe the nature of their relationship with the site, and to provide evidence of that relationship. EPD's effectiveness in expanding the pool of responsible parties will depend on our ability to communicate with those parties; therefore, your assistance in obtaining current mailing addresses and phone numbers for appropriate contact persons is requested. We encourage responsible parties to collaborate to expedite and simplify the investigation and cleanup of this site. Therefore, a list of parties that have received a similar letter from EPD is attached.

If you have any questions or comments, please contact Jason Metzger at 404-657-8600.

Sincerely,

Jane Hendricks
Unit Coordinator

Document Submittal Format

All documents more than 25 pages in length shall be submitted as one paper copy and two compact disc (CD) copies with the documents in searchable (i.e., tagged) Portable Document Format (PDF). A signed certification page must be included in the CD copies. The certification page states that the electronic copy is complete, identical to the paper copy, and virus free.

All documents currently in electronic format should be converted into the searchable PDF format. All documents not available electronically and pages that contain signatures, initials, or other information not in the electronic copy should be scanned into a searchable PDF format including the signed certification page. Scanning should be at 200 dpi with any documents requiring color being scanned in color.

The document should be broken down into multiple searchable PDF files along the following guidelines with the file name referenced in the table of content.

Table of Contents
Signature / Certification pages
Main body of document
Each Attachment (Appendices, Tables, Figures, Reports, etc.)

The CDs shall be enclosed in a jewel case. The CD shall be labeled with the following information written on the CD in indelible ink or affixed to the CD with an adhesive CD label.

RE: Listing of site on Hazardous Site Inventory
Fashion Care/Executive Care
Chamblee, Georgia
HSI Site Number: 10786

Dear Ms. Kittrell:

Pursuant to the Georgia Rules for Hazardous Site Response, specifically Rule 391-3-19-.05(1) "Listing on the Hazardous Site Inventory," the Georgia Environmental Protection Division (EPD) has evaluated the above referenced site to determine whether a release of a regulated substance exceeding a reportable quantity has occurred. Based upon information provided in your release notification dated March 24, 2004, it has been determined that a release exceeding a reportable quantity has occurred at this site. Therefore, this site is now listed on the Hazardous Site Inventory (HSI) and will be included in the next publication of the HSI.

Enclosed is a document entitled "Introduction to the Hazardous Site Inventory" that provides an overview of the listing process. Also enclosed is a printout of the data on your site that has been entered into the HSI database. The printout indicates the numerical values assigned when the site was evaluated using the Reportable Quantities Screening Method (RQSM). If it is your position that any of the values shown on the enclosed printout do not represent actual conditions at the site as of the date of this letter, then you may request that the value be changed. If analytical data not yet submitted to EPD is the basis of your request for a change in a RQSM value, the data must have been collected prior to your receipt of this letter to affect the listing of your site on the HSI. Your request should be made in writing and provide documentation to support your position, including a statement as to what you think the appropriate value for that factor should be.

In accordance with O.C.G.A. §12-8-70(d) and Rule 391-3-19-.05(2) "Release Reporting," you are required to submit the following information unless such information has already been submitted pursuant to Rule 391-3-19-.04(4) "Notification Requirements":

(1) Name, mailing address, and telephone number of the site's property owner, lessee, tenant, or facility owner or operator (for all such properties at the site);

(2) Street address of the site or, if a numbered address is not available, a location descriptor;

(3) An original of the most current topographic map of scale 1:24,000 produced by the United States Geological Survey, with the geographic center of the site identified;

(4) A description of the property boundaries in the vicinity of the site by legal description, survey plat, tax map (EPD requires that you provide a **tax map parcel ID number** for the parcel at

which the reportable quantity release was identified), or other means (the property boundary description must include other owners' properties if other properties have been affected by the release);

(5) A chemical name, taken from Appendix I, of each regulated substance released at the site that independently meets the notification criteria in Rule 391-3-19-.04(3);

(6) A general description of the nature of the release and the location of areas affected by the release or by its subsequent migration, both within and beyond the original site's boundaries;

(7) Suspected or known source, quantity, and date of the release;

(8) A summary of actions taken to investigate, clean up, or otherwise remediate the site; and

(9) A statement that identifies the criteria of Rule 391-3-19-.04(3) by which the property owner determined that a release, which required notification, has occurred.

You have the option to use EPD's revised standardized Release Notification/Reporting Form (copy enclosed) in submitting the above information. If there are items requested on the revised notification form that were not previously submitted, please provide those items using the new form. If you change or add any information previously submitted in a standardized form, please provide a cover letter with the new completed form that clearly states that you are providing supplemental information only, and that you are not submitting a new notification.

Please submit the required information within forty-five (45) days of receipt of this letter to the following address:

Re: Voluntary Remediation Program Semiannual Status Report, July 3, 2014
Fashion Care/Executive Care Site, HSI No. 10786
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
Tax Parcel ID Nos. 18-343-13-002, 18-343-13-005, 18-343-13-001, & 18-333-02-023

Dear Ms. Norris:

The Georgia Environmental Protection Division (EPD) has reviewed the July 2014 Semiannual Status Report, submitted in accordance with the Voluntary Remediation Program (VRP) Act for the above referenced site. EPD offers the following comments, which should be addressed pursuant to the Act:

1. The conceptual site model (CSM) cross-section presented in Figure 1 does not show contaminant concentrations superimposed on the stratigraphic features and also does not include vertical and horizontal axes to scale. Please revise this cross section to scale and relocate it to include FMW-6 and FMW-9 so that it parallels the plume axis and includes the items noted above. Two additional cross sections should also be developed perpendicular to A-A'; one across the source area and one along Nancy Creek. Please note that site cross sections should be revised as new site information is obtained, and submitted as part of the updated CSM in each VRP progress report.

2. Based on the cross section provided in Figure 1, there is saprolite beneath the dense dry silt in the vicinity of FMW-4 and MW-23D. Since the attempted deep well, adjacent to FMW-5, went from dry silt to bedrock and was abandoned, there remains a data gap with regard to potential contamination beneath the dry silt as evidenced in the sampling results from MW-23D. If a replacement deep well is no longer proposed, this data gap must be satisfactorily addressed in the fate and transport modeling effort.

3. Please clarify what the flow rate was when the surface water samples were collected on April 28, 2014. In future reports please include this information with the sampling results.

4. Please clarify why the SB wells inside the building, specifically SB-26, were not sampled during the April groundwater sampling event. Please note that for the SB wells and other wells with foot note (3) in Table 1, the (3) footnote is not defined in the table notes.

5. For the low-flow purging method, the pump intake should be placed near the mid-point of the screened interval (see Groundwater Sampling, USEPA SESDPROC-301-R3, Section 3.2.2). This data was not recorded in the field sampling logs. Please place the pump intake at the recommended location in future sampling events and document the location on the field sampling logs.

The John F. Rowan, Sr. Item IV Trust (Trust) must address these comments to EPD's satisfaction in order to demonstrate compliance with the provisions, purposes, standards and policies of the Act. EPD may, at its sole discretion, review and comment on documents submitted by the Trust. However, failure of EPD to respond to a submittal within any timeframe does not relieve the Trust from complying with the provisions, purposes, standards and policies of the Act.

Please address the above comments in subsequent semi-annual progress reports. EPD anticipates receipt of the next report by December 2, 2014. If you have any questions, please contact Robin Futch, P.G., PMP at (404) 657-8686.

Sincerely,

Jason Metzger
Unit Coordinator
Response and Remediation Program

Re: Voluntary Remediation Program Semi-Annual Status Report, June 2, 2012
Voluntary Remediation Program Semi-Annual Status Report, December 2, 2012
Voluntary Remediation Program Semi-Annual Status Report, June 2, 2013
Fashion Care/Executive Care Site, HSI No. 10786
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
Tax Parcel ID Nos. 18-343-13-002, 18-343-13-005, 18-343-13-001, & 18-333-02-023

Dear Ms. Norris:

The Georgia Environmental Protection Division (EPD) has reviewed the above-referenced reports submitted by Winter Environmental in accordance with the Voluntary Remediation Program Act (the Act) for the above-referenced properties. EPD offers the following comments which should be addressed pursuant to the Act:

1. As noted in the Voluntary Remediation Program (VRP) application checklist and in EPD's December 2, 2010 VRP acceptance letter, the June 2, 2013 progress report should have included the final remedial plan. Although a draft plan is in place and the overall 5-year timeframe for submittal of the VRP compliance status report remains feasible, the necessary data collection and modeling to finalize that plan has not been completed. If the conceptual site model (CSM) changes, and active remediation becomes necessary, the schedule may be compromised. EPD encourages you to collect the necessary data and complete the modeling to finalize the CSM and remedial plan for inclusion in the June 2, 2014 progress report.

2. EPD concurs that horizontal delineation of groundwater is complete. Furthermore, vertical delineation of groundwater impacts to Type 1 risk reduction standards is not required for this site under Sections 12-8-107(g)(2) and 12-8-108(9) of the Act. However, a deep well is required to confirm conditions in the 'lower' aquifer in order to verify the CSM and support the model in accordance with EPD's December 2, 2010 (Comment 7) and February 22, 2012 (Comment 2) letters.

3. Based on Section 3.1 of the June 2013 Progress Report, EPD concurs that the probability of a complete exposure pathway on Tax Parcel 18-333-02-023 is minimal. Therefore, if appropriate language is added to the uniform environmental covenant (UEC) for Tax Parcel 18-343-13-002, a UEC for parcel 18-333-02-023 will not be required. In addition to the monitoring of property development proposed in Section 3.1, the UEC must commit to conducting vapor intrusion analysis, vapor intrusion mitigation, and/or groundwater corrective action, as appropriate, if enclosed structures are built in the vicinity of the plume. EPD recommends that the covenants be finalized after the CSM and remedial plan have been confirmed.

4. The vapor mitigation system proposed for the building on parcel 18-343-13-002 should be installed as soon as possible to ensure that there are no complete exposure pathways at this time.

5. The monitoring well network hasn't been sampled since July 2012 and many wells have only two or three data points. Therefore, EPD recommends that another round of sampling be completed for pertinent monitoring wells and for surface water prior to completing the required model.

The John F. Rowan, Sr. Item IV Trust (Trust) must address these comments to EPD's satisfaction in order to demonstrate compliance with the provisions, purposes, standards and policies of the Act. EPD may, at its sole discretion, review and comment on documents submitted by the Trust. However, failure of EPD to respond to a submittal within any timeframe does not relieve the Trust from complying with the provisions, purposes, standards and policies of the Act.

Please address the above comments in subsequent semi-annual progress reports. EPD anticipates receipt of the next report by December 2, 2013. If you have any questions, please contact Jason Metzger at (404) 657-8610.

Sincerely,

Charles D. Williams

Re: Voluntary Investigation and Remediation Plan and Application, July 9, 2010
Fashion Care/Executive Care Site, HSI No. 10786
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
Tax Parcel ID Nos. 18-343-13-002, 18-343-13-005, 18-343-13-001, & 18-333-02-023

Dear Ms. Norris:

The Georgia Environmental Protection Division (EPD) has reviewed the Voluntary Investigation and Remediation Plan (VIRP) dated July 9, 2010 submitted pursuant to the Georgia Voluntary Remediation Program Act (the Act), which has been submitted in lieu of a Corrective Action Plan required pursuant to the Georgia Rules for Hazardous Site Response (the Rules) for the above referenced site. EPD is approving your voluntary remediation plan, which specifies corrective action consisting of the following:

- Execution of Uniform Environmental Covenants to restrict exposure to contaminated soil and groundwater,
- Maintenance of existing asphalt and concrete caps to prevent exposure to contaminated soil,
- Installation and operation of a vapor collection system and installation of vapor barriers, as needed, to prevent exposure to contaminated vapors, and
- Surface water and groundwater monitoring.

Therefore, EPD is accepting the John F. Rowan, Sr. Item IV Trust (the Trust) as a participant as defined in the Voluntary Remediation Program Act for the following qualifying properties provided the Trust implements the VIRP in compliance with the following schedule and conditions:

Qualifying properties:

2211 Savoy Drive
Chamblee, Dekalb County, Georgia
Tax Parcel ID No. 18-343-13-002

4306 North Peachtree Road
Chamblee, Dekalb County, Georgia
Tax Parcel ID No. 18-343-13-005

4308 North Peachtree Road
Chamblee, Dekalb County, Georgia
Tax Parcel ID No. 18-343-13-001

North Peachtree Road
Chamblee, Dekalb County, Georgia
Tax Parcel ID No. 18-333-02-023

Within six months of detecting regulated substance(s) on a non-qualifying property, the participant must apply to EPD to include the affected property as a qualifying property under the Act or notify EPD the non-qualifying property is not included under the Act.

Schedule:

The schedule proposed in the VIRP is significantly shorter than allowed by the checklist. We encourage the Trust to adhere to its schedule as proposed in the VIRP, but have included minimum requirements, as follows:

- Semiannual progress reports are to be submitted to EPD. Each progress report must describe all actions taken since the last submittal, and include certification by the professional engineer/geologist specified in the VIRP along with a monthly summary of hours invoiced and description of services provided since the last submittal.

    - June 2nd and December 2nd through June 2, 2015.

    In addition to the information required above, the following must be included in the specific progress reports discussed below.

    - December 2, 2012 semiannual progress report must demonstrate complete horizontal delineation on all impacted properties; and,

    - June 2, 2013 semiannual progress report must demonstrate complete horizontal and vertical delineation, finalize the remediation plan and provide a cost estimate for implementation of remediation and associated continuing actions. EPD recommends that the participant finalize approval of cleanup standards for all regulated substance prior to this submittal.

- A compliance status report, including certifications, must be submitted by December 2, 2015.

Conditions:

1. EPD requests the submittal of a cost estimate for full implementation of the VIRP through CSR submittal and a financial assurance instrument in that amount by no later than March 2, 2011. Model financial assurance instruments can be located at http://www.gaepd.org/Files_PDF/forms/hwb/HSIModel.pdf.

2. The Trust must address EPD's comment letter dated December 2, 2010 and any other comment letters addressing the investigation and remediation pursuant to the Act to the satisfaction of the Director that it is consistent with the provisions, purposes, standards and policies of the Act.

3. Within ninety (90) days of the Trust's notice to withdraw from the Voluntary Remediation Program or termination by the Director pursuant to §12-8-107(d) of the Act, the Trust must submit a corrective action plan that complies with the requirements of the Hazardous Site Response Act and associated Rules for Hazardous Site Response.

4. The Trust must pay all outstanding fees within sixty (60) days of receipt of an invoice for any costs to the division in reviewing the application or subsequent document the exceeds the initial application fee.

EPD requires that the Trust and the professional engineer/geologist specified in the VIRP oversee the implementation of the VIRP in accordance with the provisions, purposes, standards and policies of the Act. EPD may, at its sole discretion, review and comment on documents submitted by the Trust. However, failure of EPD to respond to a submittal within any timeframe does not relieve the Trust from complying with the specified schedule and the provisions, purposes, standards and policies of the Act. Should the Trust fail to comply with the above schedule, EPD may terminate enrollment of the participant and the qualifying properties from the voluntary remediation program.

EPD's approval of the VIRP extends only to those technical aspects of the document that expressly require EPD approval under applicable rules and statutes. This approval is not an endorsement by EPD that it accepts as conclusive any representations made in the document. Nor does EPD guarantee or warrant that the document is free of errors or omissions. EPD may later withdraw approval of this document, in whole or in part, if EPD determines that withdrawal is necessary to ensure compliance with the applicable rules and statutes.

If you have any questions, please contact Jason Metzger at (404) 657-8600.

Sincerely,

Mark Smith, Chief
Land Protection Branch

Re: Voluntary Investigation and Remediation Plan and Application, July 9, 2010
Comment Letter
Fashion Care/Executive Care Site, HSI No. 10786
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
Tax Parcel ID Nos. 18-343-13-002, 18-343-13-005, 18-343-13-001, & 18-333-02-023

Dear Ms. Norris:

The Georgia Environmental Protection Division (EPD) has reviewed the July 9, 2010 Voluntary Investigation and Remediation Plan and Application (VIRP) submitted by Winter Environmental for the above-referenced site. EPD has noted the following items which should be addressed pursuant to the Georgia Voluntary Remediation Program Act (the Act):

Surface Water:

1. The application attempts to use a mixing zone analysis to demonstrate that the ongoing migration of groundwater into surface water will not create an unacceptable exposure pathway in the future. However, EPD conducted an evaluation in accordance with "NPDES Reasonable Potential Procedures," and the calculations demonstrate that an excursion above in-stream water quality standards (ISWQS) may occur if active groundwater remediation is not implemented. We do not concur with the following aspects of your analysis:

   - EPD does not concur with the 'areal average groundwater concentrations' used in the mixing zone analysis. The monitoring wells selected for use in the calculations represent current (or near future) groundwater conditions in the vicinity of Nancy Creek; they are not representative of groundwater concentrations in the source area of the site, which will be expected to discharge to Nancy Creek at some point in the future. The mixing zone analysis should be re-evaluated to incorporate a scenario whereby impacted groundwater in the vicinity of the dry cleaning building migrates along the plume axis and discharges to Nancy Creek as indicated by the CSM. A fate and transport model, such as BIOCHLOR, should be used to estimate a maximum discharge groundwater concentration.
   - It may be appropriate to average estimated groundwater concentrations along the plume front where it intercepts Nancy Creek. However, modeling or another appropriate method must be used to estimate the concentrations at discrete intervals coincident with the timing of the maximum discharge concentration at the plume axis.

- An appropriate leaching model must be used to estimate the ongoing contribution of the existing soil contamination to groundwater contamination. That contribution must be included in the proposed fate and transport modeling in addition to the existing groundwater contamination.
- The calculations should be completed using 7Q10 flow for the stream at the area of groundwater discharge. EPD has calculated that value to be 3 cubic feet per second using historical location-specific data.

2. Additional near-term surface water monitoring is necessary to demonstrate that the plume is not currently impacting Nancy Creek. The first progress report should include results from a minimum of eight (8) surface water sampling events. The flow rate should be measured prior to each sampling event and samples collected only when flow is close to 7Q10. Four (4) of the samples should be collected within a 30-day period.

3. With respect to surface water monitoring, EPD noted that the VIRP did not provide any threshold values protective of human health and the environment. The first progress report should include proposed corrective action that will be implemented within 30 days of detection of site constituents of concern (COCs) in any surface water sample collected from Nancy Creek.

4. Future surface water analysis should be conducted using an appropriate analytical method with a detection limit below the ISWQS for tetrachloroethene of 3.3 ug/L.

5. The Georgia ISWQS were updated in March 2010. The correct values for 1,2-dichloroethane, benzene, ethylbenzene, and toluene, are 0.037, 0.051, 2.1, and 5.98, respectively (all mg/L) (Table 3). Note that if COCs are detected in surface water, a Screening Level Ecological Risk Assessment may be necessary because ecological remedial goals are lower than ISWQS in certain cases.

<u>Groundwater</u>

6. At this time, EPD cannot concur that horizontal delineation of the groundwater plume at the Site has been completed. An additional monitoring well may be needed to complete horizontal delineation of vinyl chloride in the vicinity of FMW-15. FMW-15 must be included in the proposed monitoring network so that a delineation determination may be made based on future sampling results. With respect to plume delineation to the south, no technical justification was provided in the VIRP supporting the theory that Nancy Creek is a hydraulic barrier to groundwater flow in bedrock. Additional refinement of the CSM is necessary, and further justification, such as demonstration of an upward vertical gradient in bedrock at the site and/or a comparison of groundwater elevations and surface water elevations, should be included in future reports.

7. The conceptual site model (CSM) for the Site, as it relates to the vertical migration of contaminants, is based on a theory that a continuous layer of hard dry silt underlies the property and acts as a barrier to vertical flow thereby creating "upper" and "lower" water bearing zones. The VIRP further theorizes that high concentrations of PCE measured in "deep" monitoring well MW-23D (19,000 µg/L) are possibly the result of vertical migration of contamination along the well casing. Please note that PCE data collected from shallow monitoring wells in the vicinity of MW-23D are significantly lower in concentration than

detected in MW-23D and do not support the theory that contaminated groundwater in the immediate vicinity of MW-23D migrated vertically along the well casing. Please present additional evidence of this 'barrier' and/or revise the CSM appropriately in future progress reports. Delineation of the "deep" aquifer plume may be required in the downgradient direction.

8. Hydraulic conductivity calculations derived from slug test data may need to be re-evaluated in the event that a uniform layer of dry silt across the site is verified. The hydraulic conductivity estimation provided in the VIRP used an aquifer thickness of 40 feet and did not appear to incorporate the dry silt layer theorized to be present across the Site.

9. The VIRP did not include a vertical gradient calculation for the Site. Please note that vertical gradient should be calculated following completion of the vertical delineation well proposed in the area of monitoring well FW-4 and the gradient result should be included in the first semi-annual report.

10. Groundwater sampling techniques were not included in the VIRP and no information was provided regarding well development activities for newly installed monitoring wells FMW-12 through FMW-16. Please provide this information in the compliance status report.

Engineering / Environmental Covenants

11. EPD agrees that concrete and asphalt eliminate direct exposure to soil for current site receptors as a Type 5 RRS scenario. However, if the concrete or asphalt is breached due to utility repairs or construction work at the site, direct exposure would now be a complete pathway for site receptors. Since a future breach is likely in a commercial setting, the applicant must calculate site-specific utility and construction worker cleanup standards in accordance with Section 391-3-19-.07(10) of the Rules for Hazardous Site Response, for comparison to soil and groundwater concentrations.

12. If current soil and groundwater concentrations exceed the calculated values, the proposed institutional controls must be revised to explicitly state the procedures that will be taken to protect those workers. EPD will provide additional comments on the proposed institutional controls based upon future progress reports.

Miscellaneous

13. Table 2 presents the soil Type 1 RRS and Table 3 presents the groundwater Type 1 RRS, which are being used as site delineation concentration criteria. Please note that the correct soil Type 1 RRS for 1,1-dichloroethane is 400 mg/kg and the correct groundwater Type 1 RRS for cis-1,2-dichloroethene is 0.07 mg/L. Also note that footnote (3) is not defined for Table 3.

14. EPD did not review the Type 4 soil RRS provided on Table 2 because they are not being used for cleanup and because toxicity factors, chemical parameters, exposure assumptions, and sample calculations were not provided for these values.

15. Figures 5 and 7 attempt to demonstrate delineation to Type 1 RRS, but do not include sample results. Future progress reports should include soil and groundwater figures that

show current concentrations of all constituents of concern (soil figure should include historical data).

16. EPD concurs that the vapor intrusion pathway is likely complete on the property. However, the VIRP does not address the potential migration of vapors into the existing building on Parcel 18-343-13-005 (4306 North Peachtree Road). The building must be evaluated using the Johnson & Ettinger model or appropriate vapor sampling and results reported in the subsequent progress report.

17. During a September 2010 site visit, EPD noted that monitoring wells were not labeled and the newly installed wells were not locked. Please label and lock all wells.

The John F. Rowan, Sr. Item IV Trust (Trust) must address these comments to EPD's satisfaction in order to demonstrate compliance with the provisions, purposes, standards and policies of the Act. EPD may, at its sole discretion, review and comment on documents submitted by the Trust. However, failure of EPD to respond to a submittal within any timeframe does not relieve the Trust from complying with the provisions, purposes, standards and policies of the Act.

If you have any questions, please contact Jason Metzger at (404) 657-8600.

Sincerely,

Alexandra Y Cleary

Atlanta, Georgia 30339

Subject: Limitation of Liability
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
County Tax Parcel ID No. 18-343-13-002
Fashion Care/Executive Care, HSI No. 10786

Dear Mr. and Mrs. Pero:

The Georgia Environmental Protection Division (EPD) has reviewed the Prospective Purchaser Compliance Status Report (PPCSR), dated October 30, 2014, and the Georgia Brownfields Eligibility Form, dated November 11, 2014, submitted for the above referenced property (subject property). The subject property is identified as Dekalb County Tax Parcel 18-343-13-002 (0.656 acres) and is described in the attached legal description marked Exhibit A and the attached Tax Parcel Map marked Exhibit B.

The PPCSR was submitted to support your request for a limitation of liability for the subject property pursuant to Section 12-8-200 *et seq*. of the Brownfield Act (Act). EPD has determined that the PPCSR is complete and concurs with your certification of compliance that soil at the subject property is in compliance with the Type 5 Risk Reduction Standards in Section 391-3-19-.07 of the Rules for Hazardous Site Response.

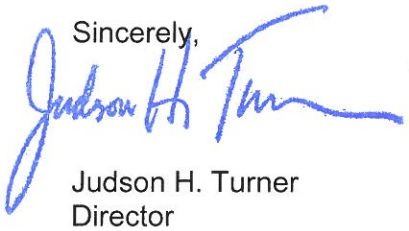
EPD hereby grants Charles and Wendy Pero (Peros) the limitation of liability provided for in Section 12-8-207 of the Act for pre-existing releases at the subject property. This limitation of liability is subject to all conditions set forth in the Act and as follows:

1. The Peros must submit a notice of purchase of the above referenced property by no later than ten (10) days after closing to EPD. Please include documentation of the prohibition of the use of tetrachloroethene on the Property.

2. The Peros will give any responsible party for groundwater contamination and/or EPD access to the subject property to perform groundwater sampling and to implement an EPD approved corrective action plan or workplan for groundwater.

3. The Peros will ensure that the requirements of the Uniform Environmental Covenant (UEC) are abided by and that the required engineering controls are properly operated and maintained.

4. In the event that the Peros wish to sell the subject property, the Peros must provide fifteen (15) days notice to EPD of its intent to offer for sale the subject property or any portion thereof. All documents offering the subject property or portion of the subject property for sale will include a copy of the PPCSR, the UEC, any other documents required by the UEC or the Act, and a copy of this letter. EPD shall be provided with the name, address, phone number, and contact person for the new property owner(s) within ten (10) days of sale.



5. For the purpose of determining liability for continuing or future releases of regulated substances upon or from the properties, the background or baseline concentration for any and all releases will be based on the information provided in the PPCSR pursuant to Section 12-8-208(d) of the Act.

The Act as amended and effective July 1, 2002 (specifically Code Section 12-8-207) states that upon the Director's approval of the Prospective Purchaser Corrective Action Plan or concurrence with the certification of compliance with Risk Reduction Standards for soil and source contained in Section 391-3-19-.07 of the Rules for Hazardous Site Response, whichever first occurs, a prospective purchaser shall not be liable to the state or any third party for costs incurred in the remediation of, equitable relief relating to, or damages resultant from the pre-existing release. Further, the prospective purchaser shall not be required to certify compliance with Risk Reduction Standards for groundwater, perform corrective action, or otherwise be liable for any pre-existing releases to groundwater associated with the qualifying properties.

EPD's approval of the PPCSR extends only to those technical aspects of the document that expressly require EPD approval under applicable rules and statutes. This approval is not an endorsement by EPD that it accepts as conclusive any representations made in the document. Nor does EPD guarantee or warrant that the document is free of errors or omissions. EPD may later withdraw approval of this document, in whole or in part, if EPD determines that withdrawal is necessary to ensure compliance with the applicable rules and statutes. EPD hereby approves the PPCSR subject to the conditions enumerated above.

If you have any questions, please contact Robin S. Futch, P.G. at 404-657-8686.

Sincerely,

Judson H. Turner
Director

2. Exhibit B: Dekalb County Tax Parcel Map

File: HSI 10786

Exhibit A

LEGAL DESCRIPTION (BASED ON THIS SURVEY)

All that tract or parcel of land lying and being in Land Lot 343 of the 18th Land District, City of Chamblee, Dekalb County, Georgia, said tract or parcel of land being more fully shown and designated on a plat of survey prepared by Valentino & Associates, Inc. (Job #14-063; Drawing/File #14-063), bearing the seal of Glenn A. Valentino, Ga. Registered Land Surveyor #2528, and being more particularly described, with bearings relative to Grid North, Georgia West Zone, as follows:

BEGINNING at a 1/2"iron pin set at the intersection of the westerly right-of-way line of North Peachtree Road (70' public r/w) and the line which divides Land Lots 334 and 343.

THENCE proceeding along said line which divides Land Lots 334 and 343 North 89 degrees 50 minutes 35 seconds West for a distance of 213.00 feet to a 1/2"iron pin set;

THENCE departing said line which divides Land Lots 334 and 343 North 21 degrees 58 minutes 35 seconds West for a distance of 126.48 feet to a computed point;

THENCE North 21 degrees 58 minutes 35 seconds West for a distance of 32.37 feet to a PK (masonry) nail set;

THENCE North 15 degrees 33 minutes 54 seconds East for a distance of 114.65 feet to a PK nail set on the southerly right-of-way line of Savoy Drive (variable width public r/w);

THENCE proceeding along said southerly right-of-way line of Savoy Drive South 75 degrees 38 minutes 07 seconds East for a distance of 100.03 feet to a PK nail set;

THENCE departing said southerly right-of-way line of Savoy Drive South 15 degrees 23 minutes 37 seconds West for a distance of 86.07 feet to a railroad spike found;

THENCE South 22 degrees 56 minutes 23 seconds East for a distance of 111.63 feet to a PK nail set;

THENCE South 60 degrees 14 minutes 53 seconds East for a distance of 60.02 feet to a railroad spike found;

THENCE South 89 degrees 50 minutes 35 seconds East for a distance of 75.00 feet to a PK nail set on the westerly right-of-way line of North Peachtree Road;

THENCE proceeding along said westerly right-of-way line of North Peachtree Road South 09 degrees 33 minutes 55 seconds West for a distance of 18.00 feet to a 1/2"iron pin set at the intersection of said westerly right-of-way line of North Peachtree Road and the line which divides Land Lots 334 and 343, said 1/2"iron pin set being the POINT OF BEGINNING.

Together with and subject to covenants, easements, and restrictions of record.

Said tract or parcel of land contains 0.656 acres or 28,554 square feet, and is intended to be a portion of the same tract of land that was previously conveyed in Deed Book 15562, Page 660, Dekalb County Georgia Records.

RE: Fashion Care/Executive Care - HSI #10786
Corrective Action Plan Approval
Chamblee, Dekalb County, Georgia

Dear Ms. Kittrell:

The Georgia Environmental Protection Division (EPD) has completed its review of the revised Corrective Action Plan (CAP), received on May 31, 2007 for the above-referenced Site. The CAP proposes to address soil contamination through the use of in situ chemical oxidation (ISCO), but does not address the solvents in groundwater. This is based on EPD's pending remediation of petroleum contamination from the adjacent EZ Serve site under the authority of the Underground Storage Tank Management Program. As stated previously, we do not expect that corrective action for the petroleum release will clean up the solvent contamination in groundwater to applicable risk reduction standards (RRS). If it does not, you will be required to clean up groundwater at this site in the future. EPD therefore recommends that you utilize an approach that will clean up both soil and groundwater. However, in the interest of addressing soil and source contamination as expeditiously as possible, EPD hereby approves the revised CAP subject to the following conditions:

Reporting/Performance Monitoring

1. A Final Pilot Study Report must be submitted to EPD prior to full-scale CAP implementation, and within 6-months of receipt of this letter. The Final Pilot Study Report must present the results of the pilot study and oxidant treatability study as specified in section 6.0 of the CAP. Assuming the pilot study shows that the site is amenable to ISCO, the Performance Monitoring Plan (PMP) referenced in the 'Remedial Design' portion of Section 6.0 should be submitted to EPD concurrently, and should include the following:

   - The PMP must provide performance monitoring sampling locations, sampling and analytical methods, analytical parameters, and the performance criteria by which the effectiveness of ISCO will be evaluated.

   - The monitoring program must include surface water sampling on a quarterly basis to ensure continued compliance with Georgia in-stream water quality standards and to ensure that oxidant breakthrough does not occur.

   - The monitoring program must include quarterly sampling of downgradient monitoring wells to monitor oxidant and contaminant flow in groundwater as alluded to in the 'Prevention of Off-Site Migration of Permanganate' portion of Section 6.0.

- Section 5.6 mentions the potential "release or migration of quantities and concentrations of chlorinated vapors that may be harmful . . ." The PMP should indicate how this will be prevented or mitigated during full-scale implementation, since the building contains ongoing dry-cleaning and restaurant operations.

- Comment 4 of EPD's December 28, 2006 Notice of Deficiency (NOD) stated that you must investigate the possible presence of a DNAPL plume in groundwater and must propose remedial action for any source material discovered. In your response letter, you state that the presence of DNAPL will be assessed during the implementation of the CAP, but the CAP does not address this issue. The PMP should fully address this comment.

2. In the event that the pilot test shows that ISCO is not effective at reducing solvent concentrations in soil at the site, an alternative corrective action plan for soil must be submitted to EPD within 60-days of the Pilot Study Report submittal.

3. An annual report must be submitted to EPD until the Director concurs that the site is in compliance with Type 1-4 risk reduction standards. The annual report must include benchmarks for demonstrating that this technology will reduce contamination at the site in a reasonable timeframe. Specific benchmarks must include provisions for modifying the ISCO design or initiating an alternate corrective action remedy in the event that ISCO technology is not achieving significantly reducing trends within a reasonable timeframe. Each annual report must also include a trend analysis, an estimate for time to meet applicable risk reduction standards, and a revised cost estimate.

4. Section 6.0 states that the screened interval of the treatment wells will start at approximately two feet below ground surface. A significant amount of PCE contamination likely remains in the interval from the bottom of the slab to the two-foot depth. Contamination in this interval has not been evaluated, so the interval should be included in performance monitoring/confirmation sampling completed after the pilot study and after full-scale implementation.

5. Section 1.3 states that tetrachloroethene (PCE) was stored in the southwest corner of the building. However, no soil sample is shown in that immediate vicinity and historical groundwater sampling in the vicinity detected PCE at 38 mg/L. Interior and exterior confirmation sampling must be completed in that area.

6. Contrary to a statement in Section 6.0, permanganate could have deleterious effects on the creek, as it is a potent algaecide. The aforementioned quarterly sampling is necessary to protect the creek since no groundwater flow velocity data has been collected. The section proposes to inject, if necessary, a sugar solution along the leading edge of the permanganate plume to prevent migration into the creek. All potential injections must be approved as part of the UIC permitting process. Furthermore, the byproduct of a sugar – permanganate reaction is typically a gelatinous residue, which may impact further mixing. Therefore, we recommend a water, vinegar, and dilute hydrogen peroxide solution.

Risk Reduction Standards

7. You derived the proposed Type 4 RRS for soil using Equation 14 - Mass Limit Soil Screening Level (MLSSL) of EPA's Soil Screening Guidance. Equation 14 assumes that the entire mass available for leaching into groundwater is contained within the soil column. Equation 14 would therefore not be applicable to sites such as Fashion Care, where contamination has already passed through the soil column and into the groundwater. Therefore, the soil leaching results using Equation 10 - Soil Screening Level (SSL) should be compared to the health-based calculations to derive the Type 4 RRS. The approved RRS for this site are shown in the table below.

8. A default f_{oc} value of 0.02 is not acceptable for calculating soil leaching concentrations protective of groundwater (SSLs). Consistent with the EPA Soil Screening Guidance (July 1996), 0.002 must be used as the default f_{oc} value. The f_{oc} value of 0.02 cited in Table 3 of the Rules for Hazardous Site Response refers to the derivation of the soil-to-air volatilization factor in the RAGs equation Part B. Use of f_{oc} values higher than 0.002 must be justified by collecting site-specific data. The corrected SSL values, as shown in Table 3-B, calculated using Equation 10 and a DAF of 20, are shown in the table below.

Compound	Groundwater RRS (mg/L)	C_w (mg/L) (DAF=20)	Soil Type 1 RRS (mg/kg)	SSL (Eq. 10) (mg/kg) (f_{oc}=0.002)	EPD Approved Soil RRS (mg/kg)
cis-DCE	1.02	20.4	0.53	6.12	6.12
trans-DCE	2	40	10	13.6	13.6
PCE	0.005	0.1	0.5	0.05	0.5
TCE	0.005	0.1	0.5	0.06	0.5
vinyl chloride	0.002	0.04	0.2	0.01	0.2

9. The Type 4 RRS for groundwater calculated for trans-DCE on Table 4-A and provided on Table 3-A is incorrect. The correct value should be 2.0 mg/L based on the non-carcinogenic risk derived from RAGS Equation 2. Since the soil Type 4 RRS is controlled by the protection of groundwater criteria, this causes changes to Table 3-B and the correct SSLs calculated for trans-DCE in soil are shown in the table above.

10. The following comments do not have an effect on the final RRS calculated for this site, but should be noted for future calculations:

    - Table 2-A states that the Type 3 RRS for soil are based on groundwater leaching; however, the Type 3 RRS are based on the notification concentration for cis-DCE and Appendix III Table 1 multiplied by 100 for trans-DCE, PCE, TCE, and vinyl chloride.

    - The Inhalation Reference Dose (RfDi) provided for trans-1,2-dichloroethene on Table 2-B is incorrect. There is no RfDi recommended.

    - The Type 3 RRS for groundwater provided for cis-1,2-dichloroethene on Table 3-A is incorrect. This value should be background or detection limit instead of 'none.'

11. The CAP included results from the Johnson and Ettinger Vapor Intrusion Model, which yielded overly conservative cleanup concentrations for soil. The intent of Comment 13 of the December 28, 2006 NOD was to confirm that current groundwater concentrations do not pose a significant vapor intrusion threat, since groundwater is not being addressed concurrently. The required PMP should demonstrate that interior PCE concentrations will not exceed OSHA standards due to vapor intrusion from groundwater contamination.

12. Section 4.1 notes that several compounds were ignored because they were detected at concentrations below their respective notification concentration. In order to delist a site, all detected regulated substances must be shown to be at concentrations below calculated RRS. Therefore, you cannot disregard those compounds which do not appear to be related to the petroleum release, including acetone, 1,2-dichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene. Although the detected concentrations are well below their respective Type 1 RRS (acetone=400 mg/kg, 1,2-DCB=60 mg/kg, 1,3-DCB=60 mg/kg, 1,4-DCB=7.5 mg/kg), these detections must be addressed in the Compliance Status Report.

13. 1,4-dioxane is a solvent stabilizer frequently found at sites contaminated with PCE. It is not part of the target compound list in SW-846; therefore it is not run on all 8260 scans. Please ensure that the lab includes 1,4-dioxane in future analysis. If it is detected, appropriate RRS must be derived and the CAP modified to address the 1,4-dioxane if necessary.

General

14. A detailed cost estimate for the selected remedy must be submitted to EPD as part of the Final Pilot Study Report.

15. The following formatting/tabular errors have been noted and should be corrected in future submittals:

- Figures 4 and 5 have boring locations B-5, B-6, and B-7 transposed with B-10, B-11, and B-12.
- Concentration units should be shown on all applicable figures.
- The sample results for B-10, B-11, and B-12 on Figure 7 should be N/T according to the analytical data submitted with the report.
- All non-detect analytical values should be presented in summary tables as less than (<) the method practical quantitation limit rather than as "BRL."

EPD is approving this CAP subject to conditions reflecting technical and regulatory requirements. Our approval of this document extends only to those technical aspects of the document that expressly require EPD approval under applicable rules and statutes. This approval is not an endorsement by EPD that it accepts as conclusive any representations made in the document. Nor does EPD guarantee or warrant that the document is free of errors or omissions. EPD may later withdraw approval of this document, in whole or in part, if EPD determines that withdrawal is necessary to ensure compliance with the applicable rules and statutes.

Since the public comment period, which began on November 28, 2007, does not expire until December 28, 2007, EPD may require additional modifications if comments are received. Upon expiration of the CAP public comment period, a public notice will be placed in *The Champion Newspaper* and the *Atlanta Journal Constitution* indicating EPD's approval of the CAP. Please ensure that electronic submittal requirements are adhered to in future submittals, per the attached guidance. If you have any questions please contact Jason Metzger of the Hazardous Sites Response Program at (404) 657-8600.

Sincerely,

Alexandra Y Cleary

1. BACKGROUND

This Surface Water Corrective Action Plan (SWCAP) has been prepared on behalf of the John F. Rowan, Sr. Item IV Trust (Trust) as part of the Voluntary Investigation and Remediation Plan for the Fashion Care/Executive Care Site (Site) located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (see Figure 1). At the time this SWCAP was prepared, the Site remains listed on the Georgia Hazardous Site Inventory (HSI) as site No. 10786. The Site was listed in the HSI due to a release of tetrachloroethene (PCE) from historical drycleaner operations conducted in the western half of the building located on the Trust property. Investigations were conducted under the HSRA Program and later the VRP Program, which fully delineated the extent of impacts to soil and groundwater. Both soil and groundwater contain PCE and its degradation constituents. The extent of these constituents in soil at the time of this report are shown in Figure 2, and the extent of constituents in groundwater are shown in Figure 3. The groundwater plume extends from the point of release to the South and West where it intersects Nancy Creek. To date, 12 rounds of surface water samples have been collected in Nancy Creek to determine the presence or absence of PCE and its degradation constituents. Surface water samples have been collected since 2008. Samples have been collected at various flow conditions, including extremely low flow conditions below the calculated 7Q10 for the section of Nancy Creek at the Site. All surface water samples to this time have not detected any constituents.

This SWCAP has been prepared to set forth a plan of action in the event drycleaner constituents from the Site are identified in the future in Nancy Creek. It will be implemented in conjunction with the implementation of a VRP Groundwater and Surface Water Monitoring Plan for the Site, if required by the EPD.

2. SURFACE WATER CORRECTIVE ACTION PLAN

EPD required the development of a SWCAP for the Site for implementation in the event that constituents of concern associated with the Fashion Care release should be identified in Nancy Creek during a future VRP surface water sampling event for the Site. The results of service water sampling events conducted to date are shown in Table 1. The sample locations associated with Table 1 are shown in Figure 3. No constituents associated with the release of PCE at the Site have been identified in Nancy Creek to date.

2.1 ACTION PLAN

Listed below are the steps to be taken should drycleaner constituents from the Site be identified in the future in Nancy Creek.

1. In the event constituents suspected to be associated with the drycleaner release from the Site are identified in Nancy Creek, the EPD will be notified in writing within 14 days. This notification will include a copy of the laboratory data report and a figure showing the locations where the samples were collected and methods of collection. The constituent detections will be tabulated and compared to Georgia Instream Water Quality Standards (ISWQS) and/or other surface water standards in effect at the time of the detection that are utilized by the EPD.
2. Following a detection of suspected Site constituents in surface water, should EPD deem it necessary after reviewing the information submitted, two additional surface water sampling events will be scheduled to be completed within 45 days of the above notification to the EPD to confirm the presence of drycleaner constituents in Nancy Creek associated with the Site. These sampling events will include the collection of upgradient and downgradient samples.

   The EPD will be sent the results of the confirmation sampling events in the form of a letter report within 14 days of receiving the laboratory data reports from both sampling events. Letter report will include a copy of the laboratory data reports from the sampling events, methods of sample collection, the sampling results tabulated and compared to Georgia Instream Water Quality Standards (ISWQS) and/or other surface water standards in effect at the time of the detection that are utilized by the EPD, and a figure showing the locations where the samples were collected.
3. Should the confirmation sampling events indicate the surface water detections were an anomaly, and upon EPD's concurrence with this conclusion, no further action will be conducted.
4. Should the sampling events in Step 2 above confirm the surface water detections identified in the original sampling event and confirm the constituents identified are associated with the historical release from the Site; upon EPD's concurrence with this conclusion, a course of action to evaluate the potential risk to human health and the environment of the constituents detected will be proposed in writing to the EPD within 30 days. The risk assessment methods proposed will be in accordance with current EPD and USEPA methods. The results of this Risk Assessment will be submitted to the EPD within 45 days of EPD's approval to proceed with the risk evaluation.
5. Should the human health and environmental risk assessment indicate a level of risk requiring action, a corrective action plan to mitigate this risk will be presented to the EPD for review within 60 days. The corrective action plan will include an initial design /scope of work and schedule for implementation.

Upon EPD's approval of the corrective action plan described in Step 5 above, actions to mitigate the release to surface water will be implemented according to the EPD approved schedule.

2.2 TERMINATION OF PLAN

This SWCAP will be implemented in conjunction with the implementation of a VRP Groundwater and Surface Water Monitoring Plan for this Site. Of the point in time at which EPD concurs that no further groundwater and surface water monitoring is required associated with the Fashion Care Site, this SWCAP would be terminated, and the notification and reporting requirements described herein would no longer be in effect.

Dear Ms. Futch:

Enclosed for your review is the Voluntary Investigation and Remediation Plan Semiannual Status Report for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia. There is one hard copy and two CD's of the report enclosed.

Please contact me with any questions or comments you may have.

Sincerely,

WOODARD & CURRAN INC.

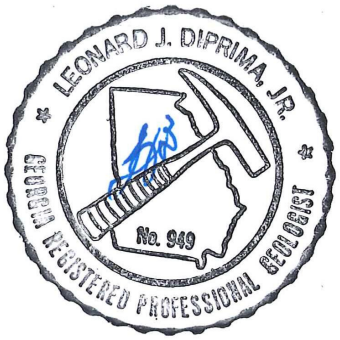
PE/PG Certification

I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional geologist who is registered with the Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.



The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Section 2
Introduction

Woodard & Curran (W&C) has prepared this Voluntary Investigation and Remediation Plan Semiannual Status Report (Status Report) in accordance with the Voluntary Remediation Program (VRP) for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust). On July 9, 2010, a Voluntary Investigation and Remediation Plan Application (VIRP) was submitted to the Georgia Environmental Protection Division (EPD) Hazardous Sites Response (HSRA) Program for the Site. On December 2, 2010, the EPD approved the VIRP with comments and entered the Site into the VRP. This Status Report has been prepared to present the activities conducted from December 2, 2013 through July 2, 2014 for the Site in accordance with the VRP.

Section 3
Work Performed – December 2, 2013 through July 2, 2014

The activities currently identified to be performed at the Site under the VRP are outlined in the following documents:

- VIRP dated July 9, 2010;
- EPD VIRP approval letter dated December 2, 2010;
- EPD VIRP comment letter dated December 2, 2010;
- VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011; and the
- EPD VIRP Status Report comment letter dated November 13, 2013.

The primary activities that have been completed or initiated from December 2, 2013 through July 2, 2014 are listed below and detail is provided in Sections 3.1 through 3.7.

- Attempted installation of a deep, Type III monitoring well;
- Completion of a conceptual site model;
- Collection of a round of groundwater and surface water samples;
- Vapor mitigation design test, final design, system installation and operation;
- Groundwater modeling of the groundwater impacts for preparation of a VRP Groundwater Monitoring Plan has been initiated;
- Preparation of a Surface Water Corrective Action Plan (CAP); and
- Completion and implementation of Uniform Environmental Covenants (UECs) for the Fashion Care and Southern Automatic Company properties.

3.1 Deep Type III Monitoring Well

The lithology and suspected hydrogeology presented in the early conceptual site model for the Site was based upon the theory that the saturated soil zone was divided into an upper and lower water bearing zone, separated by a dense, dry silt. This was based upon evidence that the upper water-bearing zone is thinner adjacent to Nancy Creek where saturated conditions are encountered in borings as shallow as 5 feet below grade and a dense dry silt is encountered at depths of 8 to 16 feet below grade, which generally corresponds to the streambed of Nancy Creek adjacent to the Site. The vertical walls and wide streambed of Nancy Creek also supported this hypothesis. The thickness of the potential upper water bearing zone appeared to be greater to the north near Savoy Drive and thinned as Nancy Creek is approached. To confirm the lithology presented in the conceptual site model, ten (10) additional soil borings were advanced across the Site in November 2013. These borings were advanced to confirm the consistent presence of the dry silt across the Site and to determine the thickness of this layer. The presence of the dry silt was confirmed across the Site through these borings. As anticipated, the dry silt was encountered at deeper

depths at the higher elevations around the Fashion Care building, at approximately 23 feet below ground surface (bgs). Toward the creek, the dry silt was encountered as shallower depths ranging from 8 feet bgs (FMW-15) to 19 feet bgs (SB-46). The dry silt is very dense and in the majority of borings drilling was terminated with DPT refusal due to the hard nature of the material. When slight pressure was applied to a core of the silt it would crumble into loose material, indicative of the lack of moisture in the silt. To determine the general thickness of the layer to aid in planning the construction of a Type III monitoring well to be screened below the silt, one boring, SB-37, successfully penetrated the silt. The silt was found to be approximately 10 feet thick (23 feet bgs to 33 feet bgs) at that location.

On April 22, 2014, Woodard and Curran mobilized to the site to install a Type III double cased monitoring well (MW-18D) adjacent to FMW-5. This location was previously agreed to by EPD for installing a deep well to establish groundwater quality conditions beneath the dry silt. A pilot hole was first drilled to identify the top of and base of the dry silt to determine the placement of the outer casing for the deep monitoring well. As anticipated, the dry silt was encountered at approximately 14 feet bgs, and water table aquifer conditions were encountered above the silt. However, bedrock was encountered immediately at the base of the dry silt at a depth of 33.5 feet bgs. A boring log is provided in Appendix A. As a result, the installation of the Type III well was aborted and EPD was notified of the conditions that were found. Based upon these findings, the following determinations were made:

- A Type III well could not be installed downgradient, and
- The water bearing zone present beneath the dry silt topographically upgradient near the fashion care building appears to pinch out moving toward Nancy Creek, with the dry silt resting upon bedrock.

Based upon discussions with EPD regarding the conditions found during the attempt to install the deep well, it was determined by Woodard & Curran and EPD that the lithology did not support the installation of a deep well. The information obtained from this attempted installation of the Type III monitoring well was used to finalize the conceptual site model for the site. The conceptual site model is discussed in Section 3.2.

3.2 Conceptual Site Model

Using a variety of data, including historical and recent boring logs, monitoring well construction logs, groundwater flow data and laboratory analytical data, the final conceptual site model for the Fashion Care/Executive Care is complete and shown as Figure 1. This conceptual site model will be used to determine the current status, and to predict the movement of impacts from the drycleaner release at the Site. The conceptual site model shows that the historical release(s) of PCE from drycleaner operations in the rear of the building migrated vertically through the unsaturated soil zone, impacting groundwater. PCE and it's degradation constituents been migrated horizontally to the south then west in the thin water table aquifer traveling above the dry silt. The groundwater plume intersects Nancy Creek, however, no drycleaner constituents have been identified in the creek in any of the surface water sampling events conducted to date, even those conducted during extreme low flow conditions in Nancy Creek. Based upon the most recent groundwater and surface water sampling event conducted in April 2014, and compared to the July 2012 sampling event and other historical water and surface water sampling events, the overall groundwater plume appears to be shrinking in size in concentration. This conclusion is based upon the comparison of groundwater data in Table 1, and the comparison of Figure 3 (July 2012 groundwater data) and Figure 4 (April 2014 groundwater

data). Groundwater modeling and statistical analysis of the current groundwater data set, and if necessary, additional rounds of groundwater and surface water sampling will be used to confirm this conclusion.

3.3 April 2014 Groundwater and Surface Water Sampling

On April 28-29, 2014, a current round of water samples were collected per the December 2, 2013 VRP Semiannual Status Report. Ten monitoring wells and three surface water locations were sampled for Target Compound List (TCL) VOCs. The monitoring wells sampled were FMW-1, FMW-4, FMW-5, FMW-6, FMW-9, FMW-13, FMW-14, FMW-15, FMW-16 and FMW-17. Surface water samples were collected at locations. SW-1 through SW-3. Sample locations are shown on Figure 2. The field sampling activities were conducted in general accordance with the protocols specified in the US EPA Field Branches Quality Systems and Technical Procedures. Monitoring well sampling logs are in Appendix A.

Prior to collecting groundwater samples, a full round of groundwater elevation measurements were collected from all monitoring wells on the Site. These measurements were collected using an electronic water level probe, with measurements collected to the nearest hundredth of a foot. The water table elevation measurements are presented in Table 2. This data was used to construct a potentiometric surface map as shown in Figure 4. Based upon this potentiometric surface map groundwater flows to the south and west, consistent with historical data.

Detected constituents are presented in Table 3, compared to HSRA Types 1/3 risk reduction standards (RRS) and Type 5 RRS established for the site. The April 2014 data is also presented on Figure 4. The results from this round of groundwater samples is compared to historical rounds of groundwater data collected on the Site in Table 1. The current round of groundwater data was compared to the last round of sample data in 2012, and to historical data back to the initial sampling at each location. The results of these comparisons are as follows, starting with the most downgradient wells and working back toward the source of groundwater contamination at the Fashion Care building:

- Downgradient wells (furthest from source); FMW-10, FMW-13, FMW-14, FMW-15, FMW-16 and FMW-17: All constituents detected in these wells in 2012 have decreased in concentration in 2014 (FMW-10 was not sampled in April 2014). Constituents are all below standard detection limits in FMW-10, FMW-15, FMW-16 and FMW-17. All constituents in FMW-13 are below detection limits with the exception of tetrachloroethene (PCE), which has reduced in concentration since 2012, and remains above a Type 1/3 RRS but below a Type 5 RRS. All constituents in FMW-14 are below standard detection limits with the exception of cis-1,2-dichloroethene, which has reduced in concentration since 2012, and remains below all RRS. Graphs showing the concentrations versus time in monitoring wells FMW-13, FMW-14, FMW-15 and FMW-16 are shown as Figures 5 through 8.

- Downgradient wells (nearer to source); FMW-4, FMW-5, FMW-6 and FMW-9: All constituents detected in these wells are relatively stable or are decreasing in concentration. Expected fluctuations in concentrations are observed in constituents undergoing the degradation process. Detected constituents in monitoring wells FMW-4 and FMW-6 are fluctuating slightly but are within the same order of magnitude in concentration. Constituents in monitoring well FMW-5 are all below detection limits, and are showing an overall decrease in concentration since sampling began at this location. Detected constituents in monitoring well FMW-9 are

generally fluctuating within the same order of magnitude, with degradation constituents slightly rising in concentration. One new constituent was detected in FMW-4; 1,1,2-trichloroethane. This constituent was not seen in any other monitoring wells. Graphs showing the concentrations versus time in these monitoring wells are shown as Figures 9 through 12.

- Peripheral and upgradient wells; FMW-1, FMW-2, FMW-3, FMW-7, FMW-8, FMW-11 and FMW-12: All of these peripheral and upgradient wells are below detection limits for all constituents or are decreasing in concentration since their initial sampling. Only FMW-1 was sampled in April 2014. A graph showing the concentrations versus time in monitoring well FMW-1 is shown as Figure 13.

In summary, an evaluation of the overall current data set for groundwater indicates at this time the plume is shrinking at the downgradient edge, and remaining generally consistent in concentrations nearest the source as the parent constituent, PCE, progresses through the reductive dechlorination degradation process. This is likely the result of the removal of the original source of constituents; the PCE drycleaning machine; the sealing of the lint sump at the rear of the building; the chemical oxidation treatment of soil in the source area conducted in March 2009 and maintaining an impervious cap over the remaining soil impacts.

This round of groundwater data and the historical data was used to begin the source to groundwater to surface water modeling discussed in Section 3.5.

The results of the surface water sampling are consistent with historical results. All constituents were below detection limits. April 2014 and historical surface water sampling results are shown in Table 4. Laboratory data reports for the April 2014 groundwater and surface water sampling event are in Appendix B.

3.4 Vapor Mitigation System Testing, Design and Installation

On June 4, 2014, Woodard and Curran performed testing to evaluate the potential radius of influence for a sub-slab depressurization system (SSDS). Testing was conducted by drawing a vacuum at previously installed shallow soil injection point IW-7, located near the center of the contaminant source area. The vacuum was induced by connecting a Shop-Vac to the IW-7 PVC riser, with the discharge hose running to the outside of the building. Three monitoring points were installed at distances of 7.5, 15, and 30 feet from IW-7 (Figure 14). The monitoring points were installed by drilling a small diameter hole in the floor, inserting a piece of polyethylene tubing, and sealing around the tubing with modeling clay. A pressure gauge (maximum pressure of 0.2 inches water) was then attached to the end of the tubing.

Once the monitoring points were installed, the pressure test was started by powering on the vacuum. Within five seconds, the pressure readings at both the 7.5 and 15-foot monitoring points reached the maximum value on the gauge. The pressure reading at the 30-foot monitoring point reached the maximum value within one minute. Based on these findings, it was determined that a single vapor extraction point would be sufficient for depressurizing the sub-slab beyond the limits of VOC impacts.

Accordingly, Woodard and Curran installed an SSDS on June 21 and 22, 2014. An extraction point was installed in the vicinity of IW-7 by coring an eight-inch hole through the floor, and removing soil to a total depth of 18 inches below the top of the floor slab. The hole was then backfilled with gravel to the bottom of the floor slab. A two-inch PVC riser protected by sections of steel rebar was placed inside the hole, and the hole was then sealed to the surface with cement. A rubber seal was placed on top of the gravel at the base of the slab to prevent the cement from entering into the gravel vapor sump. The two-inch riser was run to the roof support beams and then horizontally approximately 15 feet to and through a boarded-up window on the western wall of the building. The entire piping system was slightly sloped back towards the vapor sump to allow for condensate to drain back to the subsurface as necessary.

A radon removal fan (RadonAway model RP140) was mounted on the outside of the building, with the final discharge above the roof line. To power the fan, electric conduit was run from a nearby junction box, and the corresponding breaker in the electric panel was tagged to indicate the breaker should not be turned off. A U-tube manometer was mounted on the two-inch riser to provide a visual indication of system operation.

On June 22, 2014, the fan was turned on, and the manometer immediately registered a pressure reading of 0.2 inches water. This pressure reading was confirmed during a site visit 24 hours later to ensure the system was operating properly.

3.5 Groundwater Modeling

Groundwater modeling will be conducted to evaluate the current state of the groundwater plume emanating from the drycleaner release. It will also be used as a predictive tool to evaluate the future movement of contaminants from the soil source area, to groundwater, to surface water. This information will be used to prepare a VRP Groundwater Monitoring Plan. The April 2014 groundwater and surface water data, as well as all historical groundwater, surface water and soil data collected from the site, will be used to calibrate the model. The flow of groundwater is being modeled using MODFLOW, the industry standard for three dimensional groundwater flow modeling. The MT3DMS package is being used to model the contaminant migration at the Fashion Care Site. Model calibration was begun in June 2014.

3.6 Surface Water Corrective Action Plan

EPD required the development of a Surface Water Corrective Action Plan (SWCAP) for the Site for implementation in the event that constituents of concern associated with the Fashion Care release should be identified in Nancy Creek during a future surface water sampling event. In accordance with this requirement, Woodard and Curran has developed for EPD review and approval a SWCAP. The SWCAP is located in Appendix C. In summary, the surface SWCAP includes the following actions:

- In the event constituents associated with the drycleaner release are identified in Nancy Creek, the EPD will be notified in writing within 14 days to include a copy of the laboratory data report.

- Following a detection in surface water, two additional surface water sampling events will be scheduled to be completed within 45 days of the above notification to the EPD to confirm the presence of drycleaner constituents in Nancy Creek associated with the Fashion Care release. These sampling events will include the collection of upgradient and downgradient samples.

- The EPD will be sent the results of the confirmation sampling events in the form of a letter report within 14 days of receiving the laboratory data reports. Letter report will include a copy of the laboratory data reports from the two sampling events.

- Should the confirmation sampling events indicate the surface water detections were an anomaly, and upon EPD's concurrence with this conclusion, no further action will be conducted.

- Should the confirmation sampling events confirm the surface water detections identified in the original sampling event, and upon EPD's concurrence with this conclusion, a course of action to evaluate the potential risk to human health and the environment of the constituents detected will be proposed in writing to the EPD within 30 days.

- Should the human health and environmental risk assessment indicate a level of risk requiring action, a corrective action to mitigate this risk would be presented to the EPD for review within 60 days.

3.7 Uniform Environmental Covenants

During this six-month period the Uniform Environmental Covenant (UEC) for the Fashion Care (Trust) parcel, Parcel No. #18-343-13-002 was finalized though working with the EPD, and was executed by the Trust on April 1, 2014. Subsequent to executing the Trust UEC the following actions for the Southern Automatic Company property (parcel # 18-343-13-005) and the Trust property UEC's were initiated:

- At least 30 days prior to obtaining the EPD Director's signature, a copy of the UEC's were sent to the following:
  - Anyone identified as a "Grantee/Holder";
  - Each person holding a recorded interest in the property; "Parties with interest in the Property";
  - "Fee Owner of Property/Grantor";
  - Each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located; and

  Each owner in fee simple whose property abuts the property subject to the Environmental Covenant.
- Within thirty (30) days <u>after</u> the date of the EPD Director's signature, the UEC's were:
  - Filed with the Recorders of Deeds for DeKalb County;
  - A file stamped copy of the UEC's were sent to EPD within thirty (30) days of recording;
  - A file-stamped copy of the UEC's were sent to each of the following:
    - Each person holding a recorded interest in the property; "Parties with interest in the Property";
    - Anyone identified as a "Grantee/Holder";

- "Fee Owner of Property/Grantor";
- Each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located; and
- Each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

Table 5 presents the parties notified in accordance with the above requirements. On April 9-10, 2014 copies of the Southern Automatic Company and Trust property UEC's were sent by overnight mail to the listed parties. Confirmation signatures were obtained from all parties documenting the receipt of the UEC's. Documentation of these actions are in Appendix D.

On May 27, 2014, the UEC's were signed by the Director of the EPD. The UEC's were recorded by the Clerk of the Superior Court of DeKalb County on June 5, 2014.

In June 2014 fully executed and recorded copies of the Southern Automatic Company and Trust property UEC's were sent by overnight mail to the parties listed in Table 5. Confirmation signatures were obtained from all parties documenting the receipt of the UEC's. Documentation of these actions are in Appendix D. The fully executed and recorded UECs are in Appendix D.

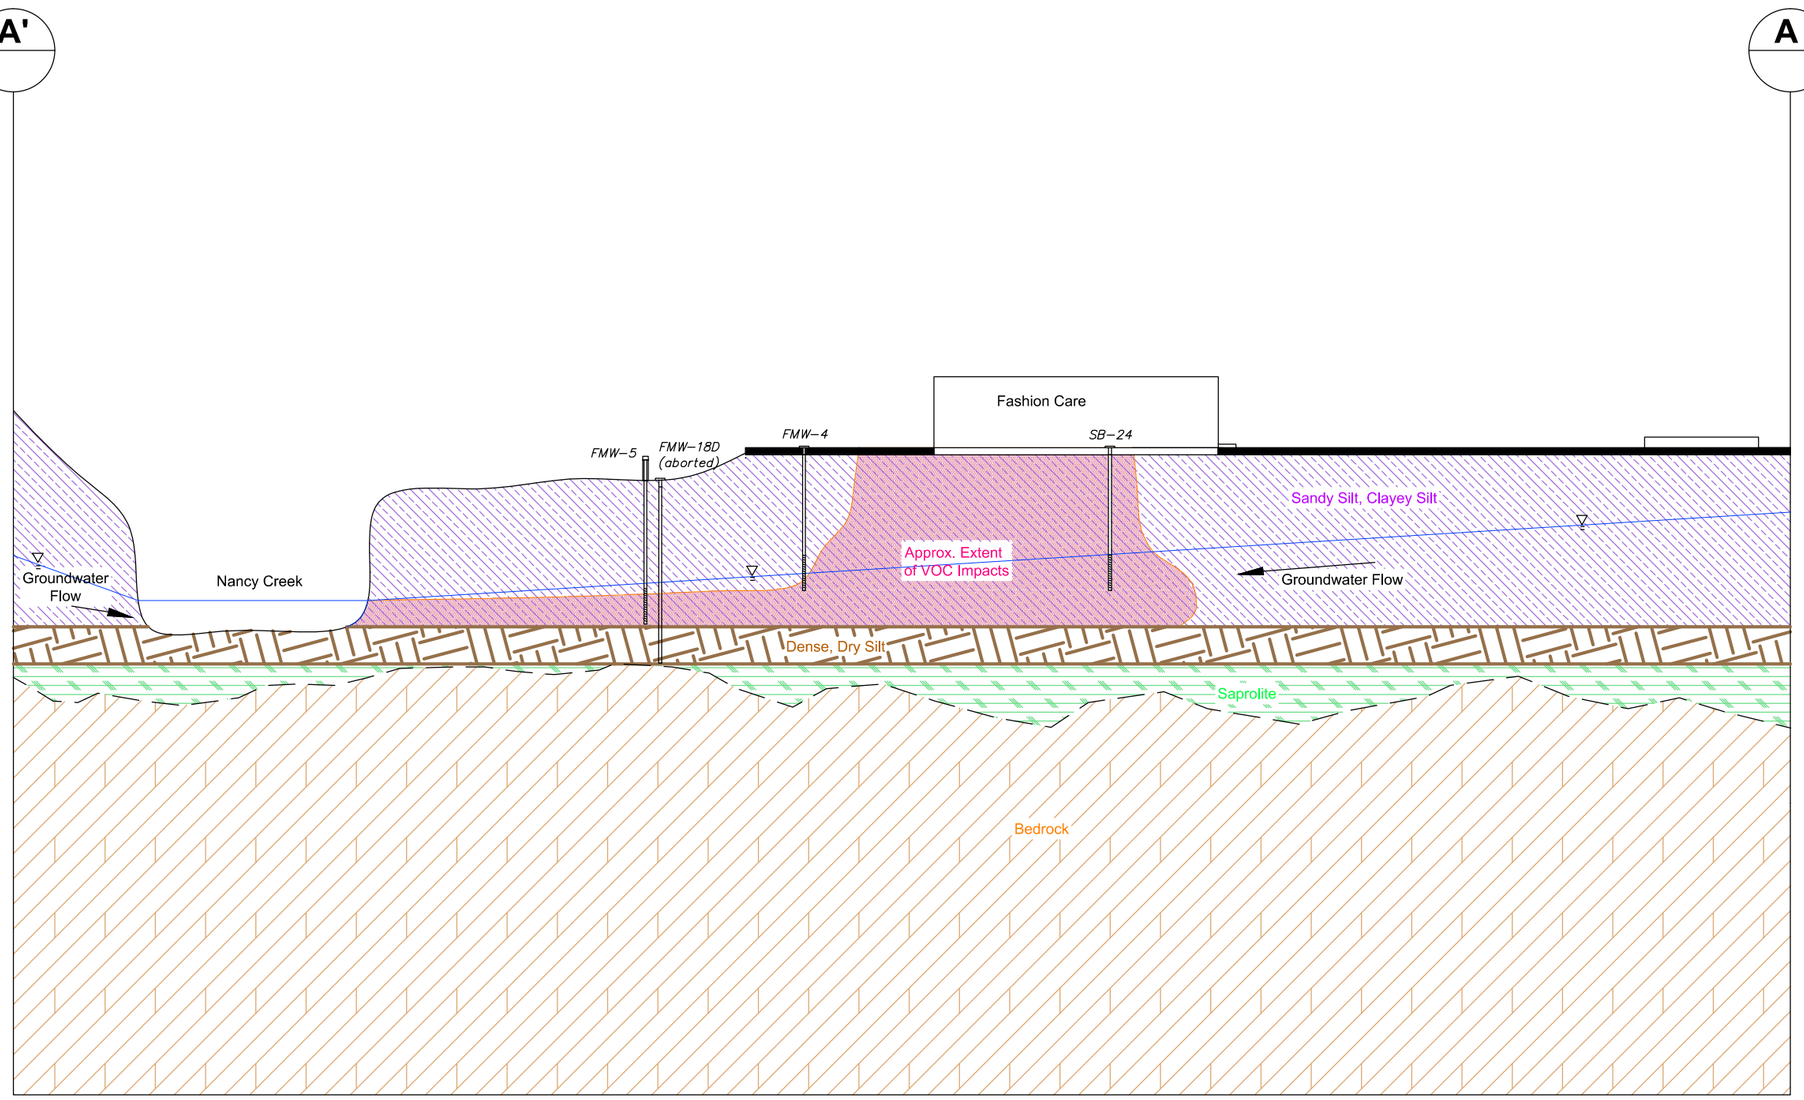
Section 4
Work to be Performed

The additional activities anticipated to be performed for the Site through completion of the VIRP are outlined in the VIRP dated July 9, 2010, the EPD VIRP approval letter dated December 2, 2010, the EPD VIRP comment letter dated December 2, 2010, and the VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011. Additional comments provided by the EPD regarding the June 2, 2012, December 2, 2012 and June 2, 2013 Status Reports in correspondence dated November 13, 2013 will also be addressed during the execution of the VIRP.

These tasks are presented on Figure 15. The primary tasks anticipated to be completed during the next six months for the period ending December 3, 2014 are presented below:

- Completion of the modeling of the contaminant transport environment at the Site; and
- Completion of the VRP Monitoring Plan for the Site.

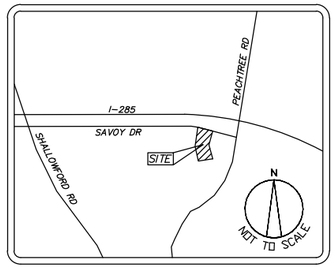
The tasks currently identified to complete the VIRP are presented on Figure 16, a revised estimated schedule. This schedule will be revised with the submittal of each Semiannual Status Report, as required.



Section 5
Professional Services Hours This Period

A total of approximately 215.75 professional service hours have been completed by Woodard & Curran from December 3, 2013 through July 2, 2014. Of these total hours, 92 hours were utilized by the professional geologist overseeing the VRP project. The approximate distribution of hours utilized for implementation of the VRP during this period is presented below.

Company	Month/Year	Project Manager / P.G. hours	Total Hours Worked
Woodard & Curran	December 2013	10.75	13.50
Woodard & Curran	January 2014	1.50	1.75
Woodard & Curran	February 2014	10.75	10.75
Woodard & Curran	March 2014	11.00	15.50
Woodard & Curran	April 2014	7.50	60.00
Woodard & Curran	May 2014	15.25	33.00
Woodard & Curran	June 2014	35.25	81.25
	Total Hours	**92.00**	**215.75**



Note: The above hours do not include subcontractor hours worked for Woodard & Curran.

Estimated Voluntary Remediation Plan Schedule
Fashion Care/Executive Care Site, 2211 Savoy Drive, Chamblee, Georgia

ID	Task Name	Duration	Start
1	**VIRP Application Submittal**	0 days	Fri 7/9/10
2	**EPD Approval of VIRP**	0 days	Thu 12/2/10
3	**1st VIRP Status Report**	0 days	Thu 6/2/11
4	Vapor Sampling Evaluation/J&E Modeling	132 days	Thu 6/2/11
5	Revise Draft Ecs	132 days	Thu 6/2/11
6	Final Design for Vapor Mitigation System	132 days	Thu 6/2/11
7	Conduct 8 Surface Water Sampling Events	65 days	Mon 8/1/11
8	**2nd VIRP Status Report**	0 days	Fri 12/2/11
9	Finalize J&E Vapor Models	132 days	Fri 12/2/11
10	Finalize Utility & Construction Worker Standards	132 days	Fri 12/2/11
11	Finalize Environmental Covenants	132 days	Fri 12/2/11
12	**3rd VIRP Status Report**	0 days	Mon 6/4/12
13	Full Round of Groundwater & Surface Water Samples	131 days	Mon 6/4/12
14	Execute Environmental Covenants (2 of 3)	131 days	Mon 6/4/12
15	**4th VIRP Status Report**	**0 days**	**Mon 12/3/12**
16	Attempt to Execute ASL Environmental Covenant	131 days	Mon 12/3/12
17	Complete Horizontal Groundwater Delineation	131 days	Mon 12/3/12
18	**5th VIRP Status Report**	0 days	Mon 6/3/13
19	Fieldwork to Confirm CSM	131 days	Mon 6/3/13
20	**6th VIRP Status Report**	0 days	Tue 12/3/13
21	Collect Additional Round of GW and SW Samples	131 days	Tue 12/3/13
22	Prepare Surface Water CAP	131 days	Tue 12/3/13
23	Complete Filing of Environmental Covenants	131 days	Tue 12/3/13
24	Complete Vertical Groundwater Delineation	131 days	Tue 12/3/13
25	Install Vapor Mitigation System - Fashion Care Building	131 days	Mon 12/2/13
26	**7th VIRP Status Report**	0 days	Tue 6/3/14
27	Site Fate & Transport Modeling	131 days	Mon 6/2/14
28	Prepare VRP Groundwater & Surface Water Monitoring Plan	131 days	Tue 6/3/14
29	Prepare VRP CSR	131 days	Tue 6/3/14
30	**Submit VRP CSR**	0 days	Tue 12/2/14
31	**Implement Groundwater & Surface Water Monitoring Plan**	0 days	Tue 12/2/14

NOTES:

BOLD Exceeds HSRA Type 1&3 RRS
BOLD Exceeds HSRA Type 5 RRS-Construction Worker
BOLD Exceeds HSRA Type 5 RRS-Utility Worker
NA(1) Not Applicable - fumigant-insecticide properly applied
NA(2) Not Applicable - Petroleum related constituent which has no In-Stream Water Quality Standard
NR Not regulated
* Type 4 RRS is defaulted to the equivalent of the Type 1 RRS because the Type 1 RRS has a higher value.
** RRS is taken from EPD CAP approval letter dated December 28, 2007, table of approved RRS in Condition 8.
FPP Free-phase petroleum present in the monitoring well

NOTES:

BOLD Exceeds HSRA Type 1&3 RRS

BOLD Exceeds HSRA Type 5 RRS-Construction Worker

BOLD Exceeds HSRA Type 5 RRS-Utility Worker

PRC Pertroleum related constituent

NA(1) Not Applicable - fumigant-insecticide properly applied

NA(2) Not Applicable - Petroleum related constituent which has no In-Stream Water Quality Standard

NR Not regulated

* Type 4 RRS is defaulted to the equivalent of the Type 1 RRS because the Type 1 RRS has a higher value.

** RRS is taken from EPD CAP approval letter dated December 28, 2007, table of approved RRS in Condition 8.

FPP Free-phase petroleum present in the monitoring well

Appendix A
Boring Log and Groundwater Sampling Logs - April 2014

Soil Boring Log

Boring ID: **MW-18D (well aborted)**

Project:	Fashion Care Cleaners	Elevation:	
Project No:	226203	Date started:	4/22/2014
Location:	2211 Savoy Drive, Chamblee, GA	Date Completed:	4/22/2014
Driller:	GeoLab	Field Oversight:	LJD
DTW:	7 ft. bgs	Final Depth:	33.5 ft. bgs

Depth (feet bgs)	Soil Classification	% Recovery	Sample No.	PID (ppm)	Well Completion	Remarks
0	Reddish-brown Silt, moist	20%	No samples collected	No readings collected	Type III well installation aborted	On 4/22/14 suspected bedrock on refusal at 33.5ft. bgs using solid-stem augers. Borehole temporarily abandoned using bentonite on 4/22/14. 4/24/14 returned with hollow-stem augers. Re-drilled borehole to refusal at 33.5 ft. bgs, used split-spoon to collect small sample of bedrock to confirm type of refusal, tremie-grouted boring with Portland-bentonite slurry to ensure good borehole seal.
5						
	Reddish-brown silty, fine to coarse SAND Wet	100%				
10	13 ft. color change to medium gray	100%				
15	Reddish-brown SILT, dense, moist	80%				
20	19.5 ft. Silt becoming dry, very dense	Solid stem augers required beginning at 20 ft. bgs due to DPT refusal. Down-pressure and cuttings used to identify lithology/lithologic changes.				
25						
30	Bedrock at 33.5 ft. immediately below SILT Mica-Garnet Greenschist					
35	Boring Terminated at 33.5 ft. bgs - Refusal

RE: Fashion Care

Dear Len Diprima: Order No: 1404S61

Analytical Environmental Services, Inc. received 14 samples on 4/30/2014 11:58:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/13-06/30/14.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 09/01/15.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

1. BACKGROUND

This Surface Water Corrective Action Plan (SWCAP) has been prepared on behalf of the John F. Rowan, Sr. Item IV Trust (Trust) as part of the Voluntary Investigation and Remediation Plan for the Fashion Care/Executive Care Site (Site) located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (see Figure 1). At the time this SWCAP was prepared, the Site remains listed on the Georgia Hazardous Site Inventory (HSI) as site No. 10786. The Site was listed in the HSI due to a release of tetrachloroethene (PCE) from historical drycleaner operations conducted in the western half of the building located on the Trust property. Investigations were conducted under the HSRA Program and later the VRP Program, which fully delineated the extent of impacts to soil and groundwater. Both soil and groundwater contain PCE and its degradation constituents. The extent of these constituents in soil at the time of this report are shown in Figure 2, and the extent of constituents in groundwater are shown in Figure 3. The groundwater plume extends from the point of release to the South and West where it intersects Nancy Creek. To date, 12 rounds of surface water samples have been collected in Nancy Creek to determine the presence or absence of PCE and its degradation constituents. Surface water samples have been collected since 2008. Samples have been collected at various flow conditions, including extremely low flow conditions below the calculated 7Q10 for the section of Nancy Creek at the Site. All surface water samples to this time have not detected any constituents.

This SWCAP has been prepared to set forth a plan of action in the event drycleaner constituents from the Site are identified in the future in Nancy Creek. It will be implemented in conjunction with the implementation of a VRP Groundwater and Surface Water Monitoring Plan for the Site, if required by the EPD.

2. SURFACE WATER CORRECTIVE ACTION PLAN

EPD required the development of a SWCAP for the Site for implementation in the event that constituents of concern associated with the Fashion Care release should be identified in Nancy Creek during a future VRP surface water sampling event for the Site. The results of service water sampling events conducted to date are shown in Table 1. The sample locations associated with Table 1 are shown in Figure 3. No constituents associated with the release of PCE at the Site have been identified in Nancy Creek to date.

2.1 ACTION PLAN

Listed below are the steps to be taken should drycleaner constituents from the Site be identified in the future in Nancy Creek.

1. In the event constituents suspected to be associated with the drycleaner release from the Site are identified in Nancy Creek, the EPD will be notified in writing within 14 days. This notification will include a copy of the laboratory data report and a figure showing the locations where the samples were collected and methods of collection. The constituent detections will be tabulated and compared to Georgia Instream Water Quality Standards (ISWQS) and/or other surface water standards in effect at the time of the detection that are utilized by the EPD.
2. Following a detection of suspected Site constituents in surface water, should EPD deem it necessary after reviewing the information submitted, two additional surface water sampling events will be scheduled to be completed within 45 days of the above notification to the EPD to confirm the presence of drycleaner constituents in Nancy Creek associated with the Site. These sampling events will include the collection of upgradient and downgradient samples.

   The EPD will be sent the results of the confirmation sampling events in the form of a letter report within 14 days of receiving the laboratory data reports from both sampling events. Letter report will include a copy of the laboratory data reports from the sampling events, methods of sample collection, the sampling results tabulated and compared to Georgia Instream Water Quality Standards (ISWQS) and/or other surface water standards in effect at the time of the detection that are utilized by the EPD, and a figure showing the locations where the samples were collected.
3. Should the confirmation sampling events indicate the surface water detections were an anomaly, and upon EPD's concurrence with this conclusion, no further action will be conducted.
4. Should the sampling events in Step 2 above confirm the surface water detections identified in the original sampling event and confirm the constituents identified are associated with the historical release from the Site; upon EPD's concurrence with this conclusion, a course of action to evaluate the potential risk to human health and the environment of the constituents detected will be proposed in writing to the EPD within 30 days. The risk assessment methods proposed will be in accordance with current EPD and USEPA methods. The results of this Risk Assessment will be submitted to the EPD within 45 days of EPD's approval to proceed with the risk evaluation.
5. Should the human health and environmental risk assessment indicate a level of risk requiring action, a corrective action plan to mitigate this risk will be presented to the EPD for review within 60 days. The corrective action plan will include an initial design /scope of work and schedule for implementation.

Upon EPD's approval of the corrective action plan described in Step 5 above, actions to mitigate the release to surface water will be implemented according to the EPD approved schedule.

2.2 TERMINATION OF PLAN

This SWCAP will be implemented in conjunction with the implementation of a VRP Groundwater and Surface Water Monitoring Plan for this Site. Of the point in time at which EPD concurs that no further groundwater and surface water monitoring is required associated with the Fashion Care Site, this SWCAP would be terminated, and the notification and reporting requirements described herein would no longer be in effect.

DeKalb County Records.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with O.C.G.A § 44-16-8(a).

Fee Owner of Property/Grantor:
The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
PO Box 197
Carmel Valley, CA 93924

Grantee/Holder:
The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
PO Box 197
Carmel Valley, CA 93924

Grantee/Entity with express power to enforce:
State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1456 East Tower
Atlanta, GA 30334

Parties with interest in the Property:
None

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property currently (2014) consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and restaurant space on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Point of Compliance Monitoring Plan, as Approved by EPD

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1054 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq.* by the Trust of John F. Rowan, Sr., its successors and assigns, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-Dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules",

respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil and groundwater in designated areas of the property. Engineering controls required for the Property include (1) maintenance of the concrete/asphalt cover over impacted soil and (2) implementation and maintenance of vapor mitigation measures for any existing enclosed structures on the Property and any future enclosed structures that may be constructed on the Property within the area indicated on attached Figures 1 and 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) and/or EPD vapor risk thresholds commensurate with the use of the Property. Accordingly, this Environmental Covenant imposes such limitations upon the use of the Property.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the Trust and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of the Holder, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, the Holder or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2 that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Periodic Reporting. The Owner shall inspect the property and applicable property instruments at *least annually* to ensure compliance with this document. Annually, by no later than December 31st following the effective date of this Environmental Covenant, the Owner shall submit to EPD an Annual Report as specified in the EPD approved Point of Compliance Monitoring Plan including: groundwater detection-monitoring report results, maintenance and inspection activities, certification of non-residential use of the Property, and documentation stating whether or not the activity and use limitations in this Environmental Covenant are being abided by. Groundwater detection-monitoring requirements may be discontinued in the future by approval of the EPD in accordance with the VRP requirements for the Property; however, the annual Site Use, Activity and Monitoring Form (Exhibit C) shall be completed and submitted to the EPD as long as the UEC is in effect.

   In addition, the annual Site Use, Activity and Monitoring Form shall include the results of a visual inspection of the adjacent Tax Parcel No. 18-333-02-023 for indications of the development or potential development of enclosed structures in the area of groundwater impacts associated with the release of drycleaner impacts from the Property. Should the visual inspection conclude the impacted area of parcel 18-333-02-023 may be developed with an enclosed structure(s) the holder of this UEC shall assess the potential for vapor intrusion with tools/methods approved by the Georgia EPD. Should it be concluded through these tools/methods that the potential risk is above then current Georgia EPD regulatory guidance/thresholds, the owner of the Property shall approach the owner of parcel 18-333-02-023 to mitigate the risk.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS and/or EPD vapor risk thresholds are met.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation is not necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated: PCE.

   The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers: PCE, trichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

   The areas with soil or groundwater concentrations above these levels is identified on the attached Figures 1 and 2, respectively. Prior to conducting construction or subsurface utility work that may result in exposure to soil or groundwater in the designated areas, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted soil or groundwater performed in the execution of work should be done in accordance with Items 7 and 6 above, respectively.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the Holder, the Owner shall allow authorized representatives of EPD and/or Holder the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) Holder, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq.*

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 11 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

Georgia Environmental Protection Division

Exhibit A

Legal Description

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin; thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court.

Fashion Care/Executive Care Site, Parcel No. 18-343-13-002,
2211 Savoy Drive, Chamblee, DeKalb County, Georgia

TYPE	No.	CRITERIA RESPONSE	YES	NO
Property Use	1	Has the property use changed, has construction work been implemented on the property, or have building permits been applied for?		
	1a	If yes to 1, was EPD notified at least 30 days in advance?		
	1b	If no to 1a, attach a written explanation.		
Exposure	2	Has subsurface site work been conducted in the areas of the property where soil and/or groundwater concentrations exceed residential cleanup standards (UEC - Figure 1 - Areas A and B and Figure 2 - Areas C and D)?		
	2a	If yes to 2, was EPD notified within 3 business days following the site work?		
	2b	Has groundwater extraction or use for non-remedial purposes occurred?		
	2c	If no to 2a or yes to 2b, attach a written explanation, including a description regarding whether the requirements of the uniform environmental covenant (UEC) were adhered to.		
Engineering Controls	3	Is the concrete/asphalt cover intact and of sufficient quality to prevent exposure to soil in the area of the property where soil concentrations exceed residential cleanup standards (UEC – Figure 1 - Areas A and B)?		
	3a	If no to 3, are corrective measures being taken? Notify EPD within 60 days of identification of damaged concrete/asphalt with a plan and schedule to repair. Please attach a written explanation.		
	3b	Have enclosed structures been installed on the property or existing structures modified in such a way as to change potential vapor intrusion assumptions?		
	3c	Is the vapor mitigation system on the existing structure operating consistently and being maintained?		
	3d	• If yes to 3b, have vapor intrusion mitigation measures been implemented? Please attach a written explanation. • If no to 3c, please attach a written explanation.		
Permanent Markers	4	Are the permanent markers that delineate the restricted areas in place and legible?		
	4a	If no to 4, attach a written explanation.		
Property Instruments	5	Do all leases or other property instruments for the site have the applicable UEC and deed notice language inserted into them.		
	5a	If no to 5, attach a written explanation.		
Inspection	6	Date of inspection:		
	6a	Name of inspector:		
	6b	Photographs showing current land use, engineering controls, and permanent markers (attached)		
Inspection Parcel # 18-333-02-023	7	Date of inspection:		
	7a	Name of inspector:		
	7b	Photographs showing current land use(attached).		
	7c	Are there indications of the development or potential development of enclosed structures in the area of groundwater impacts associated with the release of drycleaner impacts from Parcel No. 18-343-13-002? If so, notify EPD within 30 days with a plan to assess the potential for vapor intrusion in such structures.

Atlanta, GA 30334

Parties with interest in the Property:

- None at time of execution

Property:

The property subject to this Environmental Covenant is the Southern Automatic Company N. Peachtree Tract (hereinafter "Property"), located at 4306 N. Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 25, 1974 from Hoke A. Rowan, Jr. to Southern Automatic Company recorded in Deed Book 3267, Page 130, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.51 acres of property developed at the time of this covenant with a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-005 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following documents:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Vapor Intrusion Model - Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011: VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, dated March 29, 2012.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by Southern Automatic Company, its successors and assigns, The Trust of John F. Rowan, Sr. (herinafter "Trust"), and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene and cis-1,2-dichloroethene have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The engineering control required for the Property is the maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area A of Figure 1. The

institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater on the Property in Area D of Figure 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, Southern Automatic Company (hereinafter "Southern Automatic"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the Trust and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

Southern Automatic makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of the Trust, EPD, Southern Automatic and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, the Trust or its successors and assigns, Southern Automatic or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-8 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (~~attached~~ EXHIBIT C).

5. Activity and Use Limitation(s). The current use of the Property is non-residential as defined according to Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any future development of the property with enclosed structures, whether residential or non-residential as defined above shall require the following:

   - A vapor mitigation system or barrier be installed and maintained with the construction of any enclosed structures within the impacted soil Area A as indicated on attached Figure 1 and impacted groundwater Area D as indicated on Figure 2, until the HSRA regulated substances in soil and groundwater at the Property reach non-residential HSRA RRS; or vapor modeling of groundwater and/or soil contamination in Areas A and D on Figure 1 and 2, respectively, indicate that vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results; and
   - Groundwater use is prohibited (unless EPD concurs that groundwater is remediated to residential RRS).

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. The concrete and asphalt covering the area designated as Area A in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Soil removed from this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste), and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. Levels of the following HSRA regulated chemicals have been identified in groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers as indicated:

HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.12	0.82	
Trichloroethene	0.006	0.041	
Cis-1,2-dichloroethene	2.6	18.0	This chemical was identified above the construction worker threshold only.

The area with chemical concentrations in groundwater above Type 5 RRS levels is identified as Area D on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 6 above.

The exposure duration assumed for a utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, Area A in Figure 1 and Area C in Figure 2; should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/ Trust, the Owner shall allow authorized representatives of EPD and/or the Trust the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) the Trust, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

RepresentationsandWarranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 11 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

- Georgia Environmental Protection Division, Branch Chief, Land Protection Branch, 2 Martin Luther King Jr. Drive SE Suite 1454 East Tower, Atlanta, GA 30334.

- Southern Automatic Company, Lenbrook, 3747 Peachtree Rd. NE, Apt. 1623, Atlanta, GA 30319.

- The Trust of John F. Rowan, Sr., Attn. Mrs. Catherine Norris, Representative, PO Box 197, Carmel Valley, Ca 93924

Grantor has caused this Environmental Covenant to be executed pursuant to The Georgia Uniform Environmental Covenants Act, on the 24 day of July, 20 12.

DEED BOOK 24410 Pg 685
Debra DeBerry
Clerk of Superior Court
DeKalb County, Georgia

Exhibit C
SITE USE, ACTIVITY, AND MONITORING EVALUATION FORM

Fashion Care/Executive Care Site, Parcel No. 18-343-13-005,
4306 N. Peachtree Road, Chamblee, DeKalb County, Georgia

TYPE	No.	CRITERIA RESPONSE	YES	NO
Property Use	1	Has the property use changed, has construction work been implemented on the property, or have building permits been applied for?		
	1a	If yes to 1, was EPD notified at least 30 days in advance?		
	1b	If no to 1a, attach a written explanation.		
Exposure	2	Has subsurface site work been conducted in the areas of the property where soil and/or groundwater concentrations exceed residential cleanup standards (UEC - Figure 1 - Area A and Figure 2 - Areas C and D)?		
	2a	If yes to 2, was EPD notified within 3 business days following the site work?		
	2b	Has groundwater extraction or use for non-remedial purposes occurred?		
	2c	If no to 2a or yes to 2b, attach a written explanation, including a description regarding whether the requirements of the uniform environmental covenant (UEC) were adhered to.		
Engineering Controls	3	Is the concrete/asphalt cover intact and of sufficient quality to prevent exposure to soil in the area of the property where soil concentrations exceed residential cleanup standards (UEC – Figure 1 - Area A)?		
	3a	If no to 3, are corrective measures being taken? Please attach a written explanation.		
	3b	Have enclosed structures been installed on the property or existing structures modified in such a way as to change potential vapor intrusion assumptions?		
	3c	If yes to 3b, have vapor intrusion mitigation measures been implemented? Please attach a written explanation		
Permanent Markers	4	Are the permanent markers that delineate the restricted areas in place and legible?		
	4a	If no to 4, attach a written explanation.		
Property Instruments	5	Do all leases or other property instruments for the site have the applicable UEC and deed notice language inserted into them.		
	5a	If no to 5, attach a written explanation.		
Inspection	6	Date of inspection:		
	6a	Name of inspector:		
	6b	Photographs showing current land use, engineering controls, and permanent markers (attached)

Subject: **Certification of Compliance for Soil - Voluntary Remediation Program**
Fashion Care/Executive Care Site - HSI# 10786
2211 Savoy Drive
Chamblee, DeKalb County, Georgia.
Woodard & Curran Project No. 226203.00

Dear Ms. Futch:

Enclosed for your review is the Certification of Compliance for soil under the Voluntary Remediation Program (VRP) for the Fashion Care/Executive Care Site (Site), HSI# 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia. The soil on the Site is in compliance with Hazardous Site Response Program (HSRA) Type 5 Risk Reduction Standards (RRS) through the use of the following engineering and institutional controls that have been previously approved by the Georgia Environmental Protection Division (EPD).

- Engineering Controls:
  - (1) A concrete (building slab) and asphalt cap over the area defined as containing soil with established Site constituents above EPD approved non-residential RRS and Type 5 RRS. The area of soil impacts protected by the approved cap is shown on Figure 1, attached. In addition, the cap prevents the infiltration through the impacted soil of precipitation and surface water runoff, thereby inhibiting the migration of constituents in soil to groundwater.
  - (2) A sub-slab depressurization system was installed and is operating to mitigate the potential vapor exposure route from soil and groundwater impacts beneath the existing building on tax parcel 18-343-13-002. A vapor intrusion assessment on tax parcel 18-343-13-005 where there is an existing enclosed structure and impacted soil and groundwater present, determined that vapor mitigation measures were not required.
- Institutional Control – Uniform Environmental Covenants (UEC) for tax parcels18-343-13-002 (Fashion Care parcel, John F. Rowan, Sr. Item IV Trust (Trust) owner) and 18-343-13-005 (Southern Automatic Company owner) have been approved by the EPD, executed by the owners and the Director of the EPD, and recorded in the DeKalb County Deed Book by the Clerk of the DeKalb County Superior Court. The UECs implement the continuous monitoring

and annual reporting to the EPD of the soil cap integrity, vapor mitigation system operation, and continued maintenance of both engineering controls.

Details associated with the approved engineering and institutional controls can be found in the documents submitted to the EPD under the VRP. In addition, the VRP requirement for soil delineation to residential Type 1 RRS was also completed and is presented in the Voluntary Remediation Plan Application submitted to the EPD, dated July 9, 2010. Final documentation of all soil, groundwater and vapor assessments, and remedial actions conducted to obtain compliance with the VRP will be submitted in a VRP Compliance Status Report.

Please contact me with any questions or comments you may have.

Sincerely,

WOODARD & CURRAN INC.

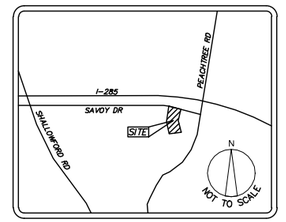
Certification of Compliance with Risk Reduction Standards for Soil
Georgia Voluntary Remediation Program
Fashion Care/Executive Care Site, HSI# 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia

I certify under penalty of law that this submittal and all attachments were prepared under my direction in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.



Based on my review of the findings of this Certification submittal with respect to the risk reduction standards for soil of the Rules for Hazardous Site Response, Rule 391-3-19-07, I have determined these properties (Fashion Care/Executive Care Site, HSI# 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, Tax Parcels 18-343-13-002 (John F. Rowan, Sr. Item IV Trust owner) and 18-343-13-005 (Southern Automatic Company owner)) are currently in compliance with Type 5 risk reduction standards for soil. In accordance with the requirements for compliance with Type 5 standards, soil outside Area A and B of Figure 1 (attached) is in compliance with Type 1 RRS.

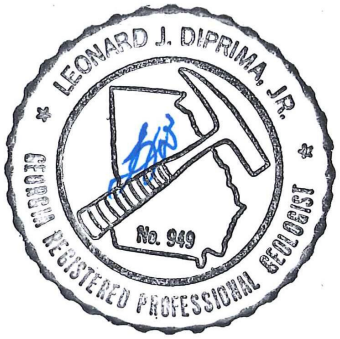
PE/PG Certification

I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional geologist who is registered with the Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.



Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Section 2
Introduction

Woodard & Curran (W&C) has prepared this Voluntary Investigation and Remediation Plan Semiannual Status Report (Status Report) in accordance with the Voluntary Remediation Program (VRP) for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust). On July 9, 2010, a Voluntary Investigation and Remediation Plan Application (VIRP) was submitted to the Georgia Environmental Protection Division (EPD) Hazardous Sites Response (HSRA) Program for the Site. On December 2, 2010, the EPD approved the VIRP with comments and entered the Site into the VRP. This Status Report has been prepared to present the activities conducted from July 3, 2014 through December 18, 2014 for the Site in accordance with the VRP.

Section 3
Work Performed – July 3, 2014 through December 18, 2014

The activities currently identified to be performed at the Site under the VRP are outlined in the following documents:

- VIRP dated July 9, 2010;
- EPD VIRP approval letter dated December 2, 2010;
- EPD VIRP comment letter dated December 2, 2010;
- VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011;
- EPD VIRP Status Report comment letter dated November 13, 2013; and the
- EPD VIRP Status Report comment letter dated August 14, 2014.

The primary activities that have been completed or initiated from July 3, 2014 through December 18, 2014 are listed below and detail is provided in Sections 3.1 through 3.5.

- Revision of the Conceptual Site Mode (CSM);
- Additional vapor sampling beneath the building located on the Fashion Care property;
- Completion of the modeling of the contaminant transport environment at the Site;
- Preparation of a proposed VRP surface water/groundwater monitoring plan; and
- The sale of the Fashion Care property, Parcel #18-343-13-002, and entry into the Georgia EPD Brownfield Program.

3.1 Conceptual Site Model

In the EPD comment letter dated August 14, 2014, it was requested that the CSM be revised to include the following cross-sections to scale:

- From the source area at the drycleaner building, downgradient to Nancy Creek, including monitoring wells FMW-6 and FMW-9 (Cross-section A-A');
- Perpendicular to cross-section A-A' across the source area at the drycleaner building (Cross-section B-B'); and
- Perpendicular to cross-section A-A' along Nancy Creek (Cross-section C-C').

The CSM has been revised in accordance with this request, and the locations of the CSM cross-sections are shown on Figure 1. Figure 2 presents the CSM cross sections A-A', B-B' and C-C' as noted above. The CSM represents data acquired during the course of installing boring and monitoring wells, soil sampling conducted, groundwater monitoring data acquired July 2012, and water table measurements collected April 28, 2014.

3.2 Vapor Sampling – Fashion Care Building

In November 2014, the EPD requested that additional vapor evaluation associated with the portion of the groundwater plume extending beneath the existing Fashion Care building, outside the area of soil impacts above non-residential RRS, be assessed relative to the potential for vapor intrusion. In addition, as part of this evaluation the vacant space on the east side of the building should be evaluated.

On November 19, 2014, Woodard & Curran performed sub-slab soil gas sampling at three locations within the vacant space on the east side of the building to be representative of conditions beneath the building outside of the area of influence of the previously installed vapor mitigation system. Sample locations are shown on Figure 3, and include one location near the front of the building and two locations near the rear of the building.

Samples were obtained by coring through the existing concrete floor slab to a depth of three inches below the concrete. The space between each vapor collection point and the surrounding concrete was sealed. The tightness of the seal was tested by placing a shroud over the sample point, filling the shroud with helium, and testing sub-slab vapors drawn from the sample point for the presence of helium. Polyethylene tubing was used to connect the sample points to laboratory-supplied six-liter SUMMA canisters. After purging the volume of air in the tubing, the canister was opened, and soil gas was collected at a maximum flow rate of 200 ml/minute. Collected soil gas samples were submitted to TestAmerica Laboratories in Knoxville, Tennessee for analysis by USEPA Method TO-15.

The analytical report for the collected soil gas samples is included in Appendix A. No analytes were detected in any of the three samples, indicating that groundwater impacts present beneath the building do not pose a vapor risk outside of the vapor mitigation system area of influence. Due to the presence of an approved cap over the source material and the discontinued use of PCE at the property, groundwater impacts are predicted to only diminish in the future and the risk associated with the vapor pathway will not increase.

3.3 Contaminant Transport Modeling

Contaminant transport modeling was conducted to evaluate the potential for additional exposure pathways to arise, and for known exposure pathways to become complete at levels that could impact potential receptors at levels above regulatory limits. The known receptors are the portions of the properties that have been impacted by the migration of the groundwater contaminant plume, and Nancy Creek that receives discharge from the plume.

Contaminant transport was evaluated using the following steps:

- Modeling of the transfer of soil contamination to the groundwater flow system by modeling the transfer of contaminant mass to the groundwater system with a soil flushing calculation.
- Groundwater modeling of flow and contaminant transport for the Site. Groundwater flow was simulated using MODFLOW 2000 (Harbaugh et al, 2000), modeling three dimensional groundwater flow.
- The computer code used to simulate contaminant transport was MT3DMS (Zheng and Wang, 1999). MT3DMS is a code for simulating transport of contaminants in three dimensions and uses the outputs from MODFLOW to calculate simulate transport in groundwater.

- Contaminant transport modeling was conducted in three distinct steps. The first step was to model distribution of total dissolved VOCs in the groundwater. The second step was to model the anticipated maximum concentration of PCE in the future, as this compound is the most prevalent compound at the Site with the lowest In-Stream Water Quality Standard (ISWQS). The third step was to evaluate the likely relative concentrations of the daughter products of PCE decay at the Site at the time of the maximum future PCE concentration and then compare these concentrations to the appropriate environmental standards. In order to understand the maximum expected concentration of each of the daughter products at the time of maximum PCE concentration, a simulation using BIOCHLOR22 was performed.
- In order to evaluate the potential for PCE and or its degradation products to be present in the stream above ISWQS, a groundwater to surface water mixing calculation was performed. The concentrations for PCE, TCE, DCE and VC in groundwater predicted in the previous modeled sections were then blended based on modeled groundwater discharge and the volume of flow in Nancy Creek at the Site at 7Q10 conditions.

Based on the modeling exercises completed, the plume will likely remain stable or decrease over the next 60 years. The plume generally appears to migrate down the axis of the Nancy Creek valley on the northern side of the creek. Generally, the overall plume distribution appears to be monitored adequately by the existing well network. Given these observations, the following conclusions/recommendations are made:

- The predicted plume footprint does not expand substantially beyond the existing monitoring well network;
- As the source area is depleted, the center of maximum plume concentration will slowly migrate and continue to degrade as it migrates toward Nancy Creek;
- The maximum modeled concentration of PCE is predicted to discharge to Nancy Creek approximately 41 years after the source remediation effort conducted in 2008;
- Mixing calculations for the predicted maximum concentrations of PCE and daughter products in Nancy Creek indicate that ISWQS will not be exceeded; and
- No other receptors for the groundwater plume are present within the existing or predicted footprint of the VOC plume at the Site.

A detailed report describing the contaminant transport modeling and findings is in Appendix B.

3.4 Proposed VRP Monitoring Plan

Based upon the results of the contaminant transport modeling with the current dataset, there will be no completed exposure pathways resulting from the migration and continued degradation of the groundwater plume. In order to confirm the predicted exposure trends for the Site, it is proposed that a limited groundwater and surface water sampling plan be initiated and the data acquired be input into the contaminant transport model to confirm the current results.

The outline of the monitoring plan would be to sample the following network of existing monitoring wells and surface water locations for two consecutive annual sampling events. The locations are shown on Figure 4.

- Monitoring Wells: FMW-4, FMW-6, FMW-9, FMW-12, and FMW-16
- Surface Water Locations: SW-1, SW-2 and SW-3.

Samples would be analyzed for the site-specific volatile organic compound list previously approved under the VRP. At the conclusion of the second sampling event, the data acquired would be input into the contaminant transport model to confirm the current results. Annual monitoring reports would be submitted for each of these events. The second annual monitoring report would also present the results of the modeling with recommendations based upon the results.

If this outline is acceptable to EPD based upon review of the enclosed information, a formal VRP Monitoring Plan will be presented in the VRP Compliance Status Report.

3.5 Sale of Fashion Care Property – Entry into Brownfield Program

On October 31, 2014 the Fashion Care property, Tax Parcel # 18-343-13-002 (address 2211 Savoy Drive, Chamblee, DeKalb County, Georgia), was entered into the Georgia EPD Brownfield Program by the prospective purchaser, Charles and Wendy Pero. To enter the property into the Brownfield Program, a Prospective Purchaser Compliance Status Report (PPCSR) was prepared entirely using data and information from documents submitted under the HSRA Program and VRP. A Limitation of Liability letter (LoL) was obtained from the EPD on December 3, 2014 and is provided in Appendix C. The LoL requires the new owner to adhere to the following conditions, as written:

1. The Peros must submit a notice of purchase of the above referenced property by no later than ten (10) days after closing to EPD. Please include documentation of the prohibition of the use of tetrachloroethene on the Property.
2. The Peros will give any responsible party for groundwater contamination and/or EPD access to the subject property to perform groundwater sampling and to implement an EPD approved corrective action plan or workplan for groundwater.
3. The Peros will ensure that the requirements of the Uniform Environmental Covenant (UEC) are abided by and that the required engineering controls are properly operated and maintained.
4. In the event that the Peros wish to sell the subject property, the Peros must provide fifteen (15) days notice to EPD of its intent to offer for sale the subject property or any portion thereof. All documents offering the subject property or portion of the subject property for sale will include a copy of the PPCSR, the UEC, any other documents required by the UEC or the Act, and a copy of this letter. EPD shall be provided with the name, address, phone number, and contact person for the new property owner(s) within ten (10) days of sale.
5. For the purpose of determining liability for continuing or future releases of regulated substances upon or from the properties, the background or baseline concentration for any and all releases will be based on the information provided in the PPCSR pursuant to Section 12-8-208(d) of the Act.

The Trust will continue to execute the requirements for the Site under the VRP until completion.

Of note, during the sale and acquisition process for the property it was determined that the approximate property boundaries depicted for this parcel in all HSRA Program and VRP documents were incorrect. Figure 5 shows the proper approximate property boundaries. The legal description used in all previous submittals is correct. The property boundaries in all figures presented in the VRP PPCSR, summarizing all activities and conclusions for the VRP site, will show the corrected boundaries.

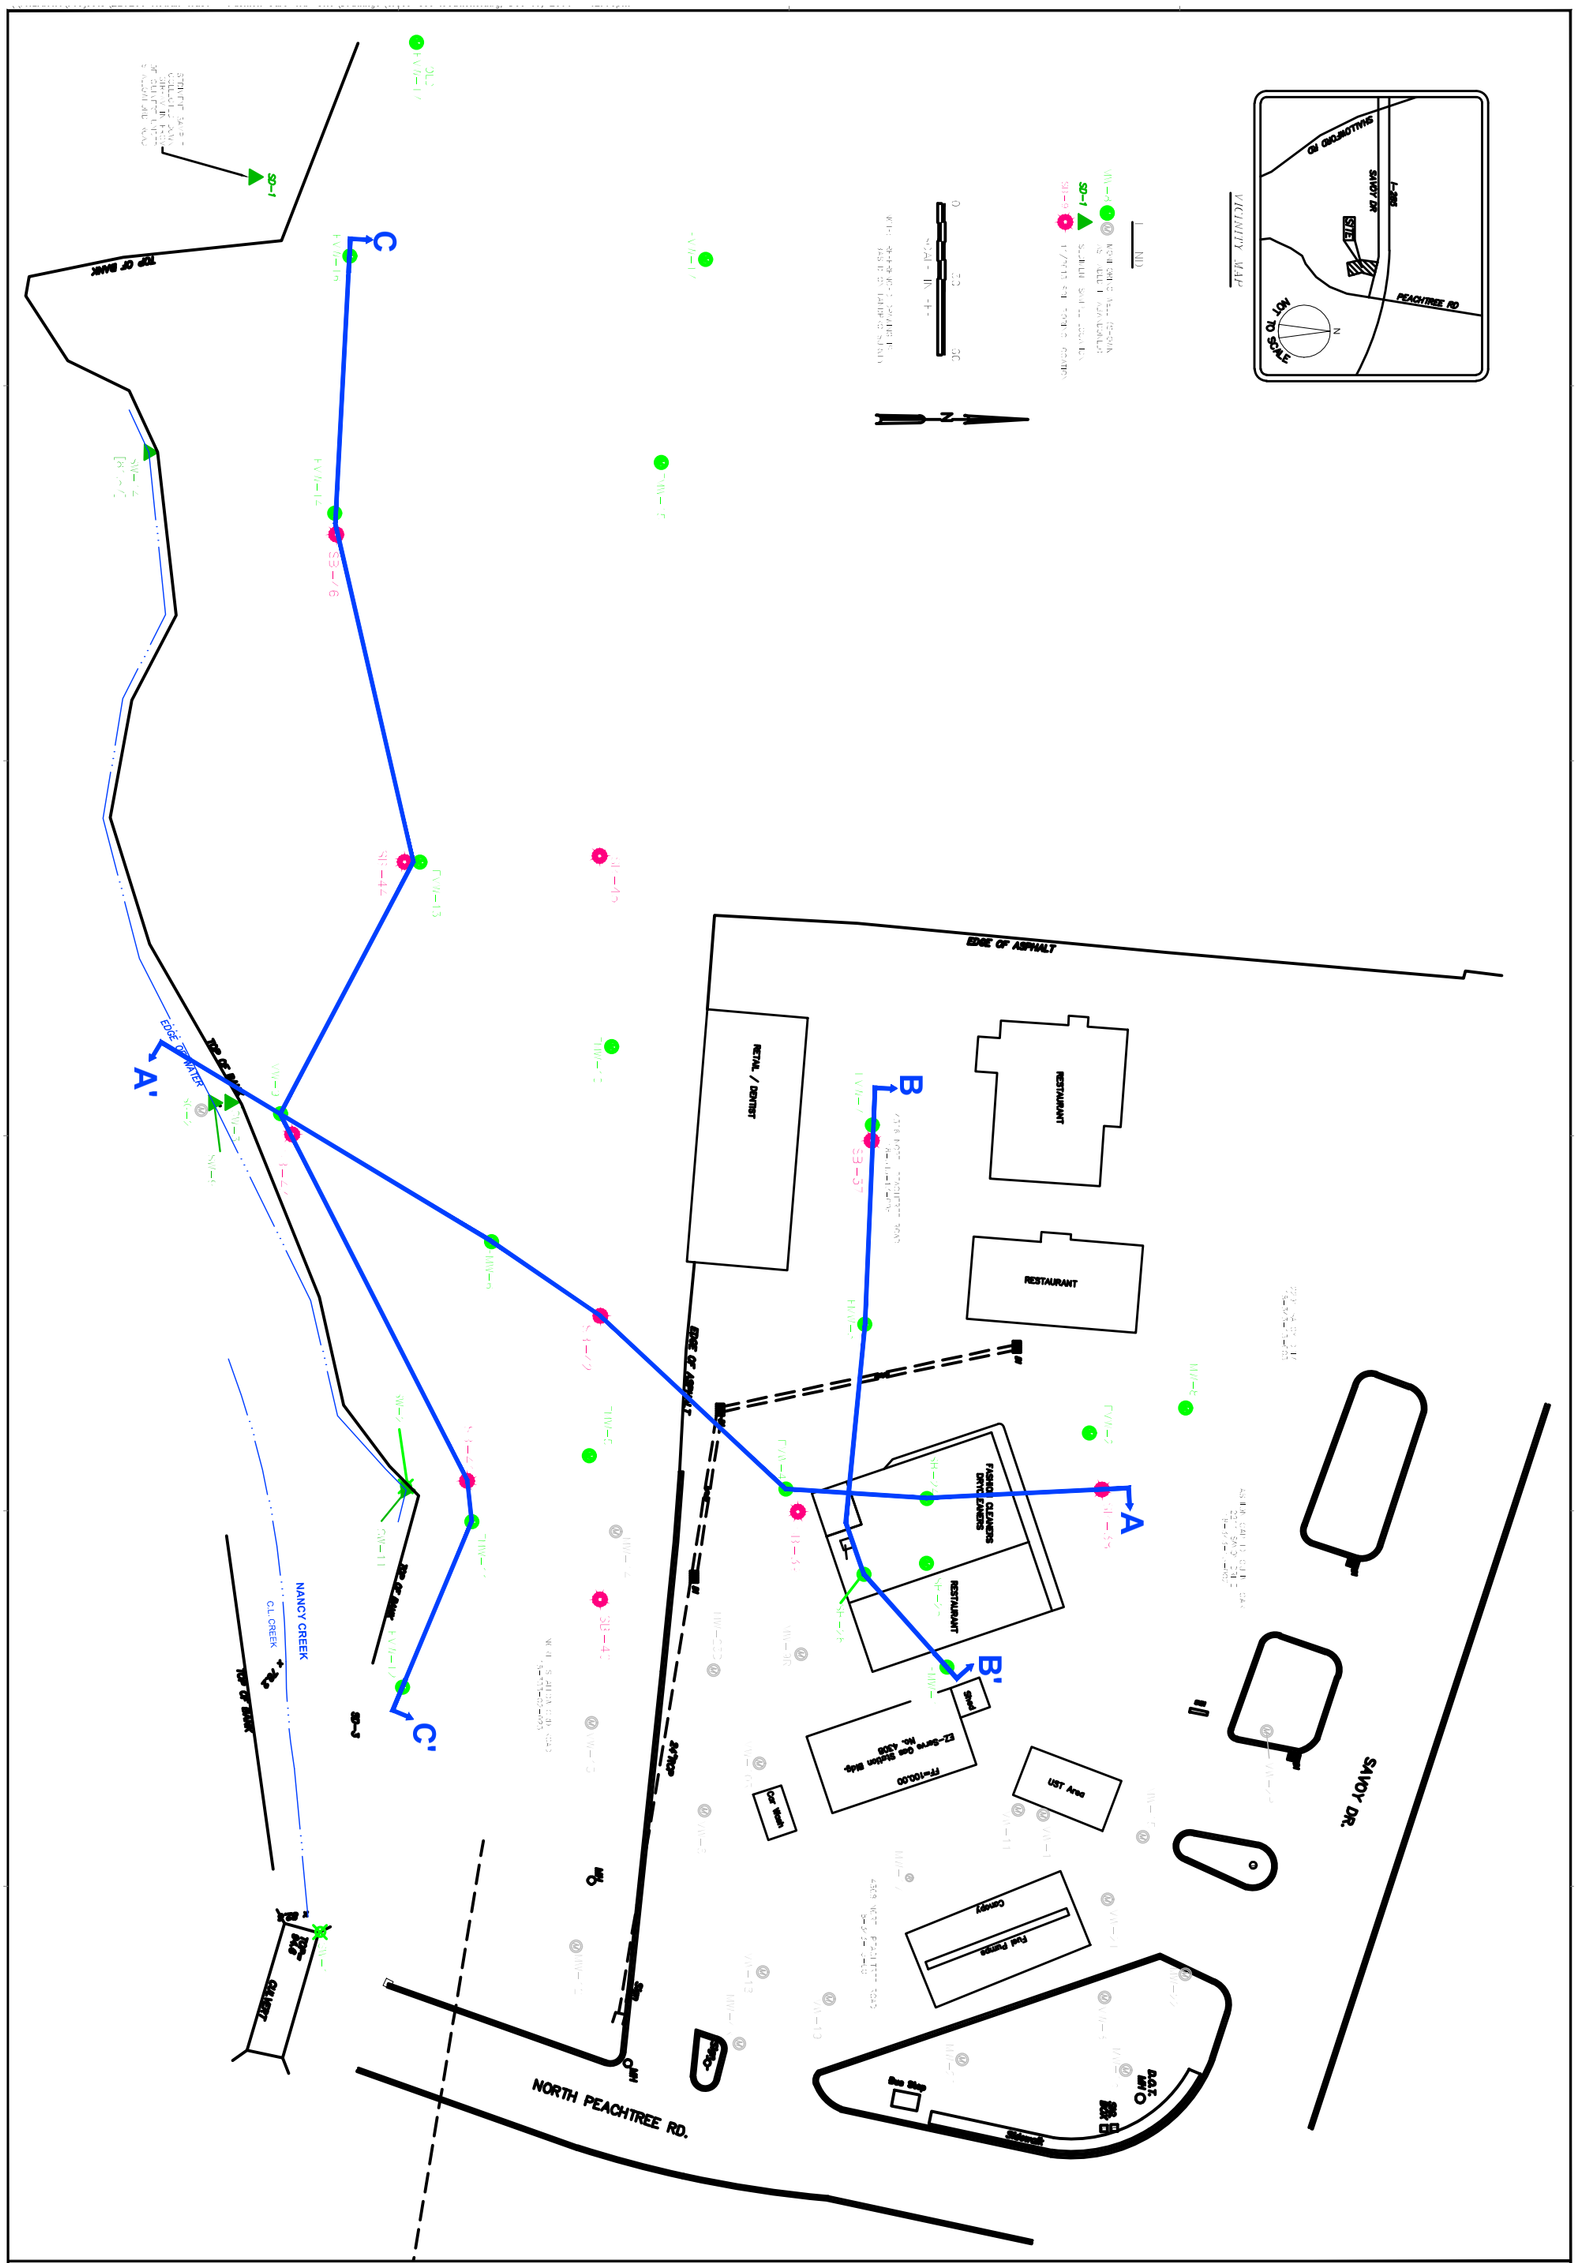
Section 4
Work to be Performed

The additional activities anticipated to be performed for the Site through completion of the VIRP are outlined in the VIRP dated July 9, 2010, the EPD VIRP approval letter dated December 2, 2010, the EPD VIRP comment letter dated December 2, 2010, and the VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011. Additional comments provided by the EPD regarding the June 2, 2012, December 2, 2012 and June 2, 2013 Status Reports in correspondence dated November 13, 2013; and EPD comments received August 14, 2014 regarding the July 3, 2014 Status Report will also be addressed during the execution of the VIRP.

These tasks are presented on Figure 6. The primary tasks anticipated to be completed during the next six months for the period ending June 3, 2014 are presented below:

- Submittal of the VRP Compliance Status Report for the Site; and
- Submittal of a Groundwater/Surface Water VRP Monitoring Plan for the Site.

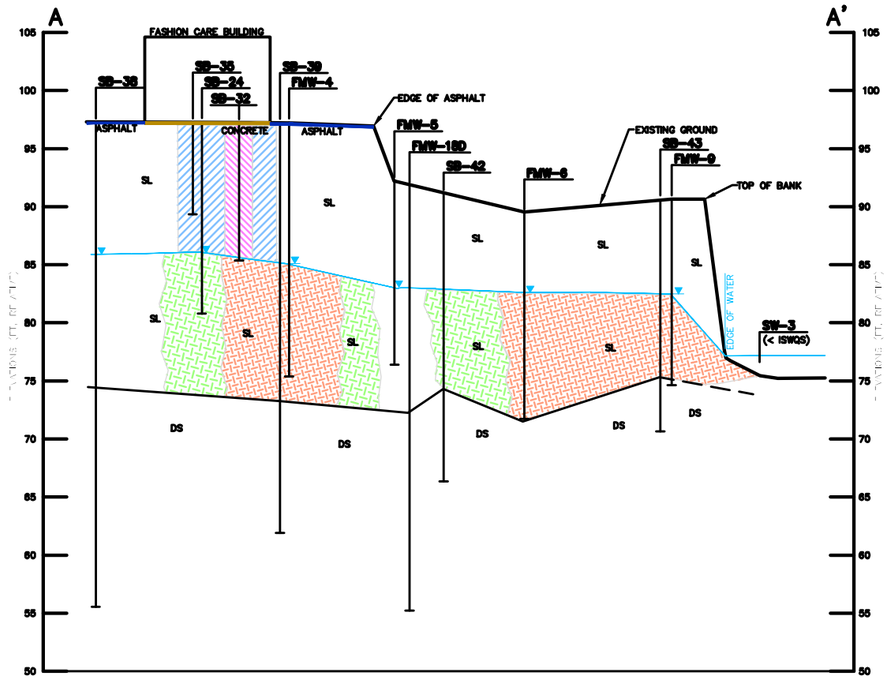
The tasks currently identified to complete the VIRP are presented on Figure 7, a revised estimated schedule. This schedule will be revised with the submittal of each Semiannual Status Report, as required.



Section 5
Professional Services Hours This Period

A total of approximately 260 professional service hours have been completed by Woodard & Curran from July 3, 2014 through December 18, 2014. Of these total hours, 75.5 hours were utilized by the professional geologist overseeing the VRP project. The approximate distribution of hours utilized for implementation of the VRP during this period is presented below.

Company	Month/Year	Project Manager / P.G. hours	Total Hours Worked
Woodard & Curran	July 2014	25.25	29.25
Woodard & Curran	August 2014	10.5	26.25
Woodard & Curran	September 2014	12.5	63.75
Woodard & Curran	October 2014	12.5	43.75
Woodard & Curran	November 2014	7.5	56.25
Woodard & Curran	December 2014	7.25	10.75
	Total Hours	**75.5**	**260**



Note: The above hours do not include subcontractor hours worked for Woodard & Curran.

Figure 6
December 19, 2014
Flow Chart – Voluntary Investigation & Remediation Plan Tasks
(Completed tasks are noted.)

(1) **COMPLETE**
Re-evaluate MW-23D construction details
EPD #7CL

(2) **COMPLETE**
Develop initial estimated cost for VRP implementation through CSR and monitoring period (3/2/11)
EPD #1

(3) **COMPLETE**
Develop Budget Estimate for Vapor Mitigation System at FC
EPD #1

(4) **COMPLETE**
Develop final design and cost estimate for Vapor Mitigation System

(5) **COMPLETE**
Obtain EPD 7Q10 surface water calculations and measuring location
EPD #1CL

(6) **COMPLETE**
Develop Draft Environmental Covenant Detail on all Properties
EPD #11,12CL
Final Covenants have been approved, but not executed.

(7) **COMPLETE**
Prepare "Corrective Action Plan" to be implemented if a surface water detection occurs
EPD #3CL

(8) **COMPLETE**
Near-Term Surface Water Sampling Events: Conduct 4 Events w/in 30-days
EPD #2CL
There were no detections during this event.

Note: The fieldwork in Items 10 through 12 will need to be conducted even if surface water detections are found.

Detections — Yes → See Page 2

No

(9) **COMPLETE**
Schedule 4 additional Near-Term Surface Water Sampling Events
EPD #2CL
There were no detections during these events.

Detections — Yes → See Page 2

No

(10)
Confirm Conceptual Site Model (CSM)
- Install borings across impacted area to confirm presence/absence of dry silt. EPD #7CL **COMPLETE**
- Install deeper soil zone well to establish vertical gradient & attempt to avoid bedrock well. EPD #9CL **COMPLETE/ABORTED**
- Install piezometers across creek to confirm creek is a gaining stream from both sides. EPD #6CL **OMITTED**
- Conduct well slug test to calculate shallow water bearing zone properties. EPD #8CL **ADDITIONAL SLUG TESTS WERE COMPLETED IN 9/2014 AT FMW-1, FMW-4 AND FMW-9 FOR THE CSM**
- **CSM WAS REVISED TO INCLUDE THREE CROSS-SECTIONS**

(11) **COMPLETE**
Complete horizontal groundwater delineation beyond FMW-15. Installed FMW-17.
- Installed 1 shallow monitoring wells & collect full round of groundwater and surface water samples for modeling and VRP baseline.

EPD #6CL

(12) **COMPLETE**
Evaluate Vapor Intrusion for Dentist's Building
- Collect 2 vapor samples beneath slab
- Depending on results, run Vapor Intrusion Model.

EPD #16CL
No vapor intrusion risk was identified.

(13)
Develop modeling process **COMPLETE**/ methods and meet with EPD to obtain methods approval, results of fieldwork and final Conceptual Site Model

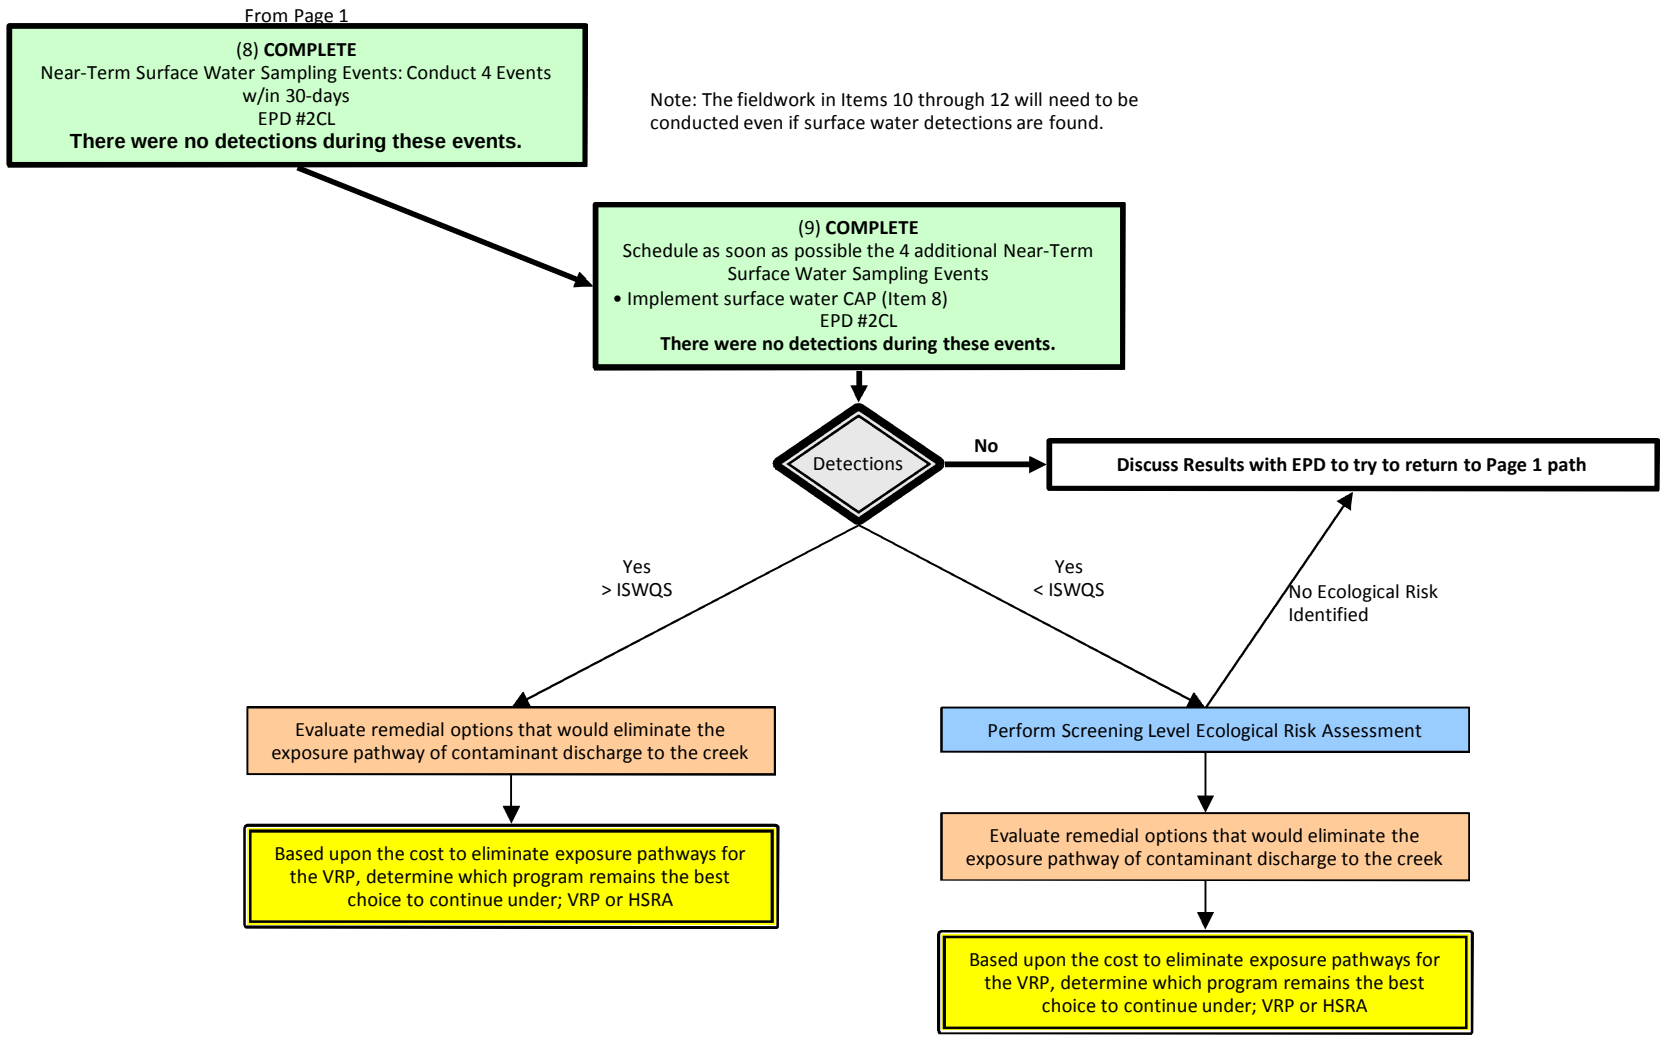
(14) **COMPLETE**
Run Leaching Model:
Soil Contamination to Groundwater
EPD #1CL

(15) **COMPLETE**
Run Groundwater Model:
Source Area to Creek
EPD #1CL
- Compare to actual groundwater concentrations

(16) **COMPLETE**
Rerun Mixing Zone Model:
Groundwater to Surface Water
(NPDES Reasonable Potential Procedures)
EPD #1CL

(17) **PLAN PROPOSED**
Develop Groundwater/Surface Water VRP Monitoring Plan
EPD #6CL

(18) **COMPLETE**
- Install Vapor mitigation system on Fashion Care building. **COMPLETE; ASSESSMENT RELATIVE TO GROUNDWATER IMPACTS COMPLETED – NO RISK IDENTIFIED**
- Execute Environmental Covenants by owners on required properties **COMPLETE**. No covenant required on parcel 18-333-02-023.
- Final execution of UEC requirements to be completed. **COMPLETE**



(19)
Prepare VRP Compliance Status Report (CSR)
EPD #1

→ Remove Property from the Georgia Hazardous Site Inventory (HSI)

(20) **PROPOSED**
Implement Groundwater/Surface Water VRP Monitoring Plan
- 2 years Annual Sampling with Annual Reporting
- Rerun Contaminant Transport Model at year 2

STAGES OF WORK
- Planning Stage
- Fieldwork/Data Collection & CSM completion
- Predictive Contaminant Modeling
- Final Documents
- Corrective Measures & Monitoring

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 11/21/2014 9:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Air - GC/MS VOA
Method(s) TO 14A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted.

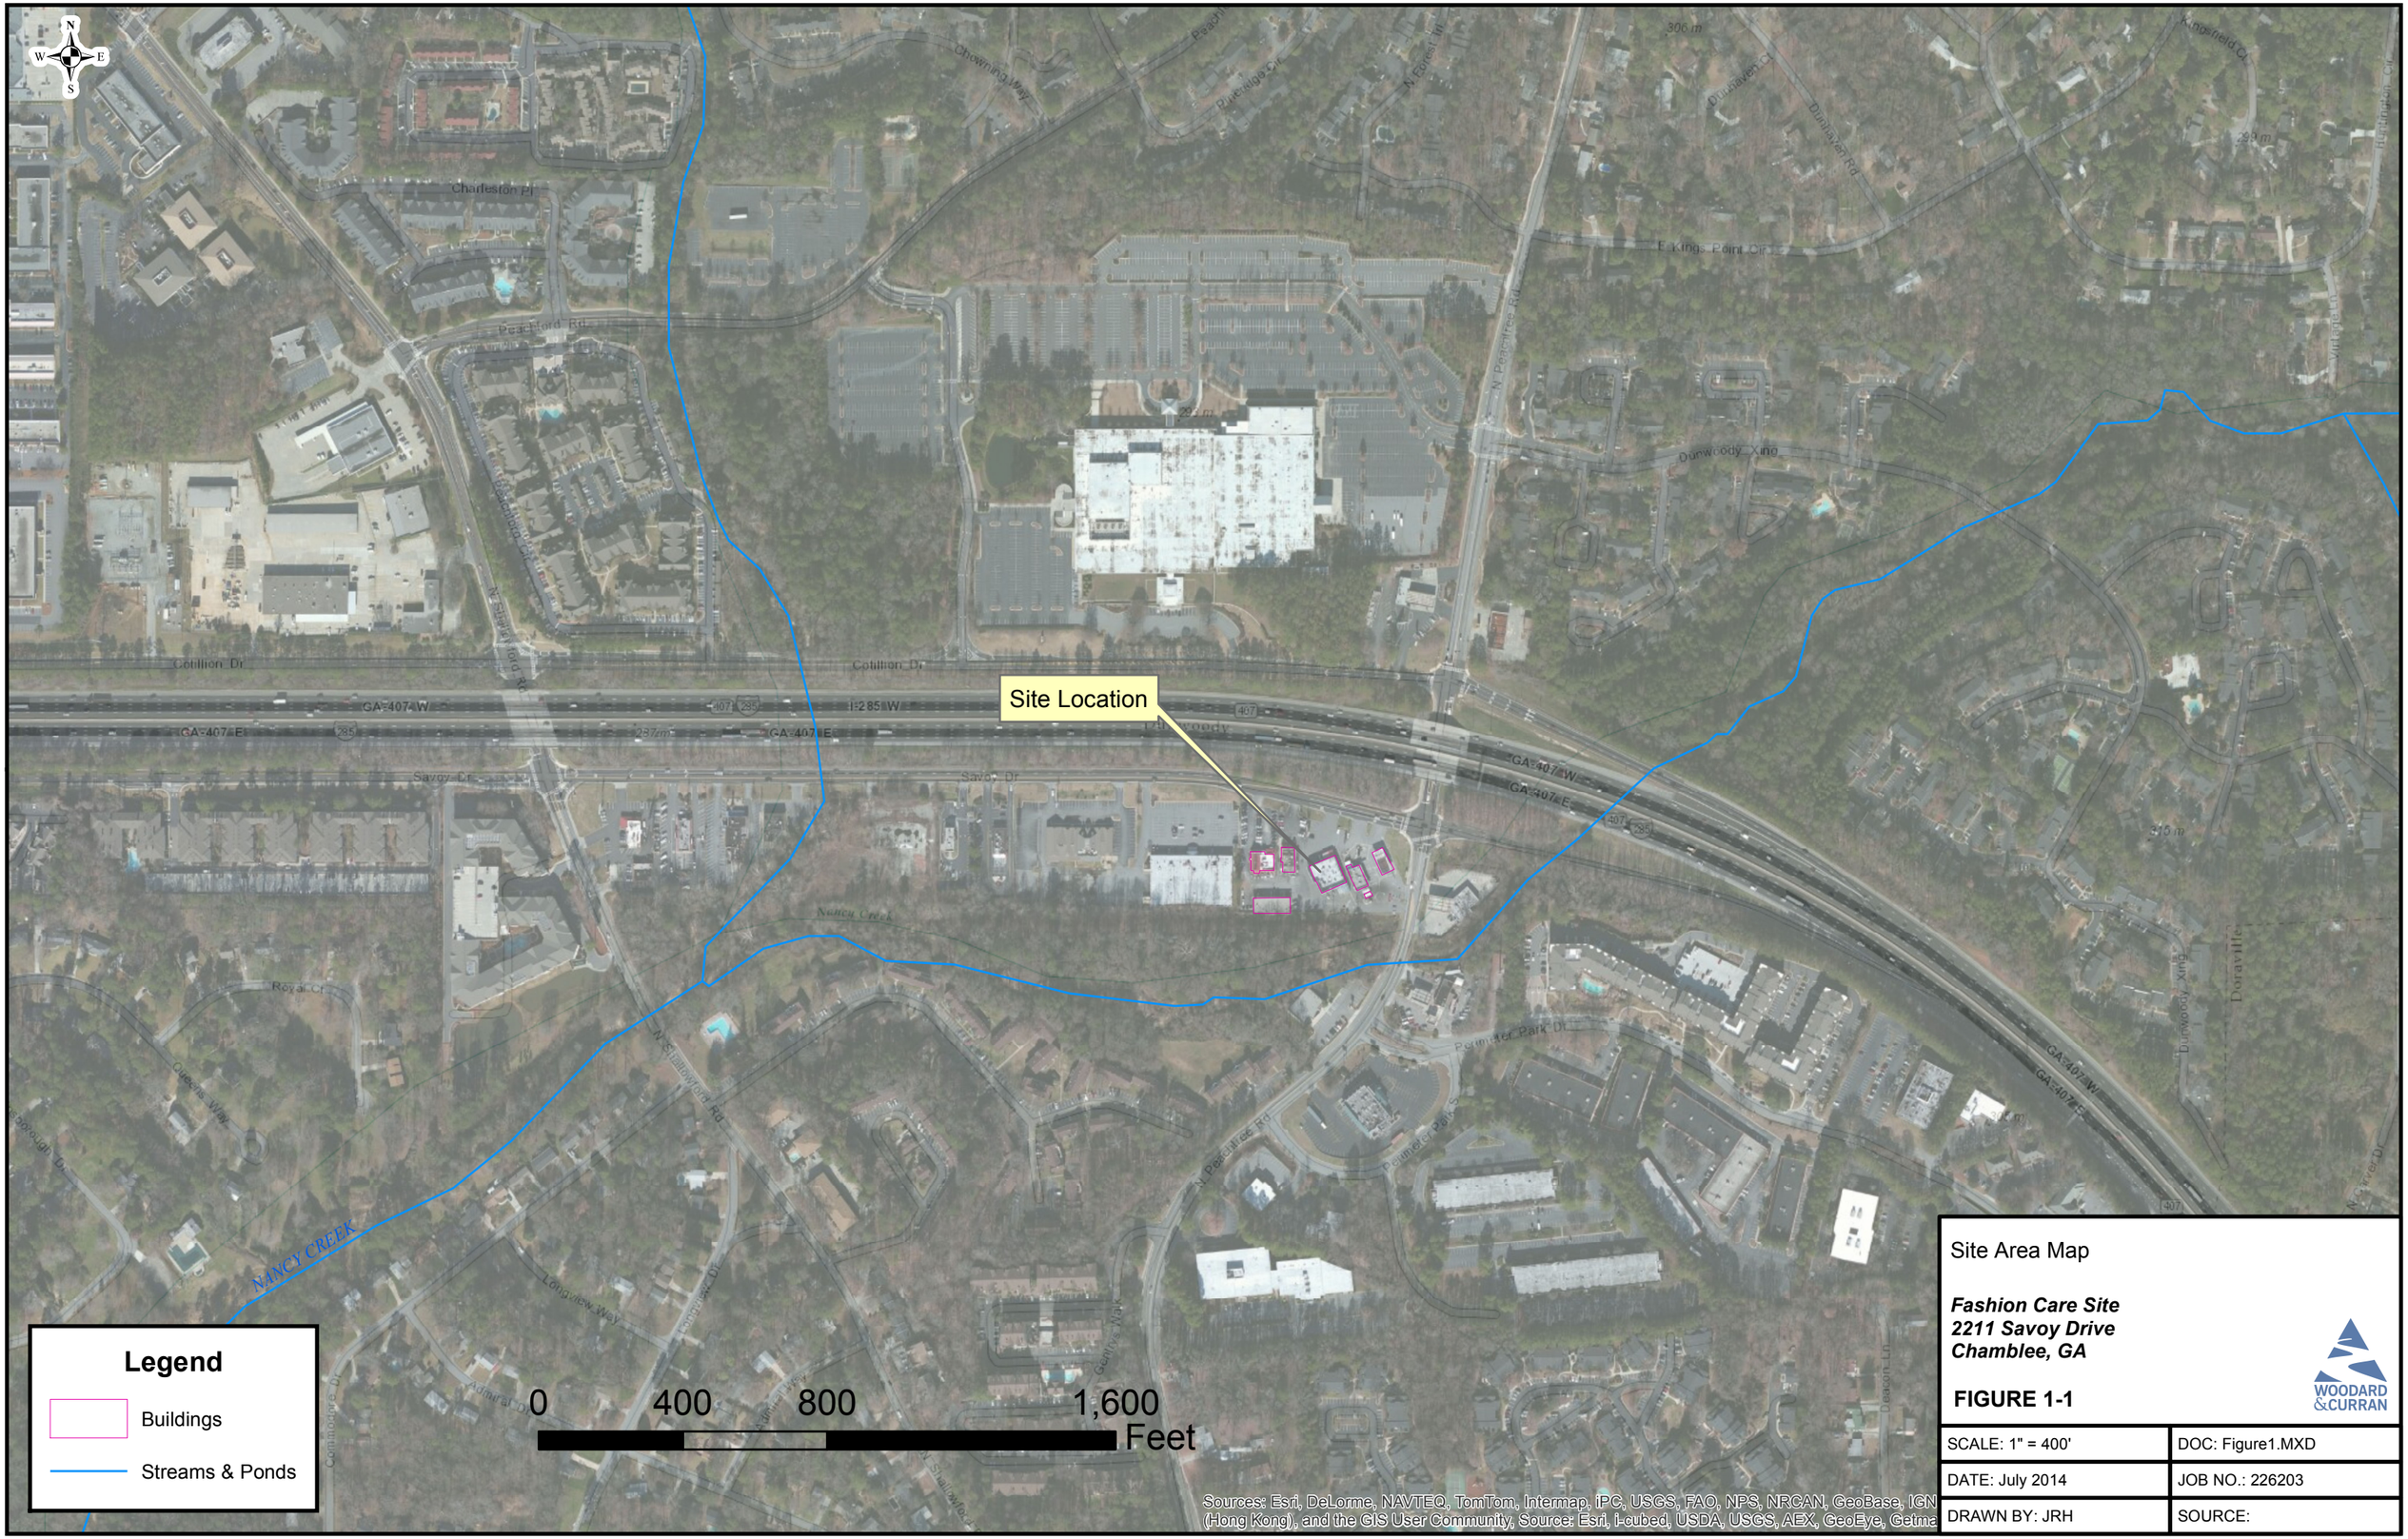
1. INTRODUCTION



1.1 PROJECT BACKGROUND

This report details chemical fate and transport modeling for volatile organic compounds (VOCs) at the Fashion Care Voluntary Remediation Program (VRP) Site in Chamblee, Georgia. The Site area is depicted on Figure 1-1. This Site consists of an active dry cleaner and adjoining vacant space. Adjacent properties include a gas station/car wash, dental office, and various retail stores. All of these properties are located on the south side of I-285 and north of Nancy Creek and in total consist of approximately 12.3 acres of land. A dry-cleaning operation has been located at the Site since the buildings were constructed during the 1960's (Winter Environmental, 2010).The drycleaner location was the site of an historical release of tetrachloroethylene (PCE) that was subject to past corrective actions no longer on-going. Residual PCE and its daughter products are present in soil and groundwater and downgradient of the Site. The adjacent gas station was the site of a release of gasoline to the subsurface from underground storage tanks (UST) which comingled with the PCE plume at the Site (Winter Environmental, 2010).

Multiple phases of investigation by multiple contractors began with an investigation of Site soils in 2006. Additional investigation of Site soils occurred in 2007. A comprehensive investigation of Site soils, groundwater, and surface water began in 2008. Soil remediation efforts consisting of sodium persulfate injection in the presumed source area and sealing of potential pathways were conducted in 2009. Since that time, supplemental well installations, soil borings, and hydrogeological investigations have been conducted. This report summarizes pertinent information from the various investigations for the purposes of modeling fate and transport of Site-related constituents in groundwater and surface water.

1.2 REPORT ORGANIZATION

This report consists of a cursory review of project background data and site conceptual model in Section 2. Section 3 provides a discussion of the construction and benchmarking of the model used at the Site. Section 4 presents the results of the modeling. Section 5 provides a brief summary and recommendations for the Site based on the modeling efforts completed for the Site.

2. CONCEPTUAL SITE MODEL AND PROJECT DATA SUMMARY

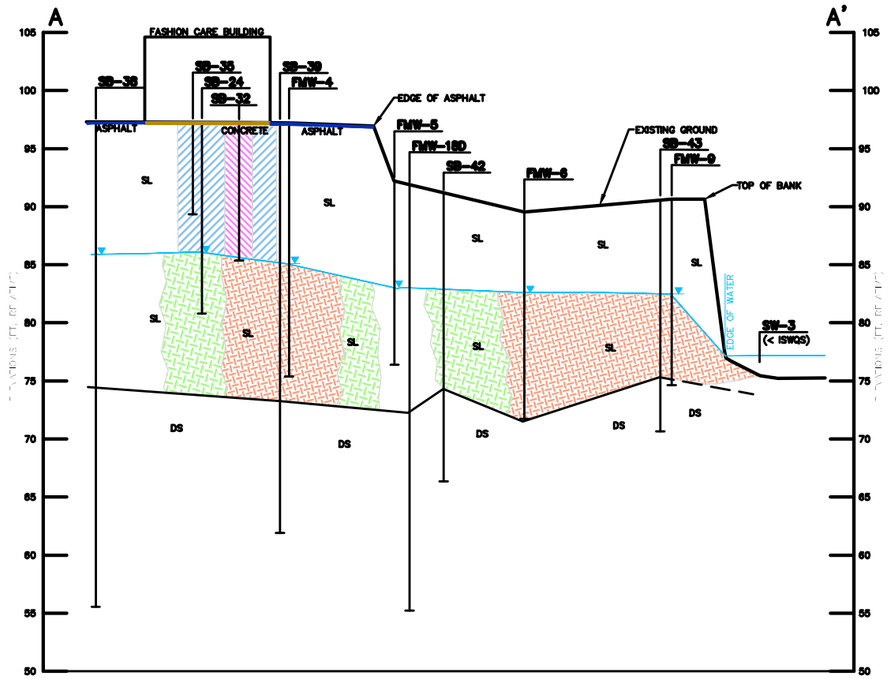
This section discusses the conceptual site model (CSM) and project data used in the evaluation and fate and transport modeling of Site-related contaminants. The CSM is discussed in Section 2.1. Data used to support the modeling efforts is summarized in Section 2.2.

2.1 SITE CONCEPTUAL MODEL

The basic CSM for the Site is summarized in Figure 2-1. The residual Site-related VOCs in soil are depicted beneath the Fashion Care building and the paved area adjacent to the building. It has been conservatively assumed that this residual soil contamination is subjected to a limited amount (owing to the predominance of impervious surfaces in the area) of infiltration from the surface and from fluctuations in the water table that likely periodically wet portions of the soil column allowing dissolution to occur. This dissolves additional contaminants which then migrate within groundwater in the sandy silt and clayey silt perched atop the dry silt, ultimately discharging to Nancy Creek.

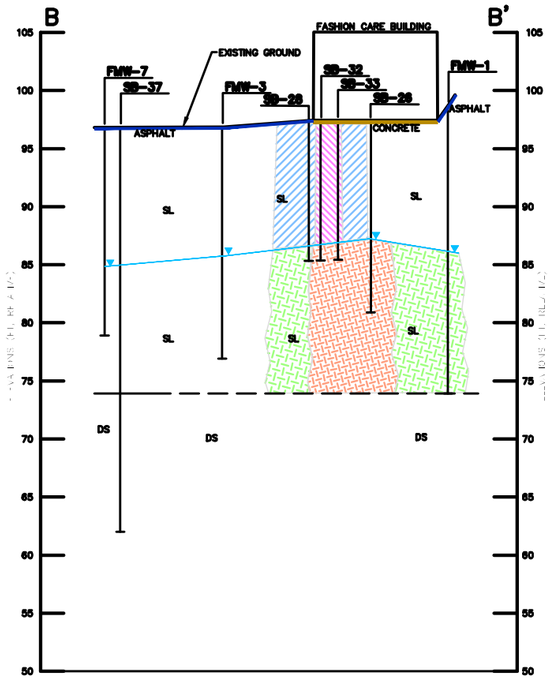
2.2 SITE DATA SUMMARY

The data used to construct and benchmark the fate and transport model for the Site comes from previous reports for the Site. The data pertinent to the modeling efforts for the Site are as follows:



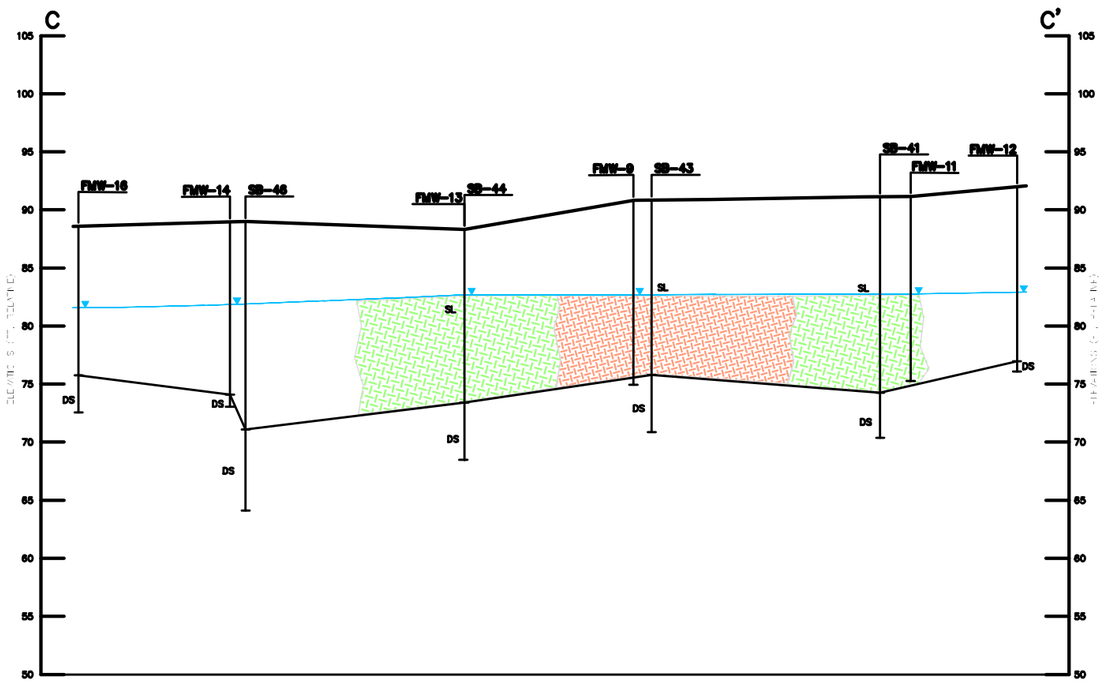
- Hydrogeologic properties of the sandy silt/clayey silt;
- Overburden thickness above dense, dry silt;
- Groundwater levels across the Site,
- Nancy Creek surface water elevations and flow data (as available);
- The current distribution of VOCs in soil and groundwater across the Site.

Each of these data types and available information for the Site is summarized below.



2.2.1 Hydrogeologic Site Data

The groundwater gradients across the Site are based on water level monitoring completed during groundwater sampling mobilizations to the Site. Figure 2-2 provides a plot of groundwater potentiometric surface from the April 2014 monitoring round. The head during this sampling round varied across the Site between approximately 4 to 5 feet. The gradients appear to be steeper near the developed areas and flatten closer to Nancy Creek. The gradients vary between approximately 0.0056 ft/ft and 0.032 ft/ft based on elevations measured in April of 2014.



Hydrogeologic properties of interest for flow and transport modeling include hydraulic conductivity and effective porosity. The hydraulic conductivity values used in the modeling efforts for the Site were obtained from recently completed and previous slug testing performed on Site wells. Historic slug testing indicated that hydraulic conductivity at the Site ranges from approximately 10 to 27 ft/day. The more recent data indicated a range from 0.45 to 57 ft/day. The data from these slug tests are summarized in Table 2-1. Data and analyses are for slug tests completed in September of 2014 and are provided in Appendix A. Effective porosity for the Site is most likely dependent

on the relative percentages of fines in the perched aquifer. There are no direct tests of effective porosity for the Site so an estimated effective porosity of 10% was assumed given the predominance of fines in the soil (Kresic, 1997)

Table 2-1: Slug Testing Summary

Well ID	Slug-In	Slug-Out	Notes
	K (ft/day)	K(ft/day)	
FMW-1	0.58	0.45	2014 Testing
FMW-4	20	9.9	Historic Testing

FMW-9	57	7.2	2014 Testing

The overburden thickness above dense, dry silt was mapped based on observations made in soil borings across the Site. The overburden thickness values assigned to each boring were then interpolated by kriging the values. The resulting thickness map is provided in Figure 2-3. The overburden thickness was subtracted from publicly available surface elevation data to obtain the bottom of the perched aquifer.

In addition to the overburden thickness above the dense, dry slit, Woodard & Curran personnel completed hand auger explorations in Nancy Creek to investigate the creek bottom. The objective of these explorations was to evaluate the potential for the creek to have eroded through the dry silt and expose bedrock in or immediately below the creek in the Site area. Locations were selected relative to the area where the groundwater plume enters the creek, and were the stream bottom was an erosional surface, not an area of sedimentation. This enabled accurate identification of the creek bed lithology. Two hand auger explorations were completed, CK-HA-1 and CK-HA-2. These locations are depicted in Figure 2-3. The CK-HA-1 location is in a bend of the creek adjacent to SB-41 and FMW-11. The CK-HA-2 location is located approximately 200 feet downstream of SB-43 and FMW-9. The hand augers penetrated to approximately 2.5 feet below the bed of the creek at which point the auger boring was terminated due to inability to further penetrate the creek bed. In both borings, grey, clayey silt was encountered. The grey clayey silt in CK-HA-1 was approximately 1.5 feet thick and was underlain by 0.5 feet of reddish-brown, poorly sorted, coarse sand and pebbles. In auger boring CK-HA-2, the grey, clayey silt, was encountered to a depth of 1.5 feet below the creek bottom at which point the boring was terminated. Based on comparison with the nearest soil borings, each boring terminated in the red to brown to grey silt located stratigraphically above the dense, dry silt which serves as the lower confining layer for the upper saturated zone through which the plume migrates. Nancy Creek at the Site is located in this upper saturated unit and has not eroded through the dense, dry silt, and does not intersect the bedrock. Appendix B provides the hand auger logs and correlation sections with adjacent borings. Photographs of the boring locations and lithology are also provided in Appendix B.

2.2.2 Surface Water Site Data and Recharge Estimates

Nancy Creek surface water elevations were taken from the data collected during Site groundwater monitoring. The differences between upstream station and downstream station elevations were used to model the surface water body and its relationship to the groundwater flow system. Surface water elevations, where available, are provided in Table 2-2 along with available groundwater elevations. The 7Q10 flow for the area where groundwater from the Site discharges to Nancy Creek has been calculated by the Georgia Environmental Protection Division (EPD) to be 3 cubic feet/second (CFS) (GAEPD, 2010).

Stream statistics from the United States Geological Survey (USGS) are available for Nancy Creek at Randall Mill Road (USGS Station ID 2336380) indicate a baseflow on the order of 10 to 18 CFS. The drainage basin size at the

Randall Mill Road gauging station is approximately 34.8 square miles. This yields a general recharge range of between 2.6 to 4.1 inches/year.

2.2.3 Site VOC Concentrations

Site residual soil VOC concentrations used in the modeling efforts are based on soil data summarized in the report on soil remediation activities completed by Winter Environmental (May 2009). The average soil data was approximately 7.5 mg/kg over and area of approximately 2,100 square feet. The approximate depth to the water table in the source area is 7 feet. At an assumed soil density of 100 pounds per cubic foot, the approximate mass of PCE on soil in the source area is 5,020,860 milligrams or 5,020 grams.

The detection of VOCs in groundwater at the Site includes breakdown products of the degradation of PCE. These detected compounds include trichloroethylene (TCE), cis-1,2 dichlroethylene (cis-1,2 DCE), trans-1,2 dichlorethylene (trans-1,2 DCE), and vinyl chloride (VC). The presence of a gasoline station adjacent to the property and the associated hydrocarbons benzene, toluene, ethylbenzene, and xylene (BTEX) indicates there is the potential for dechlorination of the PCE plume from comingling of this carbon rich source and may have set the stage for associated anaerobic conditions. The presence of higher quantities of DCE indicate that reductive dechlorination is likely occurring at the Site. The minimal detections of VC suggest that either the dechlorination stalls at the DCE stage or VC degradation occurs rapidly via another mechanism such as aerobic degradation. Other studies have indicated that VC can decay rapidly under aerobic conditions (Davis and Carpenter, 1990 and Singh et al., 2004).

Figure 2-4 depicts the total VOC plume in 2008 prior to remediation efforts. The plume extended from the source area near the Site building southward toward Nancy Creek. The plume bends to the west prior to reaching the creek. This bend is likely reflective of the plume encountering materials of greater transmissivity and the influence of the creek on groundwater flow patterns.

3. FLOW AND TRANSPORT MODELING

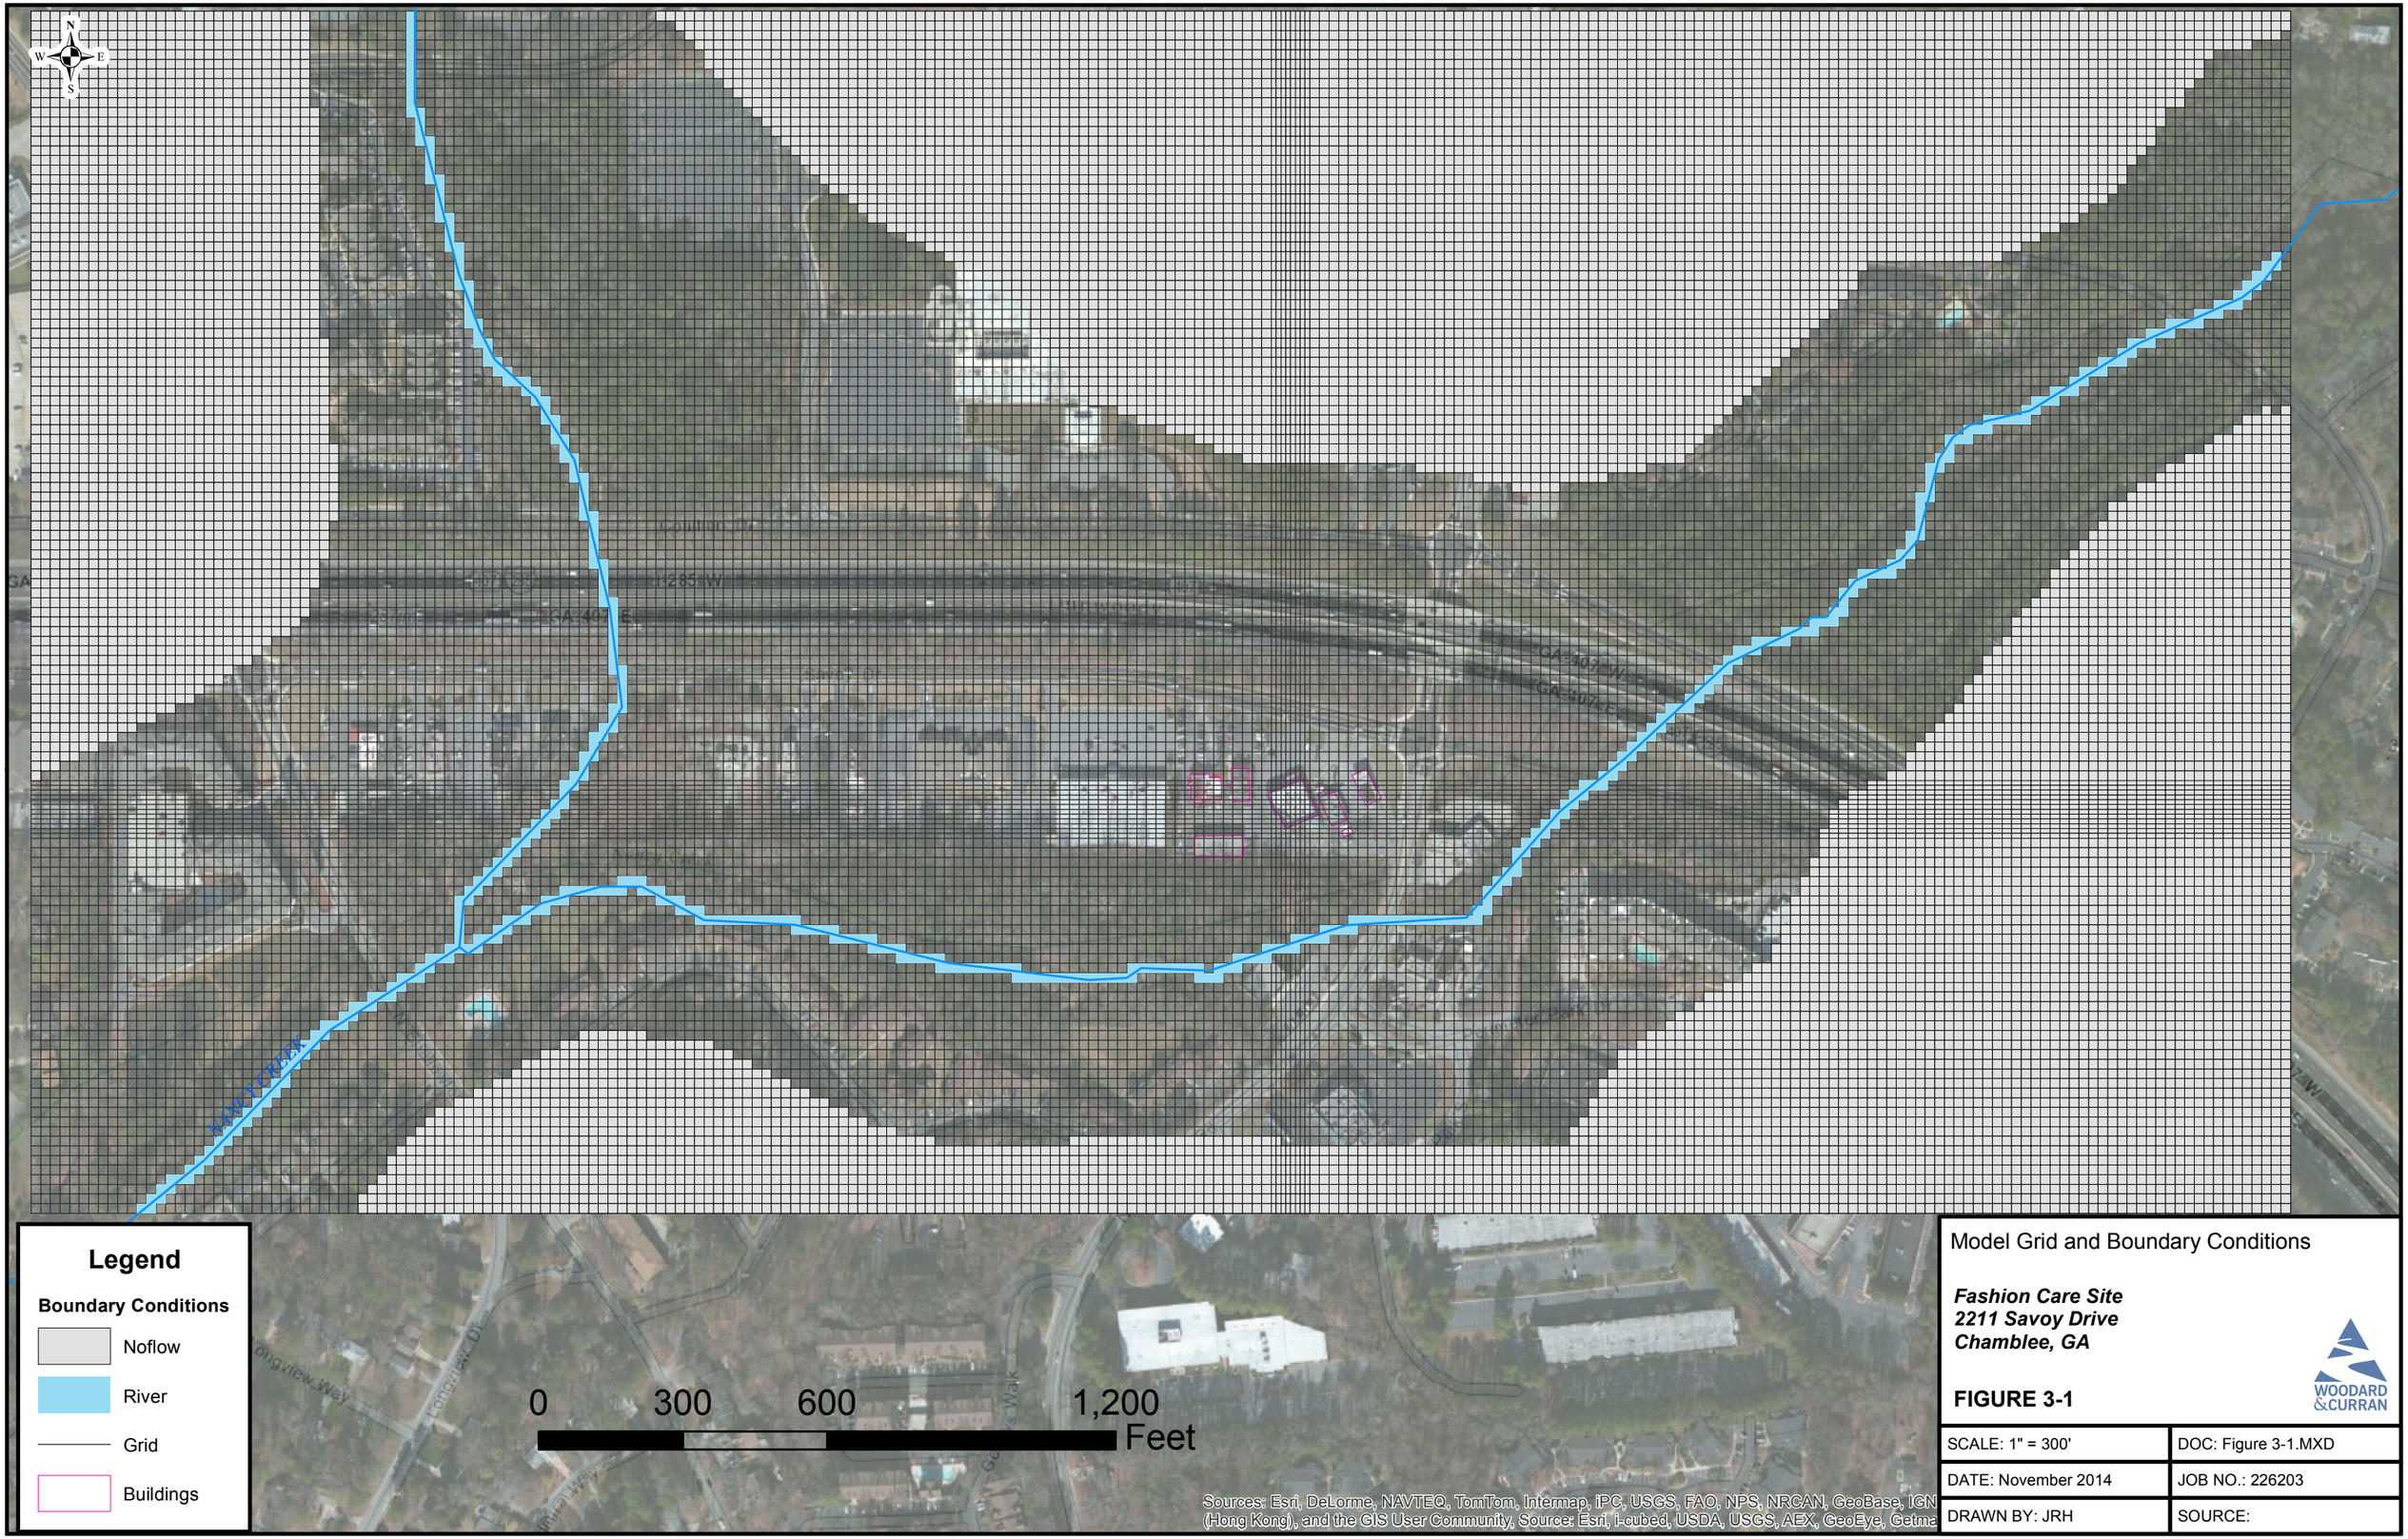
This section discusses the modeling of the soil to groundwater and groundwater flow and transport of Site related VOCs. Section 3.1 briefly describes the simplified modeling of the transfer of soil contamination to the groundwater flow system. Section 3.2 discusses the model selection, construction, and benchmarking of the groundwater flow model.

3.1 SOIL TO GROUNDWATER MODEL

For the purposes of modeling the transfer of contaminant mass to the groundwater system, a simple soil flushing calculation was used. Using the contaminant mass of 5,020,860 milligrams or 5,020 grams as estimated in Section 2.2 and an estimated infiltration rate of 1 inch/year applied over the approximate area of soil impact, the estimated time to reduce the contaminant levels to non-detect values is approximately seven years. The amount of soil contamination released to groundwater was then estimated for each year and used in step-wise fashion as the input to the contaminant transport model discussed in Section 3.2. Calculations regarding this estimation are provided in Appendix C.

3.2 GROUNDWATER FLOW AND TRANSPORT MODEL

The groundwater modeling of flow and contaminant transport for the Site is discussed in the following sections. Section 3.2.1 discusses the model code selection. Section 3.2.2 discusses the groundwater flow model construction, parameter selection, and benchmarking to Site observations. Section 3.2.3 discusses the contaminant transport model, parameter selection, and benchmarking to Site observations.



3.2.1 Computer Code Selection

The computer code used to simulate the flow of groundwater at the Site was MODFLOW 2000 (Harbaugh et al, 2000). MODFLOW is an industry standard code for modeling three dimensional groundwater flow and has various packages or modules to handle different aspects of groundwater flow. The computer code used to simulate contaminant transport was MT3DMS (Zheng and Wang, 1999). MT3DMS is a industry standard code for simulating transport of contaminants in three dimensions and uses the outputs from MODFLOW to calculate simulate transport in groundwater. Both codes were implemented using the commercially available Groundwater Vistas graphical user interface (GUI).

3.2.2 Groundwater Flow Model Construction

The construction of the groundwater flow model was based on available Site data for perched aquifer geometry, boundary conditions, and site specific parameters. The model grid and boundary conditions are indicated on Figure 3-1. The model grid was based on a nominal grid spacing of 20 feet by 20 feet. The grid was refined around the source area to a spacing of 10 feet by 10 feet. The boundary conditions used in the model included no-flow and river boundaries. The no-flow boundaries were assigned based on interpretation of presumed groundwater divides based on surface topography or where the upper unit was assumed to be unsaturated at the higher elevations in the model space. Nancy Creek was simulated as a river boundary with elevation values assigned based on surface topography and measured differences in elevations at various Site surface water stations.

Aquifer geometry was assigned based on the depth to the top of the dry silt as discussed in Section 2. The upper limit of the aquifer surface was assumed to be the surface elevation. The bottom of the aquifer was computed by subtracting the overburden thickness from the surface elevation for the entire model space.

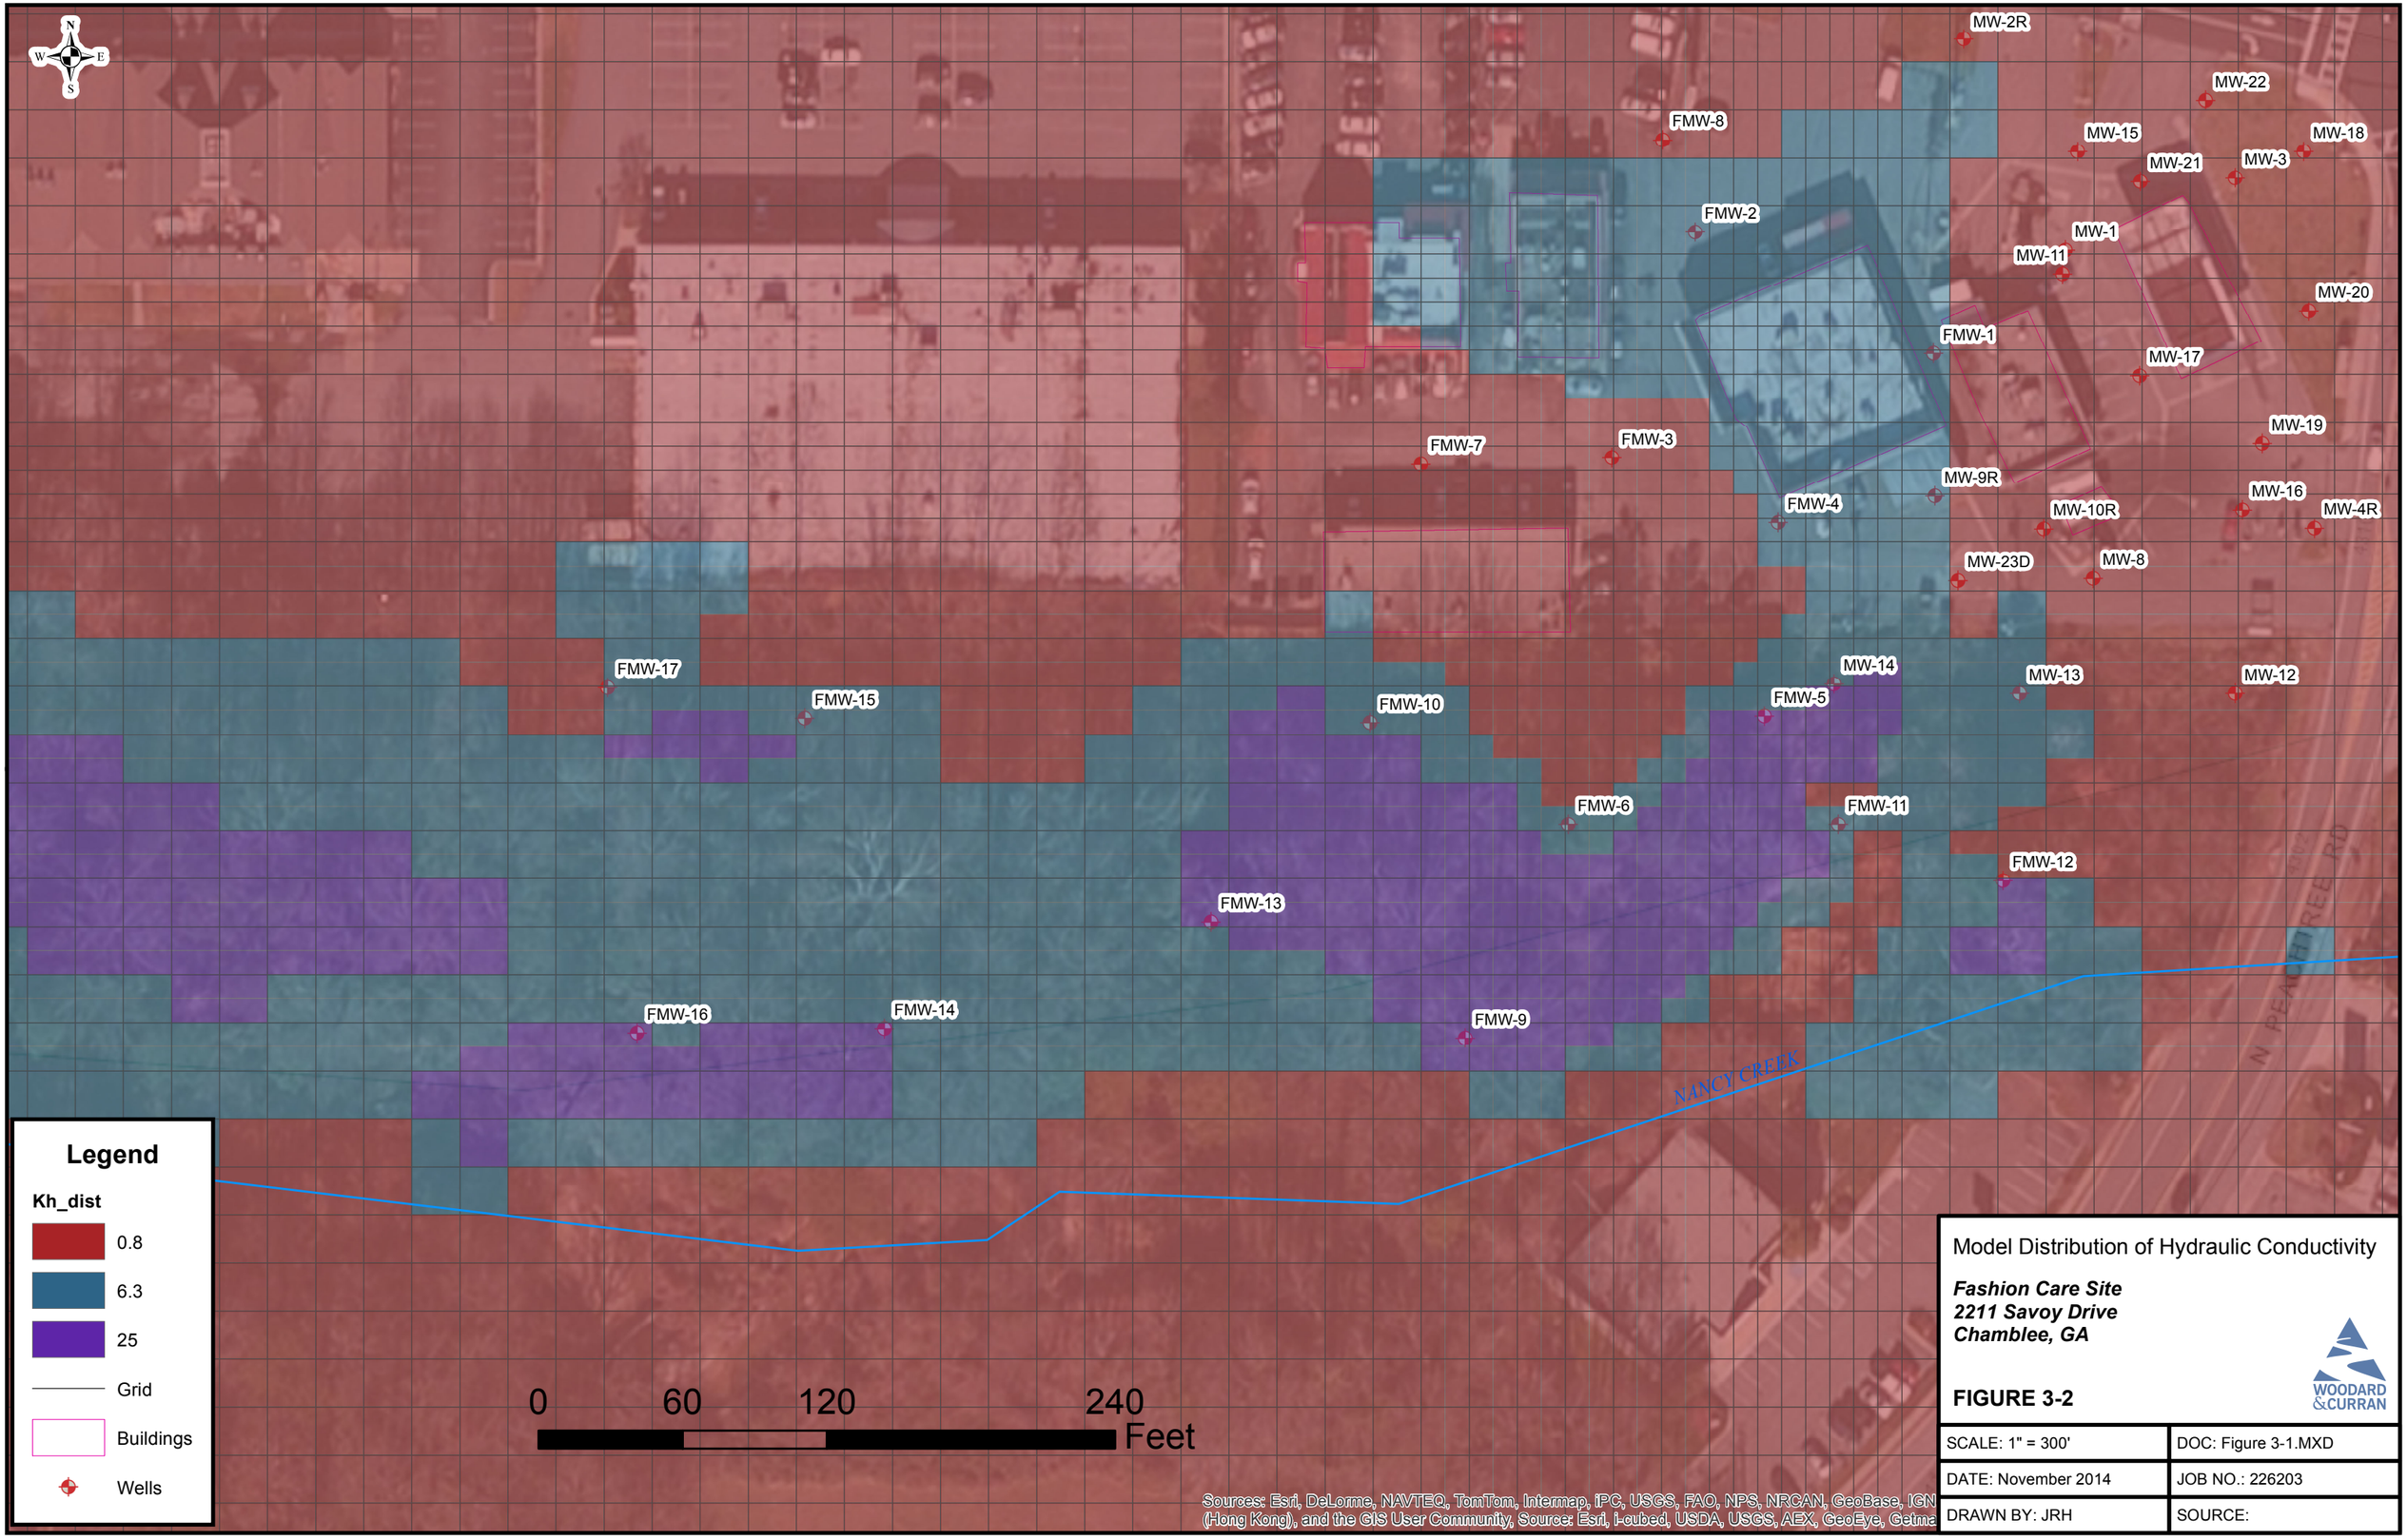
DRAWN BY: JRH	SOURCE:



Hydraulic conductivity was varied based on Site values discussed in Section 2.2. Based on benchmarking to Site water levels, two conductivity values were used. A hydraulic conductivity of 0.8 feet/day was used for the majority of the model space and reflects a predominance of silt in much of the model area. A transition value of 6.3 feet/day was assigned to reflect sandier silt present between the sand observed in some Site wells/borings and the finer-grained silt. A higher conductivity value of 25 feet/day was assigned an area near Nancy Creek. This was completed to better match the wider spacing of groundwater contours adjacent to the creek. The lower gradient in this area is indicative of more transmissive soils likely associated with the alluvium along the creek. The distribution of conductivity values is presented in Figure 3-2.

Recharge was assigned based on surface conditions in the area of the Site. Generally, paved areas were conservatively assigned a recharge rate of approximately 1 in/yr or less. Open spaces were set at approximately 4 in/year. Areas with depressions such as ditches and swales along the highways were assigned recharge rates of approximately 7 in/yr. These numbers reflect final adjustments to achieve calibration.

3.2.3 Flow Model Calibration

The groundwater flow model was calibrated to the average of groundwater elevations for the period of record collected at each well. These data were adjusted from the arbitrary Site datum to a representative elevation similar and consistent with the publicly available land surface elevation. This datum adjustment was made by computing the elevation difference between each average groundwater value from the surface water elevation at the surface water station SW-1 on March 19, 2010 (the most complete round of monitoring data for the Site), and then adding that difference to the elevation of SW-1 based on the digital elevation model (DEM). Table 2-1 provided the data for the average groundwater conditions and the adjustment to a site datum consistent with the DEM for the Site area.

Overall, the shape of the contours and the change in head across the Site in the model appears to mimic the observed change in heads and contour shapes. The groundwater model appears to be relatively well benchmarked against Site conditions. The change in modeled head across the Site is approximately 5 feet which agrees with Site observations and gradients similar for both the modeled and observed flow fields. Figure 3-3 depicts the benchmarked flow field. Figure 3-4 provides a graphic depicting modeled heads versus observed heads. The modeled graph depicts a line representing where data would fall if there were perfect agreement between modeled and observed heads. There is generally a good correlation between modeled and observed heads as indicated by the lack of scatter about the line. Table 3-1 provides the modeled versus observed heads as well as calibration statistics. The calibration statistics further indicate a good match in the modeled head data.

Figure 3-4: Observed versus Modeled Heads

3.2.4 Contaminant Transport Modeling

Contaminant transport modeling was conducted in three distinct steps. The first step was to model distribution of total dissolved VOCs in the groundwater. The second step was to model the anticipated maximum concentration of PCE in the future, as this compound is the most prevalent compound at the Site with the lowest In-Stream Water Quality Standard (ISWQS). The third step was to evaluate the likely relative concentrations of the daughter products of PCE decay at the Site at the time of the maximum future PCE concentration and then compare these concentrations to the appropriate environmental standards.

For all simulations, the model assumes that source became active in the subsurface approximately 5 years after the Site began operation in 1968. The starting time for the simulation is therefore 1973. The source was assumed constant until late 2008/early 2009 when the source remedy using sodium persulfate and chelated iron was implemented. The flushing of Site soils as discussed in Section 3.1 was then used as the basis for adjusting source concentrations over time.

3.2.4.1 Total VOC Plume Modeling

The total VOC plume modeling was conducted to evaluate the following:

1.) The expected maximum extent of the total plume in the aquifer ,

2.) The relevant environmental criteria against which to evaluate modeled future concentrations (i.e. surface water protection, drinking water, etc.);

3.) The adequacy of the existing monitoring network to effectively monitor anticipated changes, if any, in the plume distribution, and

4.) The potential for additional receptors to be impacted by the plume in the future.

The main parameters for varying in the contaminant transport model are the source distribution and concentration and the dispersivity values. The initial source area for the total VOC portion of the model was assigned based on observations of data. Source concentrations were varied between 5 mg/l and 110 mg/l in the area beneath the southern corner of the dry cleaning building. The source concentration was varied from these initial values in a stepwise fashion over 7 years until reaching an assumed, irreducible minimum of 1 mg/l in year seven. Dispersivity values were initially assigned a value of 1 for longitudinal dispersivity, 0.1 for transverse dispersivity, and 0.01 for vertical dispersivity. During benchmarking, the values for dispersivity were adjusted to 0.8, 0.08, and 0.01 respectively for longitudinal, transverse, and vertical dispersivities.

In order to develop a model that yielded modeled data consistent with Site monitoring results, plume retardation was incorporated into the transport simulation. Retardation in the MT3D model is accomplished by incorporating soil adsorption. Adsorption is based on three parameters: K_{oc}, f_{oc}, and soil bulk density. The product of K_{oc} and f_{oc} is the transport parameter K_d or adsorption constant. Since there is not a specific K_{oc} value for total VOCs and the site specific f_{oc} may vary over a large range, the value for K_d was adjusted during calibration to achieve a suitable match to observed Site chemical data.

3.2.4.2 PCE Plume Modeling

The PCE plume was developed using the same basic dispersivity as was used in the total VOC transport model. The source terms were adjusted to reflect the portion of the total VOCs that are attributed to PCE in Site groundwater. The resulting source term for PCE was adjusted to have decay proportional to that used in the total VOC plume model.

The chemical specific adsorption on soils for PCE is based on values for K_{oc}, f_{oc}, and bulk density. The K_{oc} of 94.94 L/kg for PCE was obtained from Regional Screening Level (RSL) Chemical-specific Parameters Support Table, May 2014. The initial f_{oc} value for the Site soils was estimated at 0.002 mg/L per guidance provided by the Georgia EPD. The value for f_{oc} was varied during the modeling in order to achieve a good fit to the available Site chemical data time series.

3.2.4.3 Daughter Product Prediction Modeling

The Site monitoring data include detectable concentrations of the breakdown of PCE into its various daughter products as discussed in Section 2.2.3. In order to understand the maximum expected concentration of each of the daughter products at the time of maximum PCE concentration, a simulation using BIOCHLOR22 was performed. Chemical transport parameters were initially set at those used in the PCE modeling and adjusted during benchmarking. A discussion of benchmarking and model predictions are provided in Section 3.2.5.3 below.

3.2.5 Contaminant Transport Model Benchmarking

Each stage of the contaminant transport modeling process underwent individual benchmarking to Site data. The discussion of the benchmarking for each step is provided in the sections below.

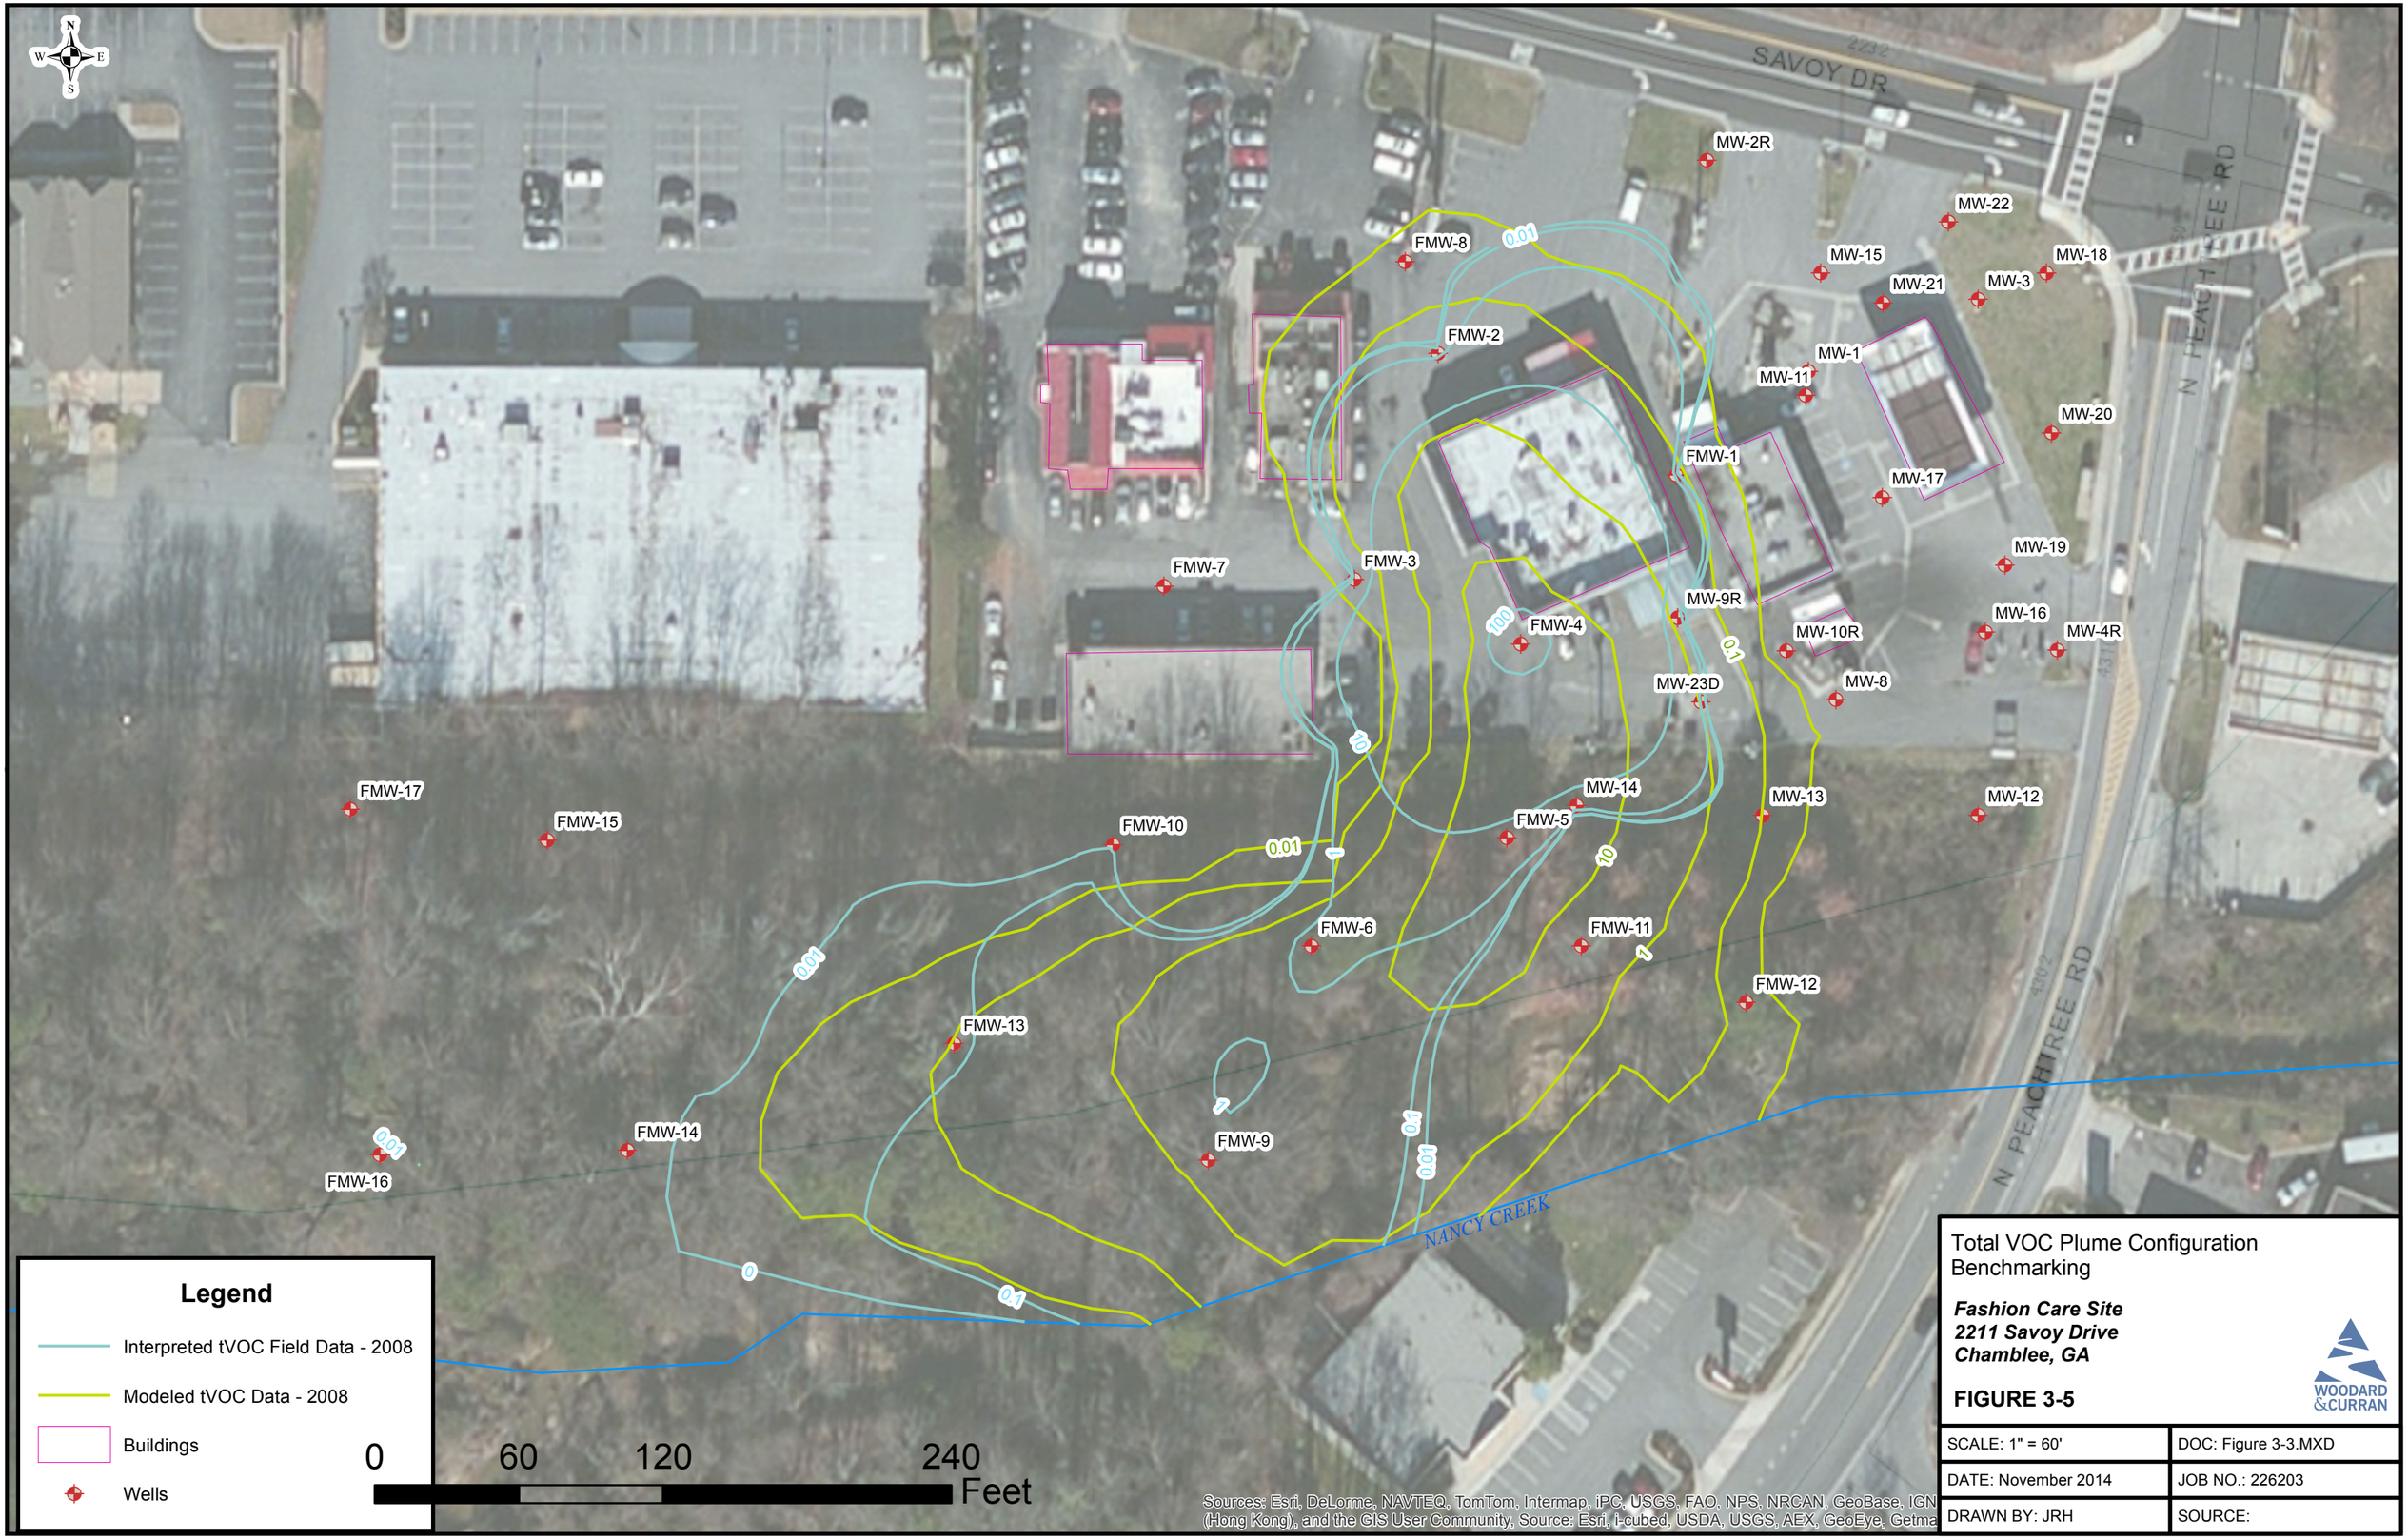
3.2.5.1 Total VOC Plume Benchmarking

The plume was generally well benchmarked against field measured values for VOCs in both the extent and shape of the plume. Figure 3-5 depicts the benchmarked plume distribution versus observed plume concentrations. As depicted, there is generally a good match with regard to plume shape and concentrations. The benchmarking of plume migration timing was accomplished by extracting modeled contaminant concentrations versus time, plotting

them, and comparing them to actual values. Figure 3-6 a, b, and c depict the modeled concentration time-series data for wells FMW-4, FMW-6 and FMW-9.

3.2.5.2 PCE Plume Benchmarking

The plume was generally well benchmarked against field measured values for PCE in both the extent and shape of the plume. Figure 3-7 depicts the benchmarked plume distribution versus observed plume concentrations. As depicted, there is generally a good match with regard to plume shape and concentrations. The benchmarking of plume migration timing was accomplished by extracting modeled contaminant concentrations versus time, plotting them, and comparing them to actual values. Figure 3-8 a, b, and c depict the modeled concentration time-series data for wells FMW-4, FMW-6 and FMW-9. While some values are under-predicted, in general the order of magnitude of predictions is correct, as are the trends in concentrations relative to the well location within the plume.



3.2.5.3 Daughter Product Model Benchmarking

The first step in this process was to benchmark the simulation against Site VOC data. Initial transport parameters were set to match those of the three dimensional model simulation for PCE transport. Model parameters were then modified to achieve a match for each of the daughter products. The BIOCHLOR22 model is spreadsheet based and provides outputs depicting modeled versus actual concentrations for each of the daughter products in the decay chain. As demonstrated in Figure 3-9, the modeled values for PCE, TCE, DCE, and VC match the field data relatively well. The calibrated parameters used in the BIOCHLOR simulation to achieve these matches are provided in Table 3-3 below.

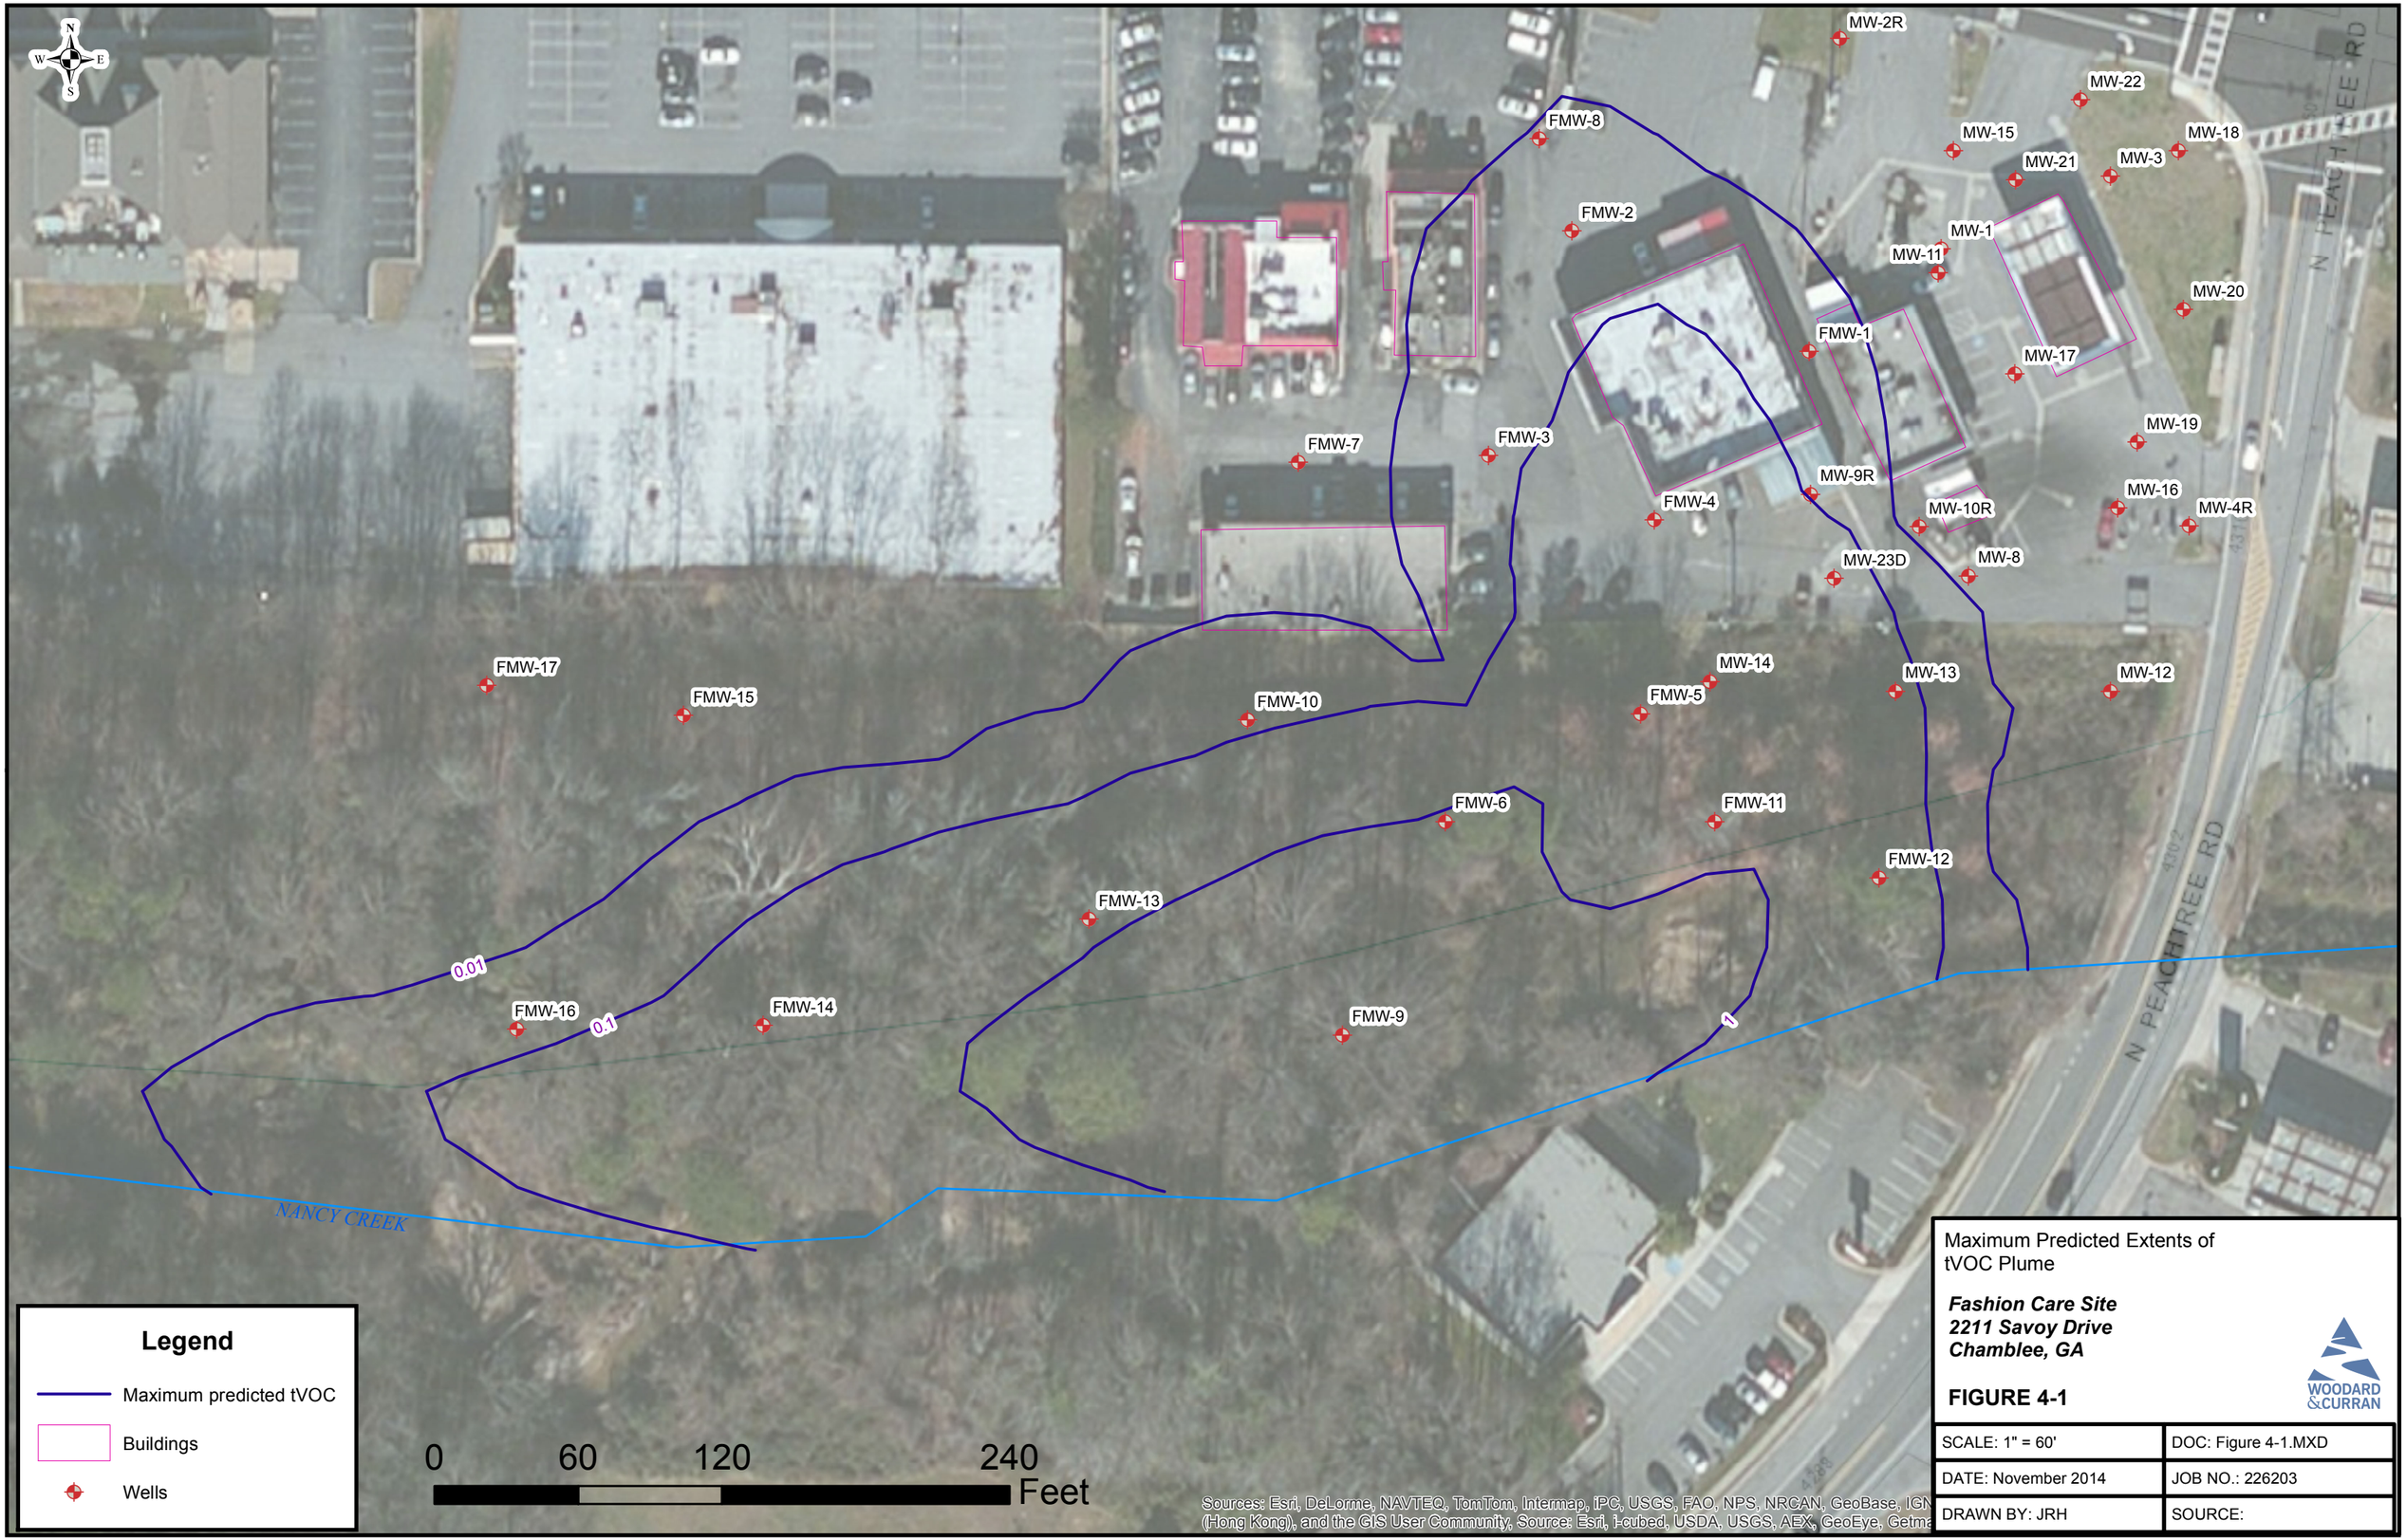
4. PLUME SIMULATIONS AND SURFACE WATER MIXING CALCULATION

The benchmarked groundwater model was used to complete various simulations to evaluate plume stability and predicted future extents. Two types of simulations were performed a steady-state simulation assuming soil remains an ongoing source at current concentrations and transient simulations assuming that soils flush in a stepwise fashion as discussed in Section 3.1.

4.1 TOTAL VOC PLUME DISTRIBUTION

The simulation of total VOC concentrations was run forward in time to evaluate the existing groundwater monitoring network distribution and the potential for influencing additional receptors. The projected maximum extent of the plume is depicted in Figure 4-1. This figure indicates that the existing monitoring network is adequate for plume monitoring as it would allow delineation and monitoring of the plume over time.

4.2 PCE PLUME DISTRIBUTION AND MAXIMUM STREAM VALUES



The maximum extent of the PCE plume is slightly less than that of the total VOC plume depicted in Figure 4-1. In order to understand the potential time-frame and concentration of the maximum discharge concentration of PCE into Nancy Creek, monitoring nodes were placed in the modeled creek at areas where the core of the modeled plume discharges to the creek. The modeled points are depicted on Figure 4-2 that depicts the maximum projected extents of the core of the plume in Nancy Creek. The modeled time frame for the maximum extents are indicated on the graphic as potentially occurring at approximately 41 years from 2014. Figure 4-3 depicts the maximum expected groundwater discharge concentration at two locations in the creek. The maximum predicted concentration of PCE entering Nancy Creek is approximately 2.42 mg/L. This predicted concentration is used in later sections to evaluate the potential for exceedance of ISWQS.

4.3 PLUME DAUGHTER PRODUCT PREDICTION AT NANCY CREEK

The calibrated BIOCHLOR22 model was used to predict concentrations of daughter products at the maximum PCE concentration of approximately 2.42 ug/L at the stream. Since BIOCHLOR22 is a simple two-dimensional model assuming a uniform flow field, the maximum concentration at a given distance at given time is located along the centerline of a symmetrical plume. Since the plume at the Site is not a simple symmetrical plume in a uniform flow-field, the distance used for prediction of daughter products based on the time projection was the distance from the source area to Nancy Creak. Table 4-1 below provides the predicted maximum concentrations of PCE and the following degradation daughter products: TCE, DCE, and VC.

4.3 SURFACE WATER MIXING CALCULATION

In order to evaluate the potential for PCE and its degradation products to be present in the stream above ISWQS, a groundwater to surface water mixing calculation was performed. The concentrations for PCE, TCE, DCE and VC in groundwater predicted in the previous sections were then blended based on modeled groundwater discharge and the volume of flow in Nancy Creek at the Site at 7Q10 conditions. Per correspondence from Georgia EPD dated December 2, 2010, the 7Q10 flow at the area of groundwater discharge is 3 cubic feet/second.

Figure 4-3: Maximum Predicted PCE Concentrations to Nancy Creek

The mixing zone calculation is as follows:

$$C_{SWVOC} = \frac{V_{gw}}{V_{gw} + V_{sw}} * C_{GWVOC}$$

where:

C_{SWVOC} = concentration of a particular VOC in surface water after mixing with groundwater containing that VOC discharges to the stream

V_{gw} = groundwater discharge volume (modeled value is 0.0019 cfs)

V_{sw} = surface water flow at 7Q10 (3 cfs for the Site)

C_{GWVOC} is the concentration in groundwater of the particular VOC being modeled

The table below provides the calculation of the concentration each VOC in surface water for the single point in the stream with the maximum predicted concentrations in groundwater and compares them to the Georgia EPD compound specific ISWQS.

Table 4-1: Predicted Point Concentrations in Surface Water after Mixing

	GW conc. (mg/L) at MS-1	Mixed Conc. (mg/L) at MS-1	GA ISWQC (mg/L)	Above Criteria
PCE	2.42	0.00153	0.003	no
TCE	0.162	0.000102	0.030	no
DCE	1.773	0.001121	10.000	no
VC	0.076	4.81E-05	0.0024	no

Notes: SW/GW = Surface water/Groundwater
GA ISWQC = Georgia In-Stream Water Quality Criteria

5. SUMMARY AND CONCLUSIONS

Based on the modeling exercises completed to date, the plume will likely remain stable or decrease over the next 60 years. The plume generally appears to migrate down the axis of the Nancy Creek Valley on the northern side of the creek. The overall plume distribution appears to be monitored adequately by the existing well network. Given these observations, the following conclusions/recommendations are made:

- The predicted plume footprint does not expand substantially beyond the existing monitoring well network;
- As the source area is depleted, the center of maximum plume concentration will slowly migrate and continue to degrade as it migrates toward Nancy Creek;
- The maximum modeled concentration of PCE is predicted to discharge to Nancy Creek approximately 41 years after the source remediation effort conducted in 2008;
- Based on modeling, plume characteristics can be adequately monitored through annual or semi-annual sampling of FMW-6, FMW-9, and FMW-16;
- Mixing calculations for the predicted maximum concentrations of PCE and daughter products in Nancy Creek indicate that ISWQS will not be exceeded; and
- No other receptors for the groundwater plume are present within the existing or predicted footprint of the plume at the Site.

Subject: Limitation of Liability
2211 Savoy Drive, Chamblee, Dekalb County, Georgia
County Tax Parcel ID No. 18-343-13-002
Fashion Care/Executive Care, HSI No. 10786

Dear Mr. and Mrs. Pero:

The Georgia Environmental Protection Division (EPD) has reviewed the Prospective Purchaser Compliance Status Report (PPCSR), dated October 30, 2014, and the Georgia Brownfields Eligibility Form, dated November 11, 2014, submitted for the above referenced property (subject property). The subject property is identified as Dekalb County Tax Parcel 18-343-13-002 (0.656 acres) and is described in the attached legal description marked Exhibit A and the attached Tax Parcel Map marked Exhibit B.

The PPCSR was submitted to support your request for a limitation of liability for the subject property pursuant to Section 12-8-200 *et seq*. of the Brownfield Act (Act). EPD has determined that the PPCSR is complete and concurs with your certification of compliance that soil at the subject property is in compliance with the Type 5 Risk Reduction Standards in Section 391-3-19-.07 of the Rules for Hazardous Site Response.

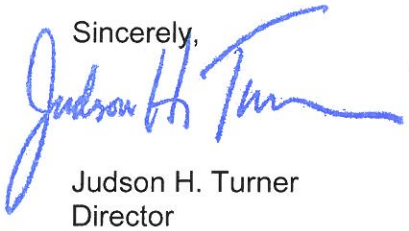
EPD hereby grants Charles and Wendy Pero (Peros) the limitation of liability provided for in Section 12-8-207 of the Act for pre-existing releases at the subject property. This limitation of liability is subject to all conditions set forth in the Act and as follows:

1. The Peros must submit a notice of purchase of the above referenced property by no later than ten (10) days after closing to EPD. Please include documentation of the prohibition of the use of tetrachloroethene on the Property.

2. The Peros will give any responsible party for groundwater contamination and/or EPD access to the subject property to perform groundwater sampling and to implement an EPD approved corrective action plan or workplan for groundwater.

3. The Peros will ensure that the requirements of the Uniform Environmental Covenant (UEC) are abided by and that the required engineering controls are properly operated and maintained.

4. In the event that the Peros wish to sell the subject property, the Peros must provide fifteen (15) days notice to EPD of its intent to offer for sale the subject property or any portion thereof. All documents offering the subject property or portion of the subject property for sale will include a copy of the PPCSR, the UEC, any other documents required by the UEC or the Act, and a copy of this letter. EPD shall be provided with the name, address, phone number, and contact person for the new property owner(s) within ten (10) days of sale.



5. For the purpose of determining liability for continuing or future releases of regulated substances upon or from the properties, the background or baseline concentration for any and all releases will be based on the information provided in the PPCSR pursuant to Section 12-8-208(d) of the Act.

The Act as amended and effective July 1, 2002 (specifically Code Section 12-8-207) states that upon the Director's approval of the Prospective Purchaser Corrective Action Plan or concurrence with the certification of compliance with Risk Reduction Standards for soil and source contained in Section 391-3-19-.07 of the Rules for Hazardous Site Response, whichever first occurs, a prospective purchaser shall not be liable to the state or any third party for costs incurred in the remediation of, equitable relief relating to, or damages resultant from the pre-existing release. Further, the prospective purchaser shall not be required to certify compliance with Risk Reduction Standards for groundwater, perform corrective action, or otherwise be liable for any pre-existing releases to groundwater associated with the qualifying properties.

EPD's approval of the PPCSR extends only to those technical aspects of the document that expressly require EPD approval under applicable rules and statutes. This approval is not an endorsement by EPD that it accepts as conclusive any representations made in the document. Nor does EPD guarantee or warrant that the document is free of errors or omissions. EPD may later withdraw approval of this document, in whole or in part, if EPD determines that withdrawal is necessary to ensure compliance with the applicable rules and statutes. EPD hereby approves the PPCSR subject to the conditions enumerated above.

If you have any questions, please contact Robin S. Futch, P.G. at 404-657-8686.

Sincerely,

Judson H. Turner
Director

Exhibit A

LEGAL DESCRIPTION (BASED ON THIS SURVEY)

All that tract or parcel of land lying and being in Land Lot 343 of the 18th Land District, City of Chamblee, Dekalb County, Georgia, said tract or parcel of land being more fully shown and designated on a plat of survey prepared by Valentino & Associates, Inc. (Job #14-063; Drawing/File #14-063), bearing the seal of Glenn A. Valentino, Ga. Registered Land Surveyor #2528, and being more particularly described, with bearings relative to Grid North, Georgia West Zone, as follows:

BEGINNING at a 1/2"iron pin set at the intersection of the westerly right-of-way line of North Peachtree Road (70' public r/w) and the line which divides Land Lots 334 and 343.

THENCE proceeding along said line which divides Land Lots 334 and 343 North 89 degrees 50 minutes 35 seconds West for a distance of 213.00 feet to a 1/2"iron pin set;

THENCE departing said line which divides Land Lots 334 and 343 North 21 degrees 58 minutes 35 seconds West for a distance of 126.48 feet to a computed point;

THENCE North 21 degrees 58 minutes 35 seconds West for a distance of 32.37 feet to a PK (masonry) nail set;

THENCE North 15 degrees 33 minutes 54 seconds East for a distance of 114.65 feet to a PK nail set on the southerly right-of-way line of Savoy Drive (variable width public r/w);

THENCE proceeding along said southerly right-of-way line of Savoy Drive South 75 degrees 38 minutes 07 seconds East for a distance of 100.03 feet to a PK nail set;

THENCE departing said southerly right-of-way line of Savoy Drive South 15 degrees 23 minutes 37 seconds West for a distance of 86.07 feet to a railroad spike found;

THENCE South 22 degrees 56 minutes 23 seconds East for a distance of 111.63 feet to a PK nail set;

THENCE South 60 degrees 14 minutes 53 seconds East for a distance of 60.02 feet to a railroad spike found;

THENCE South 89 degrees 50 minutes 35 seconds East for a distance of 75.00 feet to a PK nail set on the westerly right-of-way line of North Peachtree Road;

THENCE proceeding along said westerly right-of-way line of North Peachtree Road South 09 degrees 33 minutes 55 seconds West for a distance of 18.00 feet to a 1/2"iron pin set at the intersection of said westerly right-of-way line of North Peachtree Road and the line which divides Land Lots 334 and 343, said 1/2"iron pin set being the POINT OF BEGINNING.

Together with and subject to covenants, easements, and restrictions of record.

Said tract or parcel of land contains 0.656 acres or 28,554 square feet, and is intended to be a portion of the same tract of land that was previously conveyed in Deed Book 15562, Page 660, Dekalb County Georgia Records.

APPLICANT'S CERTIFICATION

In order to be considered a qualifying property for the VRP:

(1) The property must have a release of regulated substances into the environment;

(2) The property shall not be:

(A) Listed on the federal National Priorities List pursuant to the federal Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. Section 9601.

(B) Currently undergoing response activities required by an order of the regional administrator of the federal Environmental Protection Agency; or

(C) A facility required to have a permit under Code Section 12-8-66.

(3) Qualifying the property under this part would not violate the terms and conditions under which the division operates and administers remedial programs by delegation or similar authorization from the United States Environmental Protection Agency.

(4) Any lien filed under subsection (e) of Code Section 12-8-96 or subsection (b) of Code Section 12-13-12 against the property shall be satisfied or settled and released by the director pursuant to Code Section 12-8-94 or Code Section 12-13-6.

In order to be considered a participant under the VRP:

(1) The participant must be the property owner of the voluntary remediation property or have express permission to enter another's property to perform corrective action.

(2) The participant must not be in violation of any order, judgment, statute, rule, or regulation subject to the enforcement authority of the director.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.
I also certify that this property is eligible for the Voluntary Remediation Program (VRP) as defined in Code Section 12-8-105 and I am eligible as a participant as defined in Code Section 12-8-106.

VOLUNTARY REMEDIATION PLAN FORM 03/30/2010

Section 1
Introduction

Winter Environmental has prepared this Voluntary Remediation Plan Application (VRPA) for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust). The Site location is presented on Figure 1. The VRPA is intended for review by the Georgia Environmental Protection Division (EPD) under the Voluntary Remediation Program Act (Act). This VRPA was prepared in response to correspondence from the HSRA Program to the Trust dated February 23, 2010, which presented a proposed Consent Order under the Hazardous Sites Response (HSRA) Program and also requested a revised Corrective Action Plan (CAP) be submitted by July 1, 2010. This VRPA is submitted in place of a revised HSRA CAP and is intended, if approved by the EPD, to move the Site from the HSRA Program into the Voluntary Remediation Program (VRP).

The Trust property and other impacted properties statuses have been reviewed, and each meets the requirements of a "qualifying property" as defined by the Act. The Trust property is currently listed on the HSI for a release of chlorinated solvents in soil. None of the properties are listed on the federal National Priorities List; are not undergoing response activities required by the United States Environmental Protection Division (USEPA); are not a permitted facility under the Resource Conversation Recovery Act (RCRA); and do not have any liens filed against the property pursuant to OCGA 12-8-96(e) or 12-13-12(b). All of the properties are impacted by a release of regulated chemicals to the environment. The Trust property is identified as parcel 18-343-13-002. Other properties impacted by the release of regulated chemicals from the Trust property include parcels 18-343-13-005, 18-343-13-001, and 18-333-02-023, which have been identified through the horizontal delineation of the release. Figure 2 is a tax parcel map that shows the location of these properties. Access to these properties for delineation purposes has been obtained through access agreements executed between the Trust and the owners of each property. Warranty Deeds for these qualifying properties are in Appendix A.

The Trust property currently has a single, one-story building that contains a drycleaner on the west side with on site cleaning, and a restaurant on the east side. A drycleaner has been located in the building since the building was constructed in the 1960's. The east side of the building has contained various retail businesses. The remainder of the property is paved with asphalt.

Parcel 18-343-13-005, street address 4306 North Peachtree Road, Chamblee, Georgia is immediately to the west, and is owned by Mr. H.A. Rowan, Southern Automatic Company, 4420 Tree Haven Drive, NE, Atlanta, GA 30342-3426. The property has a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. The remainder of the property is paved with asphalt.

Parcel 18-343-13-001, street address 4308 North Peachtree Road, Chamblee, Georgia is immediately to the east, is owned by Mr. Marvin Hewatt, Georgia-Alabama Commercial Investments, LLC, 2875

University Parkway, Lawrenceville, Georgia 30043. The property has a single, one-story building that contains a gas station (UST Facility I.D. No. 900341*1; EZ-Serve Site). The remainder of the property is paved with asphalt and concrete. This property is currently undergoing remediation through the EPD Underground Storage Tank Management Program (UST Program). A dual-phase extraction system is operating to recover free-phase gasoline on the property. The dissolved phase gasoline constituents have migrated off the property the south and west. The current remediation system is not designed to address the groundwater plume. The plume has comingled with the dissolved-phase chlorinated solvent plume originating from the Trust property. The UST remediation is being conducted by the UST Program, by a UST Program contractor.

Parcel 18-333-02-023, has no street address and is immediately to the east. It is owned by Asl Limited Partnership, 1515 S. Federal Hwy., #300. Boca Raton, FL 33432-7451; and is wooded, undeveloped property. The south side of the parcel borders Nancy Creek.

As stated above, the Site has a release of chlorinated solvents that originated from historical drycleaner operations that utilized tetrachloroethene (PCE). The current drycleaner tenant recently discontinued the use of PCE in their operations and replaced the PCE machine with a non-chlorinated solvent based drycleaning machine. No PCE remains on the Site and the last suspected source of a continued release, a leaking sanitary sewer collection sump that was part of the original building construction in the rear of the building, has been resealed. The constituents of interest (COI) established during the HSRA investigation, and approved by the HSRA Program, are PCE and its regulated degradation constituents and are listed in Table 1.

Section 2
Previous Environmental Investigations

Prior to Winter Environmental's involvement, several phases of soil investigation had been conducted under the HSRA Program at the Site by Epic Consulting, Inc. of Atlanta, Georgia (Epic). The Epic soil investigations were conducted in August 2006 and April 2007. The focus of Epic's investigations was to define the extent of HSRA regulated chemicals in soil above non-residential risk reduction standards (RRS). Petroleum constituents associated with historical releases from the adjacent Former E-Z Serve Underground Storage Tank (UST) site were also identified in soil on the Site above applicable Georgia UST Program Threshold Levels.

On May 31, 2007, Epic submitted a Revised CAP to the HSRA Program, proposing *in situ* chemical oxidation of chlorinated solvent impacted soil at the Fashion Care Site. This revised CAP was approved by the HSRA Program in correspondence dated December 28, 2007 with a number of conditions. Primary among these was the recommendation by the HSRA Program that a remediation process be utilized that would address both impacted soil and groundwater at the Site, and a reminder that chlorinated solvent groundwater impacts had neither been delineated nor addressed in the May 31, 2007 Revised CAP.

The Trust placed Winter Environmental under contract to move forward with implementation of the CAP, with a focus on addressing both soil and groundwater impacts at the Site. Since 2008, Winter Environmental has defined the horizontal extent of the COI groundwater plume, conducted a chemical oxidation event to attempt to remediate soil impacts, and collected additional soil samples for delineation and to determine the effectiveness of the chemical oxidation event. Soil analytical data collected at the Site is presented in Table 2. All groundwater samples collected by Winter Environmental since 2008, and those collected by the UST Program for the adjacent UST site in 2008, are presented in Table 3. The most recent groundwater samples collected by Winter Environmental in 2010 are presented in Table 4. Surface water samples collected from Nancy Creek by Winter Environmental in 2008 and 2010 are presented in Table 5. Sediment samples collected from Nancy Creek by Winter Environmental in 2010 are presented in Table 6. Soil sample locations collected under the HSRA Program are shown on Figures 3 and 4. Groundwater sample locations for the Site are presented on Figure 5. Surface water and sediment sample locations are presented on Figure 5. A compact disk containing boring logs and monitoring well construction logs installed by Winter Environmental is in Appendix B. Previous data produced by Epic was presented to the HSRA Program in the May 31, 2007 Revised CAP. Sample collection logs and laboratory analytical data reports will be submitted with the VRP Compliance Status Report, unless requested by EPD at an earlier date.

Section 3
Previous Corrective Actions

Winter Environmental implemented, with some EPD approved modifications, the soil remediation approved in the HSRA May 31, 2007 Revised CAP prepared by Epic. A treatability study was conducted for designing the remediation of the soil above RRS using insitu chemical oxidation. A treatability study report was prepared by ExoTech, Inc. of Lilburn, Georgia. Prior to the remediation event an Underground Injection Permit was obtained from the EPD; UIC Permit #393. A total of 21 soil injection wells were installed in and around the impacted soil area that was to be treated using sodium persulfate. The location of the injection wells relative to the impacted soil area is shown on Figure 3. The injection event was conducted on March 18 and March 19, 2009, injecting 4,480 lbs of sodium persulfate activated with 66 lbs of chelated iron, using 2,200 gallons of mixture. An Injection Summary report prepared was prepared by ExoTech, Inc. following the remediation event.

On May 8, 2009 and May 18, 2009, soil remediation confirmation samples were collected following the soil chemical injection event. Soil samples were collected from nine sample locations, SB-28 through SB-36, as requested by the EPD. The confirmation sample locations are shown on Figure 4. Samples were collected from three intervals from each boring; 0 to 2 feet bgs, approximately midway to the water table, and from the approximate two foot interval immediately above the water table. The confirmation soil sample laboratory results are presented in Table 7. The post-chemical oxidation sample results showed concentrations with little or no reduction, and some cases significantly higher concentrations of constituents than the pre-remediation design concentrations. Previously, the highest concentration of PCE in soil, 18.0 mg/kg, was in SB-27 at 0 to 2 feet bgs, immediately beneath the historical source, the old PCE drycleaner machine. PCE concentrations in the post-remediation samples were higher on average at all locations than seen in the 2006 and 2007 Epic data, with concentrations up to 3,800 mg/kg at SB-32, 6 to 8 feet bgs. Tetrachloroethene (TCE) and cis-1,2-dichloroethene were also found above non-residential RRS at higher concentrations than had been seen in previous soil samples collected at the Site. Non-residential RRS exceedances of one or more of these constituents were found in all but one of the confirmation sample locations, SB-29. These higher concentrations appeared to be the result of the continued release of hazardous substances by the current drycleaning operations. Further releases were mitigated by the removal of the PCE drycleaning equipment from the Site and sealing of the sanitary system sump in the rear of the building. No additional soil remediation has been conducted at the Site. A summary of the soil remediation event was submitted to the EPD HSRA Program in correspondence dated September 10, 2009.

No active groundwater remediation has been conducted at the Site.

Section 4
Site Topography/Geology/Hydrogeology

Topography across the Site based upon visual relief and survey elevations of soil borings and monitoring wells, slopes gently to the south-southwest from Savoy Drive to Nancy Creek. The banks of Nancy Creek adjacent to the Site are near vertical, dropping approximately 10 to 12 feet to the normal water level. On the south side of Nancy Creek, across from the Site, the topography begins to immediately rise approximately 260 feet to a knoll.

Surficial geology across the Site consists primarily of reddish-brown silt with varying minor amounts of sand and clay, overlying a grey to tan and grey silty sand to sandy silt with pebbles; which overlies a hard, dry silt of varying color across the Site. All of the soil encountered is residual soil becoming more saprolitic with relict rock structure with depth. The water table in May 2010 was present at approximately 12 feet below grade to approximately 9 feet below grade near Nancy Creek. The saturated soil zone appears to be divided into an upper and lower water bearing zone, separated by the hard, dry silt indicated above. The thickness of the potential upper water bearing zone appears to be greater near Savoy Drive and thins as Nancy Creek is approached. This is based upon the evidence that the upper water bearing zone is thinner adjacent to Nancy Creek where saturated conditions are encountered in borings as shallow as 5 feet below grade and the hard dry silt is encountered at 8 to 16 feet below grade. The hard dry silt appears to generally correspond to the streambed of Nancy Creek adjacent to the Site. It is theorized that the hard dry silt has not been encountered in the borings near Savoy Drive because all the boring have penetrated the water table generally no more than 7 to 8 feet to set shallow wells and the upper water bearing zone in this area is thicker. Installation of a deeper Type III monitoring well near the Fashion Care building as part of the VRP will attempt to verify this division in the water table aquifer on Site. This could be significant in the evaluation of vertical extent of groundwater impacts. It is possible that the deep well, MW-23D, installed by the UST Program contractor, may have penetrated the dry silt separating the shallow water bearing zones and provided a conduit for vertical migration of COI. MW-23D is the only deep well on Site and has screen set at the top of bedrock at 55 feet below grade. Boring and monitoring well construction logs installed by Winter Environmental, and installed by the UST Program contractor for the EZ-Serve gas station site are included in Appendix B.

Potentiometric surface maps were constructed using the monitoring wells on Site, was constructed for the water table aquifer based upon measurements collected on March 28, 2010 and May 28, 2010. The potentiometric surface maps are presented on Figures 6 and 7. Based upon these measurements, groundwater flow is generally to the south-southwest toward Nancy Creek across the Site. Water table measurements collected by Winter Environmental in 2008 and 2010 are presented in Table 7.

Slug tests were conducted in monitoring wells FMW-4 and FMW-5 to determine hydraulic conductivity in the water table shallow water bearing zones. The hydraulic conductivity ranged from 0.00011 feet per second (FMW-4, slug-out) to 0.00025 feet per second (FMW-5, slug-out). The hydraulic gradient

across the site is approximately 0.0122 ft/ft based upon May 28, 2010 water table measurements between SB-24 and FMW-6. Slug test data is presented in Appendix B.

Section 5
Extent of Soil, Groundwater, Surface Water, and Sediment Impacts

The data collected during the Epic investigations and the Winter Environmental investigation were used to determine the extent of COI in the various media at the Site. All Winter Environmental sample locations and existing structures on Site were surveyed by a Georgia registered land surveyor. The Epic sample locations were determined from figures in the May 31, 2007 Revised CAP prepared by Epic.

5.1 Extent of COI in Soil

The estimated extent of soil impacts relative to HSRA Type 1 RRS is presented on Figure 4. This figure is based upon the soil samples collected from the treated area following the soil remediation event conducted in 2008, and from soil samples collected by Epic outside the soil remediation event area. Soil impacts above the VRP delineation criteria used for this Site (HSRA Type 1 RRS) is limited to the Trust property. Specifically, soil impacts are present beneath the south-southwestern corner of the building and extend horizontally to a limited area just outside the building. Impacts extend vertically from immediately beneath the building's concrete slab and asphalt outside, to the water table approximately 12 feet below ground surface (bgs). Soil analytical data is presented in Table 2.

5.2 Extent of COI in Groundwater

The estimated extent of COI in groundwater relative to HSRA Type 1 RRS based upon May and June 2010 data is presented on Figure 7. This is based upon groundwater samples collected in March and June of 2010. The analytical data used to prepare Figure 7 are presented in Table 4. UST release constituents in groundwater across the Site are also presented in Tables 3 and 4. Groundwater COI have migrated to the south-southwest from the release area and the plume has intersected Nancy Creek. The properties affected by COI at concentrations above the VRP delineation criteria used for this Site (HSRA Type 1 RRS), in addition to the Trust property, are parcels 18-343-13-005, 18-343-13-001, and 18-333-02-023. The COI groundwater plume has been extended to the northwest by the operation of the DPE remediation system operating on the UST site based upon a comparison of 2008 groundwater data collected prior to the DPE operating, and 2010 groundwater data collected since the DPE system has been in operation.

5.3 Extent of COI in Surface Water

Surface water samples have been collected by Winter Environmental in 2008 and 2010. Surface water samples were collected at three locations shown on Figure 5 during each sampling event; SW-1 upstream of the intersecting groundwater plume, SW-2 and SW-3 within the area where the groundwater plume intersects the creek. Based upon the samples collected by Winter Environmental in 2008 and 2010, surface water is not being impacted above standard laboratory method practical quantitation limits (PQLs) as a result of the COI groundwater plume discharging to Nancy Creek. Table 5 presents the surface water analytical data collected by Winter Environmental. Surface water data

collected from the Site by Epic, and presented in the May 31, 2007 Revised CAP, also did not detect COI above PQLs.

5.4 Extent of COI in Sediment

Sediment samples were collected at three locations shown on Figure 5 in May 2010; SD-3 upstream of the intersecting groundwater plume, SD-2 within the area where the groundwater plume intersects the creek, and SD-1 down stream of the area where the groundwater plume intersects the creek. Based upon the sediment samples collected by Winter Environmental in 2010, sediments are not being impacted above standard laboratory method PQLs for COI as a result of the groundwater plume discharging to Nancy Creek. Table 6 presents the sediment analytical data.

Section 6
Exposure Pathways and Potential Receptors

An evaluation of potential exposure pathways and receptors was conducted for the Site based upon the data collected to date. A conceptual site model of the exposure pathways for the Site, discussed below, is shown as Figure 8. The exposure pathways evaluated include:

- Potential exposure to vapor-phase COI from impacted soil and groundwater;
- Potential exposure to COI in soil;
- Potential exposure to COI in groundwater;
- Potential exposure to COI in surface water; and
- Potential exposure to COI in sediment.

It was concluded that the following exposure pathways are currently incomplete:

- Exposure to COI in soil due to the impacted soil area being covered by asphalt and concrete;
- Exposure to COI in groundwater because there are no groundwater users in the area overlying the groundwater plume;
- Exposure to COI in surface water because several rounds of surface water samples have not detected COI; and
- Exposure to COI in sediment because sediments samples collected at the Site did not detect COI.

It has been assumed that the exposure pathway for vapor-phase COI into the building on the Trust property is complete based upon the high concentrations of COI in soil and groundwater beneath the building; therefore, no vapor modeling was conducted. Vapor sampling was not conducted within the building because chlorinated solvents had been used in the drycleaner area since the 1960's until 2009, and representative samples of vapor-phase COI emanating from soil and groundwater would be difficult to collect. Based upon the assumption that the vapor-phase pathway is complete, and human exposure is possible, engineering controls will be implemented under the VRP to mitigate this exposure pathway. These engineering controls are discussed in Section 7.1.

It has been conservatively determined that the following exposure pathways have the potential to become complete in specific circumstances in the future on one or more of the impacted properties:

- Exposure to COI in soil during subsurface worker activities and future construction activities within the boundaries where COI are greater than Type 1 RRS on the Trust property;
- Exposure to COI in groundwater, if groundwater is used for irrigation, potable use, or during construction dewatering within the boundaries of the plume where COI are greater than Type 1 RRS on any of the impacted properties;

- Exposure to vapor-phase COI from impacted groundwater where enclosed structures are built in the future within the boundaries of the plume where COI are greater than Type 1 RRS; and
- Exposure to COI in surface water and sediment where the groundwater plume intersects Nancy Creek.

The possibility of potential exposure to COI in soil during subsurface worker activities and future construction activities on the Trust property, and the possibility of potential exposure to COI in groundwater on all impacted properties will be addressed through the use of institutional controls and is discussed in Section 7.2.

The possibility of potential exposure to vapor-phase COI from impacted groundwater where enclosed structures are built in the future within the boundaries of the plume will be addressed through the use of institutional and engineering controls and is discussed in Section 7.2.

The possibility of potential exposure to COI in surface water and sediment where the groundwater plume intersects Nancy Creek has been examined through the use of a site-specific mixing zone analysis. To date, surface water and sediment data collected from Nancy Creek has shown that COI are not detected above laboratory method PQLs, ISWQS, Type 1 RRS for groundwater, or HSRA RRS for soil, as applicable. However, it is known that the COI groundwater plume is discharging to the creek along a broad front on parcel 18-333-02-023. Therefore, a mixing zone analysis was conducted to evaluate the potential that sediment and/or surface water could be impacted in the future above ISWQS, Type 1 RRS for groundwater, or HSRA RRS for soil, as applicable; completing an exposure pathway for human exposure and flora and fauna exposure. The details of the mixing zone analysis are presented in Appendix C. The analysis concluded that the groundwater plume, based upon the calculations and the fact that no additional PCE is entering the subsurface from drycleaner operations, will not impact Nancy Creek above regulatory standards resulting in a completed exposure pathway. To confirm the results of the mixing zone analysis, the creek will be established as the downgradient point of exposure for the groundwater plume, and a monitoring plan will be developed as part of the VRP corrective action. The monitoring plan for the groundwater plume point of exposure is discussed in Section 7.3.

A water supply survey was also conducted to determine if there was the potential for exposure to groundwater impacts from the Site. A detailed windshield survey was conducted by Winter Environmental within a 1-mile radius of the Site. No residences or businesses were identified using groundwater wells for potable, industrial or irrigation use. All appeared to be connected to the local water system through a water meter. In addition, the USGS groundwater well database was searched within a 1-mile radius of the Site and no wells were identified.

Also, a May 19, 2004 EPD internal memorandum regarding a Field inspection of the Site was reviewed. The EPD Field Inspection conducted a well survey within a 3-mile radius of the Site and did not identify any groundwater use. It also stated that the EPD inquired with a DeKalb County building inspector, who stated that all residences in the area were on the DeKalb County water system. To update this

information, Winter Environmental contacted DeKalb County who confirmed that all residences and businesses in the area remain on the DeKalb County water system. In addition, there are no public surface water intakes within 3 miles downgradient of the Site. Therefore, there are no complete or potential exposure pathways through groundwater or surface water use. The May 19, 2004 EPD internal memorandum and the USGS Well Inventory results are in Appendix D.

Information on rare or endangered species for the Site area was obtained from the Georgia Department of Natural Resources Wildlife Resources Division website, Georgia Rare Species and Natural Community Information (http://www.georgiawildlife.com/node/1370). Information was obtained by literature search only from this website. The Site is located in the southeast quadrant of the Chamblee USGS Quadrangle. One plant species was indentified in this quarter quadrangle which is listed as a threatened species in the State of Georgia; the Bay Star-vine (Schisandra glabra). The habitat for this species is as follows: found twining over understory trees and shrubs in rich, forested bottomlands and adjacent lower slopes; sometimes older vines occur on trunks of overstory trees, or sprawl along the ground forming patches rooted in the litter, especially near mountain laurel (Kalmia latifolia) thickets. It is possible that this species could inhabit the wooded, undeveloped environment found on parcel 18-333-02-023 bordering Nancy Creek, however, an on site reconnaissance was not conducted. If present, the groundwater impacts on this parcel, and the corrective measures implemented under the VRP for the Site are not anticipated to impact the species. Information obtained from the Georgia Department of Natural Resources Wildlife Resources Division website is in Appendix E.

Section 7
Proposed Corrective Action

Soil and groundwater are impacted with chlorinated solvents and their degradation products at the Fashion Care/Executive Care Site. As a result, there is one assumed complete exposure pathway, vapor intrusion into an existing structure, and several exposure pathways that are incomplete but have the potential become complete in the future. The purpose of the VRP corrective action measures presented below for the Site are to mitigate the exposure pathways which are assumed to be complete; and to put institutional and engineering control requirements in place to mitigate the potential for currently incomplete exposure pathways from becoming complete in the future.

Also, a point of exposure monitoring plan of limited duration is proposed to verify existing data and mixing calculations which indicate that impacted groundwater discharging into Nancy Creek will not become present at levels of concern, resulting in a completed exposure pathway for human health or flora/fauna.

7.1 Engineering Controls

Engineering controls will be implemented as follows:

- A vapor collection system will be installed beneath the existing building on the Trust property (parcel 18-343-13-002) to mitigate the vapor intrusion pathway that has been assumed to be complete as a result of the presence of impacted soil and groundwater. The final design and installation schedule of the vapor collection system will be submitted in the first 6 month VRP Status Report for the Site.

7.2 Institutional Controls

Institutional controls will be implemented through the use of Environmental Covenants executed in conformance with the Georgia Uniform Environmental Covenants Act (OCGA § 44-16-1) as follows:

- To mitigate the potential vapor intrusion exposure pathway each of the impacted parcels (18-343-13-002, 18-343-13-005, 18-343-13-001, and 18-333-02-023) will require that any enclosed structures built on the properties will install a vapor barrier during construction. This will be required until the groundwater plume COI reach HSRA residential RRS.
- To mitigate the potential groundwater exposure pathway each of the impacted parcels (18-343-13-002, 18-343-13-005, 18-343-13-001, and 18-333-02-023) will require a restriction on groundwater use of any kind, unless COI are treated to below HSRA residential RRS.
- To mitigate the potential subsurface worker exposure pathway on the Trust property, the Environmental Covenant for this parcel (18-343-13-002) will require that the EPD be notified prior to any subsurface work to assure that the following occurs:

- Appropriate health and safety precautions are taken by workers if work is to be conducted in the area of impacted soil, or if work will be conducted at depths where impacted groundwater may be encountered; and
- Appropriate impacted soil management is conducted to assure that impacted soil is excavated by OSHA HAZWOPER (1910.120) trained personnel, appropriately characterized for disposal at an approved disposal facility, impacted soil is not spread to unimpacted areas, and appropriate actions are taken to prevent public exposure to impacted soil.
- Appropriate impacted groundwater management is conducted to assure that impacted groundwater is managed by trained personnel, appropriately treated where necessary for disposal/discharge with appropriate permits in place, and appropriate actions are taken to prevent public exposure to impacted groundwater.

- To mitigate the subsurface worker exposure pathway relative to impacted groundwater on parcels other than the Trust Property, each of the impacted parcels (18-343-13-005, 18-343-13-001, and 18-333-02-023) Environmental Covenants will require that the EPD be notified prior to any subsurface work to assure that the following occurs:
  - Appropriate health and safety precautions are taken by workers if work is to be conducted at depths where impacted groundwater may be encountered; and
  - Appropriate impacted groundwater management is conducted to assure that impacted groundwater is managed by trained personnel, appropriately treated where necessary for disposal/discharge with appropriate permits in place, and appropriate actions are taken to prevent public exposure to impacted groundwater.

7.3 Point of Compliance Monitoring and Natural Attenuation

A point of exposure monitoring plan of 5 years is proposed to verify existing data collected to date at the point of exposure, and to field verify mixing calculations that indicate impacted groundwater currently discharging into Nancy Creek will not become present at levels of concern, resulting in a completed exposure pathway for human health or flora/fauna.

The proposed point of exposure for monitoring of the Site under the VRP is Nancy Creek where the groundwater plume intersects the creek as shown on Figure 7. Surface water samples will be collected for laboratory analysis of the COI semi-annually at one upstream location, two locations along the intersection of the groundwater plume and the creek, and at one location downstream of this intersection. Access agreements will be maintained for the properties required for the point of exposure monitoring plan.

Groundwater samples will also be collected for laboratory analysis of the COI during the semi-annual events from select monitoring wells along the creek and in and around the currently established boundaries of the groundwater plume. This data will be used to determine the natural attenuation of the plume and to be used for exposure evaluation, as necessary, during the 5 year monitoring period.

A point of exposure monitoring plan that establishes the surface water sampling locations, monitoring wells to be sampled, and reporting format will be presented in the first 6 month VRP Status Update for the Site.

Section 8
Items for Completing VRP Compliance Status Report

Below is a list of tasks or actions that remain to be completed or implemented under the VRP for this Site for the completion of a VRP Compliance Status Report. Each of these items will be completed or implemented per the schedule presented in Section 9.

Vertical Delineation

The COI plume in groundwater has been horizontally delineated. A deep Type III double-cased monitoring well will be installed in the vicinity of FMW-4, shown on Figure 5, to delineate the vertical extent of COI in groundwater at the Site. This will be conducted within six months and the results included in the first 6 month VRP Status Update for the Site.

Execution of Environmental Covenants (Institutional Controls)

Draft Environmental Covenants for tax parcels 18-343-13-002, 18-343-13-005, 18-343-13-001, and 18-333-02-023 are present in Appendix F for EPD review and approval. Within 6 months of EPD approval of these covenants, they will be executed and included in the next 6 month VRP Status Update for the Site.

Vapor Intrusion Mitigation (Engineering Control)

A vapor collection system will be installed beneath the existing building on the Trust property (parcel 18-343-13-002) to mitigate the vapor intrusion pathway that has been assumed to be complete as a result of the presence of impacted soil and groundwater. The final design and installation schedule of the vapor collection system will be submitted in the first 6 month VRP Status Report for the Site.

Point of Compliance Monitoring Plan

A point of exposure monitoring plan and implementation schedule that establishes the surface water sampling locations, monitoring wells to be sampled, and reporting format as described in Section 7.3 will be presented in the first 6 month VRP Status Update for the Site.

Voluntary Remediation Plan Cost Estimate

A Voluntary Remediation Plan Cost Estimate and date for submitting a financial assurance instrument in the amount of the estimate will be submitted in the first 6 month VRP Status Update for the Site.

Upon completion and implementation of the above tasks/items, as appropriate, a VRP Compliance Status Report will be submitted to the EPD for approval, which is anticipated to result in the removal of the Site from the HSI. The estimated date for submittal of the VRP Compliance Status Report is presented in Section 9.

Section 9
Implementation Schedule

The schedule for implementation of the Fashion Care/Executive Care Site VRPA is presented on Figure 9. The current estimated duration for the implementation of the VRPA through submittal of a VRP Compliance Status Report is 18 months. VRP Status Update reports will be submitted to the EPD every 6 months during this implementation period until the VRP Compliance Status Report is submitted.

CORRECTIVE WARRANTY DEED

STATE OF GEORGIA

COUNTY OF ~~Ber~~ Walton

THIS INDENTURE, made the 7 day of November, in the year of two thousand three, between

BUSINESS ASSOCIATES, INC., a Georgia corporation

as party of the first part, hereinafter called Grantor, and

JOHN F. ROWAN

as party of the second part, hereinafter called Grantee (the words "Grantor" and "Grantee" to include their respective heirs, successors and assigns where the context requires or permits).

WITNESSETH that: Grantor, for and in consideration of the sum of TEN AND NO/100 DOLLARS ($10.00), in hand paid at and before the sealing and delivery of these presents, the receipt whereof is hereby acknowledged, has granted, bargained, sold, aliened, conveyed and confirmed, and by these presents does grant, bargain, sell, alien, convey and confirm unto the said Grantee,

> ALL THAT TRACT or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia, and being more particularly described on Exhibit "A", attached hereto and incorporated herein by reference.

THIS PROPERTY is conveyed subject to General Utility Easements of record, zoning ordinances of DeKalb County, Georgia, and all 2003 taxes.

THIS CORRECTIVE Warranty Deed is given for the purpose of correcting a scrivener's error contained in that certain Warranty Deed recorded in Deed Book 14413, Page 733, DeKalb County, Georgia Records. The Grantee's name set forth in said Warranty Deed should have been John F. Rowan, and not John F. Rowman.

TO HAVE AND TO HOLD the said tract or parcel of land, with all and singular the rights, members and appurtenances thereof, to the same being, belonging, or in anywise appertaining, to the only proper use, benefit and behoof of the said Grantee forever in FEE SIMPLE.

AND THE SAID Grantor will warrant and forever defend the right and title to the above-described property unto the said Grantee against the claims of all persons whomsoever.

IN WITNESS WHEREOF, the Grantor has signed and sealed this deed, the day and year above written.

Signed, sealed and delivered

WARRANTY DEED

STATE OF GEORGIA

COUNTY OF BARROW

This Indenture made this **1st** day of **April,** in the year **Two Thousand Three**, between **Business Associates, Inc.**, of the County of DeKalb, State of Georgia, as party or parties of the first part, hereinunder called Grantor, and **John F. Rowman**, as party or parties of the second part, hereinafter called Grantee (the words "Grantor" and "Grantee" to include their respective heirs, successors and assigns where the context requires or permits).

W I T N E S S E T H that: Grantor, for and in consideration of the sum of **TEN AND 00/100'S ($10.00) Dollars** and other good and valuable consideration in hand paid at and before the sealing and delivery of these presents, the receipt whereof is hereby acknowledged, has granted, bargained, sold, aliened, conveyed and confirmed, and by these presents does grant, bargain, sell, alien, convey and confirm unto the said Grantee,

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin, thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court

This property is conveyed subject to General Utility Easements of record, zoning ordinances of DeKalb County, Georgia and all 2003 taxes.

TO HAVE AND TO HOLD the said tract or parcel of land, with all and singular the rights, members and appurtenances thereof, to the same being, belonging, or in anywise appertaining, to the only proper use, benefit and behoof of the said Grantee forever in **FEE SIMPLE.**

AND THE SAID Grantor will warrant and forever defend the right and title to the above described property unto the said Grantee against the claims of all persons whomsoever.

IN WITNESS WHEREOF, Grantor has hereunto set its corporate hand and affixed its corporate seal this day and year first above written.

Signed, sealed and delivered in the presence of:

LIMITED WARRANTY DEED

STATE OF GEORGIA
COUNTY OF GWINNETT

THIS INDENTURE, Made the 9th day of May, 2007, between

METRO ATLANTA COMMERCIAL PROPERTIES, LLC,
a Georgia limited liability company

as party or parties of the first part, hereinafter called Grantor, and

GEORGIA-ALABAMA COMMERCIAL INVESTMENTS, LLC,
a Delaware limited liability company

as parties of the second part, hereinafter called Grantee (the words "Grantor" and "Grantee" to include their respective heirs, successors and assigns where the context requires or permits).

WITNESSETH that: Grantor, for and in consideration of the sum of TEN DOLLARS AND OTHER GOOD AND VALUABLE CONSIDERATIONS ($10.00) in hand paid at and before the sealing and delivery of these presents, the receipt whereof is hereby acknowledged, has granted, bargained, sold, aliened, conveyed and confirmed, and by these presents does grant, bargain, sell, alien, convey and confirm unto the said Grantee,

All that tract or parcel of land lying and being in Land Lot 178 of the 15th District and Land Lot 343 of the 18th District, DeKalb County, Georgia, as more particularly described in Exhibit "A" attached hereto and incorporated herein by reference.

The property described herein is being conveyed subject to the items listed in Exhibit "B" attached hereto and incorporated by reference.

This conveyance is made subject to that certain Deed to Secure Debt from Metro Atlanta Commercial Properties, LLC to Fidelity National Bank dated April 28, 2003, in the original principal amount of $5,360,000.00, filed for record April 30, 2003 and recorded in Deed Book 14402, Page 215, DeKalb County, Georgia records, with a current principal amount of $5,121,339.00.

TO HAVE AND TO HOLD the said tract or parcel of land, with all and singular the rights, members and appurtenances thereof, to the same being, belonging, or in anywise appertaining, to the only proper use, benefit and behoof of the said Grantee forever in FEE SIMPLE.

AND THE SAID Grantor will warrant and forever defend the right and title to the above described property unto the said Grantee against the claims of Grantor and all others claiming by, through or under Grantor.

IN WITNESS WHEREOF, the Grantor has signed and sealed this deed, the day and year above written.

Signed, sealed and delivered

Boring Log Information

Log ID: MW-11

Screened Casing Length: 5 feet

Total Drilling Depth: 33 feet

Date: June 26, 1997

Logged by: D. Shunnarah

Drilled by: Kilman Bros.

Note: Auger refusal at 33 feet.

Appendix C
Groundwater-Surface Water Mixing Zone Analysis

NANCY CREEK MIXING ZONE ANALYSIS
2211 SAVOY DRIVE, CHAMBLEE, DEKALB COUNTY, GEORGIA
HSI 10786

OVERVIEW

This mixing zone analysis has been prepared to model the groundwater discharge and resulting mixing with Nancy Creek. Nancy Creek is a significant perennial surface water flow occurring at the down-gradient boundary of the subject site. The groundwater at the site contains volatile organic compounds (VOCs) that are transported with groundwater, and subsequently into Nancy Creek. Previous stream sampling has been unable to detect target VOCs, therefore this analysis is intended to determine the theoretical VOC concentration(s) immediately in the reach forming the plume/creek interface.

METHODOLOGY

Groundwater constituents are mixed and diluted according to the ratio of flows

$$(G)/(G+S) \times C_{VOC} \qquad \textbf{EQUATION 1}$$

where
G represents groundwater discharge volume,
S represents surface flow volume, and
$\mathbf{C_{VOC}}$ is the groundwater discharge concentration of a specific VOC constituent.

Creek flow at this location is observed to highly turbulent and full water column mixing is assumed. Therefore, modeling the mixing of groundwater and surface flow to determine theoretical surface water VOC concentrations was performed using Equation 1, using flows and concentrations as determined in the attached Calculation 1. The parameters used in Equation 1 are discussed in the following:

AREAL AVERAGE C_{VOC}

A conservative areal average of the key VOC groundwater concentrations (Tetrachloroethene, Trichloroethene, Cis-1,2 Dichlorethene, and Vinyl Chloride) was obtained using the nine nearest impacted monitoring wells adjacent to Nancy Creek. Only wells with VOC detections were used to avoid skewing the result. This approach "reached back" into more concentrated areas of the plume to ensure a conservative areal average estimate of discharge into the creek. See attached Calculation 1 for the specific monitoring wells, VOC concentrations, and date of VOC measurement, and the resulting average VOC concentration.

STREAM FLOW VOLUME

Stream flow volume was directly measured on three different days, spread over a one week period, using a Global Water FP111 FLOWPROBE capable of measuring flow from 0.3 to 20 feet per second. To obtain one flow measurement, three flow depth/velocity profile measurements were made along the creek bed, spanning bank to bank. Flow was measured on June 8, June 10, and June 12, 2010. All reasonable effort was made to accurately profile flow, including selecting well-channelized locations with steep banks. No measurable precipitation had been reported in the Nancy Creek watershed for five days prior to the first two measurements. Light rain was reported prior to the June 12 measurement; however flow measurement did not detect a significant flow increase for this measurement.

Flow was measured at both the Savoy Drive location, and also at a location approximately eight miles downstream as a quality check. The downstream location is monitored continuously for flow and other parameters by the US Geologic Survey (USGS) at Station 02336360, near the bridge at Rickenbacker Drive. These downstream data were obtained to allow calibration and comparison of the Savoy Drive flow to continuous USGS measurements at Rickenbacker Drive. The USGS data are available to the public through internet access[1]. It was noted that USGS readings at Rickenbacker Drive do not match the actual (and accurate) field flow measurements conducted for this analysis, and it is assumed that floods in late 2009 damaged the USGS station and it has yet to be repaired. However, USGS data prior to the 2009 flooding is assumed to be reasonably reliable, over the range of flow for which the station was designed. For reference, see the attached USGS Station 02336360 Daily Stream Flow graph spanning continuous flow recordings from 2003 to 2010. Note that these data encompass the 100 year drought conditions. By inspection, and based on best professional judgment, the Nancy Creek 7Q10 at Rickenbacker Drive is the range of 10 to 30 cubic feet per second. Typically, USGS stations are not designed to obtain low flow conditions outside the presumed flow range, and flow below approximately 10 CFS are highly suspect.

The USGS data are helpful to demonstrate that Nancy Creek is subject to very high peak flows typical of urban watersheds, with low dry condition flows, ranging from 10 to 1000 CFS. The large range indicates variable aquifer discharge along the entire length from Savoy Drive to Rickenbacker Drive. Obviously, creek flow slows when the groundwater discharge slows. In the absence of surface runoff from precipitation, the rate of stream flow and aquifer discharge is expected to be nearly a constant ratio closely equal to the ratio shown in Equation 1, with surface runoff causing much higher mixing and dilution during and after precipitation events.

[1] http://wdr.water.usgs.gov/nwisgmap/

GROUNDWATER DISCHARGE VOLUME

Flow volume of groundwater was estimated from the measured site gradient, measured hydraulic conductivity, and groundwater flow area in the Darcy flow equation

Q=kIA **EQUATION 2**

where
Q = Flow Volume (Ft^3)
k = Hydraulic Permeability (Ft/Day)
I = Flow Gradient (dimensionless)
A = Area of Flow Across Gradient at Creek Interface (Ft^2)
See Calculation 1 for specific values and assumptions used in Equation 2.

Hydraulic conductivity was previously obtained by both falling head and rising head analysis using the Bouwer & Rice method (attached for reference, previously submitted).

Note that the area of flow used in the calculation is conservative in that the actual gradient is not perpendicular to the creek interface, therefore the flow area is significantly overestimated.

RESULTS

The mixing and dilution of VOCs is controlled by the ratio of surface water flow volume to the volume of groundwater containing VOCs. This ratio is expected to be relatively constant in accordance with the convention of groundwater and creek relationships, where less groundwater discharge results in less creek flow. The mixing and dilution ratio calculated for the 2211 Savoy Drive location is 0.0021 (or 1:470). Using this calculated ratio, the VOC dilutions based on calculated areal average are shown in the following (from Calculation 1) at both the Savoy Drive and Rickenbacker Drive locations:

Groundwater VOC	Georgia In-Stream Standard (ug/L)	GW Areal Average Concentration (ug/L)	Savoy Drive Surface Water Conc. (ug/L)	Rickenbacker Drive Surface Water Conc. (ug/L)
PCE	3.3	504	1.07	0.100
TCE	30	53	0.11	0.011
VC	2.4	95	0.20	0.019
Cis-12 DCE	[None]	360	0.77	0.072

Note that flow increases by a factor of 10 between the two locations. This mixing and dilution analysis excludes the beneficial additional dilution that will start occurring immediately outside and downstream from the mixing zone. Based on this analysis, it is unlikely that VOCs from the Savoy groundwater plume are present above detectable levels at any time or any stage of flow in the creek.

MEMORANDUM

TO: David Brownlee

THRU: Dave Yardumian

FROM: Bob Pierce

RE: Fashion Care/Executive Care Property Field Inspection Report.

Date of Inspection: May 19, 2004

Accompanied by: Martha Pierce

Arrived at the Fashion Care property at 9:30 AM. The property is located at 2211 Savoy Drive, Chamblee, Dekalb County, Georgia. The name on the facility is now Clothing Care Cleaners. The following bound the site:

North:	Savoy Drive
South:	Nancy Creek
East:	North Peachtree Road
West:	China Express and Mad Italian Restaurants plus various businesses.

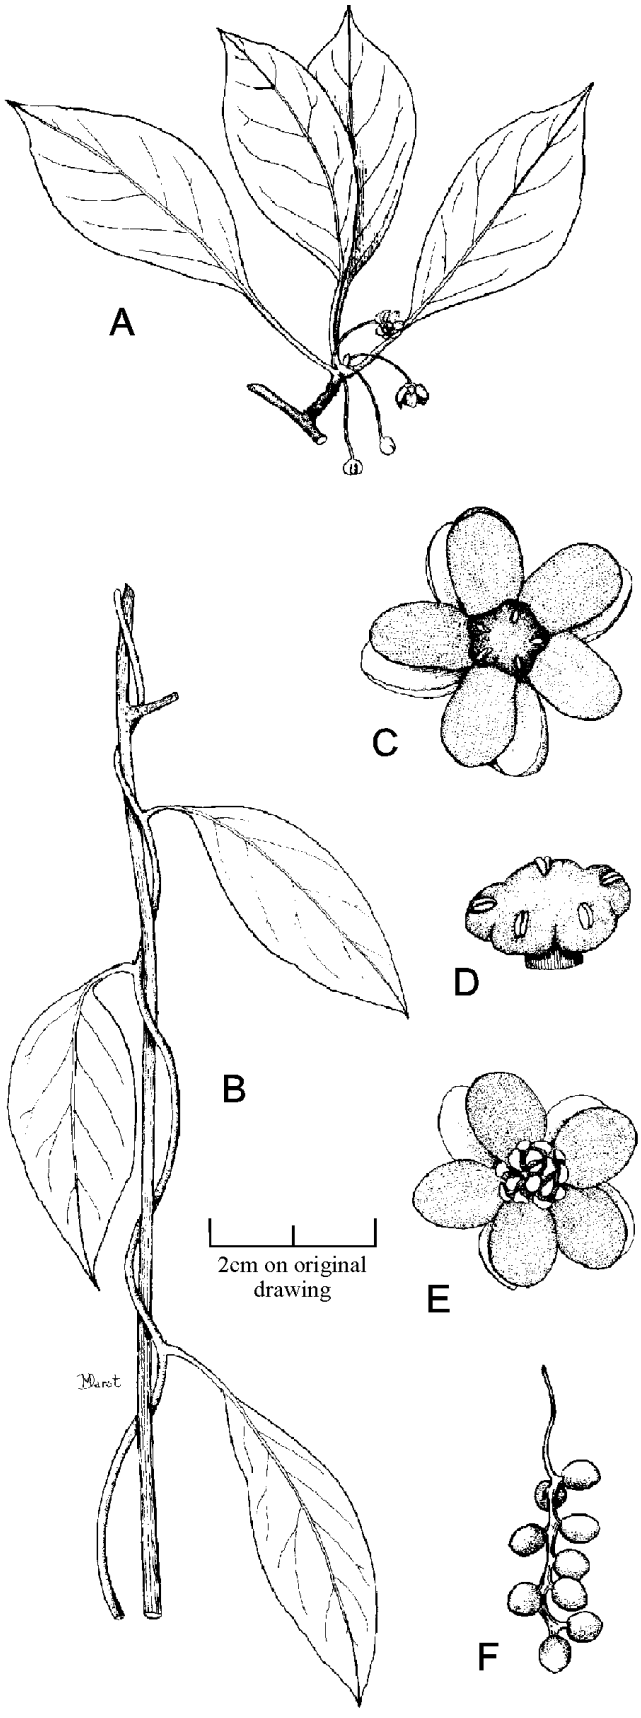
Site Characteristics

The site had no fencing around it. The company building was surrounded by an asphalt-paved parking lot. The asphalt was observed to be in good condition with only some minor cracks. The monitoring wells in Figure 2 (Site Plan) were observed to be at the locations marked in the Figure. All wells were flush mount. The Shell Gas Station on the figure is now a Mobile Station and the Texaco Gas Station is now a Shell Station.

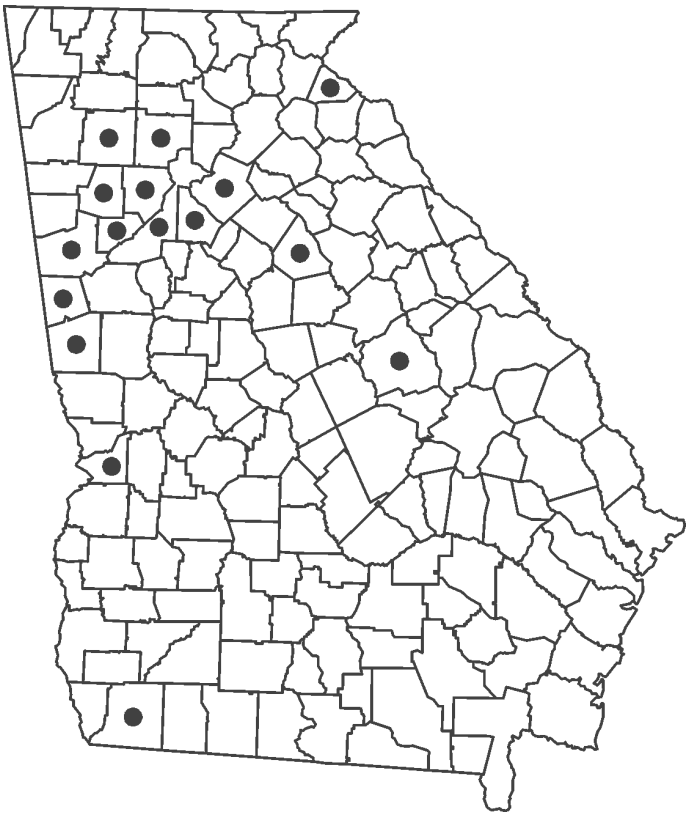
Residential Property

The property is surrounded predominately by businesses and no residential property was observed within 300 feet of the site.

Nearest Well



A well survey revealed no well within 3 miles of the site. This area of north Dekalb County and adjacent Fulton County is highly developed with new strip malls, full size shopping malls (e.g., Perimeter Mall), high density and high-end homes, medical facilities (e.g., St Joseph's Medical Center), churches, schools and other new development. We conducted a house-to-house well survey in the vicinity of the reported J.S. Wooten domestic well location near the intersection of Tilly Mill and Womack Roads but could find no trace of it. Most of this area is occupied by Georgia Perimeter College (Dunwoody Campus), a private school (The Weber School) and new construction. We spoke with a Dekalb County building inspector working in the area and she knew of no wells in the area. We all concluded that if there had been a well in the area it had been removed by development. The inspector stated that all residences in the area were on Dekalb County water.



Appendix E
Threatened Species Information

Schisandra glabra (Brickell) Rehder

Bay Star-vine, Climbing Magnolia, Wild Sarsaparilla

Star-vine Family, SCHISANDRACEAE

LEGAL STATUS:
State: THREATENED
Federal: None

SYNONYMY:
Schisandra coccinea Michaux

RANGE: Scattered in the Southeast: on the Coastal Plain from the Mississippi Embayment in Arkansas and Tennessee, south to Louisiana and east to northeastern North Carolina; on the Piedmont Plateau of Georgia; and disjunct on the Cumberland Plateau of southcentral Kentucky. Recorded from 16 counties in Georgia (see map).

ILLUSTRATION: (A) flowering shoot, 0.5x; (B) portion of vine, 0.5x; note twining stem without tendrils; (C) male flower, 4x; (D) stamens, fused into a pentagonal shield, 8x; (E) female flower, 4x; (F) cluster of fruits, as formed from a single flower, 0.8x. Source: Godfrey (1988), drawn by Melanie Darst and used with permission.

DESCRIPTION: Deciduous, woody vine. *Schisandra glabra* has stems to 3 cm thick, twining up to the crowns of trees or trailing along the ground. Sometimes large clumps of leaves form a ground cover, resembling a sprawling Virginia creeper or woodbine (*Parthenocissus quinquefolia*). The leaves are up to 15 cm long and 6 cm wide, ovate to elliptic, with sparsely toothed margins, and

are sweet-smelling when crushed. The leaves are alternate, but are close together on the slower growing secondary branchlets ("spur shoots"). Both male and female flowers occur on the same plant (monoecious), and droop on long, delicate flower stalks arising from the leaf axils of mature vines (see illustration). The 9-12 petals are 5-8 mm long, greenish outside and crimson-colored within. The fruit is an aggregate of red berries on an axis that elongates during ripening (see illustration). **Flowering period**: May to June; **fruiting period**: July to August. **Best search time**: from late spring to middle summer, since leaves tend to fall early.

HABITAT: Found twining over understory trees and shrubs in rich, forested bottomlands and adjacent lower slopes; sometimes older vines occur on trunks of overstory trees, or sprawl along the ground forming patches rooted in the litter, especially near mountain laurel (*Kalmia latifolia*) thickets.

SPECIAL IDENTIFICATION FEATURES: Bay star-vine can easily be confused with climbing hydrangea (*Decumaria barbara*), a quite common vine. The difference between the two is that *D. barbara* has opposite leaves and climbs by means of aerial roots, while *S. glabra* has alternate leaves and climbs only by twining. Both vines occupy similar habitats. The flowers of climbing hydrangea are showy, white, and in flat-topped clusters. In contrast, the flowers of bay star-vine are inconspicuous, maroon, and either solitary or in loose clusters.

MANAGEMENT RECOMMENDATIONS: Avoid disturbance. At most this species will tolerate only hand thinning of trees in its immediate vicinity, and only if done carefully. Control exotic weeds, especially Japanese honeysuckle.

REMARKS: John Brickell, a physician and amateur botanist, described this species in 1803, based upon collections from near Savannah, where he lived, and from Beaufort, South Carolina. Like croomia (*Croomia pauciflora*), twinleaf (*Jeffersonia diphylla*), and Oconee bells (*Shortia galacifolia*), the closest living relatives of this species are found in Asia. *Schisandra* and, for example, *Illicium*, *Isoetes*, and *Torreya* are described by many as "primitive" because they share some significant characteristics with fossil forms that are many millions of years old. Others dislike such terms as "primitive" (or "lower plants" for ferns, mosses, etc.), feeling that these labels have some negative connotations. After all, plants such as these have demonstrated a perfection of adaptation that has enabled them to survive through eons when many evolutionary innovations have been tried and found wanting! *Schisandra glabra* is rare throughout its range and has sustained significant habitat loss due to clearing of hardwood forest for conversion to agricultural land or pine plantation.

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and a restaurant on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by the Trust of John F. Rowan, Sr., its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, and Trichloroethene in soil and groundwater, and trans- 1, 2-Dichloroethene in soil occurred on the Property. Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, Trichloroethene and trans- 1, 2-Dichloroethene (collectively, "Constituents of Concern, or "COI") are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action consists of the installation and maintenance of engineering controls (a vapor collection system will be installed beneath the existing building) and institutional controls (limit use to non-residential activities) to protect human health and the environment.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land,

pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any site work that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Periodic Reporting. Annually, by no later than <date> following the effective date of this Environmental Covenant, the Owner shall submit to EPD an Annual Report as specified in the EPD approved Point of Compliance Monitoring Plan including: groundwater detection-monitoring report results, maintenance and inspection activities, certification of non-residential use of the Property, and documentation stating whether or not the activity and use limitations in this Environmental Covenant are being abided by.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use on the Property shall be prohibited. A vapor barrier shall be installed and maintained prior to and during the construction of any enclosed structures until COI in groundwater at the Property reach HSRA residential risk reduction standards.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

7. Permanent Markers. Permanent markers on each side of the Property shall be installed and maintained that delineate the restricted area as specified in Section 391-3-19-.07(10) of the Rules. Disturbance or removal of such markers is prohibited.

8. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

9. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

10. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 Risk Reduction Standards, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

11. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

12. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

Georgia Environmental Protection Division
Branch Chief
Land Protection Branch

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin; thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq.* by ASL Limited Partnership, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, and Trichloroethene in soil and groundwater, and trans- 1, 2-Dichloroethene in soil occurred on the Property. Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, Trichloroethene and trans- 1, 2-Dichloroethene (collectively, "Constituents of Concern," or "COI") are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action consists of institutional controls (limit use to non-residential activities) to protect human health and the environment.

Grantor, ASL Limited Partnership (hereinafter "ASL"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

ASL makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land,

pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, ASL and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, ASL or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any site work that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use on the Property shall be prohibited. A vapor barrier shall be installed and maintained prior to and during the construction of any enclosed structures until COI in groundwater at the Property reach HSRA residential risk reduction standards.

5. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

6. Permanent Markers. Permanent markers on each side of the Property shall be installed and maintained that delineate the restricted area as specified in Section 391-3-19-.07(10) of the Rules. Disturbance or removal of such markers is prohibited.

7. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

8. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

9. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 Risk Reduction Standards, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

10. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

11. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or

other law regulating use of the Property; and

g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor: Georgia-Alabama Commercial Investments, LLC
2875 University Parkway
Lawrenceville, Georgia 30043

Grantee/Holder: <Company Name or individual(s)>
<Mailing address>

Grantee/Entity with express power to enforce: State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1152 East Tower
Atlanta, GA 30334

Parties with interest in the Property: <Company Name or individual(s)>
<Mailing address>

Property:

The property subject to this Environmental Covenant is the EZ Serv Tract (hereinafter "Property"), located at 4308 North Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on _____ from ____ to ____ recorded in Deed Book ___, Page ___, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately --- acres of property developed with an EZ Serve gasoline service station. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-001 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq.* by Georgia-Alabama Commercial Investments, LLC, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, and Trichloroethene in soil and groundwater, and trans- 1, 2-Dichloroethene in soil occurred on the Property. Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, Trichloroethene and trans- 1, 2-Dichloroethene (collectively, "Constituents of Concern," or "COI") are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action consists of institutional controls (limit use to non-residential activities) to protect human health and the environment.

Grantor, Georgia-Alabama Commercial Investments, LLC (hereinafter "GACI"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

GACI makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land,

pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, GACI and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, GACI or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any site work that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use on the Property shall be prohibited. A vapor barrier shall be installed and maintained prior to and during the construction of any enclosed structures until COI in groundwater at the Property reach HSRA residential risk reduction standards.

5. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

6. Permanent Markers. Permanent markers on each side of the Property shall be installed and maintained that delineate the restricted area as specified in Section 391-3-19-.07(10) of the Rules. Disturbance or removal of such markers is prohibited.

7. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

8. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

9. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 Risk Reduction Standards, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

10. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

11. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or

other law regulating use of the Property; and

g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Atlanta, GA 30334

Parties with interest in the Property: <Company Name or individual(s)>
<Mailing address>

Property:

The property subject to this Environmental Covenant is the Southern Automatic Company N. Peachtree Tract (hereinafter "Property"), located at 4306 N. Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on _____ from ____ to ____ recorded in Deed Book ___, Page ___, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.51 acres of property developed with a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-005 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq.* by Southern Automatic Company, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, and Trichloroethene in soil and groundwater, and trans- 1, 2-Dichloroethene in soil occurred on the Property. Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, Trichloroethene and trans- 1, 2-Dichloroethene are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action consists of institutional controls (limit use to non-residential activities) to protect human health and the environment.

Grantor, Southern Automatic Company (hereinafter "Southern Automatic"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

Southern Automatic makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run

with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Southern Automatic and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, Southern Automatic or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any site work that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

5. Permanent Markers. Permanent markers on each side of the Property shall be installed and maintained that delineate the restricted area as specified in Section 391-3-19-.07(10) of the Rules. Disturbance or removal of such markers is prohibited.

6. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

7. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

8. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 Risk Reduction Standards, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

9. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

10. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Mr. Jason Metzger
Compliance Officer – Environmental Engineer
Georgia Environmental Protection Division
Hazardous Sites Response Program
2 Martin Luther King, Jr. Drive, SE
Atlanta, GA 30334

Subject: Voluntary Investigation and Remediation Plan Semiannual Status Report for the Fashion Care/Executive Care Site, Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia
Winter Environmental Project No. 08096

Dear Mr. Metzger:

Enclosed for your review is the Voluntary Investigation and Remediation Plan Semiannual Status Report for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia. There is one hard copy and two CD's of the report enclosed.

Please contact me with any questions or comments you may have.

Sincerely,

Leonard J. Diprima, Jr., P.G.
Senior Consultant

PE/PG Certification

I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer/professional geologist who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Section 2
Introduction

Winter Environmental has prepared this Voluntary Investigation and Remediation Plan Semiannual Status Report (Status Report) in accordance with the Voluntary Remediation Program (VRP) for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust). On July 9, 2010, a Voluntary Investigation and Remediation Plan Application (VIRP) was submitted to the Georgia Environmental Protection Division (EPD) Hazardous Sites Response (HSRA) Program for the Site. On December 2, 2010, the EPD approved the VIRP with comments and entered the Site into the VRP. This Status Report has been prepared to present the activities conducted from June 2, 2011 through December 2, 2011 for the Site in accordance with the VRP.

Section 3
Work Performed – December 2, 2010 through June 2, 2011

The activities currently identified to be performed at the Site under the VRP are outlined in the VIRP dated July 9, 2010, the EPD VIRP approval letter dated December 2, 2010, the EPD VIRP comment letter dated December 2, 2010 and the VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011 (see Figure 1). The activities that have been performed from June 3, 2011 through December 2, 2011 are as follows:

- Re-evaluation of the Johnson and Ettinger (J&E) Vapor Model for parcels 18-343-13-001, 18-343-13-005 and 18-333-02-023, to address cumulative the volatile organic compounds (VOCs) specific to each parcel;

- Revision of the draft Environmental Covenants for the following qualifying properties (see Figure 2, Tax Parcel Map) per EPD's comments to the initial draft covenants:
  - Parcel 18-343-13-002, 2211 Savoy Drive, Chamblee, Georgia, John F. Rowan, Sr. Item IV Trust;
  - Parcel 18-333-02-023, no street address, Asl Limited Partnership; and
  - Parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company.

- Conduct eight surface water sampling events during late summer/early fall when stream flow in Nancy Creek is close to 7Q10, and evaluation of the results;

- Final design and estimate for the installation of a vapor mitigation system for the building located on parcel 18-343-13-002;

These activities are described in more detail below.

3.1 Re-evaluation of the Johnson and Ettinger Vapor Models

The J&E convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004) was rerun for parcels 18-343-13-001, 18-343-13-005 and 18-333-02-023 to evaluate the cumulative risk of vapor intrusion specific to each parcel. The model calculations and a summary of the input parameters and results for the parcels are included in Appendix A. The modeling was performed using the most recent round of groundwater data collected in May and June of 2010 presented in the VIRP, and the vapor sampling results from beneath the slab of the building currently on parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company

conducted May 19, 2011. The vapor sample laboratory results from the sub-slab sampling of the building currently located on parcel 18-343-13-005 are in Appendix A.

Modeling of cumulative VOC vapor intrusion was conducted for the building currently on parcel #18-343-13-005 (Southern Automatic Company). Two soil vapor samples collected directly beneath the floor of the building were used to obtain data input for the model. Results from the vapor intrusion analysis indicate a cumulative human health risk below the HSRA standard of one incremental cancer in a population of 100,000.

Modeling of cumulative VOC vapor intrusion was conducted for the undeveloped, wooded parcel #18-333-02-023 (Asl Limited Partnership) using shallow groundwater water concentration data obtained from monitoring wells FMW-5, FMW-6, FMW-11 (March 2010) and MW-14 (September 2008). This groundwater data was used to calculate VOC groundwater concentrations where a hypothetical structure would encounter vapor intrusion at a future date on the property. The area encompassed by these wells fairly represents a potential development area from a structure similar to the EZ-Serve Gas Station located on the Georgia-Alabama Commercial Investments property. This area also emphasizes the portion of the groundwater plume with significant PCE and TCE concentrations. The conclusion for this hypothetical scenario for parcel #18-333-02-023 is that the incremental cancer risk exceeds the allowable HSRA standard of one incremental cancer in a population of 100,000.

Modeling of cumulative VOC vapor intrusion was conducted for the EZ-Serve Gas Station building located on parcel 18-343-13-001 (Georgia-Alabama Commercial Investments) using the most recent shallow groundwater water concentration data collected March, 2010, from monitoring wells FMW-1 and MW-11. VOC concentrations from monitoring wells FMW-1 and MW-11 were averaged in order to provide a representative groundwater concentration scenario for this location. Several monitoring wells surrounding the Gas Station have or had free product (petroleum) and did not provide representative (or any) chlorinated compound data. Results from the vapor intrusion analysis indicate a cumulative human health risk below the HSRA standard of one incremental cancer in a population of 100,000.

The results from the J&E modeling were used to develop the vapor mitigation requirements in the revised draft Environmental Covenants for parcels 18-343-13-005 and 18-333-02-023 in Appendix B.

3.2 Revision of the draft Environmental Covenants

In accordance with comments from the EPD, the draft Environmental Covenants for parcel 18-343-13-002 (2211 Savoy Drive, Chamblee, Georgia, John F. Rowan, Sr. Item IV Trust), parcel 18-343-13-005 (4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company), and parcel 18-333-02-023 (Asl Limited Partnership) have been revised and are included in Appendix B, for EPD's review.

Based on the J&E model indicating that there was no vapor intrusion exposure pathway for parcel 18-343-13-001 (4308 North Peachtree Road, Chamblee, Georgia, Georgia-Alabama Commercial

Investments, LLC), and that the Site was not listed on the HSI for groundwater, under the VRP Program, an Environmental Covenant will not be required for this parcel.

3.3 Surface Water Sampling Events

Eight surface water sampling events have been conducted in accordance with EPD's Comment Letter regarding the Site's acceptance into the VRP dated December 2, 2010 EPD, specifically comments regarding surface water, Nos. 1-Bullet 4, 2 and 4. The events were conducted in October 2011 during a three week period. The first sequence of four consecutive events was obtained from October 6 through October 9, 2011. The second sequence of four events was taken from October 21 through October 24, 2011.

Surface water flow volume and VOCs were measured in Nancy Creek, downgradient of the Site, at three locations; upstream and two within the groundwater plume boundary. Previous stream sampling events did not detect target VOCs. The sampling and flow gauging was optimized for detection using sequential events at low flow conditions. The sampling effort was intended to definitively examine low flow (drought) surface water concentrations of VOCs resulting from Site groundwater discharging to Nancy Creek. The EPD requested that samples be collected during flow periods that were close to the 7Q10 value of 3 cubic feet per second, provided by EPD for the Site. Measurements were obtained using an electromagnetic flow meter with capability of measuring flow velocity from 0.01 to 20 feet per second. Stream flow during all the sampling events was well below the 7Q10 value of 3.0 cubic feet per second. During the first series of sampling, October 6 through October 9, 2011, flow ranged from 0.09 to 0.52 cubic feet per second. During the second series of sampling, October 21 through October 24, 2011, flow ranged from 0.53 to 1.45 cubic feet per second.

No measurable precipitation was reported in the Nancy Creek watershed during the ten days prior to the first sequence, and drought conditions were reported by local weather forecasters. Based on USGS station data, light rain was recorded approximately two days prior to the second sampling sequence, October 21 – 24, and a gradual flow volume decline to dry condition was observed. Flow measurement decline in the second sequence was corroborated by the USGS stream flow data. Declining stream flow during the days after a rain event was expected to provide optimum conditions for detecting groundwater VOCs in Nancy Creek.

No Site constituents were observed in the surface water laboratory results. A low detection of chloromethane, 2 ug/L, was observed at the upstream sampling location and does not appear associated with the Site. Acetone was detected in all of the second sampling event sampling sequence samples, and appears to originate from an up-stream source not associated with the Site. Notably, the trend in the acetone data appears to corroborate the expectation that declining stream flow subsequent to a rain event produces the optimum conditions for detecting VOCs discharging to surface water from groundwater. In conclusion, surface water sampling conducted during both extreme low flow conditions and during post-rain groundwater discharge into Nancy Creek at the Site, did not detect VOCs associated with the Site during any of the sampling events. The details regarding the surface water

sampling, including summary tables for flow and VOC concentrations, flow calculations and laboratory data reports is in Appendix C.

3.4 Design of a Vapor Mitigation System - Parcel 18-343-13-002

A vapor mitigation system design and estimate for the Fashion Care building located on the parcel 18-343-13-002, to prevent the migration of volatile drycleaner constituents into the building from the impacted soil and groundwater beneath the structure has been developed. An active sub-slab depressurization system has been selected. An example of this system was presented in the June 2, 2011 Semiannual Status Report. Figure 3 shows the proposed location of the system in the building. The system will be maintained for the life of the structure, or until natural degradation of the impacted soil and groundwater reaches contaminant concentrations that based upon actual vapor sampling, and/or vapor modeling approved by the EPD, no longer pose a vapor intrusion risk. Vapor mitigation requirements have been placed into the draft Environmental Covenant for the property for existing and future structures placed over the established impacted area. The estimate for the installation and start up of the system is approximately $10,000. The system will be installed in 2012, and as-built specifications will be provided to the EPD in the Semiannual Status Report that follows completion.

3.5 Miscellaneous Activities

In accordance with Item #11 of the EPD VIRP comment letter dated December 2, 2010, site-specific utility and construction worker clean-up standards were calculated for the Site in accordance with HSRA Rules, Section 391-3-19-.07(10) for soil and groundwater. The calculations were presented in the June 2, 2011 Semiannual Status Report, However, the sources of the input values were not identified. Per EPD's requested the calculations are presented in Appendix D with the sources of the input values identified for review.

Section 4
Work to be Performed

The additional activities currently identified to be performed at the Site through completion of the VIRP are outlined in the VIRP dated July 9, 2010, the EPD VIRP approval letter dated December 2, 2010, the EPD VIRP comment letter dated December 2, 2010 and the VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011. More specifically, these tasks are presented on Figure 1. The tasks projected to be completed during the next six months and included in the next Status Report to be submitted June 2, 2012 are Item Nos. 7, 10, and 11, presented below. Item 18, vapor mitigation system installation for the Fashion Care building will also be completed in 2012. The results of the tasks completed will be presented in the next Status Report to be submitted June 2, 2012.

Scheduled Tasks, December 3, 2011 through June 2, 2012:

- Preparation of a "Corrective Action Plan" to be implemented if a surface water detection occurs during future surface water sampling events;
- Complete horizontal groundwater delineation beyond FMW-15 through the installation of two shallow monitoring wells, and the collection of a full round of groundwater and surface water samples from the Site for use in modeling and to reestablish a groundwater concentration baseline;
- Refining of the Conceptual Site Model:
  - Installation of borings across the impacted area to confirm presence/absence of a dry silt, shallow confining unit,
  - Installation of a deeper soil zone well next to FMW-4 to establish a vertical gradient if the dry silt, shallow confining unit is uniformly present,
  - Installation of piezometers across Nancy Creek to confirm creek is a gaining stream, and
  - Conduct a well pump test to recalculate horizontal hydraulic gradient for the Site and for input into future modeling.

The tasks required to complete the VIRP are presented on Figure 5, a revised estimated schedule. This schedule will be revised with the submittal of each Semiannual Status Report, as required.

Section 5
Professional Services Hours This Period

A total of approximately 207.25 professional service hours have been completed by Winter Environmental from June 3, 2011 through December 2, 2011. A table of the approximate breakdown of Winter Environmental's hours by month is presented in Table 1.

Tables

Table 1

Approximate Professional Service Hours

June 3, 2011 through December 2, 2011

Company	Month/Year	Hours Worked
Winter Environmental	June 2011	75.75
Winter Environmental	July 2011	48
Winter Environmental	August 2011	24.75
Winter Environmental	September 2011	5
Winter Environmental	October 2011	20.25
Winter Environmental	November 2011	33.5
	Total Estimated Hours	**207.25**

Note: The above hours do not include subcontractor hours worked for Winter Environmental

Johnson and Ettinger Vapor Models

INTRODUCTION

This technical summary describes a vapor intrusion analysis of volatile organic compounds (VOCs) into the structure at Parcel #18-343-13-005 Southern Automatic Company Property (Dentist Office), located adjacent to the Fashion Care Dry Cleaner at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HSI 10786). The Johnson & Ettinger transport model (J&E), release 3.1, obtained directly from the EPA download page was used to estimate the incremental cancer risk and Hazard Quotient from all detected VOCs based on sub-foundation soil vapor sampling conducted on May 31, 2011. For reference, the J&E Model can be obtained from the USEPA Web page[1]. The following discussion is obtained directly from the J&E User's Guide:

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

In addition to the finite and infinite source models referred to above, two models (are included) that allow the user to input empirical soil gas concentration and sampling depth information directly into the spreadsheets. These models will subsequently estimate the resulting steady-state indoor air concentrations and associated health risks.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the Dentist Office property associated with Fashion Care vapor intrusion analysis summarized in Table D-1 are discussed in the following:

Soil Vapor Concentration: Shallow soil gas VOC concentration data were obtained on March 31, 2011. Samples were obtained approximately four inches below the concrete floor at sample locations VS-1 and VS-2. All detected VOC concentrations from this event were used in the J&E calculation to obtain a cumulative risk factor for cancer and hazard. 4-Ethyltoluene was included in the model as o-Xylene since the J&E compound database (VLOOKUP) does not specifically include this gasoline-related hydrocarbon.

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm

Soil Profile SCS Classifications: As shown in Table D-1, soil boring FMW-1 was used to obtain the soil characterization of the vadose zone lithology (primarily Sand immediately below the slab). Due to proximity to surface, these data have minimal influence on model results for the SG-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent "exposure per unit volume" composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of cumulative VOC vapor intrusion was conducted for the building located on Parcel #18-343-13-005, Southern Automatic Company Property, associated with the Fashion Care site using the standardized Johnson & Ettinger convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004). Two soil vapor samples directly beneath the floor were used to obtain data input for the soil gas screening model discussed previously. Individual VOC constituents used to calculate the cumulative risk factors are summarized in Table D-2.

Results from the vapor intrusion analysis indicate a cumulative human health risk below the HSRA standard of one incremental cancer in a population of 100,000. This calculation is performed under conservative exposure assumptions.

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

Cummulative Risk - Hazard Quotient	3.3E-02	CummulativeToxicity All Detected VOCs
Cummulative Risk - Cancer	3.1E-06	Cummulative Cancer All Detected VOCs

Table D-2
Results - Vapor Intrusion Modeling
Parcel #18-343-13-005 Southern Automatic Company Property
Johnson-Ettinger Soil Gas Scenario

Vapor Constituent	SAMPLE NO.		CAS No.	RISK FACTOR	
	VS-1	VS-2	(VLOOKUP)	Cancer	Hazard
Acetone	**240**	210	67641	N/A	**2.8E-03**
Carbon Disulfide	**43**	<6.3	75150	N/A	**2.5E-04**
Chloroform	**12**	<5.0	67663	**4.8E-07**	N/A
Benzene	**57**	9.1	71432	**7.5E-07**	**7.5E-03**
Trichloroethene	**9.2**	<5.5	79016	**1.7E-06**	**8.9E-04**
Tetrachloroethene	**15**	10	127184	**1.4E-07**	**9.5E-05**
Toluene	**130**	48	108883	N/A	**1.3E-03**
Ethylebenzene	**21**	13	100414	**8.6E-08**	**8.0E-05**
o-Xylene	**16**	15	95476	N/A	**6.3E-04**
M,P-Xylene (as P-)	21	**38**	106423	N/A	**1.5E-03**
Styrene	**7.4**	6.5	100425	N/A	**2.8E-05**
4-Ethyltoluene	5.2	<5.0	N/A	N/A	**2.0E-04**
1,3,5-Trimethylbenzene	**6.2**	5.7	108678	N/A	**3.8E-03**
1,2,4-Trimethylbenzene	21	**23**	95636	N/A	**1.4E-02**
Cummulative Risk				**3.1E-06**	**3.3E-02**

Notes:

1) Ethylbenzene unit risk factor (URF) was updated in the J&E model database per EPA changes in 2008.
2) 4-Ethyltoluene is not in J&E compound data and calculated as o-xylene.
3) Risk Factor calculated on the highest detection in either sample VS-1 or VS-2, indicated b y bolded value.
4) N/A for Cancer Risk Factor indicates compound is not reported in J&E as carcinogen.

Vapor Intrusion Analysis Fashion Care Site/HSI 10786
Tax Parcel 18-343-13-001, Georgia-Alabama Commercial Investments, LLC Property, and
Parcel 18-333-02-023, Asl Limited Partnership Property
November 2011

INTRODUCTION

This technical summary describes a vapor intrusion analysis of volatile organic compound (VOC) plumes at the Fashion Care Dry Cleaner located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HSI 10786). The Johnson & Ettinger transport model (J&E), release 3.1, obtained directly from the EPA download page was used to estimate the incremental cancer risk and Hazard Quotient from VOCs in groundwater at the EZ-Serve Gas Station building, Tax Parcel 18-343-13-001, Georgia-Alabama Commercial Investments, LLC property (Gas Station). A companion analysis was performed for Tax Parcel 18-333-02-023, Asl Limited Partnership property, an undeveloped wooded area located adjacent to the Fashion Care property (Wooded Area). A hypothetical structure identical to the Gas Station was the basis for calculations for the Wooded Area. Table E-1 summarizes the J&E model inputs and cumulative incremental risk results for the Gas Station the Wooded Area. For reference, the J&E Model can be obtained from the USEPA Web page[1]. The following discussion is obtained directly from the J&E User's Guide:

This revised version of the User's Guide corresponds with the release of Version 3.1 of the Johnson and Ettinger (1991) model (J&E) spreadsheets for estimating subsurface vapor intrusion into buildings. Several things have changed within the models since Version 2 was released in December 2000 and since the original version was released in September 1998. The following represent the major changes in Version 3.1 to be consistent with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Quality from Groundwater and Soils dated November 25, 2002.

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the Fashion Care vapor intrusion analysis summarized in Table E-1 are discussed in the following:

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm

Groundwater Concentration (Gas Station): Shallow groundwater water concentration data obtained in March, 2010, was evaluated as the basis for estimating representative VOC concentrations in groundwater beneath the Gas Station tax parcel. VOC concentrations from monitoring wells FMW-1 and MW-11 were averaged in order to provide a representative groundwater concentration scenario for this location. Several monitoring wells surrounding the Gas Station have or had free product (petroleum) and did not provide representative (or any) chlorinated compound data. Results of individual VOC constituent risk used to determine the cumulative incremental cancer and Hazard Quotient risk for the Gas Station are shown in Table E-2.

Groundwater Concentration (Wooded Area): Shallow groundwater water concentration data obtained from monitoring wells FMW-5, FMW-6, FMW-11 (March 2010) and MW-14 (September 2008) were used to calculate VOC groundwater concentrations where a hypothetical structure would encounter vapor intrusion at a future date. The area encompassed by these wells fairly represents a potential development area from a structure similar to the Gas Station. This area also emphasizes the portion of the groundwater plume with significant PCE and TCE concentrations. Results of individual VOC constituent risk used to determine the cumulative incremental cancer and Hazard Quotient risk for the Wooded Area are shown in Table E-3.

Soil Profile SCS Classifications: As shown in Table E-1, soil boring FMW-1 was used to obtain the depth to groundwater, the soil characterization at the groundwater interface (Silty Clay) and the vadose zone lithology (Sand). These data have some of the largest influence on model results for the GW-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent “exposure per unit volume” composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of VOC vapor intrusion was conducted for Fashion Care adjoining properties using the standardized Johnson & Ettinger convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Vesion 3.1 (2004). Groundwater concentrations are summarized in Tables E-2 for the Gas Station and in Table E-3 for the Wooded Lot.

All scenarios are far below a Hazard Quotient of 1 for cumulative VOCs.

The conclusion for the Gas Station vapor intrusion analysis is that the incremental cancer risk, as calculated using very conservative model input assumptions, is below the HSRA standard of one-per-hundred thousand.

The overall conclusion for the Wooded Area hypothetical scenario is that the incremental cancer risk exceeds the allowable HSRA standard of one-per-hundred thousand.

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

Appendix B
Revised Draft Environmental Covenants

Included are revised draft Environmental Covenants for:

- Parcel 18-343-13-002; 2211 Savoy Drive, Chamblee, Georgia; John F. Rowan, Sr. Item IV Trust.
- Parcel 18-343-13-001; 4308 North Peachtree Road, Chamblee, Georgia; Georgia-Alabama Commercial Investments, LLC.
- Parcel 18-333-02-023; no street address; Asl Limited Partnership.
- Parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company

Parcel 18-343-13-002; 2211 Savoy Drive, Chamblee, Georgia; John F. Rowan, Sr. Item IV Trust

After Recording Return to:

Georgia Environmental Protection Division
Response and Remediation Program
2 Martin Luther King, Jr. Drive, SE
Suite 1462 East
Atlanta, Georgia 30334

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:	The Trust of John F. Rowan, Sr. Mrs. Catherine Norris, Representative P.O. Box 82 Rancho Santa Fe, CA 92067
Grantee/Holder:	<Company Name or individual(s)> <Mailing address>
Grantee/Entity with express power to enforce:	State of Georgia Department of Natural Resources Environmental Protection Division 2 Martin Luther King Jr. Drive, SE Suite 1152 East Tower Atlanta, GA 30334
Parties with interest in the Property:	<Company Name or individual(s)> <Mailing address>

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and a restaurant on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Point of Compliance Monitoring Plan (as referenced in Activity 4)

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Fashion Care Cleaners
2211 Savoy Drive
Chamblee, GA

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by the Trust of John F. Rowan, Sr., its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-Dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil and groundwater in designated areas of the property. Engineering controls required for the Property are the maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area _ (see Figure _), the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures on the Property and any enclosed structures constructed on the Property within the area indicated on attached Figure 1 and Figure 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under

this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-8 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Non-Residential Monitoring Evaluation Form (attached). In addition, an Annual Point of Compliance Monitoring Report. as specified in the EPD approved Point of Compliance Monitoring Plan, must be submitted to the EPD until point of compliance monitoring is deemed unnecessary by the EPD in accordance with the specifications set forth in the Point of Compliance Monitoring Plan.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless EPD concurs that soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained on existing structures and on any additional enclosed structures constructed until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. The concrete and asphalt covering the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within this area be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area with soil concentrations above these levels is identified on Figure 1, attached.

Soil - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/kg)	Utility Worker Threshold Concentration (mg/kg)	Comments
PCE	214	61	

The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area(s) with groundwater concentrations above Type 5 RRS is identified on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

Groundwater - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.286	0.082	
Trichloroethene	1.02	0.290	
Cis-1,2-dichloroethene	12.8	91.3	This chemical was identified above the construction worker threshold only.
Trans-1,1-dichloroethene	0.174	1.24	
Vinyl chloride	0.27	0.097	

Prior to conducting construction or subsurface utility work that may result in exposure to soil or groundwater in the designated Type 5 areas, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted soil or groundwater performed in the execution of work should be done in accordance with Items 7 and 6 above, respectively.

The exposure duration assumed for utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, within for a period of one year. Therefore, uitility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminated the work exposure pathway.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin; thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:	ASL Limited Partnership 1515 S. Federal Hwy. 300 Boca Raton, FL 33432-7451
Grantee/Holder:	<Company Name or individual(s)> <Mailing address>
Grantee/Entity with express power to enforce:	State of Georgia Department of Natural Resources Environmental Protection Division 2 Martin Luther King Jr. Drive, SE Suite 1152 East Tower Atlanta, GA 30334
Parties with interest in the Property:	<Company Name or individual(s)> <Mailing address>

Property:

The property subject to this Environmental Covenant is the ASL Limited Partnership Tract (hereinafter "Property"), located on the 4200 – 4300 Block of North Shallowford Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on October 12, 1982 from ARA Associates – Shangri-La, Ltd., a New Jersey limited partnership to ASL Limited Partnership recorded in Deed Book 4673, Page 272, DeKalb County Records. The area is located in Land Lot 334 of the 18th District of DeKalb County, Georgia. The property consists of approximately 10.45 acres of undeveloped property. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-333-02-023 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in

the following document:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Add Property Address here, or Owner Contact Information if undeveloped.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by ASL Limited Partnership, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride have been detected in groundwater beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater in designated area of the property. Engineering controls required for the Property are the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures and any enclosed structures constructed within the area indicated on attached Figure 1. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, ASL Limited Partnership (hereinafter "ASL"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

ASL makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, ASL and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, ASL or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s). The EPD must be notified within 3 business days of any subsurface site work in the environmentally impacted area shown on Figure 1 that would affect the Property.

3. **Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.** The notice shall explicitly state the requirements of Activities 5-7 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Non-Residential Monitoring Evaluation Form (attached).

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless EPD concurs that groundwater is remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures within Areas _ and _ indicated on attached Figure 1 until the HSRA regulated substances in groundwater at the Property reach HSRA RRS.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be

pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Utility Worker & Construction Worker Protection. Levels of PCE have been identified in groundwater above 0.286 mg/L and 0.082 mg/L, the calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and utility workers, respectively. The area(s) with concentrations above Type 5 RRS levels is identified on attached Figure 1. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 5 above.

   The exposure duration assumed for utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, within for a period of one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

8. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

9. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

10. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

11. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

12. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

13. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lots 333 and 334 of the 18th District of DeKalb County, Georgia, and being more particularly described as follows:

Starting at an iron pin at the intersection of the North line of Land Lot 334 and the Nortwesterly side of North Peachtree Road (70 foot right-of-way), running thence South 15 degrees 26 minutes West along the Northwest side of North Peachtree Road, 117.62 feet; thence South 24 degrees 59 minutes West along siad right-of-way, 97.22 feet to a point; thence South 32 degrees 49 minutes West along said right-of-way, 97.52 feet to a point; thence running South 40 degrees 46 minutes West along said right-of-way, 97.55 feet to a point; running thence South 48 minutes 24 minutes West along said right-of-way 82.79 feet to a point; thence North 48 degrees 29 minutes West 157.2 feet to a point in Nancy Creek; thence North 88 degrees 44 minutes 30 seconds West 435.3 feet to a point; thence North 1 degree 15 minutes 30 seconds West 78 feet to a point in Nancy Creek; thence North 70 degrees 5 minutes 30 seconds West 80.10 feet to a point in Nancy Creek; thence South 62 degrees 24 minutes 30- seconds West 73.50 feet to a point in Nancy Creek; thence north 66 degrees 25 minutes 30 seconds West 158.30 feet to a point in Nancy Creek; thence North 78 degrees 16 minutes West 585.0 feet to a point in Nancy Creek; thence South 70 degrees 55 minutes West 138.50 feet to a point in Nancy Creek; thence South 34 degrees 5 minutes West 118.40 feet to a point in Nancy Creek; thence South 28 degrees 55 minutes East 35.0 feet to a point; thence South 61 degrees 5 minutes West 194.4 feet to a point on the Easterly right-of-way of North Shallowford Road, said road being an 80 foot right-of-way; thence North 29 degrees 30 minutes West 98.54 feet to a point; thence North 25 degrees 59 minutes 30 seconds West 255.67 feet to a point; thence South 89 degrees 49 minutes East 2175.67 feet to a point on the Northwesterly side of North Peachtree Road and the point of beginning.

Less and except all that tract or parcel of land lying and being in Land Lot 334 of the 18th District, DeKalb County, Georgia, conveyed from ASL Limited Partnership to Carlton G. Chapman on December 23, 1988, recorded in Deed Book 5689 page 052, DeKalb County Records, and being more particularly described as follows:

TO FIND THE TRUE POINT OF BEGINNING, commence at an iron pin set at the intersection of the north line of Land Lot 334 and the northwesterly right-of-way of North Peachtree Road; running thence south 15 degrees 12 minutes 04 seconds west along said right-of-way a distance of 116.74 feet to an iron pin set; running thence south 24 degrees 38 minutes 05 seconds west a distance of 60.00 feet to an iron pin set and the TRUE POINT OF BEGINNING; from the TRUE POINT OF BEGINNING run thence along the northwesterly right-of-way of North Peachtree Road, south 24 degrees 38 minutes 05 seconds west a distance of 37.22 feet to an iron pin set; thence continuing along said right-of-way south 32 degrees 28 minutes 05 seconds west a distance of 978.52 feet to a point; running thence south 40 degrees 03 minutes 05 seconds west a distance of 82.79 feet to an iron pin set; running thence north 48 degrees 49 minutes 55 seconds west a distance of 157.20 feet to an iron pin set; running thence north 00 degrees 07 minutes 01 seconds west a distance of 141.34 feet to an iron pin set; running thence north 89 degrees 50 minutes 05 seconds east a distance of 311.32 feet to an iron pin set and the TRUE POINT OF BEGINNING. Said tract containing 1.151 acres as shown by plat of survey for Carl Chapman, prepared by Quadra-Tech, Inc., dated December 12, 1986, being certified by Wallace Long Hambrick, Georgia Registered Land Surveyor No. 1375.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor: Southern Automatic Company
4420 Tree Haven Drive, N.E.
Atlanta, Georgia 30342-3426

Grantee/Holder: <Company Name or individual(s)>
<Mailing address>

Grantee/Entity with express power to enforce: State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1152 East Tower
Atlanta, GA 30334

Parties with interest in the Property: <Company Name or individual(s)>
<Mailing address>

Property:

The property subject to this Environmental Covenant is the Southern Automatic Company N. Peachtree Tract (hereinafter "Property"), located at 4306 N. Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 25, 1974 from Hoke A. Rowan, Jr. to Southern Automatic Company recorded in Deed Book 3267, Page 130, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.51 acres of property developed at the time of this covenant with a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-005 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document:

Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Add Property Address here, or Owner Contact Information if undeveloped.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by Southern Automatic Company, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-Dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene and cis-1,2-dichloroethene have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater in designated area of the property. Engineering controls required for the Property are the maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area _ (see Figure _), and the implementation and maintenance of vapor mitigation measures beneath any enclosed structures constructed on the Property within Area _ on attached Figure 1.

These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, Southern Automatic Company (hereinafter "Southern Automatic"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce compliance with this

Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

Southern Automatic makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Southern Automatic and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, Southern Automatic or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activityand/orUseLimitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s. The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. . The notice shall explicitly state the requirements of Activities 5-7 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Non-Residential Monitoring Evaluation Form (attached).

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless EPD concurs that soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained on any enclosed structures built over Area _ on Figure 1, until the HSRA regulated substances in soil in this area reach HSRA RRS.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. The concrete and asphalt covering the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. Levels of the following HSRA regulated chemicals have been identified in groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers as indicated:

HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.286	0.082	
Trichloroethene	1.02	0.290	
Cis-1,2-dichloroethene	12.8	91.3	This chemical was identified above the construction worker threshold only.

The area(s) with concentrations above Type 5 RRS levels is identified on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 5 above.

The exposure duration assumed for utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, within for a period of one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

RepresentationsandWarranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Surface Water Sampling Data

NANCY CREEK LOW FLOW SAMPLING
FASHION CARE/EXECUTIVE CARE SITE
2211 SAVOY DRIVE, CHAMBLEE, DEKALB COUNTY, GEORGIA
HSI 10786

OVERVIEW

Surface water flow volume and volatile organic compounds (VOCs) were measured in Nancy Creek at three locations; upstream and two within the groundwater plume boundary, at the Fashion Care/Executive Care site (Site), HSI #10786. The Site is located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia. This work was done to address Item 1-bullet 4, Item 2 and Item 4 of the Environmental Protection Division's (EPD) correspondence dated December 2, 2010 regarding the Voluntary Investigation and Remediation Plan and Application dated July 9, 2010. Previous stream sampling events have been unable to detect target VOCs. This sampling and flow gauging was optimized for detection using sequential events at low flow conditions. This sampling effort is intended to definitively examine low flow (drought) surface water concentrations of VOCs resulting from Site groundwater discharging to Nancy Creek.

STREAM FLOW VOLUME

In October 2011, stream flow volume in Nancy Creek near 2211 Savoy Drive, Chamblee, Georgia, was directly measured on eight different days during approximately a three-week period. The EPD requested that samples be collected during flow periods that are close to the 7Q10 value of 3 cubic feet per second, which EPD provided (Item 1-bullet 4, Item 2 referenced above). Measurements were obtained using a Marsh-McBirney Flo-Mate 2000 electromagnetic flow meter with capability of measuring flow velocity from 0.01 to 20 feet per second. Stream flow volume was calculated by measuring an array of three to five flow velocities (depending on channel width) and respective flow depths to obtain a velocity/depth profile at the measurement station. Two measurement stations (Figure A) were used for each sampling event. The upstream flow station was located adjacent to the Site. The second station was located approximately 150 yards down-stream from the Site, and was intended to provide a quality check. Flow measurement stations were selected based on favorable stream channelization in order to facilitate consistent results and to reduce measurement error. Care was taken during measurements to accurately profile the flow channel, including measurement of channel width and multiple depth and velocity points across the profile to properly represent the depth and velocity. Flow volume measurements and associated surface water samples were conducted in two sequences, each consisting of four consecutive daily flow measurements and water sampling events (see Table A). The first sequence was obtained from October 6 through October 9, 2011. The second sequence was taken from October 21 through October 24, 2011. No measurable precipitation was reported in the Nancy Creek watershed during the ten days prior to the first sequence, and drought conditions were reported by local weather forecasters. USGS Station 02336360 (Nancy Creek at Rickenbacker Drive) precipitation data during this time period for are attached for reference. Based on

USGS station data, light rain was recorded approximately two days prior to the second, October 21 – 24 sequence, and a gradual flow volume decline to dry condition was observed (see the attached USGS hydrograph). Flow measurement decline in the second sequence, shown on Table A, are corroborated by the USGS data. Declining stream flow during the days after a rain event was expected to provide optimum conditions for detecting groundwater VOCs in Nancy Creek.

As shown on Table A, the stream flow during all the sampling events was well below the 7Q10 value of 3.0 cubic feet per second. During the first series of sampling, October 6 through October 9, 2011, flow ranged from 0.09 to 0.52 cubic feet per second. During the second series of sampling, October 21 through October 24, 2011, flow ranged from 0.53 to 1.45 cubic feet per second.

STREAM SAMPLING

Surface water samples were collected at three locations during each of the eight sampling events (Figure A and Table B). The location SW-1, located at the bridge on North Peachtree Road, is up-stream of the Site and was intended to detect up-stream sources of VOCs not associated with the Fashion Care site. Locations SW-2 and SW-3 are located as shown in Figure A to intercept any VOCs that would enter Nancy Creek from groundwater discharging from the Fashion Care site.

Samples were collected in preserved sample containers provided by Atlanta Environmental Services, Inc (AES). Sampling consisted of dipping the sample container directly into the stream flow and taking care to not flush the sample preservative from the vial. Samples containers were sealed then labeled, iced, and transported to the laboratory under proper chain of custody.

Laboratory results are summarized in Table B, and complete laboratory reports are attached. No Site constituents were observed in the results. A low detection of chloromethane was observed at 2 ug/L in SW-1 and does not appear associated with the Fashion Care site. Acetone was detected in all of the second sequence of samples, and appears to originate from an up-stream source not associated with the Fashion Care Site. Notably, the trend in the acetone data appears to corroborate the expectation that declining stream flow subsequent to a rain event produces the optimum conditions for detecting VOCs discharging to surface water from groundwater.

CONCLUSION

Surface water sampling conducted during both extreme low flow conditions and during post-rain groundwater discharge into Nancy Creek at the Fashion Care Site did not detect VOCs associated with the Site.

RE: Fashion Care Stream

Dear Leonard Diprima: Order No: 1110547

Analytical Environmental Services, Inc. received 6 samples on 10/7/2011 5:40:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/11-06/30/12.
-AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 09/01/13.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client Water Env Work Order Number 1110547

Checklist completed by MG 10/10/11
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (4°C±2)* Yes ✓ No __

Cooler #1 4.5°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Fashion Care Stream

Dear Leonard Diprima: Order No: 1110685

Analytical Environmental Services, Inc. received 6 samples on 10/10/2011 8:55:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/11-06/30/12.
-AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 09/01/13.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client Winter Work Order Number 1110685

Checklist completed by [signature] 10/10/11
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (4°C±2)* Yes ✓ No __

Cooler #1 4°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Fashion Care Stream

Dear Leonard Diprima: Order No: 1110H79

Analytical Environmental Services, Inc. received 6 samples on 10/22/2011 12:03:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/11-06/30/12.
-AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 09/01/13.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client Winter Work Order Number 1110H79

Checklist completed by M. Cobler 10/22/11
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (4°C±2)* Yes ✓ No __

Cooler #1 3.2 Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted ✓ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

RE: Fashion Care Stream

Dear Leonard Diprima: Order No: 1110I45

Analytical Environmental Services, Inc. received 6 samples on 10/24/2011 4:22:00 PM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES' certifications are as follows:
-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/11-06/30/12.
-AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 09/01/13.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sample/Cooler Receipt Checklist

Client Winter Work Order Number 1110145

Checklist completed by _____ 10/24/11
Signature Date

Carrier name: FedEx __ UPS __ Courier __ Client ✓ US Mail __ Other _____

Shipping container/cooler in good condition? Yes ✓ No __ Not Present __

Custody seals intact on shipping container/cooler? Yes __ No __ Not Present ✓

Custody seals intact on sample bottles? Yes __ No __ Not Present ✓

Container/Temp Blank temperature in compliance? (4°C±2)* Yes ✓ No __

Cooler #1 3.2°C Cooler #2 _____ Cooler #3 _____ Cooler #4 _____ Cooler#5 _____ Cooler #6 _____

Chain of custody present? Yes ✓ No __

Chain of custody signed when relinquished and received? Yes ✓ No __

Chain of custody agrees with sample labels? Yes ✓ No __

Samples in proper container/bottle? Yes ✓ No __

Sample containers intact? Yes ✓ No __

Sufficient sample volume for indicated test? Yes ✓ No __

All samples received within holding time? Yes ✓ No __

Was TAT marked on the COC? Yes ✓ No __

Proceed with Standard TAT as per project history? Yes __ No __ Not Applicable ✓

Water - VOA vials have zero headspace? No VOA vials submitted __ Yes ✓ No __

Water - pH acceptable upon receipt? Yes ✓ No __ Not Applicable __

Adjusted? _____ Checked by _____

Sample Condition: Good ✓ Other(Explain) _____

(For diffusive samples or AIHA lead) Is a known blank included? Yes __ No ✓

See Case Narrative for resolution of the Non-Conformance.

* Samples do not have to comply with the given range for certain parameters.

March 29, 2012

Mr. Jason Metzger
Unit Coordinator – Environmental Engineer
Georgia Environmental Protection Division
Hazardous Sites Response Program/Voluntary Remediation Program
2 Martin Luther King, Jr. Drive, SE
Atlanta, GA 30334

Subject: Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011:
VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia

Dear Mr. Metzger:

On behalf of the John F. Rowan, Sr. Item IV Trust (Trust), Winter Environmental has addressed, and attached for your review, a number of the comments to the Voluntary Remediation Program (VRP) Reports submitted through December 2, 2011 regarding the Fashion Care/Executive Care VRP Site (HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia). The following comments have been addressed and should replace previous versions of the documents provided in the VRP Semiannual Status Report dated December 2, 2012.

Comment #1. The draft Uniform Environmental Covenants (UEC's) have been revised per comments received from the EPD on February 10, 2012. The revised UEC's are attached for your review. These covenants should replace the associated covenants in Appendix B of the VRP Semiannual Status Report dated December 2, 2012.

Comment #5. The Johnson & Ettinger (J&E) vapor models for parcel 18-343-13-001 (Georgia-Alabama Commercial Investments, LLC property) and 18-343-13-005 (Southern Automatic Company property) have been revised per your comments. The results indicate that both properties are below the Hazardous Site Response Act (HSRA) Rules threshold values. The revised models are attached for your review. These revised J&E vapor models should replace the J&E models in Appendix A of the VRP Semiannual Status Report dated December 2, 2012.

Comment #6. The summary tables and input parameters for the J&E models for parcels 18-343-13-001 and 18-343-13-005 have been revised and are attached for your review.

Comment #7. The Type 5 Risk Reduction Standards (RRS) for construction workers and utility workers have been revised in the attached UEC's, as have been the RRS derivation tables. There are very small differences in our calculations for tetrachloroethene and 1,1-dichloroethene that

3350 Green Pointe Parkway

Norcross, Georgia 30092
Main: 404.588.3300
Fax: 404.223.6251
www.winter-environmental.com
A division of
The Winter Construction Company

appear to be due to Excel rounding that could not be resolved. We have defaulted to the values for these constituents provided by EPD. The revised RRS derivation tables are attached for your review. These revised RRS should replace the RRS tables in Appendix D of the VRP Semiannual Status Report dated December 2, 2012.

Comment #8. The Type 5 RRS for 1,1-dichloroethene has been revised in the RRS derivation tables. The revised RRS derivation tables are attached for your review.

Comment #9. The chemical specific input parameters for 1,1-dichloroethene and cis-1,2-dichloroethene have been revised in the RRS derivation tables. The revised RRS derivation tables are attached for your review.

Also noted are Comments #2, #3 and #4 that will be addressed in future site investigation activities and Semiannual VRP Status Reports.

In addition to the responses provided by the Trust, the Trust requests that the EPD provide a property specific "Site Use and Non-Residential Soil RRS Monitoring Evaluation Form" for each Environmental Covenant presented for this site. This is needed prior to presenting the covenants for signature to the affected property owners.

Winter Environmental and the Trust await your review and reply to these items. The Trust would like to obtain executed UEC's from the surrounding property owners as soon as possible to continue to move forward with the VRP. Please contact me with any questions or comments you may have.

Sincerely,

Leonard J. Diprima, Jr., P.G.
Senior Consultant

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:	ASL Limited Partnership 1515 S. Federal Hwy. 300 Boca Raton, FL 33432-7451
Grantee/Holder:	<Company Name or individual(s)> <Mailing address>
Grantee/Entity with express power to enforce:	State of Georgia Department of Natural Resources Environmental Protection Division 2 Martin Luther King Jr. Drive, SE Suite 1152 East Tower Atlanta, GA 30334
Parties with interest in the Property:	<Company Name or individual(s)> <Mailing address>

Property:

The property subject to this Environmental Covenant is the ASL Limited Partnership Tract (hereinafter "Property"), located on the 4200 – 4300 Block of North Shallowford Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on October 12, 1982 from ARA Associates – Shangri-La, Ltd., a New Jersey limited partnership to ASL Limited Partnership recorded in Deed Book 4673, Page 272, DeKalb County Records. The area is located in Land Lot 334 of the 18th District of DeKalb County, Georgia. The property consists of approximately 10.45 acres of undeveloped property. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-333-02-023 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in

the following documents:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Vapor Intrusion Model - Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011: VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, dated March 14, 2012.

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Add Property Address here, or Owner Contact Information if undeveloped.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by ASL Limited Partnership, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride have been detected in groundwater beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater in Area D as shown on Figure 1 of the Property. Engineering controls required for the Property are the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures and any enclosed structures constructed within Area C and Area D as shown on Figure 1, unless updated vapor modeling approved by the EPD indicates vapor mitigation is unnecessary.. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, ASL Limited Partnership (hereinafter "ASL"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the

rules promulgated there under. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

ASL makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, ASL and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, ASL or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days of any subsurface site work in the environmentally impacted area shown on Figure 1 that would affect the Property. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-7 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (attached).

5. Activity and Use Limitation(s). The Property shall be used for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant, unless the requirements for residential use identified below are followed.

   A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures within Areas C and D indicated on attached Figure 1 until the HSRA regulated substances in groundwater at the Property reach HSRA RRS, or if vapor modeling of groundwater contamination indicates that a vapor mitigation is not required for enclosed structures and EPD concurs

with the vapor modeling results.

Residential use of the Property requires:

- Vapor mitigation measures approved by EPD installed on enclosed structures placed within Area C and Area D as shown on Figure 1; or
- Vapor modeling of groundwater contamination within Area C and Area D as shown on Figure 1 indicating that a vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results; and
- Groundwater use is prohibited, unless EPD concurs that groundwater is remediated to residential RRS.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless COI are treated to below HSRA residential risk reduction standards.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Utility Worker & Construction Worker Protection. Levels of PCE have been identified in groundwater above 0.286 mg/L and 0.082 mg/L, the calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and utility workers, respectively. The area(s) with concentrations above Type 5 RRS levels is identified as Area D on Figure 1. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 6 above.

   The exposure duration assumed for a utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

8. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

9. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental

Covenant, and to inspect records that are related to the Corrective Action.

10. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

11. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

12. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

13. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lots 333 and 334 of the 18th District of DeKalb County, Georgia, and being more particularly described as follows:

Starting at an iron pin at the intersection of the North line of Land Lot 334 and the Nortwesterly side of North Peachtree Road (70 foot right-of-way), running thence South 15 degrees 26 minutes West along the Northwest side of North Peachtree Road, 117.62 feet; thence South 24 degrees 59 minutes West along siad right-of-way, 97.22 feet to a point; thence South 32 degrees 49 minutes West along said right-of-way, 97.52 feet to a point; thence running South 40 degrees 46 minutes West along said right-of-way, 97.55 feet to a point; running thence South 48 minutes 24 minutes West along said right-of-way 82.79 feet to a point; thence North 48 degrees 29 minutes West 157.2 feet to a point in Nancy Creek; thence North 88 degrees 44 minutes 30 seconds West 435.3 feet to a point; thence North 1 degree 15 minutes 30 seconds West 78 feet to a point in Nancy Creek; thence North 70 degrees 5 minutes 30 seconds West 80.10 feet to a point in Nancy Creek; thence South 62 degrees 24 minutes 30- seconds West 73.50 feet to a point in Nancy Creek; thence north 66 degrees 25 minutes 30 seconds West 158.30 feet to a point in Nancy Creek; thence North 78 degrees 16 minutes West 585.0 feet to a point in Nancy Creek; thence South 70 degrees 55 minutes West 138.50 feet to a point in Nancy Creek; thence South 34 degrees 5 minutes West 118.40 feet to a point in Nancy Creek; thence South 28 degrees 55 minutes East 35.0 feet to a point; thence South 61 degrees 5 minutes West 194.4 feet to a point on the Easterly right-of-way of North Shallowford Road, said road being an 80 foot right-of-way; thence North 29 degrees 30 minutes West 98.54 feet to a point; thence North 25 degrees 59 minutes 30 seconds West 255.67 feet to a point; thence South 89 degrees 49 minutes East 2175.67 feet to a point on the Northwesterly side of North Peachtree Road and the point of beginning.

Less and except all that tract or parcel of land lying and being in Land Lot 334 of the 18th District, DeKalb County, Georgia, conveyed from ASL Limited Partnership to Carlton G. Chapman on December 23, 1988, recorded in Deed Book 5689 page 052, DeKalb County Records, and being more particularly described as follows:

TO FIND THE TRUE POINT OF BEGINNING, commence at an iron pin set at the intersection of the north line of Land Lot 334 and the northwesterly right-of-way of North Peachtree Road; running thence south 15 degrees 12 minutes 04 seconds west along said right-of-way a distance of 116.74 feet to an iron pin set; running thence south 24 degrees 38 minutes 05 seconds west a distance of 60.00 feet to an iron pin set and the TRUE POINT OF BEGINNING; from the TRUE POINT OF BEGINNING run thence along the northwesterly right-of-way of North Peachtree Road, south 24 degrees 38 minutes 05 seconds west a distance of 37.22 feet to an iron pin set; thence continuing along said right-of-way south 32 degrees 28 minutes 05 seconds west a distance of 978.52 feet to a point; running thence south 40 degrees 03 minutes 05 seconds west a distance of 82.79 feet to an iron pin set; running thence north 48 degrees 49 minutes 55 seconds west a distance of 157.20 feet to an iron pin set; running thence north 00 degrees 07 minutes 01 seconds west a distance of 141.34 feet to an iron pin set; running thence north 89 degrees 50 minutes 05 seconds east a distance of 311.32 feet to an iron pin set and the TRUE POINT OF BEGINNING. Said tract containing 1.151 acres as shown by plat of survey for Carl Chapman, prepared by Quadra-Tech, Inc., dated December 12, 1986, being certified by Wallace Long Hambrick, Georgia Registered Land Surveyor No. 1375.

After Recording Return to:

Georgia Environmental Protection Division
Response and Remediation Program
2 Martin Luther King, Jr. Drive, SE
Suite 1462 East
Atlanta, Georgia 30334

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor:	The Trust of John F. Rowan, Sr. Mrs. Catherine Norris, Representative P.O. Box 82 Rancho Santa Fe, CA 92067
Grantee/Holder:	<Company Name or individual(s)> <Mailing address>
Grantee/Entity with express power to enforce:	State of Georgia Department of Natural Resources Environmental Protection Division 2 Martin Luther King Jr. Drive, SE Suite 1152 East Tower Atlanta, GA 30334
Parties with interest in the Property:	<Company Name or individual(s)> <Mailing address>

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and a restaurant on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Point of Compliance Monitoring Plan (as referenced in Activity 4)

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Fashion Care Cleaners
2211 Savoy Drive
Chamblee, GA

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by the Trust of John F. Rowan, Sr., its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil in Area B on Figure 1, and groundwater in Area D on Figure 1 of the Property. Engineering controls required for the Property are the maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area A on Figure 1, the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures on the Property and any enclosed structures constructed on the Property within the areas indicated on attached Figure 1 (Area A) and Figure 2 (Area C). These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. The notice shall explicitly state the requirements of Activities 5-8 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (attached). In addition, an Annual Point of Compliance Monitoring Report. as specified in the EPD approved Point of Compliance Monitoring Plan, must be submitted to the EPD until point of compliance monitoring is deemed unnecessary by the EPD in accordance with the specifications set forth in the Point of Compliance Monitoring Plan.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless EPD concurs that soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained on existing structures and on any additional enclosed structures

constructed until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS, or vapor modeling of groundwater and soil contamination in the respective areas defined on Figure 1 and 2 indicate that vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. The concrete and asphalt covering Area A in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within this area be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area with soil concentrations above these levels is identified as Area B on Figure 1, attached.

Soil - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/kg)	Utility Worker Threshold Concentration (mg/kg)	Comments
PCE	142	1015	

The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area with groundwater concentrations above Type 5 RRS is identified as Area D on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

Groundwater - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.12	0.82	
Trichloroethene	0.006	0.041	
Cis-1,2-dichloroethene	2.6	18.0	This chemical was identified above the construction worker threshold only.
Trans-1,1-dichloroethene	0.174	1.24	
Vinyl chloride	0.27	0.097	

Prior to conducting construction or subsurface utility work that may result in exposure to soil or groundwater in the designated Type 5 areas, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted soil or groundwater performed in the execution of work should be done in accordance with Items 7 and 6 above, respectively.

The exposure duration assumed for a utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, uitility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in a year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminated the work exposure pathway.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin; thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor: Southern Automatic Company
4420 Tree Haven Drive, N.E.
Atlanta, Georgia 30342-3426

Grantee/Holder: <Company Name or individual(s)>
<Mailing address>

Grantee/Entity with express power to enforce: State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1152 East Tower
Atlanta, GA 30334

Parties with interest in the Property: <Company Name or individual(s)>
<Mailing address>

Property:

The property subject to this Environmental Covenant is the Southern Automatic Company N. Peachtree Tract (hereinafter "Property"), located at 4306 N. Peachtree Road, in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 25, 1974 from Hoke A. Rowan, Jr. to Southern Automatic Company recorded in Deed Book 3267, Page 130, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.51 acres of property developed at the time of this covenant with a single, one-story building that contains a dentist office, a beauty shop, and other retail stores. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-005 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.
- Vapor Intrusion Model - Response to EPD Comments dated February 22, 2012 regarding Voluntary Remediation Program Reports submitted through December 2, 2011: VRP Site, Fashion Care/Executive Care, HSI No. 10786, 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, dated March 14, 2012.

This document is available at the following location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Add Property Address here, or Owner Contact Information if undeveloped.

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act and the Georgia VRP.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by Southern Automatic Company, its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the adjacent property; 2211 Savoy Drive, Chamblee Georgia. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene and cis-1,2-dichloroethene have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated there under (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted groundwater in designated area of the property. Engineering controls required for the Property are:

- The maintenance of existing concrete and asphalt covering soil impacted with regulated chemicals in Area A of Figure 1, and
- The implementation and maintenance of vapor mitigation measures beneath any enclosed structures constructed on the Property within Area C on attached Figure 2, unless updated vapor modeling approved by the EPD indicates vapor mitigation is unnecessary.

These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, Southern Automatic Company (hereinafter "Southern Automatic"), hereby binds Grantor, its successors and assigns to the activity and use restrictions for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated there under. Failure to timely enforce compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from exercising any authority under applicable law.

Southern Automatic makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Southern Automatic and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, Southern Automatic or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activityand/orUseLimitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, or to apply for building permit(s). The EPD must be notified within 3 business days following any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2. These notifications shall include a certification that the requirements of this covenant were adhered to.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant. . The notice shall explicitly state the requirements of Activities 5-7 to ensure worker protection and proper handling of impacted media.

4. Periodic Reporting. Annually, beginning no later than 12 months following the effective date of this Environmental Covenant, the Owner shall submit to EPD a completed Site Use, Activity and Monitoring Evaluation Form (attached).

1. Activity and Use Limitation(s). The Property shall be used for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant, unless the requirements identified below are followed for residential use. Non-residential use requires:
   - A vapor mitigation system or barrier be installed and maintained with the construction of any enclosed structures within the impacted soil Area A as indicated on attached Figure 1 and impacted groundwater Area C as indicated on Figure 2, until the HSRA regulated substances in soil and groundwater at the Property reach non-residential HSRA RRS,; or
   - Vapor modeling of groundwater and/or soil contamination in the respective areas defined on Figure 1 and 2 indicate that a vapor mitigation is not required for enclosed structures and EPD concurs with the vapor modeling results; and
   - Groundwater use is prohibited (unless EPD concurs that groundwater is remediated to residential RRS).

Residential use of the Property requires:
- A vapor mitigation system or barrier be installed and maintained with the construction of any enclosed structures within the impacted groundwater Area C as indicated on Figure 2, until the HSRA regulated substances in groundwater at the Property reach non-residential HSRA RRS; or
- Vapor modeling of groundwater contamination indicates that a vapor mitigation is not required for enclosed structures in this area and EPD concurs with the vapor modeling results,; and
- No residential structures should be constructed over the impacted soil Area A as indicated on attached Figure 1 and the requirements defined in Section 6 (Soil Limitations) below must be adhered to, unless the soil is remediated to residential standards in this area; and
- Groundwater use is prohibited, unless EPD concurs that groundwater is remediated to residential RRS.

5. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

6. Soil Limitation. The concrete and asphalt covering the area designated as Area A in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS, must be maintained and shall only be breached in accordance with the restrictions herein. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

7. Utility Worker & Construction Worker Protection. Levels of the following HSRA regulated chemicals have been identified in groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers as indicated:

HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.12	0.82	
Trichloroethene	0.006	0.041	
Cis-1,2-dichloroethene	2.6	18.0	This chemical was identified above the construction worker threshold only.

The area(s) with concentrations above Type 5 RRS levels is identified as Area D on attached Figure 2. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade. Prior to conducting construction or subsurface utility work that may result in exposure to groundwater in the designated area, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted groundwater performed in the execution of work should be done in accordance with Item 5 above.

The exposure duration assumed for utility worker was 35 days per year, for a period of 25 years. The exposure duration assumed for a construction worker was 250 days a year, for a period of no more than one year. Therefore, utility worker exposure in the areas that meet Type 5 RRS, but exceed Type 1-4 RRS, should not exceed 35 days per year for 25 years, and for construction workers should not to exceed 250 days in one year. If on site works in the areas designated above are to be exceeded, then the procedures outlined above must be followed to eliminate the work exposure pathway.

8. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

9. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

10. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

11. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

12. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any

respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

13. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

RepresentationsandWarranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;
c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 11 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Exhibit A Legal
Description

Beginning at an iron pin on the south line of Land Lot 343, said point being south 89 degrees 53 minutes west 213.00 feet from the westerly right of way of North Peachtree Road, (70' R/W), thence south 89 degrees 53 minutes west 225.00 feet along the south line of Land Lot 343 to an iron pin, thence north 0 degrees 7 minutes west 316.8 feet to an iron pin on the southerly right of way of I-285, thence south 74 degrees 49 minutes east along the southerly right of way of I-285, 203.9 feet to an iron pin, thence south 15 degrees 11 minutes west 120.0 feet to a masonry nail, thence south 22 degrees 15 minutes east to the south line of Land Lot 343 and the point of beginning.

Revised Johnson & Ettinger Vapor Models

- Parcel 18-343-13-001 (Georgia-Alabama Commercial Investments, LLC property)
- Parcel 18-343-13-005 (Southern Automatic Company property)

WINTER ENVIRONMENTAL

INTRODUCTION

This technical summary describes a vapor intrusion analysis of volatile organic compound (VOC) plumes originating from the Fashion Care Dry Cleaner site located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HSI 10786), and from the release of gasoline from the gas station located on Georgia-Alabama Commercial Investments, LLC property. The Johnson & Ettinger transport model (J&E), release 3.1, obtained from the EPA download page and updated with the November 2011 Regional Screen Level Table (RSLT), was used to estimate the incremental cancer risk and Hazard Quotient from VOCs in groundwater at the Georgia-Alabama Commercial Investments, LLC property (EZ-Serve Gas Station), Tax Parcel 18-343-13-001. Table E-1 summarizes the J&E model inputs and cumulative incremental risk results for the EZ-Serve Gas Station resulting from vapor intrusion from groundwater impacts. For reference, both the J&E Model and RSLT can be obtained from the USEPA[1,2]. The following discussion is obtained directly from the J&E User's Guide:

This revised version of the User's Guide corresponds with the release of Version 3.1 of the Johnson and Ettinger (1991) model (J&E) spreadsheets for estimating subsurface vapor intrusion into buildings. Several things have changed within the models since Version 2 was released in December 2000 and since the original version was released in September 1998. The following represent the major changes in Version 3.1 to be consistent with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Quality from Groundwater and Soils dated November 25, 2002.

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the EZ-Serve Gas Station vapor intrusion analysis summarized in Table E-1 are discussed in the following:

Groundwater Concentration (EZ-Serve Gas Station): Shallow groundwater water concentration data obtained in March, 2010, was evaluated as the basis for estimating representative VOC concentrations in groundwater beneath the EZ-Serve Gas Station property. VOC concentrations

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm
[2] http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/pdf/resair_sl_table_run_NOV2011.pdf

from monitoring wells FMW-1 and MW-11 were averaged in order to provide a representative groundwater concentration scenario for this location. Several monitoring wells surrounding the EZ-Serve Gas Station have or had free product (petroleum) and did not provide representative (or any) chlorinated compound data. Results of individual VOC constituent risk used to determine the cumulative incremental cancer and Hazard Quotient risk for the EZ-Serve Gas Station are shown in Table E-2.

Soil Profile SCS Classifications: As shown in Table E-1, soil boring FMW-1 was used to obtain the depth to groundwater, the soil characterization at the groundwater interface (Silty Clay) and the vadose zone lithology (Sand). These data have some of the largest influence on model results for the GW-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent "exposure per unit volume" composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of VOC vapor intrusion was conducted for EZ-Serve Gas Station property using the standardized Johnson & Ettinger convection/diffusion model Vesion 3.1 (2004), and updated with the November 2011 RSLT. The groundwater VOC concentrations utilized summarized in Tables E-2.

The conclusion for the EZ-Serve Gas Station property vapor intrusion analysis is that the incremental cancer risk, as calculated using very conservative model input assumptions, is below the HSRA standard of one-per-hundred thousand, and the calculated Hazard Quotient is below the threshold of one (1.0).

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

INTRODUCTION

This technical summary describes a vapor intrusion analysis of volatile organic compounds (VOCs) into the structure at Parcel #18-343-13-005, Southern Automatic Company property (Dentist Office), located adjacent to the Fashion Care Dry Cleaner at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HSI 10786). The Johnson & Ettinger transport model (J&E), release 3.1, was obtained directly from the EPA download page and updated with values from the November 2011 Regional Screening Level Table (RSLT). Tetrachloroethylene was updated to match the February 10, 2012 update from EPA. The J&E Model was then used to estimate the incremental cancer risk and Hazard Quotient from all detected VOCs based on sub-foundation soil vapor sampling conducted on May 31, 2011. For reference, the J&E Model[1] and November 2011 RSLT[2] can be obtained from current USEPA Websites. The following discussion is obtained directly from the J&E User's Guide:

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

In addition to the finite and infinite source models referred to above, two models (are included) that allow the user to input empirical soil gas concentration and sampling depth information directly into the spreadsheets. These models will subsequently estimate the resulting steady-state indoor air concentrations and associated health risks.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the Dentist Office property vapor intrusion analysis, associated with Fashion Care site, are summarized in Table D-1 are discussed in the following:

Soil Vapor Concentration: Shallow soil gas VOC concentration data were obtained beneath the foundation slab of the Dentist Office building on March 31, 2011. Samples were obtained approximately four inches below the concrete floor at sample locations VS-1 and VS-2. All detected VOC concentrations from this event were used in the J&E calculation to obtain a cumulative risk factor for cancer and hazard. 4-Ethyltoluene was included in the model as

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm
[2] http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/index.htm

tert-butylbenzene since the J&E compound database (VLOOKUP) does not specifically include this gasoline-related hydrocarbon.

Soil Profile SCS Classifications: As shown in Table D-1, soil boring FMW-1 was used to obtain the soil characterization of the vadose zone lithology (primarily Sand immediately below the slab). Due to proximity to surface, these data have minimal influence on model results for the SG-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent "exposure per unit volume" composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of cumulative VOC vapor intrusion was conducted for the Dentist Office (Parcel #18-343-13-005 Southern Automatic Company Property), associated with the Fashion Care site, using the updated Johnson & Ettinger convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Version 3.1 (2004). Two soil vapor samples collected directly beneath the floor were used to obtain data input for the soil gas screening model discussed previously. Individual VOC constituents used to calculate the cumulative risk factors are summarized in Table D-2.

Results from the vapor intrusion analysis indicate a cumulative human health risk below the HSRA standard of one incremental cancer in a population of 100,000, and below the Hazard Quotient threshold of 1.0. This calculation is performed under conservative exposure assumptions.

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

PE/PG Certification

I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer/professional geologist who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Section 2
Introduction

Winter Environmental has prepared this Voluntary Investigation and Remediation Plan Semiannual Status Report (Status Report) in accordance with the Voluntary Remediation Program (VRP) for the Fashion Care/Executive Care Site (Site), Hazardous Site Inventory (HSI) No. 10786, located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia, on behalf of the John F. Rowan, Sr. Item IV Trust (Trust). On July 9, 2010, a Voluntary Investigation and Remediation Plan Application (VIRP) was submitted to the Georgia Environmental Protection Division (EPD) Hazardous Sites Response (HSRA) Program for the Site. On December 2, 2010, the EPD approved the VIRP with comments and entered the Site into the VRP. This Status Report has been prepared to present the first six months of activities, December 2, 2010 through June 2, 2011, conducted for the Site in accordance with the VRP.

Section 3
Work Performed – December 2, 2010 through June 2, 2011

The activities currently identified to be performed at the Site under the VRP are outlined in the VIRP dated July 9, 2010, the EPD VIRP approval letter dated December 2, 2010, the EPD VIRP comment letter dated December 2, 2010 and the VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011. The activities that have been performed from December 2, 2010 through June 2, 2011 are as follows:

- Preparation of a scope of work and cost estimate to implement the VIRP;
- Submittal of a Financial Assurance instrument for completion of the VIRP;
- Re-examination of the construction log and analytical data for MW-23D (the deepest monitoring well on Site) and surrounding monitoring wells analytical data;
- Development of a budget estimate for installation of vapor mitigation system for the Fashion Care building (Parcel 18-343-13-002);
- Evaluation of the EPD 7Q10 stream flow value presented in the EPD VIRP comment letter dated December 2, 2010;
- Vapor modeling using the Johnson and Ettinger (J&E) Vapor Model for parcels 18-343-13-001 and
  18-333-02-023;
- Collection of vapor samples beneath the slab of the building currently on parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company;
- Calculation of site-specific utility and construction worker clean-up standards in accordance with Section 391-3-19-.07(10) for comparison to known soil and groundwater concentrations on each qualifying property;
- Winter Environmental and the Trust's counsel, Mr. Scott Hitch, Esquire, of Hitch and Webb LLP, have prepared revised draft Environmental Covenants for the following qualifying properties (see Figure 2, Tax Parcel Map):
  - Parcel 18-343-13-002, 2211 Savoy Drive, Chamblee, Georgia, John F. Rowan, Sr. Item IV Trust;
  - Parcel 18-343-13-001, 4308 North Peachtree Road, Chamblee, Georgia, Georgia-Alabama Commercial Investments, LLC (UST Facility I.D. No. 900341*1; EZ-Serve Site);
  - Parcel 18-333-02-023, no street address, Asl Limited Partnership;

- Evaluation of the optimum time of the year to conduct the eight surface water sampling events requested in the EPD VIRP comment letter dated December 2, 2010, based on publically available stream flow data for Nancy Creek; and

- Initial evaluation of modeling techniques for the Site.

These activities are described in more detail below.

3.1 Financial Assurance Instrument

On March 2, 2011, Mr. Scott Hitch, Esquire, of Hitch and Webb LLP, acting on behalf of the Trust, submitted to the EPD the Financial Assurance instrument in accordance with Condition #1 of the EPD VIRP approval letter dated December 2, 2010. The Financial Assurance instrument presented was in the form of a Surety Bond in the amount of $163,600. The scope of work and cost estimate to implement the VIRP was prepared by Winter Environmental and presented in a Technical Memorandum dated February 3, 2011 and included as an attachment. The flow chart of the currently anticipated scope of work is provided as Figure 1 in this Status Report.

3.2 Vapor Modeling and Vapor Sampling

Vapor modeling using the J&E Vapor Model (1991) was conducted for parcels 18-343-13-001 and 18-333-02-023. The model calculations and a summary of the input parameters and results for the parcels are included in Appendix A. The modeling was performed using the most recent round of groundwater data collected in May and June of 2010 and presented in the VIRP. The results from the J&E model were used to develop the vapor mitigation requirements, as required, and the revised draft Environmental Covenants.

The J&E model run for parcel 18-343-13-001 (Georgia-Alabama Commercial Investments, LLC) was run using only those constituents impacting groundwater as a result of the release of tetrachloroethene (PCE) from the Fashion Care Site, and not from the release of petroleum from the underground storage tanks (USTs) on this parcel. None of the constituents of interest (COI) from the Site are present in soil on this parcel; therefore, only groundwater impacts were used as input data into J&E. The results of the J&E indicate that the drycleaner constituents present do not pose a vapor intrusion risk above the HSRA standard (Rules for Hazardous Waste Management, Chapter 391-3-19-.07 (10)(d)) of 10^{-5} incremental cancer risk per constituent or cumulative risk for all constituents; nor does it exceed a Hazard Quotient of 1. Accordingly, based upon the J&E results, no vapor mitigation requirements were included in the draft Environmental Covenant for this property.

The J&E model run for parcel 18-333-02-023 (Asl Limited Partnership) was also run using only those constituents impacting groundwater as a result of the release of PCE from the Fashion Care Site, and not from the release of petroleum from the USTs on parcel 18-343-13-001. None of the COI from the Site are present in soil on this parcel; therefore, only groundwater impacts were used as input data into J&E

model. The results of the J&E model indicate that the drycleaner constituents present in groundwater do not pose a vapor intrusion risk above the HSRA standard (Rules for Hazardous Waste Management, Chapter 391-3-19-.07 (10)(d)) of 10^{-5} incremental cancer risk per constituent; however, the cumulative risk for multiple constituents does present a vapor intrusion potential above the HSRA standard of 10^{-5} incremental cancer risk. The Hazard Quotient of 1 is not exceeded. Accordingly, based upon the J&E model results, vapor mitigation requirements were included in the draft Environmental Covenant for this property.

Vapor sampling was conducted on May 20, 2011 beneath the building located on Parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company. The results of the vapor sampling had not been received at the time of this Status Report. The results and conclusions of the vapor sampling event will be included in, or submitted before, the next Semiannual Status report due December 2, 2011.

3.3 Site-specific Utility and Construction Worker Clean-up Standards

In accordance with Item #11 of the EPD VIRP comment letter dated December 2, 2010, site-specific utility and construction worker clean-up standards were calculated for the Site in accordance with HSRA Rules, Section 391-3-19-.07(10) for soil and groundwater. The calculations are presented in Appendix B, and the results are presented in Table 1. These standards were then compared to known soil and groundwater concentrations on each qualifying property for the Site to determine if, and what, worker protection measures should be included in the revised draft Environmental Covenants.

The standards were compared to the groundwater data points from each qualifying property in the most recent round of groundwater data collected in May and June of 2010 and the soil data presented in Table 2 of the VIRP from each property. The soil and groundwater data comparisons are presented in Tables 2 and 3. The results indicate that utility and construction worker protection measures should be taken as follows, and the Environmental Covenants for each property were revised accordingly:

- Parcel 18-343-13-002, 2211 Savoy Drive, Chamblee, Georgia, John F. Rowan, Sr. Item IV Trust. The construction and utility worker RRS for PCE in soil was exceeded. The construction and utility worker RRS for PCE, trichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride in groundwater were exceeded.
- Parcel 18-343-13-001, 4308 North Peachtree Road, Chamblee, Georgia, Georgia-Alabama Commercial Investments, LLC. There were no construction or utility worker RRS for groundwater exceeded on the property. No soil releases occurred on this property.
- Parcel 18-333-02-023, Asl Limited Partnership. The construction and utility worker RRS for PCE in groundwater was exceeded. No soil releases occurred on this property.
- Parcel 18-343-13-005, 4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company. The utility and construction worker RRS will be compared to the soil and groundwater data from this property prior to the revision of its Environmental Covenant. The revised draft

Environmental Covenant for this property will be included in, or submitted before, the next Semiannual Status report due December 2, 2011.

3.4 Revised Draft Environmental Covenants

Winter Environmental and the Trust's counsel, Mr. Scott Hitch, Esquire, of Hitch and Webb LLP, have prepared revised draft Environmental Covenants for parcel 18-343-13-002 (2211 Savoy Drive, Chamblee, Georgia, John F. Rowan, Sr. Item IV Trust), parcel 18-343-13-001 (4308 North Peachtree Road, Chamblee, Georgia, Georgia-Alabama Commercial Investments, LLC), and parcel 18-333-02-023 (Asl Limited Partnership). The revised draft Environmental Covenants for these parcels are included in Appendix C, for EPD's review.

The revised draft Environmental Covenant for parcel 18-343-13-005 (4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company) cannot be completed until the results from the vapor sampling conducted on the property have been received and evaluated. The revised draft Environmental Covenant for this property will be included in, or submitted before, the next Semiannual Status report due December 2, 2011.

3.5 Miscellaneous Activities

In response to EPD Item #7 of the EPD VIRP comment letter dated December 2, 2010, the construction log for MW-23D, currently the deepest monitoring well on Site and installed for the adjacent UST investigation at parcel 18-343-13-001, was reexamined along with the analytical data from MW-23D and surrounding monitoring wells. This was done to design additional assessment at the Site to further develop the Conceptual Site Model. No confirmatory change could be made in the Conceptual Site Model presented in the VIRP; therefore, additional data collection will be conducted in the vicinity of MW-23D and elsewhere on the Site, to further develop the current Conceptual Site Model (see Figure 3). The additional assessment activities are presented as Item 10 in the Figure 1 flow chart.

Winter Environmental prepared a budget estimate for installation of vapor mitigation system under the Fashion Care building on the parcel 18-343-13-002, to prevent the migration of volatile drycleaner constituents into the building from the impacted soil and groundwater beneath the structure. An active sub-slab depressurization system is proposed, and an example is presented in Appendix D. The system will have to be maintained for the life of the structure, or until natural degradation of the impacted soil and groundwater reaches contaminant concentrations set forth in the VIRP for a non-residential setting. Vapor mitigation requirements have been placed into the draft Environmental Covenant for the property for existing and future structures placed over the impacted area. A final estimate for the installation of the system will be provided to the Trust during the next six months and an installation schedule will be established and presented to the EPD.

Winter Environmental has evaluated EPD 7Q10 stream flow value of 3.0 cubic feet per second presented in the EPD VIRP comment letter dated December 2, 2010, and concurs with the use of this stream flow

value for future fieldwork and data evaluation. The EPD, in Item # 2 of the VIRP comment letter dated December 2, 2010, requested that eight surface water sampling events be conducted before June 2, 2011 when flow is close to 7Q10 and the results included in this Status Report. An evaluation of the historical, publically available, stream flow data for Nancy Creek was reviewed and it was determined that 7Q10 conditions are most likely to occur during the historical dry period of late summer to early fall for the Greater Atlanta Area. Therefore, based upon conversation with EPD, verbal approval of this rationale was given to Winter Environmental to conduct the surface water sampling events during this historical dry period. The results will be submitted in the second VRP Progress Report in December 2011. This change in schedule was documented in correspondence to the EPD dated May 13, 2011.

In response to EPD Item #17 of the EPD VIRP comment letter dated December 2, 2010, locks were installed on the protective casings on the monitoring wells that were most recently installed on Parcel 18-333-02-023, the Asl Limited Partnership property. The wells will be label during the next fieldwork event.

Section 4
Work to be Performed

The additional activities currently identified to be performed at the Site through completion of the VIRP are outlined in the VIRP dated July 9, 2010, the EPD VIRP approval letter dated December 2, 2010, the EPD VIRP comment letter dated December 2, 2010 and the VRP Action Plan Technical Memorandum dated February 3, 2011 included as an attachment to the Financial Assurance submittal to the EPD dated March 2, 2011. More specifically, these tasks are presented on Figure 1, Items #4, 6 through 11 and 13 through 20. The tasks projected to be completed during the next six months and included in the next Status Report to be submitted December 2, 2011 are as follows:

- Evaluation of the vapor sampling results from parcel 18-343-13-005 (4306 North Peachtree Road, Chamblee, Georgia, Southern Automatic Company), and completion of the draft Environmental Covenant for this property;

- Completion of a final design and cost estimate for the installation of a vapor mitigation system for the building on parcel 18-343-13-002;

- Preparation of a "Corrective Action Plan" to be implemented if a surface water detection occurs during future surface water sampling events;

- Conduct eight surface water sampling events during late summer/early fall when stream flow in Nancy Creek is close to 7Q10, and evaluation of the results;

- Complete horizontal groundwater delineation beyond FMW-15 through the installation of two shallow monitoring wells, and the collection of a full round of groundwater and surface water samples from the Site for use in modeling and to reestablish a groundwater concentration baseline for the VIRP;

- And possibly, to refine the Conceptual Site Model:
  - Installation of borings across the impacted area to confirm presence/absence of a dry silt, shallow confining unit,
  - Installation of a deeper soil zone well next to FMW-4 to establish a vertical gradient if the dry silt, shallow confining unit is uniformly present,
  - Installation of piezometers across Nancy Creek to confirm creek is a gaining stream, and
  - Conduct a well pump test to recalculate horizontal hydraulic gradient for the Site and for input into future modeling.

The tasks required to complete the VIRP are presented on Figure 4, a revised estimated schedule. This schedule will be revised with the submittal of each Semiannual Status Report, as required.

Section 5
Professional Services Hours This Period

A total of approximately 180.25 professional service hours have been completed by Winter Environmental and 30.5 service hours complete by Hitch and Webb, LLP from December 2, 2010 through June 2, 2011. A table of the approximate breakdown of Winter Environmental's hours by month is presented in Table 4.

NOTES:

BOLD Laboratory detection is above applicable regulatory standard.

ISWQS Georgia In-Stream Water Quality Standards (Rule 391-3-6-.03 Water Use Classifications and Water Quality Standards)

PRC Pertroleum related constituent

NA(1) Not Applicable - fumigant-insecticide properly applied

NA(2) Not Applicable - Petroleum related constituent which has no In-Stream Water Quality Standard

NR Not regulated

* Type 4 RRS is defaulted to the equivalent of the Type 1 RRS because the Type 1 RRS has a higher value.

** RRS is taken from EPD CAP approval letter dated December 28, 2007, table of approved RRS in Condition 8.

FPP Free-phase petroleum present in the monitoring well

Exceeds HSRA Type 5 RRS for both construction and utility workers

Exceeds one HSRA Type 5 RRS standard for either construction or utility workers

Appendix A
Johnson and Ettinger Vapor Models

INTRODUCTION

This technical summary describes a vapor intrusion analysis of the tetrachloroethylene (PCE) and trichloroethylene (TCE) plumes at the Fashion Care Dry Cleaner located at 2211 Savoy Drive, Chamblee, DeKalb County, Georgia (HIS 10786). The Johnson & Ettinger transport model (J&E), release 3.1, obtained directly from the EPA download page was used to estimate the incremental cancer risk and Hazard Quotient from PCE in groundwater at the Georgia-Alabama Commercial Investments, LLC property (UST Facility I.D. No. 900341*1, EZ-Serve Gas Station Site, Tax Parcel 18-343-13-001). A companion analysis was performed for the Asl Limited Partnership property (Tax Parcel 18-333-02-023), an undeveloped wooded area located adjacent to the Fashion Care property. A hypothetical structure identical to the EZ-Serve Gas Station was the basis for calculations for the undeveloped Asl Limited Partnership property. Table VM-1 summarizes the model inputs and results for the both properties. For reference, the J&E Model can be obtained from the USEPA Web page[1]. The following discussion is obtained directly from the J&E User's Guide:

This revised version of the User's Guide corresponds with the release of Version 3.1 of the Johnson and Ettinger (1991) model (J&E) spreadsheets for estimating subsurface vapor intrusion into buildings. Several things have changed within the models since Version 2 was released in December 2000 and since the original version was released in September 1998. The following represent the major changes in Version 3.1 to be consistent with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Quality from Groundwater and Soils dated November 25, 2002.

The J&E Model is a one-dimensional analytical solution to convective and diffusive vapor transport into indoor spaces and provides an estimated attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. The model is constructed as both a steady-state solution to vapor transport (infinite or non-diminishing source) and as a quasi-steady-state solution (finite or diminishing source). Inputs to the model include chemical properties of the contaminant, saturated and unsaturated zone soil properties, and structural properties of the building.

This manual provides documentation and instructions for using the vapor intrusion model as provided in the accompanying spreadsheets.

Model results (both screening and advanced) are provided as either a risk-based soil or groundwater concentration, or as an estimate of the actual incremental risks associated with a user-defined initial concentration. That is to say that the model will reverse-calculate an "acceptable" soil or groundwater concentration given a user-defined risk level (i.e., target risk level or target hazard quotient), or the model may be used to forward-calculate an incremental cancer risk or hazard quotient based on an initial soil or groundwater concentration.

USER INPUTS

Limited input from the user is allowed in the screening version of the J&E model. User model inputs for the Fashion Care vapor intrusion analysis summarized in Table VM-1 are discussed in the following:

Groundwater Concentration (Georgia-Alabama Commercial Investments, LLC property): Shallow groundwater water concentration data obtained in March, 2010, were evaluated as a basis for estimating representative PCE and TCE concentrations in groundwater beneath the

[1] http://www.epa.gov/oswer/riskassessment/airmodel/johnson_ettinger.htm

Georgia-Alabama Commercial Investments, LLC property tax parcel. PCE and TCE concentrations from monitoring wells FMW-1 and MW-11 were averaged in order to provide a representative groundwater concentration scenario for this location. Several monitoring wells surrounding the EZ-Serve Gas Station have or had free product (petroleum) and did not provide PCE or TCE data.

Groundwater Concentration (Asl Limited Partnership property): Shallow groundwater water concentration data obtained from monitoring wells FMW-5, FMW-6, FMW-11 (March 2010) and MW-14 (September 2008) were used to calculate PCE and TCE groundwater concentrations where a hypothetical structure would encounter vapor intrusion at a future date. The area encompassed by these wells fairly represents a potential development area from a structure similar to the EZ-Serve Gas Station. This area also emphasizes the portion of the groundwater plume with significant PCE and TCE concentrations.

Soil Profile SCS Classifications: As shown in Table VM-1, soil boring FMW-1 was used to obtain the depth to groundwater, the soil characterization at the groundwater interface (Silty Clay) and the vadose zone lithology (Sand). These data have some of the largest influence on model results for the GW-SCREEN module used for this analysis.

Model Defaults: Default values for air exchange, slab thickness, air entry rate, and other structure variables were used. Although site specific building structure data could be used, the results from the modeling would likely not change significantly due to the model assumptions for human exposure and associated pathways of exposure. This is due to the inherent "exposure per unit volume" composition of the model. More advanced modeling would require a significant amount of structure measurement, including estimates of floor crack area, actual air exchange rates for this specific dry cleaner, and pressure differentials between inside and outside the building.

RESULTS AND CONCLUSION

Modeling of PCE and TCA vapor intrusion was conducted for Fashion Care adjoining properties using the standardized Johnson & Ettinger convection/diffusion model as executed in Excel spread sheet format and distributed by USEPA, Vesion 3.1 (2004). Results for two groundwater concentrations (as discussed above) are summarized in Table VM-1 for the Georgia-Alabama Commercial Investments, LLC property. There appears to be less ambiguity regarding a representative groundwater concentration for a future hypothetical structure on the undeveloped Asl Limited Partnership property. Therefore, a single scenario for vapor intrusion into a hypothetical structure identical to the EZ-Serve Gas Station was conducted for the Asl Limited Partnership property, and results are also summarized in Table VM-1.

Results from the vapor intrusion analysis are easily interpreted, but the conclusion from the analysis is much less straight forward. A general conclusion regarding both properties is that, under the default structure parameters provided in the model, there is virtually no expectation of human health impacts resulting from toxicity. All scenarios are far below a Hazard Quotient of 1 for both TCE and PCE.

Conclusions regarding incremental cancer for workers over a lifetime of exposure must be drawn after calculating added risk of 0.14-per-million (PCE) and 0.91-per-million (TCE). When added together, the cumulative risk is 0.105-per- hundred thousand, substantially below the HSRA standard of one-per-hundred thousand. The overall conclusion for the Georgia-Alabama Commercial Investments, LLC property vapor intrusion incremental cancer risk is that there is likely to be virtually no additional cancer risk, as calculated using very conservative model input assumptions.

Conclusions regarding incremental cancer risk for the Asl Limited Partnership property hypothetical scenario are different compared to the Georgia-Alabama Commercial Investments, LLC property. Without modern vapor barriers or controls, i.e., assuming identical construction compared to the EZ-Serve Gas Station structure assumptions, the incremental cancer risk is 6-per-million (PCE) and 10-per-million (TCE), or a cumulative 1.6 per-hundred thousand. This value slightly exceeds the allowable HSRA standard of one-per-hundred thousand.

Model limitations are a significant factor in drawing conclusions from this analysis.

MODEL LIMITATION

The simplified Johnson & Ettinger one-dimensional convection and diffusion model used in the calculations is useful for screening under ideal conditions using site specific data. The Fashion Care site does not offer ideal conditions and exhibits the potential for significant variability in key simulation data inputs. Alternative site specific data inputs and assumptions could also be used to generate much different results. The conceptual model upon which this analysis was conducted may require revision in the future in order to improve the vapor intrusion predicative capability.

Appendix C
Revised Draft Environmental Covenants

Included are revised draft Environmental Covenants for:

- Parcel 18-343-13-002; 2211 Savoy Drive, Chamblee, Georgia; John F. Rowan, Sr. Item IV Trust.
- Parcel 18-343-13-001; 4308 North Peachtree Road, Chamblee, Georgia; Georgia-Alabama Commercial Investments, LLC.
- Parcel 18-333-02-023; no street address; Asl Limited Partnership.

There is a redline copy, and a copy with the redlines incorporated, for each draft Environmental Covenant so the changes made can be easily identified.

Parcel 18-343-13-002; 2211 Savoy Drive, Chamblee, Georgia; John F. Rowan, Sr. Item IV Trust

After Recording Return to:

Georgia Environmental Protection Division
Response and Remediation Program
2 Martin Luther King, Jr. Drive, SE
Suite 1462 East
Atlanta, Georgia 30334

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor: The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
P.O. Box 82
Rancho Santa Fe, CA 92067

Grantee/Holder: <Company Name or individual(s)>
<Mailing address>

Grantee/Entity with express power to enforce: State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1152 East Tower
Atlanta, GA 30334

Parties with interest in the Property: <Company Name or individual(s)>
<Mailing address>

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and a restaurant on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by the Trust of John F. Rowan, Sr., its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-Dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil and groundwater in designated areas of the property. Engineering controls required for the Property are the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures on the Property and any enclosed structures constructed on the Property within the area indicated on attached Figure 1 and Figure 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce

compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2 that would affect the Property

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Periodic Reporting. Annually, by no later than <date> following the effective date of this Environmental Covenant, the Owner shall submit to EPD an Annual Report as specified in the EPD approved Point of Compliance Monitoring Plan including: groundwater detection-monitoring report results, maintenance and inspection activities, certification of non-residential use of the Property, and documentation stating whether or not the activity and use limitations in this Environmental Covenant are being abided by.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS.

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated.

Soil - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/kg)	Utility Worker Threshold Concentration (mg/kg)	Comments
PCE	214	61	

The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area(s) with groundwater concentrations above these levels is identified on attached Figure #. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

Groundwater - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.286	0.082	
Trichloroethene	1.02	0.290	
Cis-1,2-dichloroethene	12.8	91.3	This chemical was identified above the construction worker threshold only.
Trans-1,1-dichloroethene	0.174	1.24	
Vinyl chloride	0.27	0.097	

Prior to conducting construction or subsurface utility work that may result in exposure to soil or groundwater in the designated areas, a worker must have appropriate HAZWOPER training per OSHA's Hazardous Waste Operations and Emergency Response Standard 29 CFR 1910.120, and perform the work in accordance with a Health and Safety Plan prepared by a qualified safety professional. All management of impacted soil or groundwater performed in the execution of work should be done in accordance with Items 7 and 6 above, respectively.

9. Permanent Markers. Permanent markers shall be installed and maintained on the Property that delineate the restricted area as specified in Section 391-3-19-.08(7)(d) of the Rules. Disturbance or removal of such markers is prohibited. The markers should indicate that an Environmental Covenant exists for the Property, and that the covenant should be reviewed prior to any site disturbance.

10. Right of Access. In addition to any rights already possessed by EPD and/or the <name of Holder>, the Owner shall allow authorized representatives of EPD and/or <name of Holder> the right to enter the Property at reasonable times for the purpose of evaluating the Corrective Action; to take samples, to inspect the Corrective Action conducted at the Property, to determine compliance with this Environmental Covenant, and to inspect records that are related to the Corrective Action.

11. Recording of Environmental Covenant and Proof of Notification. Within thirty (30) days after the date of the Director's signature, the Owner shall file this Environmental Covenant with the Recorders of Deeds for each County in which the Property is located, and send a file stamped copy of this Environmental Covenant to EPD within thirty (30) days of recording. Within that time period, the Owner shall also send a file-stamped copy to each of the following: (1) <name of Holder>, (2) each person holding a recorded interest in the Property subject to the covenant, (3) each person in possession of the real property subject to the covenant, (4) each municipality, county, consolidated government, or other unit of local government in which real property subject to the covenant is located, and (5) each owner in fee simple whose property abuts the property subject to the Environmental Covenant.

12. Termination or Modification. The Environmental Covenant shall remain in full force and effect in accordance with O.C.G.A. § 44-5-60, unless and until the Director determines that the Property is in compliance with the Type 1, 2, 3, or 4 RRS, as defined in Georgia Rules of Hazardous Site Response (Rules) Section 391-3-19-.07 and removes the Property from the Hazardous Site Inventory, whereupon the Environmental Covenant may be amended or revoked in accordance with Section 391-3-19-08(7) of the Rules and O.C.G.A. § 44-16-1 *et seq*.

13. Severability. If any provision of this Environmental Covenant is found to be unenforceable in any respect, the validity, legality, and enforceability of the remaining provisions shall not in any way be affected or impaired.

14. No Property Interest Created in EPD. This Environmental Covenant does not in any way create any interest by EPD in the Property that is subject to the Environmental Covenant. Furthermore, the act of approving this Environmental Covenant does not in any way create any interest by EPD in the Property in accordance with O.C.G.A. § 44-16-3(b).

Representations and Warranties.

Grantor hereby represents and warrants to the other signatories hereto:

a) That the Grantor has the power and authority to enter into this Environmental Covenant, to grant the rights and interests herein provided and to carry out all obligations hereunder;
b) That the Grantor is the sole owner of the Property and holds fee simple title which is free, clear and unencumbered;

c) That the Grantor has identified all other parties that hold any interest (e.g., encumbrance) in the Property and notified such parties of the Grantor's intention to enter into this Environmental Covenant;
d) That this Environmental Covenant will not materially violate, contravene, or constitute a material default under any other agreement, document or instrument to which Grantor is a party, by which Grantor may be bound or affected;
e) That the Grantor has served each of the people or entities referenced in Activity 10 above with an identical copy of this Environmental Covenant in accordance with O.C.G.A. § 44-16-4(d).
f) That this Environmental Covenant will not materially violate or contravene any zoning law or other law regulating use of the Property; and
g) That this Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by a recorded instrument that has priority over the Environmental Covenant.

Notices.

Any document or communication required to be sent pursuant to the terms of this Environmental Covenant shall be sent to the following persons:

Exhibit A
Legal Description

All that tract or parcel of land lying and being in Land Lot 343 of the 18th District of DeKalb County, Georgia and being more particularly described as follows: Beginning at an iron pin on the westerly line of the right of way of North Peachtree Road (which line is 35 feet westerly from the center line of said road) and on the line dividing Land Lots 343 and 334; and running thence along said Land Lot line South, 89 degrees 53 minutes West, 213 feet to an iron pin; thence North 22 degrees 15 minutes West, 158.85 feet to an iron pin; thence North 15 degrees 11 minutes East, 120 feet to an iron pin on the southerly line of the right of way of I-285; thence South 74 degrees 49 minutes East along the southerly right of way of I-285, 100 feet to an iron pin; thence South 15 degrees 11 minutes West, 990 feet to an iron pin; thence South 23 degrees 25 minutes 30 seconds East, 111.6 feet to an iron pin; thence South 60 degrees 44 minutes East, 60 feet to an iron pin; thence North 89 degrees 53 minutes East, 75 feet to an iron pin on the westerly right of way of North Peachtree Road; thence along said right of way South 9 degrees 17 minutes 30 seconds West, 18 feet to the POINT OF BEGINNING. According to a Plat by Earnest L. Boggus dated June 14, 1968, revised April 10, 1969, revised May 8, 1970. Subject to covenants, easements and restrictions of record and to utility easements.

This is the same property conveyed by Business Associates, Inc. to CJH Capital Corporation by Warranty Deed dated September 21, 1987, recorded in Deed Book 5954, page 189, Clerk's Office, DeKalb County Superior Court.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, *et seq.* This Environmental Covenant subjects the Property identified below to the activity and/or use limitations specified in this document. The effective date of this Environmental Covenant shall be the date upon which the fully executed Environmental Covenant has been recorded in accordance with OCGA § 44-16-8(a).

Fee Owner of Property/Grantor: The Trust of John F. Rowan, Sr.
Mrs. Catherine Norris, Representative
P.O. Box 82
Rancho Santa Fe, CA 92067

Grantee/Holder: <Company Name or individual(s)>
<Mailing address>

Grantee/Entity with express power to enforce: State of Georgia
Department of Natural Resources
Environmental Protection Division
2 Martin Luther King Jr. Drive, SE
Suite 1152 East Tower
Atlanta, GA 30334

Parties with interest in the Property: <Company Name or individual(s)>
<Mailing address>

Property:

The property subject to this Environmental Covenant is the Fashion Care/Executive Care Tract (hereinafter "Property"), located at 2211 Savoy Drive in Chamblee, DeKalb County, Georgia. This tract of land was conveyed on November 7, 2003 from Business Associates, Inc., a Georgia Corporation to John F. Rowan recorded in Deed Book 15562, Page 660, DeKalb County Records. The area is located in Land Lot 343 of the 18th District of DeKalb County, Georgia. The property consists of approximately 0.61 acres of property developed with a single, one-story building that contains a drycleaner on the west side and a restaurant on the east side. A complete legal description of the area is attached as Exhibit A and a map of the area is attached as Exhibit B.

Tax Parcel Number(s):

18-343-13-002 of DeKalb County, Georgia

Name and Location of Administrative Records:

The corrective action at the Property that is the subject of this Environmental Covenant is described in the following document[s]:

- Georgia Environmental Protection Division (EPD) Voluntary Remediation Program (VRP) Application/Corrective Action Plan (CAP) for the Fashion Care/Executive Care Site, HSI #10786, July 9, 2010.

These documents are available at the following locations:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1462 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Description of Contamination and Corrective Action:

This Property has been listed on the state's hazardous site inventory and has been designated as needing corrective action due to the presence of hazardous wastes, hazardous constituents, or hazardous substances regulated under state law. Contact the property owner or the Georgia Environmental Protection Division for further information concerning this Property. This notice is provided in compliance with the Georgia Hazardous Site Response Act.

This Declaration of Covenant is made pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq*. by the Trust of John F. Rowan, Sr., its successors and assigns, <name of Grantee/Holder>, and the State of Georgia, Department of Natural Resources, Environmental Protection Division (hereinafter "EPD"), its successors and assigns. This Environmental Covenant is required because a release of tetrachloroethene (PCE) occurred on the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene, vinyl chloride and 1,1-Dichloroethene have been detected in groundwater beneath the Property. PCE, trichloroethene, trans-1,2-dichloroethene, cis-1,2-dichloroethene and vinyl chloride have been detected in soil beneath the Property. These chemicals are "regulated substances" as defined under the Georgia Hazardous Site Response Act, O.C.G.A. § 12-8-90 *et seq.*, and the rules promulgated thereunder (hereinafter "HSRA" and "Rules", respectively). The Corrective Action associated with these regulated substances on the Property consists of engineering and institutional controls to protect human health and the environment. The institutional controls consist of no use of groundwater on the Property, and utility and construction worker protection requirements regarding impacted soil and groundwater in designated areas of the property. Engineering controls required for the Property are the implementation and maintenance of vapor mitigation measures beneath any existing enclosed structures on the Property and any enclosed structures constructed on the Property within the area indicated on attached Figure 1 and Figure 2. These controls shall remain in effect until the EPD deems the regulated substances above are in compliance with HSRA Risk Reduction Standards (RRS) commensurate with the use of the Property.

Deleted: Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, and Trichloroethene in soil and groundwater, and trans- 1, 2-Dichloroethene in soil occurred on the Property. Vinyl chloride, Dichloroethylene, N.O.S., Tetrachloroethene, Trichloroethene and trans- 1, 2-Dichloroethene (collectively, "Constituents of Concern, or "COI")

Deleted: The Corrective Action consists of the installation and maintenance of engineering controls (a vapor collection system will be installed beneath the existing building) and institutional controls (limit use to non-residential activities) to protect human health and the environment.

Grantor, the Trust of John F. Rowan, Sr. (hereinafter "Trust"), hereby binds Grantor, its successors and assigns to the activity and use restriction(s) for the Property identified herein and grants such other rights under this Environmental Covenant in favor of the <name of Holder> and EPD. EPD shall have full right of enforcement of the rights conveyed under this Environmental Covenant pursuant to HSRA, O.C.G.A. § 12-8-90 *et seq*., and the rules promulgated thereunder. Failure to timely enforce

compliance with this Environmental Covenant or the use or activity limitations contained herein by any person shall not bar subsequent enforcement by such person and shall not be deemed a waiver of the person's right to take action to enforce any non-compliance. Nothing in this Environmental Covenant shall restrict EPD from excising any authority under applicable law.

The Trust makes the following declaration as to limitations, restrictions, and uses to which the Property may be put and specifies that such declarations shall constitute covenants to run with the land, pursuant to O.C.G.A. § 44-16-5(a); is perpetual, unless modified or terminated pursuant to the terms of this Covenant pursuant to O.C.G.A. § 44-16-9; and shall be binding on all parties and all persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereinafter "Owner"). Should a transfer or sale of the Property occur before such time as this Environmental Covenant has been amended or revoked then said Environmental Covenant shall be binding on the transferee(s) or purchaser(s).

The Environmental Covenant shall inure to the benefit of <name of Holder>, EPD, Trust and their respective successors and assigns and shall be enforceable by the Director or his agents or assigns, <name of Holder> or its successors and assigns, the Trust or its successors and assigns, and other party(ies) as provided for in O.C.G.A. § 44-16-11 in a court of competent jurisdiction.

Activity and/or Use Limitation(s)

1. Registry. Pursuant to O.C.G.A. § 44-16-12, this Environmental Covenant and any amendment or termination thereof, may be contained in EPD's registry for environmental covenants.

2. Notice. The Owner of the Property must give thirty (30) day advance written notice to EPD of the Owner's intent to convey any interest in the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Corrective Action. The Owner of the Property must also give thirty (30) day advance written notice to EPD of the Owner's intent to change the use of the Property, apply for building permit(s), or propose any subsurface site work in the environmentally impacted areas shown on Figures 1 and 2 that would affect the Property.

3. Notice of Limitation in Future Conveyances. Each instrument hereafter conveying an interest in the Property subject to this Environmental Covenant shall contain a notice of the activity and use limitations set forth in this Environmental Covenant and shall provide the recorded location of the Environmental Covenant.

4. Periodic Reporting. Annually, by no later than <date> following the effective date of this Environmental Covenant, the Owner shall submit to EPD an Annual Report as specified in the EPD approved Point of Compliance Monitoring Plan including: groundwater detection-monitoring report results, maintenance and inspection activities, certification of non-residential use of the Property, and documentation stating whether or not the activity and use limitations in this Environmental Covenant are being abided by.

5. Activity and Use Limitation(s). The Property shall be used only for non-residential uses, as defined in Section 391-3-19-.02 of the Rules and defined in and allowed under the DeKalb County's zoning regulations as of the date of this Environmental Covenant. Any residential use of the Property shall be prohibited unless soil and groundwater are remediated to residential RRS. A vapor mitigation system or barrier shall be installed and maintained with the construction of any enclosed structures until the HSRA regulated substances in soil and groundwater at the Property reach HSRA RRS.

Deleted: . [WHAT ARE THE LIMITATIONS ON "SITE WORK" REGARDING NOTIFICATION?]

Deleted: prior to and during the

Deleted: COI

Deleted: residential risk reduction standards

6. Groundwater Limitation. The use or extraction of groundwater beneath the Property for drinking water or for any other non-remedial purposes shall be prohibited, unless HSRA regulated substances are treated to below HSRA residential RRS for groundwater.

   Should any dewatering of groundwater for construction or utility work purposes be necessary, a sanitary sewer system discharge permit should be acquired from DeKalb County. The extracted water should be pretreated to DeKalb County requirements prior to discharge into the sanitary sewer system. Extracted groundwater should not be discharged into the storm water system or surface waters. All management of impacted groundwater should be done in accordance with all applicable local, state and federal rules and regulations governing the management of such material.

7. Soil Limitation. Should intrusive activities within the area designated in Figure 1 as having regulated substances at concentrations greater than HSRA non-residential RRS be required, the extracted, impacted soil should be managed in accordance with all applicable local, state and federal rules and regulations governing the management of such material. Removed soil in this area should not be placed back into the excavation, but be properly characterized for disposal in accordance with 40 CFR Part 261(specifically 40 CFR Parts 261.20-24, regarding characteristic waste) and transported and disposed of at an appropriate disposal facility. The excavation should be backfilled with clean fill material and recapped with an impervious surface. Recapping of the area of excavation would not be necessary if all the impacted soil in the excavation area is removed to below applicable HSRA residential RRS to the water table for the regulated chemicals of concern noted in the "Description of Contamination and Corrective Action" above.

8. Utility Worker & Construction Worker Protection. HSRA regulated chemicals have been identified in soil and groundwater above calculated risk-based threshold levels (HSRA Type 5 RRS) for the protection of construction workers and/or utility workers. The following regulated chemicals have been identified in soil above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated.

Soil - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/kg)	Utility Worker Threshold Concentration (mg/kg)	Comments
PCE	214	61	

The following regulated chemicals have been identified in groundwater above calculated risk-based threshold levels for the protection of construction workers and/or utility workers as indicated. The area(s) with groundwater concentrations above these levels is identified on attached Figure #. At the time of the preparation of this covenant, groundwater was present in the identified area at approximately 13.5 feet below current grade.

Groundwater - HSRA Type 5 RRS for the Protection of Construction Workers and/or Utility Workers			
HSRA regulated chemical	Construction Worker Threshold Concentration (mg/L)	Utility Worker Threshold Concentration (mg/L)	Comments
PCE	0.286	0.082	
Trichloroethene	1.02	0.290	
Cis-1,2-dichloroethene	12.8	91.3	This chemical was identified above the construction worker threshold only.
Trans-1,1-dichloroethene	0.174	1.24	
Vinyl chloride	0.27	0.097
