**Subject:** **Seventh VIRP Semi-annual Progress Report**
**VOPAK Terminal Savannah**
**HSI Site No. 10464**
**Turner and Hart Street, Savannah, Chatham County, Georgia**
**Tax Parcel: 1-0618-01-003L**

Dear Mr. Metzger:

On behalf of VOPAK Terminal Savannah, Inc. Environmental International Corporation (EIC) is pleased to submit the attached Seventh VIRP Semi-annual Progress Report for the above referenced site.

Enclosed are the following:

1. One signed and sealed certification page for the Semiannual Report.
2. One bound paper copy of the Seventh VIRP Semi-annual Progress Report.
3. Two Compact Discs each with the report in searchable PDF format.

If you have any questions regarding this submittal, please contact Mr. Branden Jones of VOPAK at 912-964-1811 extn. 10114, or me at the above location.

Sincerely,
ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.
President & CEO

## CERTIFICATION AND SUPPORTING DOCUMENTATIONS
**Seventh VIRP Semi-annual Progress Report**
**VOPAK Terminal Savannah**
**HSI Site No. 10464**
**February 27, 2015**

*"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.*

*Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.*

*The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."*

# 1.0 Introduction

On behalf of VOPAK, Environmental International Corporation (EIC) is pleased to submit the Seventh VIRP Semi-annual Progress Report for review by the Georgia Environmental Protection Division (EPD). This report was prepared as specified in the April 2, 2011 "Revised Voluntary Investigation and Remediation Plan (VIRP) and Application" that was approved by the EPD on August 31, 2011 under the Voluntary Remediation Program (VRP) (EIC, 2011a).

## 1.1 Primary Objectives

The primary objective of this report is to present a compilation of tasks completed and findings determined by EIC during the six-month period from September 2014 through February 2015. This report documents the following subjects:

- Follow up responses to the April 3, 2014 EPD comment letter, regarding additional tasks completed, and a response to the February 6, 2015 EPD comment letter.
- Well abandonment and repair activities
- Continued evaluation of COC trends
- Evaluation of natural attenuation conditions

The following sections describe each task.

SECTION

# 2.0 EPD Comment Letters

## 2.1 EPD Comment Letter dated April 3, 2014

In response to EPD's comment letter dated April 3, 2014, EIC had addressed each comment in EIC's Sixth VIRP Semi-annual report dated August 29, 2014. The following subsections update selected comments pertaining to the EPD's April 3, 2014 comment letter and pertaining to tasks EIC completed since the Sixth VIRP Semi-annual report submittal.

### 2.1.2 EPD Comment 4

*The approved VIRP checklist required that the Conceptual Site Model (CSM) and Remediation Plan be finalized by February 28, 2014. However, the Fifth VIRP Semi-Annual Progress Report does not provide a clear remedial plan or address all potential exposure pathways. Given that the VIRP schedule calls for submission of the Compliance Status Report by August 31, 2016, and the rate of contaminant attenuation is not likely to reduce COC concentrations to RRS by that date, VOPAK must consider active corrective action or certifying to Type 5 RRS. Type 5 RRS would include Uniform Environmental Covenants (UECs) to restrict groundwater use on affected properties and presenting evidence that contaminated groundwater discharging to the Savannah River will not cause a violation of Georgia In Stream Water Quality Standards. The CSM and remedial plan should also address the potential for vapor intrusion in building in the vicinity of the plume (current and future).*

**Response to EPD Comment 4 previously noted in Sixth Semi-Annual VIRP Report:**

The revised VOPAK Terminal Savannah Site Conceptual Model is included in the Sixth Semi-annual Report as Appendix A. The Revised Site Conceptual Model addresses exposure pathways with updated references to site sub-gradient features. VOPAK is currently developing a protocol for groundwater microcosm testing to determine the most feasible approach to reach remedial end points. Also, EIC is currently evaluating the potential for vapor intrusion for onsite workers. EIC will include this further analysis in the following Semi-annual report.

**Follow Up Response to EPD Comment 4:**

Full evaluation of potential vapor intrusion at the site is pending site redevelopment activities. The "GPA Garage," which is the only building with limited human occupancy, was reduced in size during the railroad spur extension. Currently, the building is approximately one half the size of the original building foot-print. If GPA continues to utilize the building, EIC will include the building in the vapor intrusion study currently under development.

### 2.1.2 EPD Comment 5

*EPD concurs with the conclusion that horizontal delineation is now complete on the downgradient (northern) side of the plume. If subsequent sampling of MW-37on the GAF Material Property (southern side of plume) continues to show concentrations of contaminants of concern above the delineation standard, further delineation may be required in that area.*

**Response to EPD Comment 5 previously noted in Sixth Semi-Annual VIRP Report:**

The EPD's concurrence of the downgradient (northern) side of the plume is noted and will be referenced in future reports. If during the next semi-annual sampling event, scheduled for October 2014, any constituents of concern (COCs) at MW-37 continue to exceed the delineation standard or criterion, EIC will evaluate concentration trends of COCs at MW-37 and investigate the possibility of any off-site sources of COCs in determining whether an additional monitoring well is necessary to delineate the up-gradient side of the plume.

**Follow Up Response to EPD Comment 5:**

The completion of the October 2014 sampling event (described in Section 4 of this report) confirms sustained concentrations of monitored contaminants of concern above the delineation standard in the area of MW-37. Trend analysis of contaminant concentrations at this well is included in Section 5 of this report. Considering that MW-37 is hydraulically upgradient of the previously known PCE release at Tank 24 of VOPAK Tank Farm No. 2, EIC is unable to confirm the potential source of COCs in MW-37.

### 2.1.3 EPD Comment 7

*EPD acknowledges attempts to locate and rehabilitate or abandon wells noted in our comment letter of November 20, 2012. Please complete abandonment of monitoring wells IW-1 and IW-2. Although it is preferable to remove the well screen and casing, the USEPA SESD guide, Design and Installation of Monitoring Wells (SESDGUID-101-R1), permits backfilling the well with bentonite or neat cement with the casing in place if it cannot be removed. Please refer to that document and follow the method of abandonment with the casing in place for wells where it is not practicable to remove the casing because of danger to existing infrastructure.*

**Response to EPD Comment 7 previously noted in Sixth Semi-Annual VIRP Report:**

Due to site conditions, it is not practicable to remove the well casing at well IW-1 nor to over-ream this well with augers (due to the possible presence of nearby buried utilities), per SESDGUID-101-R1. Consequently, EIC plans to remove a temporary concrete patch EIC installed over this well and to backfill the well casing with a 30-percent solids bentonite grout to within 6 inches from the surface. Abandonment will be completed by installing a permanent six-inch thick concrete cap over the grout/excavation to ground surface.

As detailed in the fifth semi-annual VIRP progress report (EIC, 2014), a rhodimet product line was accidentally ruptured by an auger bit during the over-reaming of well IW-2. Augering was discontinued at a depth of approximately 3 feet below ground surface. During rhodimet cleanup activities by VOPAK, rhodimet-stained soil was removed from the borehole and the borehole was expanded to a diameter of approximately 2 feet. As other product lines and a possible electrical conduit lie less than one foot from the original well at this depth, EIC plans to abandon monitoring well IW-2 by backfilling the existing 3-foot deep excavation with a 30-percent solids bentonite grout to within 6 inches of the surface. Abandonment will be completed by installing a six-inch thick concrete cap over the grout to ground surface.

These well abandonment activities are scheduled to be completed during the next semi-annual groundwater monitoring event in October 2014.

**Follow Up Response to EPD Comment 7:**

The abandonment of wells IW-1 and IW-2 was completed in October of 2014 and is described in Section 3 of this report.

## 2.2 EPD Comment Letter dated February 6, 2015

EIC received a copy of EPD's February 6, 2015 comment letter on February 13, 2015 via email. Following is a response to each comment.

### 2.2.1 EPD Comment 1

*As noted in correspondence from EPD regarding previous sampling events, the observed concentrations of PCE and other COCs during the April 2014 sampling event suggest that the site will not reach Type 1 through 4 risk reduction standards (RRS) within the timeline of the approved VIRP (by August 31, 2016). Based on our August 11, 2014 meeting, we understand that the next report will evaluate the timeline and should propose alternatives to reach the standards, such as active corrective action or certification to Type 5 RRS with Uniform Environmental Covenants (UECs) to address exposure pathways.*

**Response to EPD Comment 1**

As discussed in the Sixth VIRP Semi-Annual Progress Report, MNA had substantially reduced the PCE under favorable MNA conditions. Based on the base plume originally defined in the VIRP, MNA was progressing reasonably well, negating the requirement for an active remediation. It is important to recognize, however, that additional wells installed during horizontal delineation under the VIRP revealed additional areas of COC contamination. For instance, well MW-32 was installed during the VIRP program as a replacement well for well MW-20, which was not sampled since August 2003. It appears that MW-20 was destroyed or paved over. After installation, PCE concentrations at MW-32 have steadily increased until the last sampling event in October 2014, when the PCE concentration dropped by approximately 68% compared to the April 2014 sampling event. EIC will further verify the PCE concentration trend at this and other wells in subsequent sampling events.

As discussed in the VIRP, VOPAK has authorized EIC to evaluate potential alternatives to accelerate the MNA process. In this regard, VOPAK recently conducted one round of groundwater sampling from selected wells to determine the current status of key indicators of MNA parameters. This is an important step in developing options for microcosm evaluation for potential enhanced attenuation or certification options. In addition, EIC is in the process of developing a contingency plan as discussed in Section 5.

### 2.2.2 EPD Comment 2

*The Mann-Kendall analysis provided for selected wells was helpful in assessing trends. In future reports please include trend analysis charts for all wells with ongoing detections above RRS. For example, MW-32 has an obvious upward trend in concentration as impaired groundwater migrates north-easterly and likely into the Tidal Flat.*

**Response to EPD Comment 2**

The purpose of the Mann-Kendall analysis is to evaluate the attenuation potential of up-gradient, mid-gradient, and down-gradient wells. We do not have evidence of plume migration as discussed in Section 5.

### 2.2.3 EPD Comment 3

*EPD has noted VOPAK's intention to evaluate the vapor intrusion potential onsite. There may be some concern with the "GPA Garage", which sits above the plume and may be a location in which workers are regularly present. This risk as well as the risk to potential future buildings will need to be addressed in any institutional controls.*

**Response to EPD Comment 3**

These risks will be addressed in a vapor intrusion study, as noted in Section 2.1.2.

### 2.2.4 EPD Comment 4

*Considering the shallow groundwater present in many areas of the site, there is some concern for exposure to construction workers. This risk will need to be addressed in any institutional controls.*

**Response to EPD Comment 4**

These risks will be addressed in a vapor intrusion study, as noted in Section 2.1.2.

### 2.2.5 EPD Comment 5

*EPD has noted the intention to assess the potential of preferential flow through utility trenches, such as the large storm water conveyance pipe discharging to the Tidal Flat near MW-32. Please note that VOPAK will need to provide evidence that contaminated groundwater discharging to the Savannah River (or the Tidal Flat) via any pathway will not create ecological risks associated with concentrations in surface water or sediment. Evidence is needed to support the claim that the sheet pile wall is an effective hydraulic barrier.*

**Response to EPD Comment 5**

EIC will compile available drawings and construction details for subgrade structures in the area, including the sheet pile wall installation, and evaluate the fluid flow mobility as it relates to COCs of interest.

### 2.2.6 EPD Comment 6

*EPD has noted the sampling challenges cited in the Report related to turbidity stabilization and drawdown minimization. Please continue to make all efforts to adhere to USEPA SESD standard operating procedure, Groundwater Sampling (SESDPROC-301-R3), with a specific focus on stabilization criteria. Also, while the additional purging of well IW-1R described in the Report may be useful, EPD does not agree that it can be considered "redevelopment".*

**Response to EPD Comment 6**

EIC will continue to attempt stabilization and minimization of drawdown. It is important to note that the site conditions such as short water columns, low recharge rates, and small well diameters may present continued challenges during future sampling events. EIC made reasonable attempts to redevelop IW-1R as discussed in Section 3.2.3.3 of the Sixth VIRP Semiannual Progress Report. EIC is uncertain if EPD requires additional steps for "redevelopment."

SECTION

3

# 3.0 Well Modifications

To meet the objectives set forth in Comment 7 of the EPD's April 3, 2014 VIRP comments letter (Section 2) and to address well-related issues regarding the proposed construction of a new railroad spur by the Georgia Ports Authority (GPA), VOPAK conducted various field tasks in October and December of 2014. These tasks included completing the abandonment of two former injection wells south of Tank Farm # 2, the replacement of a damaged concrete pad and vault at well LAW-PZ-8R, and the abandonment of two former injection wells east of Tank Farm # 2 - which were located within the proposed construction area for the new railroad spur. These site modifications are illustrated in Figure 3-1. The following subsections describe the relevant tasks completed by EIC.

## 3.1 Railroad Spur Impact Evaluation

In October 2014, VOPAK retained EIC to complete an impact assessment of a proposed railroad spur on the site's groundwater monitoring network. This railroad spur was proposed for construction in January 2015 along the east side of Tank Farm # 2, as shown in Figure 3-2. EIC generated Figure 3-2 from plan drawings supplied by GPA and prevailing well locations to evaluate the potential impact of the construction on wells. This analysis showed that two former injection wells, IW-6 and IW-7, which lied directly in the proposed path of the railroad spur, would likely be destroyed during construction of the spur. The abandonment of these two wells was completed in December 2014 as discussed in Section 3.2. EIC determined that wells lying within a 10-foot buffer around the proposed construction area (Figure 3-2) could potentially be damaged by construction activities. An evaluation of the impact of the construction activities on these wells by EIC is pending the completion of the railroad spur.

## 3.2 Well Abandonment And Repairs

During two mobilizations that EIC conducted in October 2014 and in December 2014, EIC completed several tasks pertaining to the existing monitoring well network. The following sections describe the related tasks.

### 3.2.2 Utility Clearance

Clearance for buried utilities was not required for abandonment of wells IW-1 and IW-2, as these wells were to be abandoned in-place and no intrusive drilling or other excavation activities were anticipated. Since abandonment of wells IW-6 and IW-7 required over-reaming with powered augers, EIC determined from VOPAK that buried utilities had previously been located and marked in the area of these wells by a GPA contractor in preparation for the installation of the proposed rail spur. EIC also understood that utilities that had been marked included power lines, gas lines, communication lines, product lines, and water lines. Upon arrival at the site for abandonment of IW-6 and IW-7, EIC observed that the locations of buried power lines had been clearly marked on the pavement in the area of these wells. Based on the observation, it was apparent that no power lines were present near IW-6 or IW-7. No other utilities were identified in these wells.

### 3.2.3 Site Access

EIC did not encounter any limitations in accessing the areas to conduct the well-related tasks. EIC coordinated with VOPAK, regarding all site activities for access, as needed.

### 3.2.4 Well Abandonment

During each of EIC's two mobilizations to the site, an EIC professional geologist supervised the abandonment of each of four wells in accordance with the Design and Installation of Monitoring wells (SESDGUID-101-R1) in the United States Environmental Protection Agencies (EPA's) Region IV Field Branches Quality System and Technical Procedures document (EPA 2013a), with the Water Well Standards Act of 1985, O.C.G.A. 12-5-120 (GA 2011), and in accordance with Comment 7 of the EPD's April 3, 2014 comments letter. Details of the abandonment procedures are described in the following two sections.

#### 3.2.4.1 Wells IW-1 and IW-2

During EIC's first mobilization in October 2014, utilizing maintenance contractor, U.S. Mechanical Contractors, Ltd., under contract with VOPAK, EIC completed the abandonment of wells IW-1 and IW-2.

To complete the abandonment of well IW-1, initially, a temporary concrete patch that EIC had installed over this well in December 2013 and the original underlying well vault/concrete pad were removed. Next, the well PVC cap was removed and the well casing was completely filled in place with a 30-percent solids bentonite grout slurry, as shown in Photo 1. The well cap was then replaced and abandonment was completed by installing a permanent approximately 1-foot thick concrete pad flush-to-grade (FTG) over the well casing and within the excavated pit where the former concrete pads had been removed. Photo 2 shows the completed well abandonment.

After VOPAK had completed rhodiment cleanup activities at IW-2 in December 2013, an approximately 3 feet deep and 2-foot diameter open hole remained. VOPAK then placed a steel plate over this hole to accommodate vehicle traffic. To complete the abandonment of well IW-2, the steel plate was removed, water that had accumulated in the hole was pumped out, and sediment that had accumulated in the bottom of the hole was removed. The open hole was then filled with a 30% solids bentonite grout slurry to within six inches below ground surface. After allowing an adequate period for the grout to solidify (as shown in Photo 3), abandonment was completed by installing a concrete pad, reinforced with steel rebar and with a thickness of approximately 6 inches, FTG over the grout. Photo 4 shows the completed well abandonment.

During the abandonment of wells IW-1 and IW-2, soil, sediment, and concrete pad debris had been removed and containerized in labeled 55-gallon drums for later disposal by VOPAK. On each non-hazardous waste label, EIC noted VOPAK as the generator, investigative derived waste (IDW) soil as the contents, and noted the accumulation date.

#### 3.2.4.2 Wells IW-6 and IW-7

During EIC's second site mobilization to abandon wells in December 2014, EIC completed the abandonment of wells IW-6 and IW-7 utilizing drilling contractor Environmental Monitoring Services. Initially, the well vaults/concrete pads surrounding these wells were excavated and removed. Next, buried utilities were checked at each well casing utilizing a hand auger followed by slow advancement of powered augers to a depth of 5 feet. Next, utilizing a GeoProbe drill rig with 4.25-inch internal diameter (ID) decontaminated Hollow Stem Augers (HSA), each well borehole was over-reamed, whereby the PVC well casing, cement grout, bentonite seal, and sand filter pack were removed. The open boreholes were then filled with a 30% solids bentonite grout slurry from the borehole total depth to within six inches below ground surface. Photo 5 illustrates the boreholes filled with this grout.

After allowing an adequate period for the grout to solidify, a concrete pad with a thickness of approximately 6 inches was then installed FTG over the grouted hole. Photos 6 and 7 show the completed well abandonment for wells IW-6 and IW-7, respectively. As with the abandonment of wells IW-I and IW-2, EIC had soil cuttings, well casing material, and original concrete pads materials containerized in labeled 55-gallon drums for later disposal by VOPAK.

### 3.2.5 Repair of FTG Vault/Concrete Pad at LAW-PZ-8R

During EIC's site visit in April, 2014, EIC observed that the well vault and concrete pad of well LAW-PZ-8R had been damaged from site activities resulting in a severely shifted, tilted, and loosened well casing. The damage apparently took place from tanker trucks driving over a portion of the well. However, the 1-inch diameter PVC well casing was found undamaged. During the first mobilization for well repairs in October 2014, EIC directed the mechanical contractor to remove a damaged FTG 8-inch diameter/deep well vault and an approximately 2-foot long by 2-foot wide by 0.25 to 0.5-foot thick square concrete pad at LAW-PZ-8R. EIC then directed the contractor to

replace it with an identical 8-inch vault, that EIC provided, and an approximately 2.5-foot diameter and 0.75-foot thick circular concrete pad per SESDGUID-101-R1 and O.C.G.A. 12-5-120.

The new well vault installed included a bolted lid. The pit that was excavated around the well for the new concrete pad was substantially larger and deeper than the one of the previous pad allowing for a larger and stronger concrete pad. Photo 8 shows the completed new well vault/pad. The resulting soil and concrete debris were containerized in labeled 55-gallon drums for later disposal by VOPAK.

### 3.2.6 Basemap Revisions

Based on the abandonments and repairs to the site wells, EIC revised the site basemap to reflect the well abandonments.

SECTION

4

# 4.0 Groundwater Monitoring

The semi-annual groundwater monitoring (sampling) event documented in this section was conducted during October 2014. This was the first semi-annual sampling event of the VIRP program following EPD's approval of semi-annual sampling as opposed to quarterly sampling previously performed at the site. EPD's approval of change in sampling frequency is noted in Comment 3 of its April 3, 2014 comment letter (Section 2.0).

The sampling event entailed the collection of groundwater samples for analysis from wells within the previously established area of concern with constituents (or contaminants) of concern (COCs) including dissolved chlorinated volatile organic compounds (CVOCs) and volatile organic compounds (VOCs) contamination. This was the eleventh monitored natural attenuation (MNA) sampling event overall since the approval of the VIRP (EIC, 2011a) and the first semi-annual sampling event since the 2014 second semi-annual report, submitted on August 29, 2014 (EIC, 2014b).

During this event, all available monitoring wells and two selected former injection wells within and adjacent to the CVOC/VOC contaminant plumes were utilized for groundwater sampling. Accordingly, EIC collected groundwater samples for CVOC/VOC analysis from a total of 25 wells. Additionally, monitoring well MW-28, which had previously been designated as un-located on historical maps, was discovered on GAF property and sampled during this event. A description of the location and condition of MW-28 is detailed in Section 4.2.4.

In addition to the routine groundwater monitoring activities at the site to measure CVOC/VOC concentrations, EIC collected additional samples in select wells for the purpose of analyzing parameters which are indicative of the natural attenuation of COC plumes. This sampling and analysis are summarized in Sections 4.2.3 and 4.4.5, respectively.

The analytical data from the October 2014 sampling event was compared to the first quarterly sampling event (EIC, 2011b) and all other subsequent sampling events (EIC, 2012a, 2012b, 2012c, 2012d, 2013a, 2013b, 2013c, 2014a, and 2014b respectively) to track prevailing contaminant concentration trends. A previous analysis of these trends were documented in the Site Conceptual

Model (SCM) Report, submitted as Appendix A, of the 6th Semiannual Progress Report (EIC, 2014b).

The following subsections describe the results of the seventh groundwater monitoring event.

## 4.1 Groundwater Monitoring Objective

During the October 2014 groundwater monitoring event, the primary objective was to meet the following goals set forth in the VIRP.

- Review plume stability.
- Track natural attenuation of COCs by monitoring the groundwater concentrations of VOCs/CVOCs within the existing plume.
- Determine if the prevailing groundwater contaminant concentrations meet or are trending towards meeting the established RRS.
- Determine if the horizontal and vertical extents of the COC on all impacted properties have been and remain defined, respectively.
- Determine if conditions throughout the plume promote natural attenuation.

The following sections outline the tasks performed by EIC to meet this objective.

## 4.2 Groundwater Monitoring Field Program

During the October 2014 groundwater monitoring event, EIC conducted groundwater monitoring utilizing 22 shallow monitoring wells, two shallow injection wells, and one deep monitoring well. EIC also conducted MNA parameter sampling at six of these shallow monitoring wells. The site layout is illustrated in Figure 4-1. The following sub-sections describe EIC's technical approach during this event.

### 4.2.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. Region 4 EPA groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013b).

### 4.2.2 Site Access

Prior to EIC's site visit, EIC coordinated with the GPA and GAF Materials Corp. (GAF) in gaining access during the sampling event to collect groundwater samples from a total of seven off-site monitoring wells MW-17R, MW-28, MW-32, MW-34, MW-35, MW-36, and MW-37. Monitoring

wells MW-28 and MW-37 are located on GAF property and wells MW-17R, MW-32, MW-34, MW-35, and MW-36 are located on GPA property.

### 4.2.3 Field Procedures

Prior to sampling, EIC gauged each well with a Solinst Model 122 interface meter ("oil/water interface probe") to determine the static depth to groundwater. EIC utilized top-of-casing (TOC) elevations from the most recent well surveys to determine the current groundwater elevations. The gauging data is tabulated in Table 4-1.

Prior to EIC initiating field sampling activities, EIC obtained a 55-gallon drum from VOPAK to containerize purged groundwater. During the October 2014 event, the 55-gallon drum was placed on the west shoulder of the road between Tank Farm #2 and Tank Farm #3, near well MW-27. EIC placed a non-hazardous waste label on the drum and marked the contents on it as investigative derived waste ("IDW") well purge water and the accumulation date with a black permanent marker. The drum was later disposed of by VOPAK.

At each well-head designated for sampling, EIC monitored VOC air concentrations in parts per million (ppm) with a calibrated photoionization detector. A total of three measurements were taken at each well to document VOC concentrations in the ambient air within two feet of and outside the outer well casing, air between the inner well casing and the outer protective casing or vault, and air within the inner well casing once the well cap was removed. The VOC concentrations observed during the second quarter of 2014 were recorded on EIC's October 2014 Well Purging and Sampling Data field logs (Attachment A).

EIC utilized a peristaltic pump for purging and sampling. New disposable 1/4-inch inner diameter and 3/8-inch outer diameter Teflon-lined tubing was utilized at all wells for purging. The well purging data is represented in Table 4-2. Groundwater from each monitoring well was pumped via the peristaltic pump through a multi-parameter field water quality meter equipped with a flow-through cell. Based on the depth to groundwater that was determined during gauging and the known depth to the bottom of the screened interval of each well, EIC determined the depth to set the Teflon-lined tubing intake. Following the SOP, SESDPROC-301-R3, EIC set the tubing intake at the center of the available wetted screen interval.

After purging began and prior to sampling at each well, water quality parameters, including temperature, pH, oxidation-reduction potential (ORP), specific conductivity, turbidity, and dissolved oxygen (DO) were monitored. Additionally, the rate of evacuation and depth to water, if possible, were measured at approximately 5-minute intervals until water quality parameters stabilized, per SESDPROC-301-R3. EIC considered that parameters had stabilized when 3 consecutive readings were within ± 0.1 for pH and ± 5% for specific conductivity. Additionally, reasonable attempts were made to reach 0.2 mg/L DO and a turbidity reading at or below 10 Nephelometric Turbidity Units (NTUs) at each well. These measurements were recorded on EIC's Well Purging and

Sampling Data field logs and are presented with historical data in Table 4-3. Depth to water readings were taken before, during, and after pumping in wells with two-inch ID casing and before and after pumping in wells with 1-inch ID casing, as the water probe could not fit into 1-inch wells while the tubing was in the well.

After water quality parameters had either stabilized or reasonable attempts had been made to reach stabilization, EIC collected groundwater samples from each well. Samples for CVOC/VOC analysis were collected at all 25 wells sampled while 6 specific wells were also sampled for MNA parameters. CVOC/VOC samples were collected utilizing the "soda straw method", per SESDPROC-301-R3, whereby the Teflon-lined tubing was removed from the well, the peristaltic pump was switched to positive head displacement, and sample bottles filled from the bottom end of the tubing. To ensure that no groundwater in the tubing from or beyond the peristaltic pump head reached the sample bottles during sample collection, EIC utilized a minimum of 20 feet of tubing from the pump head.

At wells selected for MNA parameter sampling, prior to collecting CVOC/VOC samples, a segment of Teflon-lined tubing between silicon tubing at the pump head and the field water quality meter was removed and MNA parameter samples were collected directly from the silicon tubing at the pump head. Following the MNA parameter sampling at each of these wells, the above procedure for CVOC/VOC sampling was followed. All sample bottles were properly sealed and labeled in the field. Each sample set was then stored with ice in insulated cooler containers provided by the laboratory. Completed and signed chain of custody forms accompanied all samples.

EIC delivered and relinquished the samples to Test America Laboratories, a Georgia-certified laboratory located in Savannah, Georgia, prior to returning to EIC headquarters. The laboratory conducted analysis of volatile organic compounds via EPA method 8260B and of select MNA parameters as described in Section 4.4.5. The laboratory report for the October 2014 event is included as Attachment B. The results of the MNA parameters and COC analysis of samples collected during this event, along with historical MNA and COC analytical data, are summarized in Table 4-3 and Table 4-4, respectively.

### 4.2.4 Discovery of Well MW-28

While conducting sampling on GAF property, an unknown well was brought to the attention of EIC field technicians by GAF staff. Upon examination, EIC determined that the identity of the well was MW-28, based on the well name being etched into its concrete pad. EIC documented the condition of the well and gauged its depth to water and total depth. As the well appeared to be in good condition and apparently did not contain any significant silt deposit, EIC elected to sample the well, following the same procedure detailed in Section 4.2.3.

Upon conclusion of the field activities, EIC conducted an investigation to determine the potential source of the error that caused the well to be deemed unlocated. The results of the investigation revealed that the drawings that EIC inherited from previous site managers had illustrated MW-28 in a location that placed the well in the middle of the main driveway on GAF property. It appears

therefore that the sampling teams that managed the environmental program prior to EIC could have deemed the well to have been paved over. These are possible reasons for why MW-28 was not identified or sampled after the October 2002 sampling event. Furthermore, MW-28, that was actually adjacent to the GAF building, was also covered with various objects until the recent discovery.

### 4.3 Quality Assurance and Quality Control

For quality assurance and quality control purposes during the groundwater sampling process, EIC submitted one trip blank set, provided by the laboratory, with each sample container with CVOC/VOC samples for analysis via EPA Method 8260B. The trip blanks were stored with ice in the coolers and relinquished to the laboratory along with the rest of the CVOC/VOC samples.

To prevent cross-contamination, new disposable 1/4-inch inner diameter and 3/8-inch outer diameter Teflon-lined tubing was used to collect samples at each well, which was later disposed of. EIC's oil/water interface meter, 2,000 mL cylinder, and Teflon tubing cutter were field decontaminated prior to use and between sample locations by washing with a phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. After each sample was collected, the water quality parameters instrument was also decontaminated with DI water.

### 4.4 Data Evaluation

EIC conducted an evaluation of the data compiled from field measurements and laboratory analyses to determine the groundwater potentiometric surface, the horizontal and vertical extent of the prevailing contaminant plumes based on the October 2014 monitoring event. Data from the sampling event was compared with the data from the baseline and each of the eleven subsequent quarterly sampling events to develop a potential strategy to reach remedial end points.

#### 4.4.1 Groundwater Potentiometric Map

Table 4-5 tabulates the historical groundwater elevations for all gauging events at the Site since groundwater monitoring was initiated under the VIRP. From this table, it is apparent that during the October 2014 gauging event, the overall potentiometric surface was similar in elevation to the previous two October gauging events. In general, the potentiometric surface elevation at the Site during the October 2014 event was slightly above the average groundwater elevation.

Figure 4-2 illustrates the potentiometric surface map. Referring to Figure 4-2, certain unique groundwater surface features continue to remain persistent. These features include, most notably, a trough feature, which originates southwest of the southern end of Tank Farm No. 2 and an equipotential (relatively flat) surface within or southwest of Tank Farm No. 2. The prevailing groundwater flow direction in the vicinity of the COC plume footprint is from the southwest to the northeast.

### 4.4.2 Horizontal Extent of COC Plumes

Figure 4-3 illustrates a summary of the analytical results for the COCs from the October 2014 sampling event for each sampled well. Figures 4-4 through 4-11 illustrate each of the eight monitored COC plumes. Table 4-4 lists a compilation of available analytical results dating back to September 1997. The following sub-sections describe a spatial and temporal analysis of the COC plumes.

#### 4.4.2.1 CVOC Plume

The CVOC plume consists of perchloroethylene (PCE), Trichlorethylene (TCE), Cis 1, 2 Dichloroethylene (DCE), and Vinyl Chloride (VC). Based on current analytical results, it apparent that the overall extent and concentration of the CVOC plume at the site has significantly decreased since the inception of the VIRP sampling program in October 2011. However, residual CVOC contamination is present in certain areas. The following subsections describe spatial and temporal changes of individual CVOC constituents since VIRP sampling was initiated in October 2011.

**PCE Plume:**

Figure 4-4 illustrates the horizontal extent of the PCE plume during the October 2014 sampling event. The current PCE plume is composed of two distinctly separated areas of contamination, with one centered near IW-1R at the up-gradient southwestern end of the original CVOC plume footprint, and the second centered near MW-32 near the down-gradient northeastern end of the original CVOC plume footprint.

Within the up-gradient portion of the original CVOC plume footprint, the PCE concentration near IW-1R fell from 310 ug/L to 170 ug/L from April to October 2014 respectively. However, no significant changes in concentrations at the surrounding wells were observed.

Within the down-gradient portion of the original CVOC plume footprint, the overall extent and concentrations in this area has fluctuated since the first VIRP sampling event in October 2011, but overall there has been a decreasing concentrations trend. It is noteworthy that the PCE concentration at MW-32 has significantly decreased from 6,000 ug/L to 1,900 ug/L from April to October 2014, respectively. Additionally, the PCE concentrations reduced in the surrounding wells such as MW-29 and PAN-MW-9. In summary, the overall extents of the PCE plume have reduced or remained stable over time and concentrations are decreasing and trending towards RRS values. Clearly, MNA is effective in reducing the PCE mass concentrations.

**TCE Plume:**

Figure 4-5 illustrates the horizontal extent of the TCE plume during the October 2014 sampling event. The TCE plume is also composed of two distinctly areas of contamination. The up-gradient area of contamination is centered near IW-1R. This area of contamination did reduce slightly in extent since the April 2014 sampling event, where the concentration near IW-1R reduced from 210

ug/L to 190 ug/L. There were also other slight reductions in concentration near the adjacent monitoring wells, such as at wells IW-18 and MW-37.

The down-gradient TCE plume is currently centered near well MW-32. This area of the plume did have a significant reduction in concentration and a slight reduction in horizontal extent. The three most significant areas of reduction occurred near wells MW-29, MW-32, and PAN-MW-9. The concentrations near these wells reduced from 150, 1,500, and 190 ug/L to 55, 680, and 35 ug/L, respectively.

In summary, the overall extents of the TCE plume have reduced or remained stable over time and concentrations are decreasing and trending towards RRS values. Considering that TCE is produced from the reductive dechlorination of PCE, substantial reduction in concentration relative to the original foot-print is indicative that the MNA is effective in reducing the TCE concentrations.

**DCE Plume:**

Figure 4-6 illustrates the horizontal extent of the DCE plume during the October 2014 sampling event. The most significant increase in concentration occurred near LAW-PZ-8R with an increase from 7,400 ug/L to 15,000 ug/L. Prior to this sampling event, the concentration at LAW-PZ-8R had been on a decreasing trend. Significant decreases in concentration occurred at most other areas of the plume footprint, such as at wells IW-1R, IW-18, MW-16, MW-24R, MW-29, and at PAN-MW-9. The most significant reduction in DCE concentration occurred near well MW-29, which decreased in concentration from 8,400 ug/L to 4,300 ug/L from April to October 2014, respectively. Therefore, it appears that DCE concentrations will continue to persist at the Site until the source PCE and TCE plumes have fully attenuated.

In summary, the overall extent of the DCE plume has reduced or remained stable over time and concentrations are decreasing and trending towards RRS values. Considering that DCE is a second step daughter product from the reductive dechlorination of PCE, substantial reduction in concentration relative to the original foot-print is indicative that the MNA is effective in reducing the DCE concentrations.

**VC Plume:**

Figure 4-7 illustrates the horizontal extent of the VC plume during the October 2014 sampling event. Relative to the October 2014 VC plume, the up-gradient VC concentration in the southwestern portion of the original CVOC plume footprint, increased in concentration - most notably near LAW-PZ-8R, where the VC concentration increased from 980 ug/L to 1,900 ug/L. This major increase in VC concentration may be indicative of an increased rate of degradation of PCE and DCE, reconfirming MNA activity. The further breakdown of VC into ethene and ethane would indicate that natural attenuation is leading to the complete mineralization of PCE by MNA. The further breakdown of VC into ethene and ethane is discussed in Section 4.4.5 regarding metrics for natural attenuation.

#### 4.4.2.2 VOC Plume

The VOC plume consists of Benzene, Toluene, Ethylbenzene, and Total Xylenes (BTEX). Since the first VIRP sampling event, conducted in October 2011, the VOC plume concentrations within the original VOC plume footprint had declined substantially. Based on the more recent sampling events in 2014, however, BTEX concentrations have been increasing at well LAW-PZ-8R. The following subsections describe spatial and temporal changes of individual VOC constituents since VIRP sampling was initiated in October 2011.

**Benzene Plume:**

Figure 4-8 illustrates the horizontal extent of the benzene plume during the October 2014 sampling event The benzene plume is composed of two isolated areas of contamination near the up-gradient and down-gradient portions of the original VOC plume footprint. The benzene plume continues to maintain stability except that the concentrations at LAW-PZ-8R increased threefold from 1,200 ug/L in April 2014 to 3,400 ug/ L - the highest ever recorded. By contrast, benzene concentrations at well MW-26R reduced from 110 ug/L to 19 ug/L. Nevertheless, the benzene plume remains stable within the original plume foot-print.

**Toluene Plume:**

Figure 4-9 illustrates the horizontal extent of the toluene plume during the October 2014 sampling event. Until the last sampling event in January 2014, the toluene plume concentrations were on a decreasing trend and had remained below the RRS limit. In October 2014, however, the toluene increased in LAW-PZ-8R to 800 ug/L, therefore exceeding the RRS limit. Nevertheless, the toluene plume remains stable within the original foot-print.

**Ethylbenzene Plume:**

Figure 4-10 illustrates the horizontal extent of the ethylbenzene plume during the October 2014 sampling event. Similar to toluene, the ethylbenzene plume was on a decreasing trend and had remained below the RRS limit. Between the January 2014 and October 2014 sampling events, however, the ethylbenzene concentration increased in LAW-PZ-8R almost threefold - from 4,900 ug/L to 13,000 ug/L, thereby exceeding the RRS limit. Nevertheless, the ethylbenzene plume remains stable within the original foot-print.

**Total Xylenes Plume:**

Figure 4-11 illustrates the horizontal extent of the total xylenes plume during the October 2014 sampling event. As with the benzene, toluene, and ethylbenzene plumes, the overall extent of the total xylenes plume was on a decreasing trend. Between the April 2014 and October 2014 sampling events, however, the total xylenes concentration at well LAW-PZ-8R had significantly increased threefold from 58,000 ug/L to 180,000 ug/L. Nevertheless, the total xylenes plume remains stable within the original foot-print.

### 4.4.3 Vertical Extent of COC Plumes

The historical groundwater sampling results of samples from the single deep well MW-14 within the original COCs footprint through October 2014 are tabulated in Table 4-4. Since the redevelopment and integration of well MW-14 into the regular CVOC and VOC sampling schedule in October 2013, EIC confirmed that all monitored COC concentrations in the well were below delineation standards. In the EPD comment letter to VOPAK dated April 3, 2014, the Georgia EPD concurred with EIC that vertical delineation is complete.

### 4.4.5 MNA Indicator Parameter Analysis

As noted in Section 4.2.3, EIC has collected field indicator parameters such as pH, DO, and ORP during groundwater purging prior to sampling events. To determine whether other key indicator parameters continue to demonstrate favorable conditions for MNA, EIC collected one round of groundwater samples for key indicator parameters that require laboratory analysis. The key indicator parameter samples were collected from selected wells, including LAW-PZ-8R, MW-18R, MW-24R, MW-29, MW-32, and MW-33. These wells are located within the original PCE plume footprint.

Table 4-3 includes the results of the indicator parameters appended to data from historic sampling results. Figure 4-12 illustrates the site map with analytical results of the indicator parameters for the respective wells sampled during the October 2014 sampling event.

Referring to the results of the key indicator parameters, it is clear that conditions for the MNA of COCs remain favorable in the majority of the locations within the original PCE plume foot print. The spatial and temporal plume maps included in section 4.4.2 further support evidence of MNA with a substantial reduction of the PCE footprint. Some of the key indicator parameters, such as TOC, sulfite, sulfate, and nitrate, are not within the ideal range for favorable MNA conditions at MW-32 – located at the leading edge of the plume. EIC will verify these results in the next key MNA indicator parameter sampling event.

SECTION

5

# 5.0 Remedial Progress

To determine the remedial progress, EIC performed a spatial and temporal analysis of the COCs and an evaluation of COC trends in individual wells. The following subsections discuss the remedial progress.

## 5.1 Spatial and Temporal Analysis

The spatial and temporal analysis of the plume, discussed in Section 4, provides a clear insight into the overall remedial progress and the plume stability. The following subsections discuss each COC.

### 5.1.1 CVOC Plume

Prior to a discussion of the spatial and temporal extent of the CVOC, it is important to recognize a key well, MW-20, located at the leading edge of the plume, was not sampled since August 2003. It appears that MW-20 was not accessible for sampling as it may have been paved over prior to the implementation of the VIRP. The leading edge of the CVOC plume had therefore remained undefined prior to the implementation of the VIRP.

Prior to the initiation of the VIRP program, EIC installed MW-32 as a replacement well for MW-20 and initiated sampling effective October 2011. During subsequent sampling events, analytical data from MW-32 revealed CVOC concentrations thereby extending the horizontal limits of the base plume originally defined in the VIRP. In reviewing the analytical data, from the most recent sampling event conducted in October 2014, EIC noticed that the PCE concentrations that were previously on an increasing trend have, in fact, decreased substantially. EIC will evaluate the PCE data from subsequent sampling events to determine if the PCE concentrations exhibit a decreasing trend.

The overall extent of the base PCE plume, as defined in October 2011, has substantially reduced in areal extent since the implementation of the VIRP. In fact, data from the July 2012 sampling event indicates that the PCE plume has attenuated within a large area encompassing the middle of the October 2011 baseline plume, resulting in isolated pockets of PCE plume at the leading edge (at MW-32) and at the trailing edge (at IW-1R, that was recently redeveloped and added to the monitoring network) of the plume. TCE, representing PCE's degradation product, followed a

similar trend. By contrast, DCE and VC, that resulted from sequential degradation of TCE, remained persistent throughout the original PCE footprint. Consequently, the PCE and TCE plumes at the leading edge of the plume – as defined since July 2012 - represent isolated pockets of plumes that have not undergone complete degradation. Furthermore, PCE is far less soluble than its degradation products and the seepage velocity, as discussed in the VIRP application, is apparently 21 to 23 feet per year. Considering that the isolated pocket of plume at MW-32 was delineated in less than a year after the inception of the VIRP program, the seepage velocities do not support plume migration within such a short time frame. Consequently, the increase in CVOC concentrations at MW-32, located within an isolated pocket, and the corresponding decrease in CVOC concentrations in the middle of the plume does not represent plume migration. The PCE reduction in the middle of the plume is more likely due to cometabolic degradation with the VOC plume within the PCE footprint.

A more detailed analysis of fluid flow hydrodynamics as well as fate and transport evaluation will be included in an updated site conceptual model currently in preparation. Nevertheless, the CVOC plume has remained stable as evidenced by the consistently low CVOCs concentrations data from sentinel wells comprised of wells MW-17R, MW-36, and PAN MW-10. In summary, MNA appears to be effective in substantial reduction of the baseline PCE plume.

### 5.1.2 VOC Plume

Following a similar cometabolic trend as with the PCE plume, the VOC plume has also reduced substantially in the middle and leading edge of the VOC baseline footprint. This has resulted in an isolated pocket of VOC plume at well LAW-PZ-8R in the trailing edge of the original VOC footprint.

Referring to the October 2014 analytical data, it is apparent that the VOC concentrations have sharply increased at monitoring well LAW-PZ-8R. EIC is conducting an investigation in the area to determine the potential cause for the increased concentrations.

## 5.2 COC Trends in Individual Well

Pursuant to EPD's requirement (Section 2.2.2), EIC prepared trend graphs to illustrate the concentrations of each constituent for all wells with detection limits above RRS. These trend graphs are presented as Figures 5-1 through 5-13.

In general, all graphs illustrate the initial increase in PCE concentrations but then a gradual decline in concentrations during subsequent sampling events. By contrast, the degradation products of PCE have increased in some areas and remained persistent in other areas of the PCE footprint – confirming natural attenuation of PCE. A more detailed analysis of fluid flow hydrodynamics as well as fate and transport evaluation of CVOC and VOC concentrations will be included in an updated site conceptual model currently in preparation.

### 5.3 Remedial Progress

From the aforementioned discussions, it is apparent that MNA is effective at the site. VOPAK is also aware that the VIRP established the regulatory deadline of August 2016 to reach remedial end points. As discussed in Section 5.1, VOPAK was clearly on the path to reach this milestone based on the base COC plumes originally defined in the VIRP. Additional pockets of COCs were, however, discovered after the VIRP implementation. Furthermore, recent sampling data indicates that some of the key indicator parameters are not within the ideal range at one well, potentially impacting the rates of degradation at an isolated pocket in the leading edge of the baseline CVOC plume. Consequently, it appears that the time to reach remedial points may extend beyond the August 2016 deadline. VOPAK is currently in the process of developing a contingency plan to determine whether enhanced attenuation or an alternative remedial approach is feasible to further increase the rate of attenuation to meet the 2016 deadline.

### 5.4 Final Remediation Plan

Based on the remedial progress, VOPAK is currently in the process of updating the MNA process and develop a final remediation plan. As provisioned in the VIRP, contingency measures are being considered to determine whether enhanced attenuation or an alternative remedial approach is feasible to further increase the rate of attenuation to meet the 2016 deadline. As part of the contingency plan, VOPAK is considering the following tasks:

1. Using modeling, statistical analysis, or projections, estimate the time needed to reach remedial end points based on the MNA trends relative to the current COC footprint.
2. Conduct Microcosm Testing and Evaluation to determine whether amendments of some of the key parameters support enhanced attenuation option.
3. Prepare an Updated Site Conceptual Model to define the fluid flow hydrodynamics at the leading edge.
4. Conduct an Evaluation of the integrity of the sheet pile wall and other substructures as effective barriers to the potential migration of COCs.
5. Conduct an evaluation of the potential for treatment of an isolated pocket of COCs using a treatment train.
6. Conduct an evaluation of other options to reach remedial end points within the VIRP deadline or extend the deadline with EPD concurrence.

### 5.5 Updated Schedule and Timeline

Considering that the EPD's February 6, 2015 letter was received only recently, VOPAK will submit a final remediation plan, updated schedule, and cost estimate in the next Semi-Annual Progress Report.

SECTION

6

# 6.0 Summary

VOPAK has addressed the comments noted in EPD's letters dated April 3, 2013 and February 6, 2015. During the current reporting period, EIC also completed the abandonment of certain unused injection wells and other wells that were in the pathway of a rail-spur construction at the Site. Data from the recent October 2014 sampling event, continues to reflect the success of the MNA approach defined in the VIRP.

After the initiation of the VIRP program, however, additional contamination was delineated at the leading and trailing edges of the COC plumes. This additional area of contamination presents a challenge to reach remedial end points within the regulatory deadline of August 2016 established in the VIRP.

Nevertheless, MNA has successfully attenuated the COCs in a substantial area encompassing the center of the baseline plume footprint, resulting in isolated pockets of plumes at the leading and trailing edges. In addition, recent sampling data indicates that some of the key indicator parameters at one well were not within the ideal range, potentially impacting the potential rates of degradation at a small portion within the leading edge of the CVOC plume. Based on these findings, it appears that the time to reach remedial points may extend beyond the August 2016 deadline.

VOPAK is currently in the process of updating the MNA process and developing a final remediation plan. Upon preparation and approval of the final remediation plan, VOPAK will submit an updated schedule and cost estimate.

**Notes:**

ID = Identity

mL = Milliliter

TOC = Well Top of Casing

* During well purging, the Teflon-lined tubing was lowered as needed when the water level fell to the depth of the intake, causing air to be recovered.

**Notes:**
All data prior to October 2011 tabulated by ERM.
Beginning on October 2011, pH, Temperature, Dissolved Oxygen, Specific Conductivity, and Oxidation-Reduction Potential, were field measured utilizing a Horiba U-52 water quality measuring device after parameters had stablized and prior to sample collection.
All other parameters measured from October 2011 onward were analyzed by a laboratory.
NS = Not Sampled
NL= Not Located
NU= Located but Not Utilized
NI = Well Not yet Installed
LAW-PZ-8 was replaced by LAW-PZ-8R on October 9, 2006
MW-17 was replaced by MW-17R on October 10, 2006
MW-26 was replaced by MW-26R on October 9, 2006
MW-14 was located by EIC on January 24, 2013.
IW-18 was ultilized as a replacement for MW-15 beginning on October 2011
MW-30 was installed as a replacement for MW-21 on April 6, 2011
MW-31 was installed as a replacement for MW-27 on April 28, 2011
MW-27 was located by EIC on April 28, 2011
MW-32 was installed as a replacement for MW-20 on April 25, 2011
MW-33 was installed as a replacement for MW-22 on April 28, 2011
MW-34 was installed as a replacement for MW-28 on April 26, 2011
MW-35, MW-36, MW-37 were installed on December 16 and 17 2013 respectively
MW-28 was located during the October 2014 sampling event

**Notes:**

NI - Not Installed

NS - Not Surveyed, TOC elevation information is not available for well

NL - Not Located

NA - Not Applicable

NG - Not Gauged

*** = Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

*[2] = MW-14 is considered a deep well at the Site and is not considered for the shallow potentiometric surface at the Site.

***[3] = MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from October 2011 to October 2014 where available.

***[4]= Global Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from October 2011 to October 2014

VOPAK TERMINAL SAVANNAH, SAVANNAH, GEORGIA

REFERENCE: AUTOCAD BASE MAP MODIFIED FROM ERM REPORT TITLED "2010 VOPAK ANNUAL REPORT ON CORRECTIVE ACTION, HAZARDOUS SITE INVENTORY NUMBER 10484, SAVANNAH GEORGIA". CHANNEL DIMINSIONS ADAPTED FROM AUTOCAD DRAWING: "SAVANNAH TERMINAL GENERAL PLOT PLAN" DRAWN BY GULF COAST AERIAL MAPPING 3/16/99 SV-0001-P 001-REV 0

NOTES: ALL MONITORING WELLS ("MW") EAST OF OFFICE (EXCEPT "NL","FC","KMW" WELLS, AND MW-15), IW-18, FENCE LINES BTWN VOPAK AND GPA, GPA EASEMENT AND TANKS 32, 34, 37, AND 52 WERE DRAWN BASED ON SURVEY CONDUCTED BY EMC ENGINEERING SERVICES, INC. (EMC) ON 6/30/2011. MONITORING WELLS, MW-14, MW-26R, MW-30, MW-33, AND INJECTION WELLS ("IW"), IW2-R, IW5-R, IW-6, IW-7, IW-8, AND IW-21 WERE ADJUSTED BASED ON SURVEY CONDUCTED BY EMC ON 1/24/2013. SHEET PILING, TIMBER PILING, STORMWATER PIPES AND RAIL ROAD FEATURES WERE DRAWN BASED ON AS-BUILT DRAWINGS PROVIDED BY THE GEORGIA PORTS AUTHORITY. MW-35, MW-36, AND MW-37 WERE PLOTTED BASED ON SURVEY CONDUCTED BY EMC ON 1/20/2014. MW-28 WAS DISCOVERED 10/16/2014 AND PLOTTED BASED ON FIELD MEASUREMENTS.
* NITRATE/NITRITE SAMPLE FROM MW-29 WAS ANALYZED BEYOND LAB HOLD TIME.

COMMENTS:

SAMPLE COLLECTION TIME: 11:27

PREPARED BY: Will Grant

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:

SAMPLE COLLECTION TIME: 15:17

PREPARED BY: S Helms

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:

SAMPLE COLLECTION TIME: 16:58

PREPARED BY: Will Grant

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

| Initial tubing depth (ft.) BTOC | 10.5 |
| Final tubing depth (ft.) BTOC | 10.5 |
| Initial pump speed | 2.67 |
| Time pump speed was initialized | 13:40 |
| Pump speed at flow into cylinder | 2.67 SH |
| Started new roll of tubing at | |
| Three well volume (mL) | |

Clipped small amount of dense particulate from tubing that had been in pump. Restart pump at 13:44

2,000 mL volume poured into bucket:

| Time | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Cummulative Volume (mL) | | | | | | | | |

Additional remarks: Used opening for PID Reading. Water emerged from Outer metal casing. Backed away and ground water spray as well casing. Interior was still in place. Spray resulted in high VOC reading. Washed casing with DI water and allowed to sit. Removed outer cap. ~~Put~~ and measured VOC emissions. Next to High VOC reading. Opened well to sit. Next prior to sampling. Returned to sample. Ensure casing VOC reading 1.7

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### HPLC/IC

| Qualifier | Qualifier Description |
|---|---|
| H | Sample was prepped or analyzed beyond the specified holding time |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Job ID: 680-106392-1

**Laboratory: TestAmerica Savannah**

**Narrative**

### CASE NARRATIVE

### Client: Environmental International Corporation

### Project: VOPAK, Savannah

### Report Number: 680-106392-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

**RECEIPT**

The samples were received on 10/18/2014; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 3.6 C.

**VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples IW-1R (680-106392-1), IW-18 (680-106392-2), LAW-PZ-8R (680-106392-3), MW-14 (680-106392-4), MW-16 (680-106392-5), MW-17R (680-106392-6), MW-18R (680-106392-7), MW-19 (680-106392-8), MW-24R (680-106392-9), MW-23 (680-106392-10), MW-25 (680-106392-11), MW-26R (680-106392-12), MW-27 (680-106392-13), MW-28 (680-106392-14), MW-29 (680-106392-15), MW-30 (680-106392-16), MW-31 (680-106392-17), MW-32 (680-106392-18), MW-33 (680-106392-19), MW-34 (680-106392-20), MW-35 (680-106392-21), MW-36 (680-106392-22), MW-37 (680-106392-23), PAN-MW-9 (680-106392-24), PAN-MW-10 (680-106392-25) and Trip Blank (680-106392-26) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 10/22/2014, 10/23/2014, 10/24/2014 and 10/25/2014.

Samples IW-1R (680-106392-1)[200X], IW-18 (680-106392-2)[50X], LAW-PZ-8R (680-106392-3)[1000X], MW-24R (680-106392-9)[5X], MW-26R (680-106392-12)[5X], MW-29 (680-106392-15)[50X], MW-32 (680-106392-18)[20X], MW-33 (680-106392-19)[5X], MW-37 (680-106392-23)[2X] and PAN-MW-9 (680-106392-24)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**METALS (ICP)**

Samples LAW-PZ-8R (680-106392-3), MW-29 (680-106392-15) and MW-32 (680-106392-18) were analyzed for Metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 10/20/2014 and analyzed on 10/21/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**ALKALINITY**

Samples LAW-PZ-8R (680-106392-3), MW-29 (680-106392-15) and MW-32 (680-106392-18) were analyzed for alkalinity in accordance with EPA Method 310.1. The samples were analyzed on 10/22/2014 and 10/23/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**SULFIDE**

Samples LAW-PZ-8R (680-106392-3), MW-29 (680-106392-15) and MW-32 (680-106392-18) were analyzed for sulfide in accordance with EPA SW-846 Method 9034. The samples were prepared and analyzed on 10/22/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Job ID: 680-106392-1 (Continued)

### Laboratory: TestAmerica Savannah (Continued)

**9056 ANIONS**

Samples LAW-PZ-8R (680-106392-3), MW-29 (680-106392-15) and MW-32 (680-106392-18) were analyzed for 9056 Anions in accordance with SW 846 9056. The samples were analyzed on 10/28/2014 and 10/29/2014.

Samples LAW-PZ-8R (680-106392-3)[4X], MW-29 (680-106392-15)[10X], MW-29 (680-106392-15)[2X] and MW-32 (680-106392-18)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**ANIONS BY IC (NITRATE/NITRITE)**

Samples LAW-PZ-8R (680-106392-3), MW-29 (680-106392-15) and MW-32 (680-106392-18) were analyzed for Anions by IC (Nitrate/Nitrite) in accordance with EPA SW-846 Method 9056A. The following sample was received outside of holding time: MW-29 (680-106392-15). The samples were analyzed on 10/18/2014.

Samples LAW-PZ-8R (680-106392-3)[5X], MW-29 (680-106392-15)[2X] and MW-32 (680-106392-18)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**TOTAL ORGANIC CARBON**

Samples LAW-PZ-8R (680-106392-3), MW-29 (680-106392-15) and MW-32 (680-106392-18) were analyzed for total organic carbon in accordance with EPA SW-846 Method 9060A. The samples were analyzed on 10/28/2014.

Samples LAW-PZ-8R (680-106392-3)[4X] and MW-29 (680-106392-15)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

*Microseeps Workorder: 13724*

Dear Sheila Hoffman:

Enclosed are the analytical results for sample(s) received by the laboratory on Tuesday, October 21, 2014. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbin Robl 10/31/2014

# ANALYTICAL RESULTS QUALIFIERS

Workorder: 13724 680-106392-1 / VOPAK

## DEFINITIONS/QUALIFIERS

| | |
|---|---|
| Disclaimer : | The Pennsylvania Department of Environmental Protection (PADEP) has decided to no longer recognize analyses that do not produce data for primary compliance, for NELAP accreditation. The methods affected by this decision are AM20GAx, AM21G, SW846 7199 and AM4.02. The laboratory shall continue to administer the NELAP/TNI standard requirements in the performance of these methods. |
| MDL | Method Detection Limit. Can be used synonymously with LOD; Limit Of Detection. |
| PQL | Practical Quanitation Limit. Can be used synonymously with LOQ; Limit Of Quantitation. |
| ND | Not detected at or above reporting limit. |
| DF | Dilution Factor. |
| S | Surrogate. |
| RPD | Relative Percent Difference. |
| % Rec | Percent Recovery. |
| U | Indicates the compound was analyzed for, but not detected at or above the noted concentration. |
| J | Estimated concentration greater than the set method detection limit (MDL) and less than the set reporting limit (PQL). |

**HSI Site No. 10464**
**Turner and Hart Street, Savannah, Chatham County, Georgia**
**Tax Parcel: 1-0618-01-003L**

Dear Mr. Metzger:

On behalf of VOPAK Terminal Savannah, Inc. Environmental International Corporation (EIC) is pleased to submit the attached Eighth VIRP Semi-annual Progress Report for the above referenced site.

Enclosed are the following:

1. One signed and sealed certification page for the Semiannual Report.
2. One bound paper copy of the Eighth VIRP Semi-annual Progress Report.
3. Two Compact Discs each with the report in searchable PDF format.

If you have any questions regarding this submittal, please contact Mr. Branden Jones of VOPAK at 912-964-1811 extn. 10114, or me at the above location.

Sincerely,
ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.
President & CEO

# 1.0 INTRODUCTION

On behalf of VOPAK Terminal Savannah, Inc. (VOPAK), Environmental International Corporation (EIC) is pleased to submit the Eighth VIRP Semi-annual Progress Report for review by the Georgia Environmental Protection Division Response and Remediation Program (EPD). This report was prepared as specified in the April 2, 2011 "Revised Voluntary Investigation and Remediation Plan (VIRP) and Application" that was approved by the EPD on August 31, 2011 under the Voluntary Remediation Program (VRP) (EIC, 2011a).

## 1.1 Primary Objectives

The primary objective of this report is to present a compilation of tasks completed and findings determined by EIC during the six-month period from March 2015 through August 2015. This report documents the following subjects:

- Responses to the July 29, 2015 EPD comment letter
- Revision of the Site Conceptual Model
- Further evaluation of COC trends
- Evaluation MNA goals and the development of a remedial strategy

The following sections describe each task related to these subjects.

SECTION

2

# 2.0 EPD COMMENT LETTERS

## 2.1 EPD Comment Letter dated July 29, 2015

EIC received a copy of the July 29, 2015 EPD comment letter from VOPAK on August 4, 2015 and has prepared the following responses on behalf of VOPAK.

### 2.1.1 EPD Comment 1

*EPD concurs that natural attenuation is occurring at the site and that data collected after enrollment in the VRP has expanded the known footprint of the plume. However, we do not agree that this is the reason that the property will not meet Type 1 through 4 RRS within the 5-year timeframe, as implied in Section 5.3 of the Report. Since enrollment, EPD has indicated that meeting these cleanup goals within the prescribed timeframe was unlikely based on data from wells such as LAW-PZ-8R, MW-29, and PAN-MW-9, all of which have been sampled consistently before and after enrollment. EPD expects the forthcoming report(s) to evaluate the VIRP timeline, consider alternatives to reach risk reduction standards (RRS), and provide a final remediation plan, such as active corrective action or certification to Type 5 RRS with Uniform Environmental Covenants (UECs) to address exposure pathways. EPD is eager to work with VOPAK in developing a path to certification.*

**Response to EPD Comment 1:**

VOPAK understands that natural attenuation alone may be insufficient in reaching the RRS within the 5-year time frame. Referring to the April 2015 groundwater analytical data, however, it is apparent that the CVOC plume has substantially reduced in size at the leading edge. Consequently, CVOCs in only MW-29 appear to be recalcitrant – but at very low ppbs. VOPAK will review analytical data from the next sampling event - scheduled for October 2015 - to verify whether the areal extent of the CVOC is further reduced. Based on that finding, VOPAK will evaluate the need for contingency remedial measures for localized

treatment, request a time extension to reach remedial end points, or explore Type 5 RRS with UECs to address exposure pathways.

### 2.1.2 EPD Comment 2

*EPD has previously noted concern over the possibility that contaminated groundwater is discharging to the Savannah River (or the Tidal Flat) as a pathway that could create ecological risks associated with concentrations in surface water or sediment. There is no groundwater data available for the small area between two higher concentration monitoring wells (MW-32 and PAN-MW-9) and the Tidal Flat, and thus no evidence that contaminated groundwater is not discharging to the Tidal Flat. Additionally, Figure 4-6 and 4-7 indicate two discrete plumes of DCE and VC, respectively, at these wells and MW-16, though there is no evidence that these plumes are not connected. Additional monitoring well(s) or sediment sampling may be necessary to better delineate the plume and characterize ecological risks.*

**Response to EPD Comment 2:**

As discussed in the updated site conceptual model (Appendix A), it appears that the area previously presumed to be a tidal flat in previous maps is actually a narrow area that functions as a drainage channel or an inlet depending on the river tides. The retaining wall (labeled on the site figures as a concrete bulkhead) equipped with a sluice gate and the tides in the Savannah River affect the fluid flow hydrodynamics in this localized area. EIC is currently compiling additional supporting material from various sources to substantiate this finding. As stated in the aforementioned EIC's response to EPD Comment 1, the CVOC plume has also substantially reduced in size at the leading edge. Consequently, EIC is developing a detailed work plan to evaluate whether potential ecological risks are present from the contaminated groundwater that may migrate to the Savannah River. Prior to the preparation of a work plan, EIC proposes a meeting with EPD to discuss the plan objectives and scope of work.

### 2.1.3 EPD Comment 3

*EPD anticipates reviewing VOPAK's assessment of potential preferential flow through utility trenches, such as the large stormwater conveyance pipe discharging to the Tidal Flat near MW-32, as well as the hydraulic and transport evaluation of the sheet pile wall.*

**Response to EPD Comment 3:**

As noted in the updated site conceptual model (Appendix A), EIC has provided detailed schematics of the retaining wall and other related substructures. In addition, VOPAK is evaluating the feasibility of performing a flow-net analysis to determine fluid flow pathways.

### 2.1.4 EPD Comment 4

*EPD anticipates reviewing the forthcoming vapor intrusion study, indicated to assess potential risks to existing and potential future structures as well as an assessment of potential risks to construction workers in areas of shallow groundwater. Risks to construction workers are associated with incidental contact and possible ingestion of contaminated groundwater during subsurface work. Any risks associated with these pathways will need to be addressed in an institutional control.*

**Response to EPD Comment 4:**

A work plan for vapor intrusion study to evaluate the potential risks to structures and construction workers is currently under preparation. VOPAK will submit the plan to EPD for concurrence of the scope of work. Upon EPD approval, VOPAK will complete the study and submit the results in a subsequent semiannual report.

SECTION

3

# 3.0 SITE CONCEPTUAL MODEL

VOPAK Terminal Savannah, Inc. (VOPAK) submitted a preliminary site conceptual model (SCM) of the area affected by a tetrachloroethene/perchloroethene (PCE) plume as a part of the VIRP. A SCM is typically updated as additional material is progressively gained during the implementation of the VIRP.

In the Sixth VIRP Semi-annual Progress Report submitted on August 29, 2014 (EIC, 2014), VOPAK included a revised SCM. Subsequently, EIC has compiled additional data to further define the site characteristics and potential fluid flow hydrodynamics. The updated SCM is included as Appendix A. In Preparing the 2015 SCM Report, EIC made significant revisions to the groundwater hydrology section of the 2014 SCM Report regarding fluid flow hydrodynamics, COC plume delineation, and COC concentration trend analysis.

SECTION

4

# 4.0 GROUNDWATER MONITORING

The semi-annual groundwater monitoring (sampling) event documented in this section was conducted from March 30, to April 2, 2015. This was the second semi-annual sampling event of the VIRP program following EPD's approval of semi-annual sampling, as opposed to quarterly sampling that EIC previously conducted at the site.

The sampling event entailed the collection of groundwater samples, for laboratory analysis of constituents (or contaminants) of concern (COCs), from wells within the previously established area of concern. COCs that EIC monitored included dissolved chlorinated volatile organic compounds (CVOCs) and volatile organic compounds (VOCs) contamination.

During this event, all available monitoring wells and two selected former injection wells within and adjacent to the CVOC/VOC contaminant plumes were utilized for groundwater sampling. Accordingly, EIC collected groundwater samples for CVOC/VOC analysis from a total of 25 wells.

The analytical data from the March/April 2015 sampling event was compared to the first quarterly sampling event (EIC, 2011b) and all other subsequent sampling events (EIC, 2012a, 2012b, 2012c, 2012d, 2013a, 2013b, 2013c, 2014a, 2014b, and 2015) to track prevailing contaminant concentration trends. A statistical analysis of these trends is documented in the 2015 Site Conceptual Model (SCM) Report, submitted as Appendix A of this report.

The following subsections describe the results of the seventh groundwater monitoring event.

## 4.1 Groundwater Monitoring Objective

During the March/April 2015 groundwater monitoring event, the primary objective was to meet the following goals set forth in the VIRP.

- Review plume stability.
- Track natural attenuation of COCs by monitoring the groundwater concentrations of VOCs/CVOCs within the existing plume.
- Determine if the prevailing groundwater contaminant concentrations meet or are trending towards meeting the established RRS.
- Determine if the horizontal and vertical extents of the COC on all impacted properties have been and remain defined, respectively.
- Determine if conditions throughout the plume promote natural attenuation.

The following sections outline the tasks performed by EIC to meet this objective.

## 4.2 Groundwater Monitoring Field Program

During the March/April 2015 groundwater monitoring event, EIC conducted groundwater monitoring utilizing 22 shallow monitoring wells, two shallow injection wells, and one deep monitoring well. The site layout is illustrated in Figure 4-1. The following sub-sections describe EIC's technical approach regarding this event.

### 4.2.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. Region 4 EPA groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

### 4.2.2 Site Access

Prior to EIC's site visit, EIC coordinated with the Georgia Ports Authority (GPA) and GAF Materials Corp. (GAF) in gaining access during the sampling event to collect groundwater samples from a total of seven off-site monitoring wells consisting of MW-17R, MW-28, MW-32, MW-34, MW-35, MW-36, and MW-37. Monitoring wells MW-28 and MW-37 are located on GAF property and wells MW-17R, MW-32, MW-34, MW-35, and MW-36 are located on GPA property.

### 4.2.3 Groundwater Gauging

Prior to sampling, EIC gauged each well with a Solinst Model 122 interface meter ("oil/water interface probe") to determine the static depth to groundwater. The gauging data is tabulated in Table 4-1. In preparing this table, EIC utilized top-of-casing (TOC) elevations from the multiple well surveys to calculate the groundwater elevation data regarding this event. From Table 4-1, EIC noted that, while gauging IW-1R, the oil/water interface probe detected a light non-aqueous phase liquid (LNAPL). Upon retrieval of the probe, EIC observed a clear oily substance which resembled the lactate injection fluid that had been previously utilized at the site. The LNAPL was evacuated from the well via hand-bailing, the groundwater level was allowed to equilibrate, and EIC then gauged the well again prior to sampling.

### 4.2.4 Groundwater Sampling Field Procedures

Prior to EIC initiating field sampling activities, EIC obtained a 55-gallon drum from VOPAK to containerize purged groundwater. During the March/April 2015 event, the 55-gallon drum was placed on the west shoulder of the Hart Street, which lies between Tank Farm #2 and Tank Farm #3, near well MW-27. EIC placed a non-hazardous waste label on the drum and marked the contents on it as investigative derived waste ("IDW") well purge water and the accumulation date with a black permanent marker. The drum was later disposed of by VOPAK.

At each well-head designated for sampling, EIC monitored VOC air concentrations in parts per million (ppm) with a calibrated photoionization detector. A total of three measurements were taken at each well to document VOC concentrations in the ambient air within two feet of and outside the outer well casing, air between the inner well casing and the outer protective casing or vault, and air within the inner well casing once the well cap was removed. The VOC concentrations observed during the second quarter of 2014 were recorded on EIC's March/April 2015 EIC Well Purging and Sampling Data Field Logs (Attachment A).

EIC followed the "low-flow" purge technique, noted in Section 4.2.1, to conduct all groundwater sampling. EIC used a peristaltic pump with disposable 1/4-inch ID Teflon-lined tubing and a 6-inch segment of 3/16-inch ID silicon tubing at the pump head to purge each well until groundwater quality parameters reached stabilization prior to sampling. The length of Teflon-tubing necessary to place the intake at the center of the wetted screened interval was determined from water levels and available well construction data noted in EIC well purging and sampling data field logs (Attachment A).

Groundwater stabilization parameters were monitored via direct pumping to a multi-parameter field water quality field meter equipped with a flow-through cell. These parameters were recorded at approximately five minute intervals on EIC field logs (Attachment A). Additionally, purge volumes and depth-to-water (DTW) measurements were recorded at the same five-minute intervals when

possible. At each well, the pumping rate and tubing depth were adjusted accordingly if excessive drawdown was observed. In 1-inch and ¾-inch diameter wells, where downhole assembly constricted the access for the interface probe, the depth to water could not be gauged during purging. In these wells gauging was performed only just prior to inserting the tubing and immediately after the tubing was removed.

EIC considered that stabilization was reached when 3 consecutive stabilization parameter readings were within ± 0.1 for pH and ± 5% for specific conductivity. Reasonable attempts were made at each well to reach 0.2 mg/L dissolved oxygen (DO) and a turbidity reading below 10 Nephelometric Turbidity Units (NTUs) prior to sampling. Groundwater quality field parameters (Temperature, pH, oxygen reduction potential (ORP), conductivity, turbidity, and DO) after stabilization and prior to sample collection are summarized in Table 4-3. Note, however, that during the March/April 2015 sampling event, the turbidity levels at 9 wells could not be lowered below 10 NTUs and the DO levels could not be lowered below 0.2 mg/L at any of the wells sampled. All samples were collected using the "soda straw method" specified in SOP SESDPROC-301-R3.

### 4.2.5 Sample Custody and Laboratory Analysis

Immediately after each sample set was collected, the sample bottles were sealed and labeled in the field. Each sample set was then placed in padded sealable plastic bags to prevent breakage and stored with ice in insulated cooler containers provided by the laboratory. Complete and signed chain of custody forms accompanied all samples. EIC delivered and relinquished the samples to Test America Laboratories, a Georgia-certified laboratory located in Savannah, Georgia, prior to returning to EIC headquarters.

The laboratory conducted analysis of volatile organic compounds via EPA method 8260B. The laboratory report for the March/April 2015 event is included as Attachment B. The results of COC analysis of samples collected during this event, along with historical COC analytical data, are summarized in Table 4-4.

## 4.3 Quality Assurance and Quality Control

For quality assurance and quality control purposes during the groundwater sampling process, EIC submitted one trip blank set, provided by the laboratory, with each sample container with CVOC/VOC samples for analysis via EPA Method 8260B. The trip blanks were kept in the same thermal cooler as the collected CVOC/VOC samples over the entire period these samples were in the cooler until they were relinquished to the laboratory along with the CVOC/VOC samples.

To prevent cross-contamination, new disposable 1/4-inch inner diameter and 3/8-inch outer diameter Teflon-lined tubing was used to collect samples at each well, which was later properly disposed of. EIC's oil/water interface meter, 2,000 mL cylinder, and Teflon tubing cutter were field decontaminated prior to use and between sampling locations by washing with a phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. After each sample was collected, the water quality parameters instrument was also decontaminated with DI water.

## 4.4 Data Evaluation

EIC conducted an evaluation of the data compiled from field measurements and laboratory analyses to determine the groundwater potentiometric surface, the horizontal and the vertical extent of the prevailing contaminant plumes based on the March/April 2015 monitoring event. Data from the sampling event was compared with the data from the baseline and each of the eleven subsequent quarterly sampling events to develop a strategy to reach remedial end points.

### 4.4.1 Groundwater Potentiometric Map

Table 4-5 tabulates the historical groundwater elevations for all gauging events at the site since groundwater monitoring was initiated under the VIRP. From this table, it is apparent that during the March/April 2015 gauging event, the overall potentiometric surface was similar in elevation to the previous two March/April gauging events. In general, the potentiometric surface elevation at the site during the March/April 2015 event was slightly above the global average groundwater elevation. As compared to the previous March/April gauging events, the average groundwater potentiometric surface elevation for the 2015 gauging event was neither the highest nor lowest observed since the inception of the VIRP program.

Figure 4-2 illustrates the March/April 2015 potentiometric surface map. Referring to Figure 4-2, the prevailing groundwater flow direction in the vicinity of the COC plume footprint remains from the southwest to the northeast. Of note, in this potentiometric surface contains an anomaly in the area of well MW-32. The groundwater elevation measured during the March/April event was the highest ever recorded at MW-32 since the approval of the VIRP.

### 4.4.2 Horizontal Extent of COC Plumes

Figure 4-3 illustrates a summary of the analytical results of the monitored COCs from the March/April 2015 sampling event for each well sampled. Figures 4-4 through 4-11 illustrate each of the eight monitored COC plumes. Table 4-4 lists a compilation of available analytical results since September 1997. The following sub-sections describe a spatial and temporal analysis of the COC plumes.

#### 4.4.2.1 CVOC Plume

The CVOC plume consists of Perchloroethylene (PCE), Trichlorethylene (TCE), Cis-1, 2 Dichloroethylene (DCE), and Vinyl Chloride (VC). Based on current analytical results, it is apparent that the overall extent and concentration of the CVOC plume at the site has significantly decreased since the inception of the VIRP sampling program in October 2011. However, residual CVOC contamination is present in certain areas. The following subsections describe spatial and temporal changes of individual CVOC constituents since October 2011.

**PCE Plume:**

Figure 4-4 illustrates the horizontal extent of the PCE plume during the March/April 2015 sampling event. The current PCE plume is composed of two distinctly separated areas of contamination, with the peak concentration of the first area centered near IW-1R at the up-gradient southwestern end of the original CVOC plume footprint, and the peak concentration of the second area centered near MW-29 near the down-gradient northeastern end of the original CVOC plume footprint.

Within the up-gradient portion of the original CVOC plume footprint, the peak PCE concentration in IW-1R increased from 170 µg/L to 310 µg/L from October 2014 to March/April 2015 respectively. However, no significant changes in concentrations at the surrounding wells were observed. It is noteworthy that in April 2014 the concentration at IW-1R was also found to be 310 µg/L.

Within the down-gradient portion of the original CVOC plume footprint, the overall extent and concentrations in this area has fluctuated since the first VIRP sampling event in October 2011, however, overall there has been a decreasing concentrations trend. In particular, the PCE concentration at MW-32 has sharply decreased from 1,900 µg/L to below laboratory method detection limits (MDLs) from October 2014 to March/April 2015, respectively. However, during the same time interval, the PCE concentration slightly increased in MW-29 from 74 µg/L to 160 µg/L.

In summary, the overall extents of the PCE plume have reduced substantially or remained stable over time and concentrations are decreasing and trending towards RRS values. Clearly, MNA is effective in reducing the PCE mass concentrations especially at the leading edge.

**TCE Plume:**

Figure 4-5 illustrates the horizontal extent of the TCE plume during the March/April 2015 sampling event. Similar to the PCE footprint, the TCE plume is also composed of two distinct areas of contamination. The up-gradient area of peak concentration is centered near IW-1R. The areal extent of PCE in this area reduced slightly since the October 2014 sampling event and the PCE concentration

in IW-1R reduced from 190 µg/L to 150 µg/L. There were also other slight reductions in concentration near the adjacent monitoring wells, such as at wells IW-18 and MW-37 and the down-gradient well MW-33. These reductions effectively split the TCE plume into two pockets of plume.

In April 2015, the peak concentration of down-gradient TCE plume was centered near well MW-29. This area of the plume had a significant reduction in concentration and horizontal extent as compared to the previous October 2014 and other previous sampling events. The most significant areas of reduction occurred near wells MW-32 and PAN-MW-9. The TCE concentrations MW-32 and PAN-MW-9 reduced from 680 and 35 µg/L to <0.48 and 4.9 µg/L respectively. However, concentrations increased in MW-29 from 55 to 90 µg/L.

In summary, the overall extents of the TCE plume have reduced or remained stable over time and concentrations are decreasing and trending towards RRS values. Considering that TCE is produced from the reductive dechlorination of PCE, substantial reduction in concentration relative to the original foot-print is indicative that MNA is effective in reducing the TCE concentrations.

**DCE Plume:**

Figure 4-6 illustrates the horizontal extent of the DCE plume during the March/April 2015 sampling event. During the March/April 2015 event the DCE concentration in LAW-PZ-8R decreased significantly from 15,000 µg/L in October 2014 to 4,100 µg/L. The concentrations near the up-gradient portion of the DCE plume have been decreasing significantly over time and the DCE concentrations measured during March/April 2015 indicate a continuation of that trend.

The overall plume extent had significant decreases in concentration since the October 2014 and previous sampling events as well; such as near wells IW-1R, IW-18, MW-24R, and MW-32. It is notable that the concentration near MW-32 was below MDLs for DCE during the March/April 2015 sampling event.

In summary, the overall extent of the DCE plume has reduced or has remained stable over time and concentrations are decreasing and trending towards RRS values. Considering that DCE is a second step daughter product from the reductive dechlorination of PCE, substantial reduction in concentration relative to the original footprint is indicative that the MNA is effective in reducing the DCE concentrations.

**VC Plume:**

Figure 4-7 illustrates the horizontal extent of the VC plume during the March/April 2015 sampling event. Referring to historical analytical data, the March/April 2015 VC plume concentrations data

indicates that VC concentrations are decreasing over time or remaining stable. The most notable areas of decreased concentrations were in wells IW-18, LAW-PZ-8R, MW-32, and MW-33.

The mid to down-gradient portion of the VC plume was characterized by both reductions and increases in VC concentrations. The concentrations in MW-32 and MW-33 reduced from 100 and 440 µg/L to <0.50 and 100 µg/L from the October 2014 to March/April 2015 sampling event, respectively. Whereas, at well MW-29 the concentration increased from 660 to 790 µg/L from the October 2014 to March/April 2015 sampling event. Due to the reductions in concentration in wells MW-32 and MW-33, the VC plume footprint decreased significantly.

In summary, the VC plume has significantly reduced in both areal extent and in concentration relative to the original footprint and continues to trend towards RRS values. This indicates that MNA is effective in reducing VC concentrations.

#### 4.4.2.2 VOC Plume

The COCs monitored within the VOC plume consists of Benzene, Toluene, Ethylbenzene, and Total Xylenes (BTEX). Since the first VIRP sampling event, conducted in October 2011, the VOC plume concentrations within the original VOC plume footprint have declined substantially. The following subsections describe spatial and temporal changes of individual VOC constituents since VIRP sampling was initiated in October 2011.

**Benzene Plume:**

Figure 4-8 illustrates the horizontal extent of the benzene plume from the March/April 2015 sampling event The benzene plume is composed of two isolated areas of contamination near the up-gradient and down-gradient portions of the original VOC plume footprint. The up-gradient benzene plume continues to maintain stability and decreased significantly in LAW-PZ-8R from 3,400 to 1,100 µg/L from the October 2014 to March/April 2015 sampling event, respectively. However, the concentration in IW-18 increased from 170 to 350 µg/L.

The down-gradient plume, centered in MW-29, has remained relatively stable over time as compared to the original footprint. The most notable change in the down-gradient Benzene concentration was observed in MW-32 where the concentration decreased from 8.3 µg/L to below MDLs. In summary, the Benzene plume has reduced significantly in concentration and extent as compared to the original plume footprint and continues to trend towards RRS values.

**Toluene Plume:**

Figure 4-9 illustrates the horizontal extent of the toluene plume from the March/April 2015 sampling event. In the previous October 2014 sampling event, the toluene concentration in LAW-PZ-8R increased to 800 µg/L. However, during the March/April 2015 event, Toluene concentrations Toluene reduced to below MDLs or to <480 µg/L. Additionally, concentrations in IW-1R decreased from 320 to 260 µg/L. As such, it is apparent that the toluene plume continues to decrease in concentration and has remained below RRS values since the initiation of the VIRP program.

**Ethylbenzene Plume:**

Figure 4-10 illustrates the horizontal extent of the ethylbenzene plume from the March/April 2015 sampling event. In the previous progress report, EIC noted that concentrations of Ethylbenzene in the up-gradient plume increased sharply from the April to October 2014 sampling events (EIC, 2015). During the March/April 2015 sampling event, however, Ethylbenzene concentrations in LAW-PZ-8R decreased from 13,000 to 6,900 µg/L. Other concentrations in the up-gradient plume remained relatively stable, however, concentrations at MW-26R increased from 25 to 760 µg/L.

Concentrations in the down-gradient plume increased from 1,800 to 3,300 between the October 2014 and March/April 2015 sampling events. However, Ethylbenzene concentrations decreased in PAN-MW-9 and MW-32 from 650 and 36 µg/L to 580 and <0.33 µg/L respectively.

In summary, the Ethylbenzene plume has significantly reduced in concentration and extent in comparison to the original plume footprint and continues to trend towards RRS values. This indicates that MNA is effective in reducing Ethylbenzene concentrations.

**Total Xylenes Plume:**

Figure 4-11 illustrates the horizontal extent of the Total Xylenes plume from the March/April 2015 sampling event. Similar to Ethylbenzene, Total Xylenes within the up-gradient plume increased sharply between the April and the October 2014 sampling events (EIC, 2015). The up-gradient Total Xylenes plume was centered near LAW-PZ-8R in April 2015, and has remained relatively stable in concentration and extent with some variation, as compared to the original plume footprint. However, during the March/April 2015 sampling event, Total Xylenes concentrations sharply decreased in LAW-PZ-8R and IW-1R. Between the October 2014 to March/April 2015 sampling events, the Total Xylenes concentrations in wells LAW-PZ-8R and IW-1R decreased significantly - from 180,000 and 19,000 µg/L to 87,000 and 17,000 µg/L respectively. Also, similar to the Benzene and Ethylbenzene plumes, concentrations of Total Xylenes increased in wells IW-18 and MW-26R. Since the last

sampling event, Total Xylenes concentrations increased in wells IW-18 and MW-26R from 1,100 and 400 µg/L to 1,300 and 11,000 µg/L, respectively.

The down-gradient Total Xylenes plume is centered near MW-29 and has remained relatively stable over time in both concentration and extent as compared to the original plume footprint. The overall down-gradient plume concentrations decreased between October 2014 and March/April 2015- most notably in PAN-MW-9. From the October 2014 to March/April 2015, the concentration at PAN-MW-9 decreased from 1,800 to 1,400 µg/L respectively. Other smaller decreases in concentration were observed in wells MW-32 and MW-33. This slightly reduced the overall extent of the down-gradient Total Xylenes plume. In summary, the Total Xylenes plume has significantly reduced in concentration and extent as compared to the original plume footprint and remains stable in concentration and extent.

### 4.4.3 Vertical Extent of COC Plumes

The historical groundwater sampling results of samples from the single deep well MW-14 within the original COCs footprint through March/April 2015 are tabulated in Table 4-4. Since the redevelopment and integration of well MW-14 into the regular CVOC and VOC sampling schedule in October 2013 through April 2015, EIC confirmed that all monitored COC concentrations in the well have remained below delineation standards and all but one parameter were below MDLs. In the EPD comment letter to VOPAK dated April 3, 2014, the Georgia EPD concurred with EIC that vertical delineation is complete.

SECTION

5

# 5.0 REMEDIAL PROGRESS

To determine the remedial progress, EIC performed a spatial and temporal analysis of the COC plumes and an evaluation of COC trends in individual wells. The following subsections discuss the remedial progress.

## 5.1 COC Degradation

The spatial and temporal analysis of the plume, discussed in Section 4, provides a clear insight into the overall remedial progress and the plume stability. The following subsections discuss the degradation of the COCs.

### 5.1.1 CVOC Plume

As discussed in the previous report, the prevailing PCE, TCE, DCE, and VC plumes have degraded significantly in comparison to the original plume footprints (EIC, 2015). Since the inception of the VIRP program and subsequent first sampling event in October 2011, EIC has delineated the leading edge of each CVOC plume.

Referring to the March/April 2015 analytical data, the following monitoring wells exceed RRS values as of the time of the March/April 2015 groundwater monitoring event; PCE (IW-1R, IW-18, MW-26R, MW-28, MW-29, MW-37, LAW-PZ-8R, and PAN-MW-9), TCE (IW-1R and MW-29), DCE (IW-1R, LAW-PZ-8R, MW-29, and PAN-MW-9), and VC (IW-1R, IW-18, MW-16, MW-24R, MW-26R, MW-27, MW-28, MW-29, MW-33, MW-37, LAW-PZ-8R, and PAN-MW-9)

### 5.1.2 VOC Plume

Following a similar trend as the CVOC plume, the VOC plume has also reduced substantially in the center and at the leading edge of the VOC baseline footprint. This has resulted in an isolated pocket

of VOC plume at well LAW-PZ-8R in the trailing edge of the original VOC footprint. EIC has delineated the leading edge of each VOC plume.

Referring to the March/April 2015 analytical data, it is apparent that the following monitoring wells exceed RRS concentrations for VOCs; benzene (IW-1R, IW-18, LAW-PZ-8R, MW-26R, MW-29, and PAN-MW-9), ethylbenzene (IW-1R, LAW-PZ-8R, MW-26R, and MW-29), and total xylenes (IW-1R, LAW-PZ-8R, and MW-26R).

### 5.2 COC Trends in Individual Wells

Pursuant to EPD's requirement, discussed in the Seventh VIRP Semiannual Progress Report, EIC prepared trend graphs for each constituent for select wells (EIC, 2015). These trend graphs are presented as Figures 5-1 through 5-13.

In general, all graphs illustrate the initial increase in PCE concentrations but then a gradual decline in concentrations during subsequent sampling events. By contrast, the degradation products of PCE have increased in some areas and remained persistent in other areas of the PCE footprint – confirming natural attenuation of PCE. A more detailed analysis of fluid flow hydrodynamics as well as fate and transport evaluation of CVOC and VOC concentrations is included in the revised site conceptual model (Appendix A).

### 5.3 Remedial Progress

In the previous report, VOPAK notified EPD that the CVOC foot-print had expanded after additional pockets of CVOCs were discovered from new wells that replaced damaged or missing wells. The CVOC concentrations, however, rapidly declined since the previous semi-annual sampling event. Also, the areal extent of PCE is now confined to two small areas within the original footprint. VOPAK will verify this trend in the based on the analytical data from the next sampling event scheduled for October 2015. VOPAK will then evaluate the contingency remedial measures that may be required for localized treatment, request a time extension to reach remedial end points, or explore Type 5 RRS with UECs to address exposure pathways.

### 5.4 Final Remediation Plan

Although recent data indicates substantial remedial progress, VOPAK is considering multiple options in finalizing its remedial plan. However, data from the next sampling event scheduled in October 2015 is critical in verifying whether the recent reduction in the leading edge can be reconfirmed and to select the most cost-effective remedial option. Nevertheless, VOPAK is pursuing the following tasks:

1. Using modeling, statistical analysis, or projections, amend the estimate the time needed to reach remedial end points based on the MNA trends relative to the current COC footprint.
2. Conduct Microcosm Testing and Evaluation to determine whether amendments of some of the key parameters support enhanced attenuation option.
3. Conduct an evaluation of the potential for treatment of an isolated pocket of COCs using a treatment train.
4. Evaluate the feasibility of performing a flow-net analysis to determine fluid flow hydrodynamics along the bulkhead and the sheet pile in the adjacent area.
5. Conduct an evaluation of other options to reach remedial end points within the VIRP deadline or extend the deadline with EPD concurrence.

### 5.5 Updated Schedule and Timeline

Based on the aforementioned findings, VOPAK is deferring the preparation of a final remediation plan, updated schedule, and cost estimate until the analytical data is available from the October 2015 semiannual sampling event.

SECTION

6

# 6.0 SUMMARY

On behalf of VOPAK, EIC has addressed the comments noted in EPD's letter dated July 29, 2015. EIC has updated the SCM based on new information obtained regarding site conditions and fluid flow hydrodynamics. Data from the recent March/April 2015 sampling event, indicates that the natural attenuation continues to be viable.

As discussed in the previous Seventh VIRP Semiannual Progress Report, pockets of contamination were discovered following the initiation of the VIRP program (EIC, 2015). These additional areas of contamination presents a challenge in reaching remedial end points within the regulatory deadline of August 31, 2016 established in the VIRP. Nevertheless, MNA has successfully attenuated the COCs in a substantial area encompassing the center of the baseline plume footprint, resulting in isolated individual pockets of plumes at the leading and trailing edges.

Data from recent sampling event, a substantial reduction in COC concentrations at the leading edge.

Nevertheless, data from the next sampling event scheduled in October 2015 is critical in verifying whether the recent reduction in the leading edge can be reconfirmed and to select the most cost-effective remedial option. Based on the results of the October 2015 sampling event, VOPAK will explore multiple options in finalizing contingency plans.

**Notes:**
ID = Identity
TOC = Top of Casing
UNK = Unknown
NM = Not Measured

ND = Not Detected

* TOC elevations are based on well surveys conducted by EMC Engineering on June 30, 2011, January 24, 2013, and on January 20, 2014 and are of the NGVD 29 Datum convention

** DTW measurements were recorded by EIC from 3/30/2015 to 4/2/2015 prior to purging using a Solinst Oil/Water Interface Meter (probe), Model: 122

## Table 4-2: March/April Well Purging Data
## VOPAK Terminal Savannah, Savannah, Georgia

| Well ID # (Well Diameter, in.) | Date of Purge | Purge Time (minutes) | Total Purge Volume (mL) | Average Purge Rate (mL/minute) | Initial Tubing Intake Depth below TOC* (ft.) | Final Tubing Intake Depth below TOC (ft.) |
|---|---|---|---|---|---|---|
| IW-1R (1) | 4/2/2015 | 15 | 1,120 | 75 | 14.0 | 14.0 |

| PAN-MW-10 (2) | 4/1/2015 | 15 | 2,200 | 147 | 12.5 | 12.5 |

**Notes:**

ID = Identity

mL = Milliliter

TOC = Well Top of Casing

* During well purging, the Teflon-lined tubing was lowered as needed when the water level fell to the depth of the intake, causing air to be recovered.

## Table 4-3: Groundwater Natural Attenuation Parameters
## VOPAK Terminal Savannah, Savannah, Georgia

| Well ID # (Well Diameter, in.) | Groundwater Quality Field Parameters | | | | | |
|---|---|---|---|---|---|---|
| | Temp (Celcius) | pH (SU) | ORP (mV) | Specific Conductivity (mS/cm) | Turbidity (NTU) | Dissolved Oxygen (mg/L) |
| IW-1R (1) | 25.2 | 4.14 | 102 | 0.52 | 4.6 | 0.39 |

| PAN-MW-10 (2) | 18.42 | 5.68 | 143 | 0.541 | 0.0 | 2.33 |

**Notes:**
Field parameters were recorded by EIC from 10/13/2014 to 10/17/2014 after parameters had stabilized and prior to sample collection.
Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell.
ID= Identity
SU= Standard Unit
mV= Millivolts
mS/cm= Microsiemens per centimeter
NTU= Nephelometric Turbidity Unit
mg/L= Milligrams per liter

**Notes:**
**0.79** = Concentration above Minimum Detection Limit (MDL)
**39** = Concentration above RRS
NR = Not Reported by Laboratory
NS = Not Sampled
NL = Not Located
NU = Not Useable due to siltation
NA = Not Avaliable
All data prior to October 2011 tabulated by ERM

**Notes:**

NI - Not Installed

NS - Not Surveyed, TOC elevation information is not available for well

NL - Not Located

NA - Not Applicable

NG - Not Gauged

*** = Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

*[2] = MW-14 is considered a deep well at the Site and is not considered for the shallow potentiometric surface at the Site

***[3] = MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from October 2011 to April 2015 where available.

***[4]= Global Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from October 2011 to April 2015

COMMENTS: | SAMPLE COLLECTION TIME: 15:37

PREPARED BY: [signature]

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

| | |
|---|---|
| Length of tubing cut (ft.) | 20 |
| Initial tubing depth (ft.) BTOC | 14 |
| Final tubing depth (ft.) BTOC | 14 |
| Initial pump speed | 3.18 |
| Time pump speed was initialized | 15:13 |
| Pump speed at flow into cylinder | 3.18 |
| Started new roll of tubing at | — |
| Three well volume (mL) | — |

2,000 mL volume poured into bucket:

| Time | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Cummulative Volume (mL) | | | | | | | | |

Additional remarks: Contact w/ Oil Product w/ gauging. Used mini bailer 3X

Approximate Initial water level recalculated after 3 at 18:37 at 3.40 ft

COMMENTS:

SAMPLE COLLECTION TIME: 18:23

PREPARED BY: S Helwig

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:

SAMPLE COLLECTION TIME: 11:23

PREPARED BY: Dave Vasquez

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.
Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

| | |
|---|---|
| Length of tubing cut (ft.) | 20 |

COMMENTS:

SAMPLE COLLECTION TIME: 15:35

PREPARED BY: Daniel Vaughn

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Job ID: 680-111248-1

**Laboratory: TestAmerica Savannah**

**Narrative**

### CASE NARRATIVE

### Client: Environmental International Corporation

### Project: VoPak, Savannah/390020

### Report Number: 680-111248-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

**RECEIPT**

The samples were received on 04/03/2015; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 6.6 C.

**VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples IW-1R (680-111248-1), IW-18 (680-111248-2), LAW-PZ-8R (680-111248-3), MW-14 (680-111248-4), MW-16 (680-111248-5), MW-17R (680-111248-6), MW-18R (680-111248-7), MW-19 (680-111248-8), MW-23 (680-111248-9), MW-24R (680-111248-10), MW-25 (680-111248-11), MW-26R (680-111248-12), MW-27 (680-111248-13), MW-28 (680-111248-14), MW-29 (680-111248-15), MW-30 (680-111248-16), MW-31 (680-111248-17), MW-32 (680-111248-18), MW-33 (680-111248-19), MW-34 (680-111248-20), MW-35 (680-111248-21), MW-36 (680-111248-22), MW-37 (680-111248-23), PAN-MW-9 (680-111248-24), PAN-MW-10 (680-111248-25) and Trip Blank (680-111248-26) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/09/2015 and 04/10/2015.

Samples IW-1R (680-111248-1)[200X], IW-18 (680-111248-2)[10X], LAW-PZ-8R (680-111248-3)[1000X], MW-16 (680-111248-5)[2X], MW-24R (680-111248-10)[5X], MW-26R (680-111248-12)[100X], MW-29 (680-111248-15)[50X], MW-37 (680-111248-23)[2X] and PAN-MW-9 (680-111248-24)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

# Login Sample Receipt Checklist

Client: Environmental International Corporation

Job Number: 680-111248-1

**Login Number: 111248**

**List Source: TestAmerica Savannah**

**List Number: 1**

**Creator: White, Menica R**

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | False | RECEIVED ON ICE, BUT GOT A TEMP OF 6.2 WITH A CF OF 6.6 |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | N/A | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time. | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

# Certification Summary

Client: Environmental International Corporation
Project/Site: VoPak, Savannah/390020

TestAmerica Job ID: 680-111248-1

## Laboratory: TestAmerica Savannah

The certifications listed below are applicable to this report.

| Authority | Program | EPA Region | Certification ID | Expiration Date |
|---|---|---|---|---|
| Georgia | State Program | 4 | N/A | 06-30-15 |
| Georgia | State Program | 4 | 803 | 06-30-15 |

Client: Environmental International Corporation
Project/Site: VoPak, Savannah/390020

TestAmerica Job ID: 680-111248-1

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

# 1.0 INTRODUCTION

VOPAK Terminal Savannah, Inc. (VOPAK) submitted a preliminary site conceptual model (SCM) of the area affected by a tetrachloroethene/perchloroethene (PCE) plume as a part of their Voluntary Investigation and Remediation Plan (VIRP) that was approved by the Georgia Environmental Protection Division on August 31, 2011. Subsequently, VOPAK submitted an updated SCM report with the Sixth VIRP Semi-annual Progress Report submitted on August 29, 2014 (Environmental International Corporation (EIC), 2014). Following the updated 2014 SCM report, data has been obtained which further defines site characteristics and contaminant fate and transport mechanisms. Therefore, VOPAK has retained EIC to prepare a 2015 update to the VOPAK SCM.

The PCE plume at the site is the result of a release that occurred during the 1970s. Since the release, the PCE has degraded into other dissolved chlorinated volatile organic compounds (CVOCs). Additionally, certain VOCs, consisting of benzene, toluene, ethylbenzene, and xylenes (BTEX), have been consistently detected within the area of the CVOCs.

Typically, the SCM defines release sources, extent of contaminant plumes, fate and transport mechanisms, potential exposure pathways, and potential receptors that could be impacted. This information serves as an important tool in developing site remedies or in implementing certain measures designed to reach remedial end points. The sections within this report provide an updated SCM based on historical site data and data collected by EIC since the SCM was previously updated in August 2014.

## 1.1 SITE LOCATION AND PHYSICAL SETTING

It is important to note that VOPAK utilizes the subject property as a storage terminal based on a long-term lease with the Georgia Ports Authority (GPA). The physical site address is 280 Brampton Road, Savannah, Georgia (also known as the Georgia Ports Authority Gate No. 2 on Turner and Hart Street, Garden City, Georgia). The site, located in Chatham County, has operated as a bulk storage facility since 1951. Historically the terminal has stored various fuels and chemicals. The area surrounding the site consists of the Savannah River to the east; an

asphalt roofing materials manufacturing facility (GAF Materials Corporation), Brampton Road, and a rail yard to the south; and the GPA container storage facility to the west and north. Figure 1-1 illustrates the facility layout, wells utilized in the VIRP program, and other significant site features.

## 1.2 SITE BACKGROUND

As stated in EIC's SCM section of the 2011 revised VRP application (EIC, 2011), in 1996 a PCE release was discovered at the VOPAK Savannah site in the vicinity of Tank 24 within a tank farm designated as Tank Farm No. 2. Based on a historic tank inventory, PCE was stored at the site during the period from December 1972 to April 1975. Since no PCE has been stored at the site since 1975, the release was attributed to previous terminal operations. Subsequently, the previous owners of the site and VOPAK have conducted various investigatory and remedial activities per the EPD, including source removal.

In addition to the PCE release, benzene, toluene, ethylbenzene, and xylenes (BTEX) have been detected at the site above established risk reduction standards (RRS) in the underlying groundwater matrix. As discussed in EIC's previous SCM, there are three distinct BTEX plumes at the site (EIC, 2014). Two lie within the western end of Tank Farm #4 west of Tank Farm two and one lies within the CVOC plume in the vicinity of Tank Farm No. 2. The sources of these three plumes, however, are not apparent from the available historical documents (EIC, 2011). Based on the spatial and temporal distribution of the BTEX plumes relative to the groundwater flow direction, it is apparent that the two BTEX releases, located to the west of Tank Farm No. 2, are not hydraulically connected to nor are a source for the BTEX plume that is present within the PCE foot-print.

## 1.3 HYDROGEOLOGY

EIC has prepared two hydrogeological cross-sections that illustrate the subsurface at the site in the vicinity of the CVOC and VOC plumes. Figure 1-2 depicts a plan view of the cross-section traces. Cross Section A-A' (Figure 1-3) generally extends from south to north and Cross Section B-B' (Figure 1-4) generally extends from the northwest to southeast. These cross-sections are based on well boring logs recorded by EIC and correlate lithological units between adjacent wells. Based on EIC's interpretation of these cross-sections, the site is underlain by a complex inter-bedding of gravel, sand, silt, and clay units. This results in a complex matrix pathway for groundwater flow and is generally considered as anisotropic and non-homogeneous conditions.

Based on historical gauging data, depth to groundwater ranges approximately from 1 to 10 feet below ground surface. Groundwater at the site generally flows from southwest to northeast. Figures 1-5 through 1-7 illustrate variations in the groundwater potentiometric surface and flow direction at the site during three monitoring events.

Estimates of the hydraulic gradient at the site range from 0.0145 to 0.0133. Hydraulic conductivity was determined to range from 3.09 x $10^{-4}$ cm/sec to 4.31 x $10^{-5}$ cm/sec, and the estimated seepage velocity was determined to be approximately 21 to 23 feet per year (EIC, 2011).

### 1.3.1 Stratigraphy

To gain a better understanding of the hydrodynamics of fluid flow, EIC prepared stratigraphic cross-sections along the direction of the projected groundwater flow line (Figure 1-3, A-A') and perpendicular to the flow line (Figure 1-4, B-B') along equipotential lines.

EIC developed detailed lithological and well construction logs for the wells installed by EIC. Majority of the wells installed by previous contractor do not have detailed well construction and lithological logs. Consequently, EIC utilized only those wells that were installed by EIC for illustrating the stratigraphy.

From south to north, Cross Section A-A' includes monitoring wells MW-37, MW-34, MW-33, MW-32, and MW-36. From northwest to southeast, Cross Section B-B' includes monitoring wells MW-35, MW-31, MW-33, and MW-30. From these figures, it is apparent that the groundwater flow intercepts multiple stratigraphic layers which include basic lithological units such as gravel, sand, silt, and clay, as well as complex mixtures of these constituents such as sand with silt and silt with sand. The complex inter-bedding represented in the cross-sections is characteristic of local natural fluvial (river) deposits associated with the nearby Savannah River. No lower confining layers such as bedrock were encountered in any historical well logs at the site.

The flow pattern of groundwater through the complex inter-bedded units at the site would be anisotropic and non-homogeneous. Therefore, calculations based on Darcy's flow equations are rendered impractical for the purposes of modeling groundwater flow throughout the site.

### 1.3.2 Groundwater Potentiometric Surface Maps

To develop a greater understanding of the groundwater conditions at the site, EIC reviewed three select historical groundwater potentiometric surface maps, Figures 1-5 through 1-7, which illustrate the groundwater potentiometric surface during October 2011, January 2013, and April 2014, respectively. These figures were developed utilizing groundwater gauging and top-of-casing (TOC) elevation data listed in Tables 1-1 through 1-3. From these figures, it is apparent that the predominant groundwater flow direction is from the southwest to the northeast of the site.

From the data compiled from the three gauging events, EIC made the following observations. Referring to Figures 1-5 through 1-7, near the vicinity of Station 13 towards the southern tip of Tank farm No. 2, the groundwater potentiometric surface is relatively horizontal and low, sloping towards the northeast. In the vicinity of the tidal flat, towards the northeast of the site, the groundwater slope increases downward as it nears the Savannah River.

In the vicinity of Tank Farm No. 2, a surficial ridge and valley (or trough) feature has persisted which parallels the groundwater flow direction. These features originate southwest of Tank Farm No. 2, passes under Tank Farm No. 2, continues towards the northeast, and culminates northwest of Tank Farm No. 2 on GPA property. The trough feature generally crosses under the center of Tank Farm No. 2 and the ridge feature lies under and/or near the eastern berm of Tank Farm No. 2. Normally when such site conditions exist, COCs would be expected to migrate along the trough feature and to not extend up-gradient past the ridge feature paralleling the groundwater flow. This appears to be confirmed by historically relatively high COC concentrations detected at well MW-29 located within the trough feature and relatively low COC concentrations detected at well MW-30 east of the ridge feature.

### 1.3.3 Potential Impact of Substructures on Groundwater Flow

To determine the potential impact of substructures on groundwater flow, EIC has developed apparent depth to groundwater contour maps. Figures 1-8 and 1-9 illustrate the apparent depth to water at the site during the highest (April, 2014) and lowest (January, 2014) groundwater elevations recorded since October 2011, respectively.

From Figures 1-8 and 1-9, it is apparent that during the highest and lowest groundwater levels at the site, the depth to water ranged from zero to two feet near the southern end of Tank Farm No. 2. In addition, the area to the south of and surrounding the southern edge of Tank Farm No. 2 has a depth to water between zero and four feet. This shallow water table allows for the possible influence of subgrade structures and related back-filled trenching on groundwater flow such as stormwater pipes, water supply line pipes, and other below-grade conduits.

A stormwater reinforced concrete pipe, terminating at the bulkhead, is located perpendicular to groundwater flow. Figure 1-10 illustrates the location of this pipe relative to the bulkhead wall at the western end of the tidal flat. Figure 1-11 illustrates a cross sectional view of the pipe near the tidal flat bulkhead. Based on piping as-built drawings and on historical depth to groundwater measurements collected by EIC at well MW-32, the top of the pipe is submerged 1.6 to 2.8 ft. below the water table. The surrounding saturated soil, illustrated in Figure 1-12, which is based on the lithological log of MW-32, lying approximately 10 feet south of the trench, is primarily composed of silt and clay, which has inherently low effective porosity.

Although it is unlikely that the stormwater pipe itself may be inhibiting the bulk movement of contaminants in groundwater, the trench that was excavated for laying the pipe would be backfilled with highly porous material that can intersect the COC plume and prevent the plume from migrating further northward and down-gradient from the trench. Any COCs entering the pipe backfill can potentially migrate along the pipes. Based on the groundwater flow direction, such a plume can potentially migrate along the pipe towards the Savannah River. It is important to note, however, that such migration would be blocked by the concrete bulkhead wall. This is indicated by low or undetectable CVOC concentrations at well MW-17R, lying near the north end of the tidal flat bulkhead and down-gradient of the pipe trench.

It should be noted that EIC was researching additional as-built drawings of the pipe's installation, and data on the type of fill or bedding material utilized for the trench. EIC will assess potential impact of the subgrade storm water features at the site when more information becomes available.

## 1.4 TIDAL FLAT VERIFICATION

Initially, the area to the east of the bulkhead along the Savannah River was labelled as a tidal flat on site maps. Based on field observations and a cursory review of historical drawings, it appears that the stormwater discharge channel was man-made and does not represent a tidal flat. Currently, EIC is performing a detailed evaluation to verify that finding and is in the process of compiling supporting documents. The results of the evaluation will be submitted in the next semi-annual report. The discussions and figures in current document will continue referring to that area as a tidal flat until the aforementioned evaluation is complete.

SECTION

2

# 2.0 RELEASE SOURCE(S)

Based on historic data it is apparent that the there are two different release source(s) in the Tank Farm No. 2 area. Both releases are discussed in the following subsections.

## 2.1 PCE RELEASE

PCE was apparently stored in Tank 24 during the period from December 1972 through April 1975 (EIC, 2011 - VIRP). In 1996, a PCE release was discovered in the subsurface during construction activities in the vicinity of Tank 24. Considering that no PCE has been stored at the site since 1975, the release was attributed to previous terminal operations. Subsequently, the site's previous owners and VOPAK have conducted various investigatory and remedial activities per the EPD, including source removal (EIC, 2011 - VIRP).

Due to natural attenuation, the PCE has degraded into trichloroethene (TCE), cis-1, 2-dichloroethene (DCE), and vinyl chloride (VC). Therefore, both PCE and these daughter products are the primary constituents of concern (COC) at the facility. All four of these chemicals are CVOCs. Table 2-1 lists the analytical results of CVOCs monitored during the period from February 1991 through April 2015. It is noteworthy that certain monitoring wells were installed prior to the 1996 PCE release and were being monitored since February 1991. EIC is uncertain about the events that would have triggered installation and monitoring of those wells.

## 2.2 HYDROCARBON RELEASE

Based on the data presented in the 2005 corrective action plan (CAP) (ERM, 2005) and subsequent sampling events, it is apparent that certain hydrocarbons comprised of benzene, toluene, ethylbenzene, and xylenes (BTEX) have been consistently detected in certain monitoring wells at the site (EIC, 2011 – VIRP). The BTEX analytical results monitored for the period from December 1998 through April 2015 are presented in Table 2-1.

As discussed in the revised VIRP, EIC determined that three well-defined dissolved BTEX plumes were identified in 1996. The first plume was located within the same foot-print as the

current PCE plume. The second BTEX plume, located to the west of the first plume, was separated by a distance of more than 1,000 feet. A smaller third BTEX plume was located approximately 400 feet to the northwest of the second plume. EIC determined that the sources these plumes were not apparent from the available documents (EIC, 2011).

No documentation is available about the source of the BTEX release in the first plume area located beneath Tank Farm No. 2. EIC also determined that on January 12, 1999 a major diesel release took place from AST 22 in the western end of Tank Farm No. 4 that resulted in light non-aqueous phase liquid (LNAPL) accumulations near the second and third plumes (EIC, 2011). EIC is currently performing remediation of diesel light non-aqueous phase liquid hydrocarbon (LNAPL) within the southern LNAPL plume of this area in compliance with EPD requirements specified by the Watershed Protection Branch. Considering the groundwater flow direction, however, it is apparent that the BTEX plume located within the PCE foot-print is not related to the diesel LNAPL plumes at the site.

## 2.3 CONSTITUENTS OF CONCERN

As noted in Section 2.1, the COCs, within the area of the CVOC plume is comprised of dissolved phase CVOCs and VOCs. The CVOCs consists of PCE and its daughter products TCE, DCE, and VC. The dissolved-phase VOCs consists of benzene, toluene, ethylbenzene, and xylenes (BTEX).

As the COCs migrate through a multimedia environment, natural attenuation processes sequentially replace chlorine atoms that are attached to the dissolved PCE, with carbon atoms – thereby producing the aforementioned daughter products. As the attenuation processes continue, the daughter products are ultimately transformed to carbon dioxide and water. VOC, comprised of BTEX constituents, also attenuate more readily both aerobically and anaerobically resulting in carbon dioxide and water.

SECTION

3

# 3.0 COC DELINEATION

Characterizing the extent of a release entails a definition of the horizontal and vertical extent of the COCs in a multimedia environment. Utilizing historical documentation, current sampling records, and plume maps, EIC has compiled the following subsections.

## 3.1 SOIL DELINEATION

Soil contamination resulting from the PCE release was delineated during the period from 2001 to 2006. A review of the analytical results from this activity indicated that BTEX concentrations were also delineated within the area impacted by PCE release. As discussed in Section 3.1 of the Revised VIRP, sidewall confirmatory soil samples from excavations within the PCE footprint confirmed that RRS standards for both CVOCs and BTEX concentrations in soil were achieved in 2006 (EIC, 2011).

## 3.2 GROUNDWATER DELINEATION

Both CVOCs and other VOCs have been present at the site for several decades. As discussed in Section 2.3, however, these COCs have undergone natural attenuation processes. Nevertheless, additional pockets of COCs discovered after the VIRP implementation has expanded the view port of the original COC foot print. The following sections define the horizontal and vertical extent of the plumes.

### 3.2.1 CVOC

Prior to the initiation of the VIRP, EIC observed that a number of monitoring wells were historically not sampled since they were either destroyed or were not located. Since initiating the VIRP, EIC has gradually rehabilitated or replaced a number of monitoring wells. The analytical data from subsequent sampling of these additional wells in conjunction with data from routinely sampled wells has further expanded the baseline CVOC foot-print. Table 2-1 tabulates the current and historical analytical groundwater data for each well. Figures 3-1 through 3-4 illustrate

the horizontal extent of the dissolved CVOC plumes, from the latest sampling event of April 2015.

Relative to the baseline CVOC footprint defined in the VIRP, it is apparent that the horizontal extent of the CVOC plume is well defined in all directions except to the south beyond the VOPAK property line. This was substantiated by the EPD in the April 2014 comments letter to the VOPAK Savannah Terminal in line item number five.

The property beyond the VOPAK southeastern fence-line is currently occupied by GAF Materials Corporation (GAF). During December 2013, EIC installed a new monitoring well, MW-37, on GAF property to delineate the southern extent of the CVOC plume. From subsequent groundwater sampling EIC performed at MW-37, however, EIC determined that the extent of the CVOC plume extended further southward than had previously been determined prior to the installation of MW-37.

As further discussed in Section 6.3, EIC has determined that CVOC concentrations at MW-37 have been decreasing or stable since EIC began sampling this well in January 2014. This indicates that natural attenuation is progressively occurring near the trailing up-gradient edge of the CVOC plume.

It is noteworthy, that there are reported PCE releases at off-site locations along Brampton Road - up-gradient of the VOPAK terminal - which may contribute to the concentrations found in MW-37. The shallow water table present in the GAF-VOPAK site boundary may intersect utility lines that may act as a preferential pathway for groundwater flow from hydraulically up-gradient sources. EIC is currently conducting research into the effect of utilities and stormwater features on groundwater flow towards the site along Brampton Road. In addition to this research, EIC will continue to monitor the trend of CVOC concentrations near the vicinity of MW-37.

As of April 2015, the dissolved CVOC concentrations of PCE, TCE, 1,2-DCE, and VC currently meet the established RRSs specified in the 2011 Revised VIRP Application in all but twelve monitoring wells: IW-1R, IW-18, LAW-PZ-8R, PAN-MW-9, MW-16, MW-24R, MW-26R, MW-27, MW-29, MW-32, MW-33, and MW-37. Referring to the analytical results table, Table 2-1, the following observations of groundwater RRS exceedances that occurred during the last sampling event in April 2015 are noted:

- Concentrations in 8 wells (IW-1R, IW-18, LAW-PZ-8R, MW-26R, MW-28, MW-29, MW-37, and PAN-MW-9) currently exceed the RRS for PCE. The PCE concentration at IW-1R was the highest of the sampled wells at 310 ppb.
- Concentrations in 2 wells (IW-1R and MW-29) currently exceed the RRS for TCE. The TCE concentration at IW-1R is the highest of the wells sampled at 150 ppb.

- Concentrations in 4 wells (IW-1R, LAW-PZ-8R, MW-29, and PAN MW-9) currently exceed the RRS for DCE. The DCE concentration at IW-1R is the highest of the sampled wells at 9,900 ppb.
- Concentrations in 12 wells (IW-1R, IW-18, LAW-PZ-8R, MW-16, MW-24R, MW-26R, MW-27, MW-28, MW-29, MW-33, MW-37, and PAN-MW-9) currently exceed the RRS for VC. The highest VC concentration was found at IW-18 at 830 ppb.

### 3.2.2 VOC

Figures 3-5 through 3-8 illustrate the current horizontal extent of the BTEX COC concentrations as of the April 2015 sampling event based on the groundwater delineation concentrations listed in Table 2-1. Similarly to the dissolved CVOCs, the dissolved BTEX plume has substantially reduced in size, particularly near the vicinity of MW-33, since the implementation of the VIRP at the site. VOPAK is continuing to evaluate the horizontal extent of the dissolved BTEX plumes, in the area to the west of the PCE plume, under a separate program regulated by the EPD's Watershed Protection Branch.

As of April 2015, it is apparent that the BTEX plume appears to be fully delineated and is reducing at steady rates over time in both the south and north plume areas. In particular, toluene concentrations have remained below RRS at the site since October 2011 and below delineation standards since April 2012. Referring to the analytical results table, Table 2-1, the following observations of groundwater RRS exceedances are noted:

- Concentrations in 5 wells (IW-1R, IW-18, LAW-PZ-8R, MW-26R, and MW-29) currently exceed the RRS for Benzene. The Benzene concentration at LAW-PZ-8R is the highest of the sampled wells at 1,100 ppb.
- Since the first VIRP sampling event in October 2011, Toluene has not exceeded RRS concentrations at any of the sampled monitoring wells. The Toluene concentration at IW-1R is the highest detected concentration of the sampled wells at 260 ppb.
- Concentrations in 4 wells (IW-1R, LAW-PZ-8R, MW-26R, and MW-29) currently exceed the RRS for Ethylbenzene. The Ethylbenzene concentration in LAW-PZ-8R is the highest of the sampled wells at 6,900 ppb.
- Concentrations in 3 wells (IW-1R, LAW-PZ-8R, and MW-26R) currently exceed the RRS for Total Xylenes. The highest Total Xylene concentration was found at LAW-PZ-8R at 87,000 ppb.

### 3.2.3 Vertical Delineation

Based on the groundwater sampling data presented in the third, fourth, and fifth VIRP Semi-Annual Progress Reports, EPD concurred that vertical delineation is complete (EPD, 2014).

## 3.3 SOIL VAPOR

As discussed in Section 3.1, VOPAK removed all contaminated soils to below RRS levels. Also, as the groundwater is relatively shallow and the dissolved COC concentrations are relatively low, VOPAK does not anticipate residual contamination in soils to be persistent at the site. The COC footprint is primarily within a tank farm not designed for continuous human occupancy. Consequently, vapor intrusion into buildings from the COCs is not a potential area of concern. VOPAK, however, is preparing to conduct a vapor exposure survey to determine potential impacts to construction workers.

## 3.4 SEDIMENT

The original CVOC release was contained within Tank Farm No. 2. As such, VOPAK does not anticipate CVOC contamination in drainage sediments outside the tank farm. VOPAK will, however, conduct sampling in areas where the tank farm spill containment dams discharge into stormwater conveyance systems.

## 3.5 SURFACE WATER

The Savannah River is the nearest surface water body at the site. Since the original release was contained and soil contamination was removed from the tank farm, the COCs are not known to have impacted surface water. Also, as of April 2015, the COC plume in groundwater within the CVOC footprint is stable and appears to been rapidly attenuating. Furthermore, as indicated by a sharp decrease in COC concentrations at well MW-32 between October 2014 and April 2015, the leading edge of the COC plume appears to be rapidly receding up-gradient and away from the Savannah River. As such, VOPAK does not anticipate potential impact of COCs into the Savannah River.

SECTION

4

# 4.0 FATE AND TRANSPORT

The main purpose of determining potential exposure pathways is to assess the migration potential of the released COCs in a multimedia setting. Based on such an assessment, it is possible to establish potential exposure levels, critical in establishing risk-based screening and cleanup goals.

Although the COCs migrate through various pathways, they are continually subject to various biotic and abiotic attenuation processes. At a minimum, the COCs will be subject to the following mechanisms:

- Physical separation of released product into gas and other states of matter due to sorption, solubility and other equilibrium reactions.
- Advection, referring to bulk movement of immiscible liquid
- Dispersion, involving horizontal and vertical spreading of partitioned constituents.
- Diffusion, consisting of spreading from concentration gradients.
- Biodegradation by native microorganisms along the migration pathway.
- Other biotic, abiotic, and cometabolic attenuation processes that reduce the concentrations with time and distance.

The PCE release was remediated upon discovery and has not been stored at the site since 1975. According to the 2005 CAP, there are two main transport mechanisms of potential exposure occurring at the site (ERM, 2005). These included leachate from contaminated soils that act as source material and transport of leachate in the groundwater medium as dissolved COCs. However, leachate is no longer a concern at the VOPAK site, because the contaminated soil was excavated in 2006 (EPD, 2006). Since groundwater is relatively shallow, the transport of residual leachate in the form of dissolved COCs is the primary source of concern. During transport through various exposure pathways, the dissolved COCs are also subject to the aforementioned attenuation mechanisms such as advection, dispersion, diffusion, and biodegradation.

## 4.1 MIGRATION POTENTIAL

As discussed in the preceding subsection and from multiple sampling events, it is apparent that dissolved CVOCs are the primary COCs. The following sections outline both the CVOCs and VOCs that are currently under investigation.

### 4.1.1 CVOC Migration Potential

Typically, dissolved contaminants tend to move with the groundwater flow. Consequently, the peak plume would be subject to a migration consistent with seepage velocity. Referring to the contoured COC plume maps, it is apparent that the horizontal extent of all COCs have decreased and are confined within the baseline PCE foot-print.

### 4.1.2 VOC Migration Potential

VOCs primarily composed of BTEX constituents are present within the PCE plume footprint. As such, they would likely be subject to similar hydrodynamic mechanisms as those that affect the PCE plume.

## 4.2 UTILITY TRENCHES AS MIGRATION PATHWAYS

As discussed in Section 1.3.3, sub-grade structures can influence groundwater flow. Preferential pathways along pipeline utility trenches that extend below the groundwater surface, for example, could potentially allow COC's from up-gradient offsite sources to migrate onto the VOPAK property. Future analysis will determine if these sub-grade structures effect the migration of CVOC and VOC plumes from off-site sources.

Sub-grade structures both on and down-gradient of VOPAK property could also influence groundwater flow. Based on a review of historic as-built drawings and from field observations, EIC has determined that a west-to-east oriented stormwater conveyance pipe is located approximately 10 feet north of MW-32. As discussed in Section 1.3.3, this stormwater conveyance pipe may impede the migration of contaminants to the north of and down-gradient of this feature. EIC will continue to evaluate the effect of this stormwater conveyance pipe regarding contaminant migration.

## 4.3 OTHER EXPOSURE PATHWAYS

As discussed in Section 4.1, groundwater is the primary pathway for the migration of COCs at this site. Figure 4-1 illustrates potential pathways through which the COCs can migrate. EIC is currently evaluating the potential for migration of COC through other media such as soil vapor from dissolved COCs. In addition, EIC will evaluate the vapor intrusion potential to ensure that

terminal personnel, contactors, or other site visitors are not at risk of exposure. Based on the site background information available, it appears that there are currently no immediate or eminent threats and hazards from the released COCs at the site.

## 4.4 TIDAL INFLUENCE

Based on a long-term tidal study, presented in the Third VIRP Progress Report (EIC, 2013) EIC concluded that the groundwater within the PCE footprint was not significantly affected by tidal fluctuations within the Savannah River. In addition, EIC determined from a review of historical as-built drawings that a sheet pile wall is located hydraulically down-gradient of the PCE footprint at the Georgia Ports facility perimeter along the Savannah River. This feature appears to serve as an additional barrier for contaminant movement between the land mass and surface water. Furthermore since the COCs concentrations have remained stable and contained within the baseline COCs footprint (refer to Section 3), EIC does not believe that the COC's have a potential to migrate to surface waters.

SECTION

5

# 5.0 POTENTIAL RECEPTORS

Potential receptors are the most important drivers in establishing cleanup goals for the site. The receptors include human, ecological, natural resources, present and future land use, and down-gradient receptors.

## 5.1 HUMAN HEALTH RECEPTORS

Since all contaminated soil that exceeded the RRS was excavated in 2006, as discussed in Section 3.1, subsurface soil is neither a concern to VOPAK employees nor to construction workers at the site. Consequently, only groundwater contamination or saturated soils presents potential human exposure at the site. When addressing groundwater exposure receptors, the 2005 CAP states, "Because the site and surrounding area are served by a municipal water supply system, groundwater from the surficial aquifer is not being used for human consumption. VOPAK will also ensure that any construction works conducted within the area covering contaminated groundwater will be limited to the extent of the vadose zone. Therefore, human exposure to contaminated ground water is an unlikely exposure pathway" (ERM, 2005). However, should it become necessary for onsite workers to excavate groundwater saturated soils during construction activities, measures will be taken to monitor and to protect workers from soil vapor, contaminated groundwater, and/or saturated soil resulting from residual COCs. The CAP also states that there are no private wells within a two-mile radius of the VOPAK Terminal site.

## 5.2 ECOLOGICAL RECEPTORS

According to the 2005 CAP, the VOPAK Savannah site was reviewed by the Georgia Natural Heritage Program (GNHP) to identify potential ecological receptors that may be impacted from contamination levels at VOPAK. GNHP found no rare, imperiled, and critically imperiled plant and animal species at the site. Since the subject property is operated as an industrial facility, VOPAK does not provide habitat for plants or animals. In addition, wetlands are not of concern at the VOPAK site. According to the 2005 CAP, "With the exception of drainage ditches and other man-made depressions, no wetland-like areas were observed on the site."

## 5.3 NATURAL RESOURCES

There are no known natural resources that are affected by the monitored COCs.

## 5.4 PRESENT AND FUTURE LAND USE

The subject property is currently utilized as a non-residential facility in a heavily industrialized setting. As stated in the introductory section, VOPAK leased the property on a long-term lease. As such, the property will remain as a terminal for several decades. Upon lease expiration, the site property will continue to be utilized as non-industrial property consistent with GPA's long term plans for site redevelopment, local zoning, and deed restrictions.

## 5.5 DOWN-GRADIENT RECEPTORS

The GPA Port of Savannah container storage facility is located hydraulically down-gradient of the subject property. Groundwater samples collected from sentinel wells MW-35 and MW-36, located on GPA property and hydraulically down-gradient of the subject property indicates that COCs are well below delineation standards. As discussed in Sections 2 and 3, the COC plume is stable and hydraulically contained within the baseline COC foot-print.

SECTION

6

# 6.0 PERFORMANCE METRICS

To determine if the prevailing monitored natural attenuation (MNA)-based approach is effective in meeting the VIRP goals, EIC performed an evaluation using multiple lines of evidence. This process included an evaluation of indicator parameters, evidence of degradation products, statistical trend analysis, as well as spatial and temporal plume trends.

Depending on available data, several analytical tools are also available to establish the plume trends. As discussed in Section 1.3, however, the aquifer is anisotropic and non-homogeneous. Therefore, typical analytical tools based on Darcy's flow equations are considered to be impractical for the purposes of modeling groundwater flow and related performance metrics. EIC therefore utilized statistical as well as spatial and temporal analysis to evaluate the plume trends.

## 6.1 INDICATOR PARAMETERS

As discussed in previous semi-annual VIRP progress reports, EIC collected long-term data on indicator parameters utilizing downhole data loggers in conjunction with a tidal study. An evaluation of these results indicated that favorable site conditions were present for MNA. Downhole pH, ORP, DO, and temperature levels in representative wells were within ideal ranges indicating persistent favorable site conditions for continued attenuation.

## 6.2 EVIDENCE OF DEGRADATION PRODUCTS

Considering that PCE was the only source of CVOCs released at the site, the presence of PCE daughter products such as TCE, DCE, and Vinyl Chloride are clear evidence of natural attenuation at the site. Although the original source of the BTEX-related spill in the vicinity of Tank Farm No. 2 has not been determined, it is apparent that BTEX constituents are present and degrading over time.

## 6.3 STATISTICAL TREND ANALYSIS (CVOCS)

To determine the rate of natural attenuation and plume stability at the site for the dissolved CVOC constituents, EIC utilized a statistical trend analysis toolkit as a primary line of evidence. The toolkit was developed by Groundwater Services Inc. as a method to determine plume stability through measured groundwater concentrations of constituents over time (GSI, 2014). The Mann-Kendall trend analysis method is utilized within the toolkit and is widely accepted to be a deterministic method for plume stability analysis.

The Mann-Kendall trend analysis method is a non-parametric trend method that utilizes variance from individual trend means for each monitoring well CVOC concentration over time. Accordingly, plume stability can be analyzed by sector instead of by overall plume stability. Overall, plume stability can then be summarized by the trend analysis of each individual sector. In order to produce these trends, however, at least four independent sampling events must have been completed for each monitoring well utilized for this analysis, which restricts the use of newly installed monitoring wells.

For the purpose of defining current plume trends, EIC utilized analytical data from October 2011 to April 2015. In order to define plume trends throughout the site, EIC selected wells based on the following key factors: their location relative to the current and historical plume center line, the current and historical extent of each plume, well construction data, and available constituent concentration data. For wells where COCs were below the laboratory analysis detection limit, EIC assumed that the concentrations at those wells were at the minimum detection limit reported by the laboratory or the method detection limit (MDL). Figure 6-1a illustrates the wells selected for the CVOC trend analysis and Figure 6-1b illustrates the selected wells for the BTEX trend analysis.

As discussed in Section 2.3, VC is the last chlorinated COC daughter product from the PCE attenuation processes that ultimately transforms to carbon dioxide, water, and chloride ions. EIC therefore previously selected seven monitoring wells based on the 2014 VC plume map for the trend analysis in the 2014 SCM update. At the time of the 2014 SCM update, monitoring well MW-37, located at the trailing edge of the plume, had not been sampled enough times to be utilized in the trend analysis. However, as of the April 2015 sampling event, it now meets the requirements for the Mann-Kendall analysis tool and therefore was utilized in the trend analysis for this 2015 SCM update report.

Therefore, eight monitoring wells were selected along the plume centerline for the statistical analysis; three up-gradient wells (MW-18R, MW-34, and MW-37), three mid-gradient wells (MW-33, MW-29, and PAN-MW-9), and two down-gradient wells (MW-17R and PAN-MW-10). Figure 6-1a illustrates the location of these wells. The selected wells are tabulated from left (up-gradient) to right (down-gradient) within the GSI Mann-Kendall Toolkit table for each COC. Figures 6-2 through 6-5 illustrate the data and the trend analysis for each CVOC constituent (PCE, TCE, DCE, and VC, respectively).

### 6.3.1 PCE Statistical Trend Analysis

Figure 6-2 illustrates the PCE concentration over time for each of the eight selected wells. From this figure, it is apparent that the plume is either stable or concentrations are decreasing near the leading and trailing edges of the plume. Additionally, concentrations at the mid-gradient portion of the plume is decreasing with no apparent trend at MW-29. In summary, the PCE plume is statistically either stable or decreasing over time in the wells selected for the up-gradient, mid-gradient, and down-gradient portions of the plume.

### 6.3.2 TCE Statistical Trend Analysis

Figure 6-3 illustrates the TCE concentration over time for each of the eight selected wells. From this figure, it is apparent that the concentrations at the southern trailing edge and northern leading edge of the plume are either decreasing, stable, or have no trend. It is noteworthy, that at MW-17R there is no trend since the TCE concentration fluctuated between July 2012 and April 2013. Following the April 2013 event, however, the concentration at MW-17R has been below detection limits for TCE. Consequently, EIC believes that the TCE concentration is trending to be stable. The mid-gradient portion of the plume is similar to PCE in that the concentrations at both MW-33 and PAN-MW-9 are decreasing with a high probability and that there is no trend at MW-29. In summary the TCE plume is decreasing in concentration and remaining stable within the baseline CVOCs footprint.

### 6.3.3 DCE Statistical Trend Analysis

Figure 6-4 documents the DCE concentration trend analysis for each of the eight selected wells. From this figure, it is apparent that, much like with PCE and TCE, the leading and trailing edges of the plume are decreasing in concentration over time. Focusing on the mid-gradient portion of the plume, the concentrations at both wells MW-29 and PAN-MW-9 are increasing while they are steadily decreasing over time at MW-33. The increases in concentrations of DCE, noted at MW-29 and at PAN-MW-9, are indicative of natural attenuation at the site. As PCE and TCE degrade, DCE concentrations may continue to increase proportionately and eventually decrease, as the PCE and TCE daughter products reduce over time.

### 6.3.4 VC Statistical Trend Analysis

Figure 6-5 illustrates the concentration trend analysis for each of the eight selected wells for VC. From this figure, it is apparent that the concentrations at the leading and trailing edges of the plume are decreasing. Within the mid-gradient portion of the plume, the VC concentration at MW-33 is most likely decreasing, whereas at MW-29 and PAN-MW-9 the concentrations are increasing. This trend may continue until PCE and subsequent daughter products are attenuated. VC will eventually transform into carbon dioxide and water. In summary the concentration of the

plume is increasing in the mid-gradient portion of the plume; however, the concentrations at the leading and trailing edges of the plume are decreasing and stable.

## 6.4 STATISTICAL TREND ANALYSIS (other VOCS)

Similar to the CVOCs, monitored VOCs comprised of BTEX, are also attenuating and stable within the original PCE foot-print. As the BTEX constituents are independent COCs as opposed to daughter products of a primary constituent, such as PCE degrading to TCE, DCE, and VC, each of the BTEX constituents should decrease in concentration over time at each respective monitoring well. Since the first VIRP groundwater sampling event in October 2011, the BTEX constituent plumes have divided into two distinct north and south plumes, further discussed in Section 6.5.2. Due to the two distinct dissolved plumes, EIC has selected monitoring wells for the statistical trend analysis which reflect the center line of the BTEX plume in the up-gradient, mid-gradient, and down-gradient portions of both the north and south plumes. Additionally, some wells serve as both a down-gradient and up-gradient point when analyzing the plumes this way. EIC utilized the most extensive BTEX constituent from the latest April 2015 sampling event, Benzene, to select monitoring wells to represent the aforementioned portions of the south and north BTEX plumes.

In total, EIC has selected eight monitoring wells to represent both plumes in the statistical analysis, as illustrated in Figure 6-1b. For the southern plume EIC selected one up-gradient well (MW-18R), three mid-gradient wells (IW-18, LAW-PZ-8R, and MW-26R), and one down-gradient well (MW-33). For the northern plume, EIC selected one up-gradient well (MW-33), two mid-gradient wells (MW-29 and PAN-MW-9), and one down-gradient well (PAN-MW-10). Each of the eight monitoring wells are listed in the GSI Mann-Kendall toolkit in order from the up-gradient (southern) to the down-gradient (northern) portion of the site.

### 6.4.1 Benzene Statistical Trend Analysis

Figure 6-6 illustrates the benzene concentration over time for each of the eight selected wells. From this figure, it is apparent that the concentrations at the southern plume are decreasing near the leading and trailing edges of the plume. However, at the mid-gradient portion of the plume, concentrations are increasing at wells IW-18 and MW-26R and decreasing at well LAW-PZ-8R. It is pertinent to note that the concentration at MW-26R had been decreasing on a decreasing trend until January 2014. Additionally, LAW-PZ-8R also had an increase in concentration in October 2014, however, the concentration has since reduced to an all-time low since the beginning of the VIRP sampling program reaching 1,100 µg/L on April 2015. The concentration at IW-18 had remained stable over time throughout the VIRP program until January 2014, when it increased in concentration. It is unclear why concentrations in this area significantly increased during this time period.

From Figure 6-6, the benzene concentrations in the leading and trailing edge of the northern plume have been continuously decreasing over time. At the mid-gradient portion of the plume,

the concentration at MW-29 is likely increasing. However, the concentration near MW-29 has remained relatively stable since the first VIRP sampling event. Additionally, the concentration at PAN-MW-9 has decreased significantly over time and has been consistently below laboratory method detection limits since the first VIRP sampling event.

In summary, the areal extents of both plumes have remained stable with some increase in concentration in the up gradient plume, which may be attributed to offsite contaminants or other factors. EIC will continue to monitor the southern and northern plumes for variations in concentrations over time to confirm a natural attenuation trend for benzene.

### 6.4.2 Toluene Statistical Trend Analysis

Figure 6-7 illustrates the toluene concentration over time for each of the eight selected wells. From this figure, it is apparent that the concentrations within the southern plume are decreasing near the leading and trailing edges of the plume. The concentrations within the mid-gradient portion of the plume are either decreasing or are stable with no trend at well MW-26R.

From Figure 6-7, the toluene concentrations in the leading and trailing edge of the northern plume have been continuously decreasing over time. The concentrations within the mid-gradient portion of the plume have been decreasing over time at PAN-MW-9 and there has been no apparent trend at MW-29. In summary, both plumes have either decreased or remained stable over time.

### 6.4.3 Ethylbenzene Statistical Trend Analysis

Figure 6-8 illustrates the ethylbenzene concentration over time for each of the eight selected wells. From this figure, it is apparent that concentrations within the southern plume are decreasing near the leading and trailing edges of the plume. The concentrations within the mid-gradient portion of the plume are probably decreasing at LAW-PZ-8R, increasing at IW-18, and have no trend at MW-26R. As with Benzene, the concentrations of ethylbenzene at IW-18 had remained stable until January 2014, when concentrations in this area began to increase. Additionally, although there has been no apparent trend in concentrations at MW-26R, the concentration of 760 µg/L in April 2015 is significantly less than its peak concentration of 2,000 µg/L in January 2013. In summary, the southern ethylbenzene plume appears to be decreasing or remaining stable over time with the exception of the area of IW-18.

From Figure 6-8, the ethylbenzene concentrations in the leading and trailing edge of the northern plume have been continuously decreasing over time. The concentration within the mid-gradient portion of the plume has been decreasing over time at PAN-MW-9 yet increasing at MW-29. In summary, with the exception of the areas where wells IW-18 and MW-29 are located, both plumes have either decreased or remained stable over time.

### 6.4.4 Total Xylenes Statistical Trend Analysis

Figure 6-9 illustrates the total xylenes concentration over time for each of the eight selected wells. From this figure, it is apparent that concentrations within the southern plume are decreasing near the leading and trailing edges of the plume. There has been no trend within the mid-gradient portion of the plume, however, concentrations have been increasing at IW-18, as with Benzene and Ethylbenzene. As with Benzene, concentrations of Ethylbenzene at IW-18 had remained stable until January 2014, when concentrations in this area began to increase. In summary, the southern total xylenes plume appears to be decreasing or remaining stable over time with the exception of the area of IW-18.

From Figure 6-8, the total xylenes concentrations in the leading and trailing edge of the northern plume have been continuously decreasing over time. Concentrations within the mid-gradient portion of the plume have been decreasing over time at PAN-MW-9 yet increasing at MW-29. In summary, with the exception of the areas where wells IW-18 and MW-29 are located, both plumes have either decreased or remained stable over time.

## 6.5 SPATIAL AND TEMPORAL ANALYSIS

Spatial and temporal analysis of sequential plume maps provide a good perspective on the overall fate and transport of the COCs. In reviewing the sequential plume maps, included in the VIRP progress reports, it is apparent that both dissolved CVOCs and VOCs have been since the inception of the VIRP-based remedy.

### 6.5.1 Dissolved CVOCs

In comparing the CVOC plume maps in Figures 3-1 through 3-4 to those of the historical CVOC plume maps, it is apparent that all four monitored CVOC constituent plumes have degraded significantly in the mid-gradient portion of each constituent plume near MW-33, where their respective peaks were located during the October 2011 baseline conditions. The peak concentrations of these plumes are currently located at varying locations both up-gradient and down-gradient, as described in Section 3.2.1. Additionally, the significant degradation of the mid-gradient portion of the plume has effectively split each of the four monitored CVOC COC plumes into separate north and south plumes.

### 6.5.2 Dissolved VOCs

As discussed in the preceding sections, it is apparent that the BTEX constituents have decreased in concentration and in areal extent compared to the October 2011 baseline conditions. Additionally, as with the CVOC COCs, each of the four BTEX COCs have divided into separate north and south plumes. EIC attributes this division of the VOC plume to potential co-metabolic

degradation. It is also clear that the BTEX plumes are not migrating and continue to be centered on wells LAW-PZ-8R, PAN-MW-9, and MW-29, demonstrating stability.

SECTION

7

# 7.0 SUMMARY

The updated 2015 SCM, presented in this report, describes the site conditions based on a progressively increasing knowledgebase gained during the implementation of the VIRP. EIC will continue to calibrate the SCM based on subsequent findings.

In summary, contaminated soils that resulted from a PCE release that took place prior to 1975 have been removed. Some contamination is still present in the groundwater at the site. Dissolved BTEX constituents from an unknown release source of hydrocarbons are also present in the groundwater at the site. The groundwater contamination comprised of COCs are present in a complex anisotropic and nonhomogeneous hydrogeological setting. The horizontal and vertical extent of the COC plumes are well defined except that a small portion of the horizontal extent remains undefined in a hydraulically up-gradient location. There is no evidence of potential human health or ecological receptors that would be exposed to the COCs. Potential health effects to onsite workers from other multimedia pathways such as exposure to soil vapor or to contaminated groundwater during construction-related excavation activities is currently being evaluated.

EIC utilized multiple lines of evidence to evaluate the performance metrics of the MNA-based strategy. An evaluation of the site data indicates that field parameters are favorable for MNA-based remediation and the contaminant matrix indicates clear evidence of degradation products. Both statistical evaluation as well as spatial and temporal analysis indicate that the COC plumes are stable and are shrinking. The contaminant flux from mass reduction is also trending towards remedial goals and is sustainable. Analytical data also indicates that the percent rate of decrease in contaminant mass and areal extent was substantially higher than those of the pre-VIRP reduction rates. A further evaluation of the trends of the target contaminants will be conducted as more information is obtained from future sampling events from newly installed wells in both the up-gradient and down-gradient portions of the site.

Although MNA is clearly established and the COC attenuation rates are substantially high, EIC recognizes that the rate of degradation may still extend the cleanup time beyond the 5-year VIRP deadline. To evaluate other options that would accelerate remedial cleanup time, EIC is

evaluating contingency options based on the analytical results from the next sampling event scheduled in October 2015.

| MW-16 (1) | 17.01 | ND | 11.92 | 5.09 | large air bubbles present in intial withdrawal |
| MW-17R (1) | 15.89 | ND | 9.94 | 5.95 | initial withdrawal contained small amount of brown bacteria |
| IW-18 (1) | 10.07 | ND | 2.87 | 7.20 | 1" of standing water in vault above TOC; bailed prior to pumping |
| MW-18R (1) | 14.12 | ND | 6.10 | 8.02 | rotten odor when cap was removed |
| MW-19 (1) | 14.91 | ND | 6.36 | 8.55 | initial withdrawal contained small amount of orange bacteria |
| MW-23 (1) | 10.39 | ND | 2.96 | 7.43 | |
| MW-24R (1) | 11.81 | ND | 5.37 | 6.44 | initial withdrawal contained small amount of tan bacteria |
| MW-25 (1) | 14.76 | ND | 6.33 | 8.43 | small amount of orange bacteria on water level probe after initial |
| MW-26R (1) | 10.59 | ND | 2.59 | 8.00 | initial withdrawal contained large amount of orange bacteria |
| MW-27 (1) | 9.38 | ND | 3.72 | 5.66 | initial withdrawal contained large amount of orange bacteria |
| MW-29 (0.75) | 11.73 | ND | 5.90 | 5.83 | |
| MW-30 (2) | 11.23 | ND | 4.60 | 6.63 | |
| MW-31 (2) | 9.67 | ND | 4.62 | 5.05 | Initial withdrawal contained large amount of orange bacteria |
| MW-32 (2) | 11.70 | ND | 5.97 | 5.73 | |
| MW-33 (2) | 8.96 | ND | 1.94 | 7.02 | |
| MW-34 (2) | 10.81 | ND | 2.87 | 7.94 | Initial withdrawal contained small amount of red bacteria |
| MW-35 (2) | 10.40 | ND | 5.67 | 4.73 | 1.5" of standing water in vault above TOC; bailed prior to pumping |
| MW-36 (2) | 10.42 | ND | 6.98 | 3.44 | |
| MW-37 (2) | 11.57 | ND | 3.69 | 7.88 | Initial withdrawal contained large amounts of orange bacteria |

**Notes:**

ID = Identity

TOC = Top of Casing

NA = Not Applicable

NM = Not Measured

ND = Not Detected

* TOC elevations are based on well surveys conducted by EMC Engineering on June 30, 2011, January 24, 2013, and on January 20, 2014 and are of the NGVD 29 Datum convention.

** DTW measurements were recorded by EIC from 4/15/2014 to 4/17/2014 prior to purging using a Solinst Oil/Water Interface Meter (probe), Model:122.

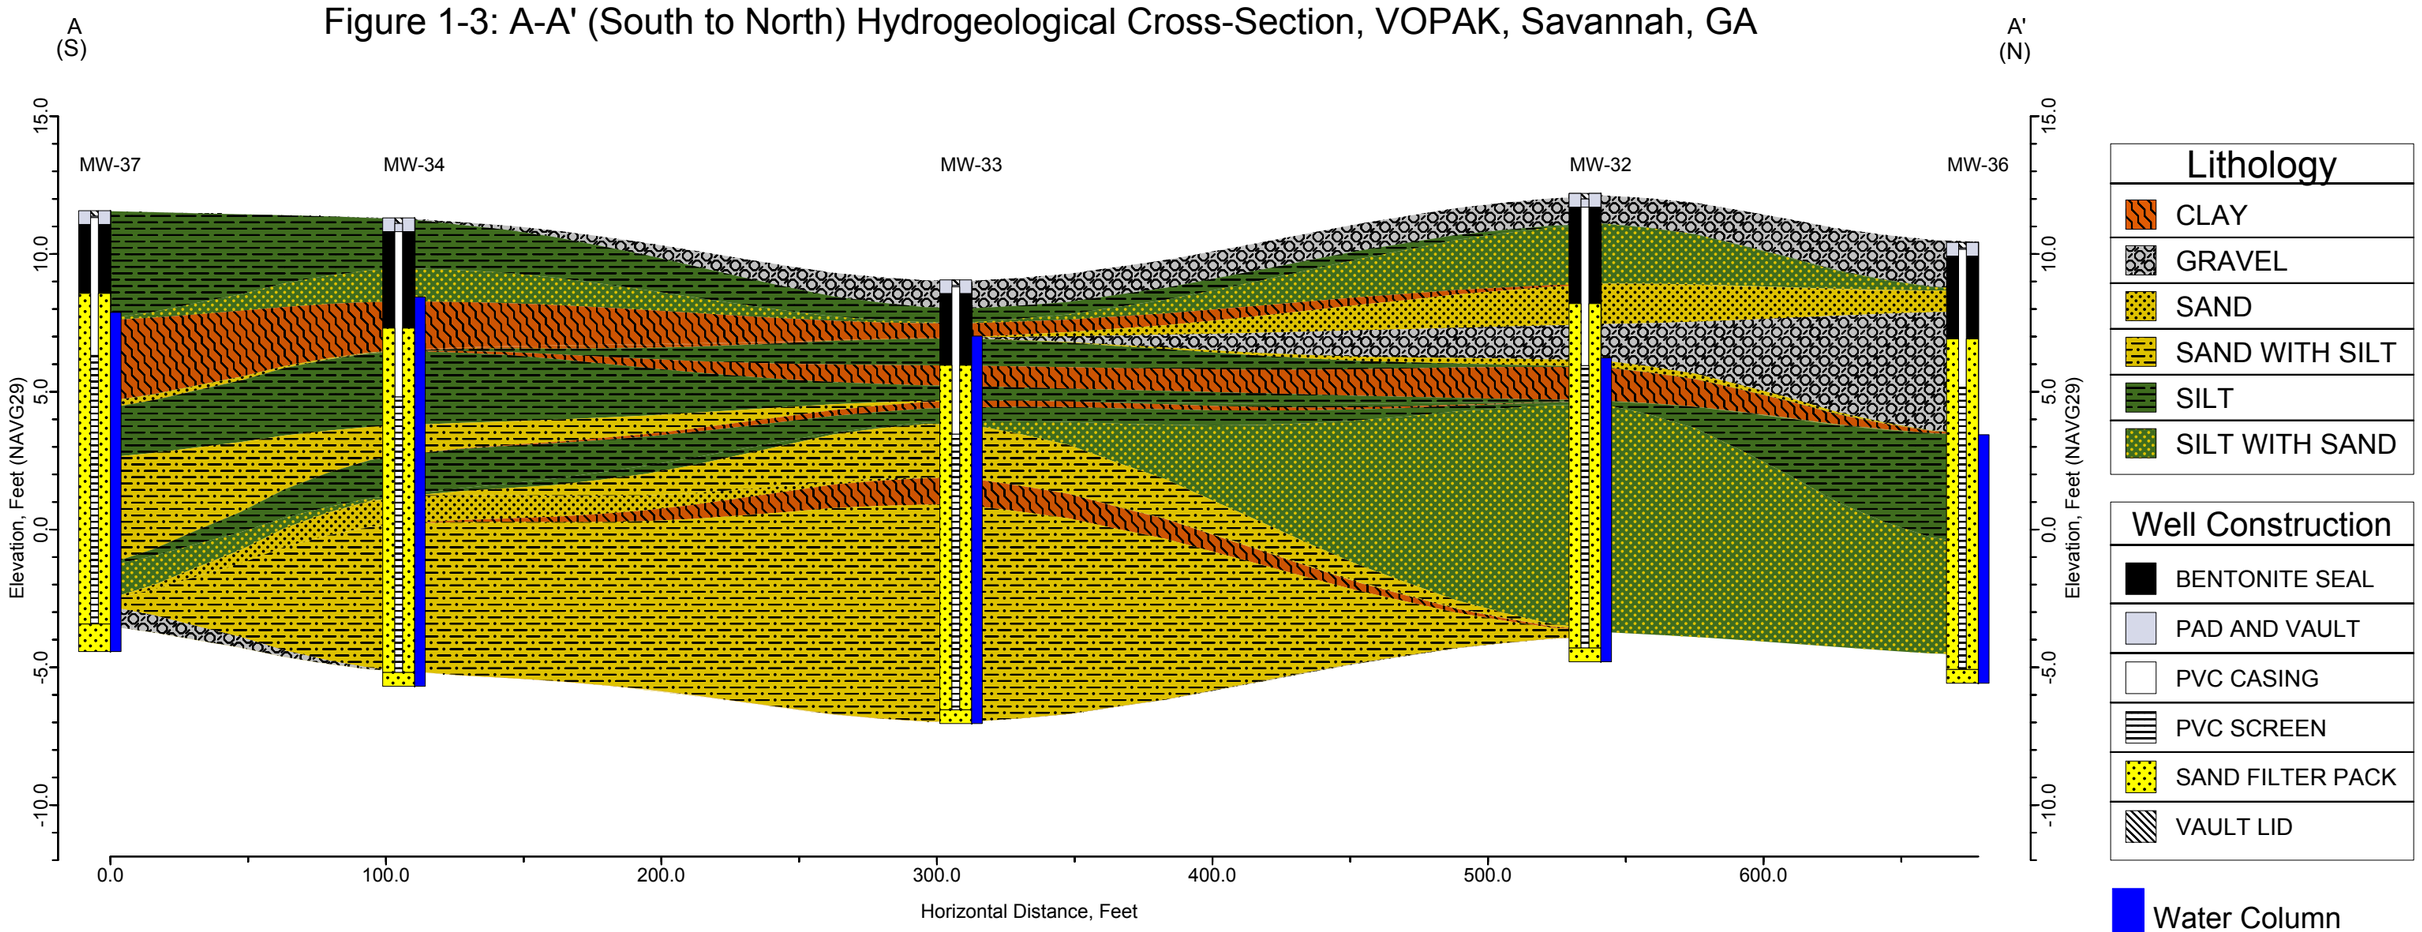
# Figure 1-3: A-A' (South to North) Hydrogeological Cross-Section, VOPAK, Savannah, GA



NOTES:
Hydrogeological cross-section is based on lithological data logs recorded during well installation at the site by EIC. Extrapolated surfaces were derived utilizing Rockworks 2006 stratigraphy modeling software by Rockware. Well construction data is based on well construction logs recorded by EIC for each respective well. Groundwater elevation is based on EIC April 2014 gauging and is the highest recorded since October 2011.

Source: Basemap aerial photograph is from ArcGIS Google Maps layer file. Topography elevation data derived from 2005 Topographic Survey Map by EMC Engineering Services and was converted to the NGVD 29 datum. Groundwater elevations are from EIC's April 2014 groundwater monitoring event. Depth to water below ground surface was estimated using ArcGIS's 3D Analyst software to interpolate and compute the difference between ground surface elevations and groundwater surface elevations. All elevations in the analysis were in the NGVD 29 datum.

CHANNEL DIMINSIONS ADAPTED FROM AUTOCAD DRAWING: "SAVANNAH TERMINAL GENERAL PLOT PLAN" DRAWN BY GULF COAST AERIAL MAPPING 3/16/99 SV-0001-P 001-REV 0

NOTES: ALL MONITORING WELLS ("MW") EAST OF OFFICE (EXCEPT "NL","FC","KMW" WELLS, AND MW-15), IW-18, FENCE LINES BTWN VOPAK AND GPA, GPA EASEMENT AND TANKS 32, 34, 37, AND 52 WERE DRAWN BASED ON SURVEY CONDUCTED BY EMC ENGINEERING SERVICES, INC. (EMC) ON 6/30/2011. MONITORING WELLS, MW-14, MW-26R, MW-30, MW-33, AND INJECTION WELLS ("IW"), IW2-R, IW5-R, IW-6, IW-7, IW-8, AND IW-21 WERE ADJUSTED BASED ON SURVEY CONDUCTED BY EMC ON 1/24/2013. SHEET PILING, TIMBER PILING, STORMWATER PIPES AND RAIL ROAD FEATURES WERE DRAWN BASED ON AS-BUILT DRAWINGS PROVIDED BY THE GEORGIA PORTS AUTHORITY. MW-35, MW-36, AND MW-37 WERE PLOTTED BASED ON SURVEY CONDUCTED BY EMC ON 1/20/2014. MW-28 WAS DISCOVERED 10/16/2014 AND PLOTTED BASED ON FIELD MEASUREMENTS.

Dear Mr. Metzger:

On behalf of Vopak Terminal Savannah, Inc., Environmental International Corporation (EIC) is pleased to submit the attached Ninth VIRP Semi-annual Progress Report for the above referenced site.

Enclosed are the following:

1. One signed and sealed certification page for the Semi-annual Report
2. One bound paper copy of the Ninth VIRP Semi-annual Progress Report
3. Two Compact Discs each with the report in searchable PDF format

If you have any questions regarding this submittal, please contact Ms. Shamekia McGriff of Vopak at 912-964-1811, extn. 10114, or me at the above location.

Sincerely,
ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.

## CERTIFICATION AND SUPPORTING DOCUMENTATIONS
**Ninth VIRP Semi-annual Progress Report**
**Vopak Terminal Savannah**
**HSI Site No. 10464**
**March 16, 2016**

*"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.*

*Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.*

*The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."*

# 1.0 INTRODUCTION

On behalf of VOPAK Terminal Savannah, Inc. (VOPAK), Environmental International Corporation (EIC) is pleased to submit the Ninth VIRP Semi-annual Progress Report for review by the Georgia Environmental Protection Division Response and Remediation Program (EPD). This report was prepared as specified in the April 2, 2011 "Revised Voluntary Investigation and Remediation Plan (VIRP) and Application" that was approved by the EPD on August 31, 2011 under the Voluntary Remediation Program (VRP) (EIC, 2011a).

## 1.1 Primary Objectives

The primary objective of this report is to present a compilation of tasks completed and evaluations completed by EIC during the six-month period from September 2015 through February 2015. This report documents the following subjects:

- Follow-up responses to the July 29, 2015 EPD comment letter
- Groundwater monitoring data evaluation
- Savannah River mixing zone evaluation
- Remedial progress
- Updated schedule and remediation plan

The following sections describe each task related to these subjects.

SECTION

2

# 2.0 EPD COMMENT LETTERS

EIC received a copy of the July 29, 2015 EPD comment letter from VOPAK on August 4, 2015 and submitted responses on behalf of VOPAK in the Eighth VIRP Semi-annual Progress Report dated August 28, 2015. The following sections include an update on the responses provided in the previous report.

## 2.1 EPD Comment 1

*EPD concurs that natural attenuation is occurring at the site and that data collected after enrollment in the VRP has expanded the known footprint of the plume. However, we do not agree that this is the reason that the property will not meet Type 1 through 4 RRS within the 5-year timeframe, as implied in Section 5.3 of the Report. Since enrollment, EPD has indicated that meeting these cleanup goals within the prescribed timeframe was unlikely based on data from wells such as LAW-PZ-8R, MW-29, and PAN-MW-9, all of which have been sampled consistently before and after enrollment. EPD expects the forthcoming report(s) to evaluate the VIRP timeline, consider alternatives to reach risk reduction standards (RRS), and provide a final remediation plan, such as active corrective action or certification to Type 5 RRS with Uniform Environmental Covenants (UECs) to address exposure pathways. EPD is eager to work with VOPAK in developing a path to certification.*

**Previous Response to EPD Comment 1:**

VOPAK understands that natural attenuation alone may be insufficient in reaching the risk reduction standards (RRS) within the 5-year time frame. Referring to the April 2015 groundwater analytical data, however, it is apparent that the chlorinated volatile organic compounds (CVOC) plume has substantially reduced in size at the leading edge. Consequently, CVOCs in only MW-29 appear to be recalcitrant – but at very low parts per billion (ppbs) concentrations. VOPAK will review analytical data from the next sampling event - scheduled for October 2015 - to verify whether the areal extent of the CVOC is further reduced. Based on that finding, VOPAK will consider the need for contingency remedial measures for localized treatment and apply for Type 5 RRS standards with UECs to address exposure pathways.

**Follow-up Response to EPD Comment 1:**

Based on the analytical results from the October 2015 groundwater sampling event, it is apparent that the aerial extent of the plume has reduced significantly as compared to the baseline October 2011 sampling event. Since a relatively small portion of the plume remained persistent, VOPAK is petitioning for a Type 5 RRS option with environmental covenants. In a meeting held at the EPD offices, GPA and EPD consented to this approach. VOPAK will therefore prepare a Uniform Environmental Convenant (UEC)

## 2.2 EPD Comment 2

*EPD has previously noted concern over the possibility that contaminated groundwater is discharging to the Savannah River (or the Tidal Flat) as a pathway that could create ecological risks associated with concentrations in surface water or sediment. There is no groundwater data available for the small area between two higher concentration monitoring wells (MW-32 and PAN-MW-9) and the Tidal Flat, and thus no evidence that contaminated groundwater is not discharging to the Tidal Flat. Additionally, Figure 4-6 and 4-7 indicate two discrete plumes of DCE and VC, respectively, at these wells and MW-16, though there is no evidence that these plumes are not connected. Additional monitoring well(s) or sediment sampling may be necessary to better delineate the plume and characterize ecological risks.*

**Previous Response to EPD Comment 2:**

As discussed in the updated site conceptual model (Appendix A), it appears that the area previously presumed to be a tidal flat in previous maps is actually a narrow area that functions as a drainage channel or an inlet depending on the river tides. The retaining wall (labeled on the site figures as a concrete bulkhead) equipped with a sluice gate and the tides in the Savannah River affect the fluid flow hydrodynamics in this localized area. EIC is currently compiling additional supporting material from various sources to substantiate this finding. As stated in the aforementioned EIC's response to EPD Comment 1, the CVOC plume has also substantially reduced in size at the leading edge. Consequently, EIC is developing a detailed work plan to evaluate whether potential ecological risks are present from the contaminated groundwater that may migrate to the Savannah River. Prior to the preparation of a work plan, EIC proposes a meeting with EPD to discuss the plan objectives and scope of work.

**Follow-up Response to EPD Comment 2:**

Based on a subsequent review of several historical drawings of the site, EIC has confirmed that the area originally presumed to be a tidal flat is in fact a man-made drainage channel constructed in 1942 or in prior years. This finding is easily discernable from the exhibit presented in Attachment A. From the area encircled in red (on the exhibit), it is apparent that the existing man-made channel was constructed by excavating a portion of the original land mass that was previously sloping towards the Savannah River along the shoreline.

As discussed in the aforementioned response to EPD Comment 1, the CVOC plume is stable and shrinking in areal extent. In lieu of additional monitoring well(s) or sediment sampling for ecological risks, EIC conducted a mixing zone analysis from potential migration of groundwater to the Savannah River. Based on the results of the mixing zone analysis, presented in Section 4.0, it is apparent that the resulting concentrations in the Savannah River would be substantially lower than both the national and state water quality standards for the Savannah River.

## 2.3 EPD Comment 3

*EPD anticipates reviewing VOPAK's assessment of potential preferential flow through utility trenches, such as the large stormwater conveyance pipe discharging to the Tidal Flat near MW-32, as well as the hydraulic and transport evaluation of the sheet pile wall.*

**Previous Response to EPD Comment 3:**

As noted in the updated site conceptual model (Appendix A), EIC has provided detailed schematics of the retaining wall and other related substructures. In addition, VOPAK is evaluating the feasibility of performing a flow-net analysis to determine fluid flow pathways.

**Follow-up Response to EPD Comment 3:**

Based on the results of the mixing zone analysis, presented in Section 4.0, EIC determined that a flow-net analysis is no longer necessary. Consequently, any potential groundwater migration along the stormwater pipes or other pathways would have negligible effect on the water quality in the Savannah River.

## 2.4 EPD Comment 4

*EPD anticipates reviewing the forthcoming vapor intrusion study, indicated to assess potential risks to existing and potential future structures as well as an assessment of potential risks to construction workers in areas of shallow groundwater. Risks to construction workers are associated with incidental contact and possible ingestion of contaminated groundwater during subsurface work. Any risks associated with these pathways will need to be addressed in an institutional control.*

**Response to EPD Comment 4:**

A work plan for vapor intrusion study to evaluate the potential risks to structures and construction workers is currently under preparation. VOPAK will submit the plan to EPD for concurrence of the scope of work. Upon EPD approval, VOPAK will complete the study and submit the results in a subsequent semi-annual report.

**Follow-up Response to EPD Comment 4:**

Based on the comments from a meeting held at the EPD office on February 25, 2016, EIC will conduct a vapor intrusion study to address construction worker exposure risks.

SECTION

3

# 3.0 GROUNDWATER MONITORING

The semi-annual groundwater monitoring (sampling) event documented in this section was conducted from September 28 to October 1, 2015. This was the second semi-annual sampling event of 2015 under VIRP program.

The sampling event entailed the collection of groundwater samples, for laboratory analysis of dissolved constituents (or contaminants) of concern (COCs), from wells within the previously established area of concern. COCs that EIC monitored included dissolved chlorinated volatile organic compounds (CVOCs) and volatile organic compounds (VOCs).

During this event, all available monitoring wells and two selected former injection wells within and adjacent to the CVOC/VOC contaminant plumes were utilized for groundwater sampling. Accordingly, EIC collected groundwater samples for CVOC/VOC analysis from a total of 25 wells.

The analytical data from the September/October 2015 sampling event was compared to the first quarterly sampling event (EIC, 2011b) and all other subsequent sampling events (EIC, 2012a, 2012b, 2012c, 2012d, 2013a, 2013b, 2013c, 2014a, 2014b, 2015a, and 2015b) to track prevailing contaminant concentration trends. A statistical analysis of these trends is documented in the remedial progress section of this report.

## 3.1 Groundwater Monitoring Objective

The primary goal of the September/October 2015 groundwater monitoring event was to meet the groundwater monitoring objectives set forth in the VIRP. The following subsections document the sampling process and an evaluation of the analytical results from the samples collected from the site.

## 3.2 Groundwater Monitoring Field Program

During the September/October 2015 groundwater monitoring event, EIC conducted groundwater monitoring utilizing 22 shallow monitoring wells, two shallow injection wells, and one deep

monitoring well. The site layout is illustrated in Figure 3-1. The following sub-sections describe EIC's technical approach regarding this event.

### 3.2.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. Region 4 EPA groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

### 3.2.2 Site Access

Prior to EIC's site visit, EIC coordinated the sampling activities with the Georgia Ports Authority (GPA) and GAF Materials Corp. (GAF) for gaining access to collect groundwater samples from a total of seven off-site monitoring wells consisting of MW-17R, MW-28, MW-32, MW-34, MW-35, MW-36, and MW-37. Monitoring wells MW-28 and MW-37 are located on GAF property and wells MW-17R, MW-32, MW-34, MW-35, and MW-36 are located on GPA property.

### 3.2.3 Groundwater Gauging

Prior to sampling, EIC gauged each well with a Solinst Model 122 interface meter ("oil/water interface probe") to determine the static depth to groundwater. The gauging data is tabulated in Table 3-1. In preparing this table, EIC utilized top-of-casing (TOC) elevations to calculate the groundwater elevation data regarding this event.

### 3.2.4 Groundwater Sampling Field Procedures

Prior to EIC initiating field sampling activities, EIC obtained a structurally competent 55-gallon drum from VOPAK to containerize purged groundwater. During the September/October 2015 event, the 55-gallon drum was placed on the west shoulder of Hart Street, which lies between Tank Farm #2 and Tank Farm #3, near well MW-27. EIC placed a non-hazardous waste label on the drum and marked the contents on it as investigative derived waste ("IDW") well purge water and the accumulation date with a black permanent marker. The drum was later properly disposed of by VOPAK.

At each well-head designated for sampling, EIC monitored VOC air concentrations in parts per million (ppm) with a calibrated photoionization detector. A total of three measurements were taken at each well to document VOC concentrations in the ambient air within two feet of and outside the outer well casing, the air between the inner well casing and the outer protective casing or vault, and the air within the inner well casing once the well cap was removed. The VOC concentrations

observed were recorded on the September/October 2015 EIC Well Purging and Sampling Data Field Logs (Attachment B).

EIC followed the "low-flow" purge technique, noted in Section 3.2.1, to conduct all groundwater sampling. EIC used a peristaltic pump with disposable 1/4-inch ID Teflon®-lined tubing and a 6-inch segment of 3/16-inch ID silicon tubing at the pump head to purge each well until groundwater quality parameters reached stabilization prior to sampling. The length of Teflon® tubing necessary to place the intake at the center of the wetted screened interval was determined from water levels and available well construction data noted in EIC well purging and sampling data field logs (Attachment B). Purging data is summarized in Table 3-2.

Groundwater stabilization parameters were monitored via direct pumping to a multi-parameter field water quality field meter equipped with a flow-through cell. These parameters were recorded at approximately five minute intervals on EIC field logs (Attachment B). Additionally, purge volumes and depth-to-water (DTW) measurements were recorded at the same five-minute intervals when possible. At each well, the pumping rate and tubing depth were adjusted accordingly if excessive drawdown was observed. In 1-inch and ¾-inch ID cased wells, where the installed tubing restricted the access of the interface probe, the depth to water could not be gauged during purging. In these wells, gauging was performed only just prior to inserting the tubing and immediately after the tubing was removed.

EIC considered that stabilization was reached when 3 consecutive stabilization parameter readings were within ± 0.1 for pH and ± 5% for specific conductivity. Reasonable attempts were made at each well to reach 0.2 mg/L dissolved oxygen (DO) and a turbidity reading below 10 Nephelometric Turbidity Units (NTUs) prior to sampling. Groundwater quality field parameters (Temperature, pH, oxygen reduction potential (ORP), conductivity, turbidity, and DO) after stabilization and prior to sample collection are summarized in Table 3-3. Note, however, that during the September/October 2015 sampling event, the turbidity levels at 13 wells could not be lowered below 10 NTUs and the DO levels could not be lowered below 0.2 mg/L at any of the wells sampled. All samples were collected using the "soda straw method" specified in SOP SESDPROC-301-R3.

### 3.2.5 Sample Custody and Laboratory Analysis

Immediately after each sample set was collected, the sample bottles were sealed and labeled in the field. Each sample set was then placed in padded sealable plastic bags to prevent breakage and stored with ice in insulated cooler containers provided by the laboratory. Complete and signed chain of custody forms accompanied all samples. EIC delivered and relinquished the samples to Test America Laboratories, a Georgia-certified laboratory located in Savannah, Georgia, prior to returning to EIC headquarters.

The laboratory conducted analysis of volatile organic compounds via EPA method 8260B. The laboratory report for the September/October 2015 event is included as Attachment C. The results

of COC analysis of samples collected during this event, along with historical COC analytical data, are summarized in Table 3-4.

### 3.3 Quality Assurance and Quality Control

For quality assurance and quality control purposes during the groundwater sampling process, EIC submitted one trip blank set, provided by the laboratory, with each sample container for analysis via EPA Method 8260B. The trip blanks were kept in the same thermal cooler as the collected CVOC/VOC samples until they were relinquished to the laboratory.

To prevent cross-contamination, new disposable 1/4-inch inner diameter and 3/8-inch outer diameter Teflon®-lined tubing was used to collect samples at each well, which were later properly disposed of. EIC's oil/water interface meter, 2,000 mL graduated cylinder, and Teflon® tubing cutter were field decontaminated prior to use and between sampling locations by washing with a phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. After each sample was collected, the water quality parameters instrument was also decontaminated with DI water.

### 3.4 Data Evaluation

EIC conducted an evaluation of the data compiled from field and laboratory analyses of groundwater samples collected during this event to determine the groundwater potentiometric surface and to determine the horizontal and the vertical extent of the prevailing COC plumes. Data from this sampling event was compared with the data from the baseline sampling event and data from each of the subsequent sampling events to develop a strategy to reach remedial end points.

#### 3.4.1 Groundwater Potentiometric Map

Table 3-5 tabulates the historical groundwater elevations for all gauging events at the site since groundwater monitoring was initiated under the VIRP in October 2011. From this table, it is apparent that during the September/October 2015 gauging event, the overall potentiometric surface was similar in elevation to the previous gauging event. In general, the potentiometric surface elevation at the site during the September/October 2015 event was slightly above the global average groundwater elevation. Additionally, the average groundwater elevation during the September/October 2015 gauging event was relatively high compared to those observed during previous groundwater monitoring events.

Figure 3-2 illustrates the September/October 2015 potentiometric surface map. Referring to Figure 3-2, the prevailing groundwater flow direction in the vicinity of the COC plume footprint remains from the southwest to the northeast.

### 3.4.2 Horizontal Extent of COC Plumes

Figure 3-3 summarizes the analytical results of the monitored dissolved COCs from the September/October 2015 sampling event for each well sampled. Figures 3-4 through 3-11 illustrate each of the eight monitored COC plumes. Table 3-4 is a compilation of available analytical data from groundwater monitoring events conducted since February 1991. The following sub-sections describe the spatial and temporal analysis of the horizontal extent of the COC plumes.

#### 3.4.2.1 CVOC Plume

The CVOC plume consists of Tetrachloroethylene or Perchloroethylene (PCE), Trichloroethylene (TCE), Cis-1, 2 Dichloroethylene (DCE), and Vinyl Chloride (VC) COCs. Based on current analytical results, it is apparent that the overall extent and concentration of the collective CVOC plume at the site has significantly decreased since the inception of the VIRP sampling program in October 2011. However, residual CVOC concentrations are present in certain areas. The following subsections describe spatial and temporal changes of individual CVOC constituents since October 2011.

**PCE Plume:**

Figure 3-4 illustrates the horizontal extent of the PCE plume during the September/October 2015 sampling event. The current PCE plume is composed of two distinctly separated areas of contamination, with the peak concentration of the first area centered near IW-1R at the upgradient southwestern end of the original CVOC plume footprint, and the peak concentration of the second area centered near MW-29 near the down-gradient northeastern end of the original CVOC plume footprint.

Within the upgradient portion of the original CVOC plume footprint, the peak PCE concentration at IW-1R decreased from 310 µg/L to 230 µg/L from March/April 2015 to September/October 2015 sampling events, respectively. It is noteworthy that PCE concentrations at MW-26R, near well IW-1R, were below detection limits.

Within the down-gradient portion of the original CVOC plume footprint, the overall extent and concentration in this area has fluctuated since the first VIRP sampling event in October 2011, however, overall, there has been a decreasing concentration trend. In particular, the sharp decrease in PCE concentration, observed at MW-32 during the March/April 2015 event, was revalidated during the September/October monitoring event. Additionally, the PCE concentration slightly decreased in MW-29 from 160 µg/L to 110 µg/L.

In summary, the overall extents of the PCE plume have reduced substantially or remained stable over time and concentrations at sampled wells are decreasing and trending downward towards RRS

values. This indicates that MNA is effective in reducing the PCE mass concentrations especially at the down-gradient leading edge plume closest to the Savannah River.

**TCE Plume:**

Figure 3-5 illustrates the horizontal extent of the TCE plume during the September/October 2015 sampling event. Similar to the PCE footprint, the TCE plume is also composed of two distinct peaks of contamination. The upgradient area of peak concentration is located between wells IW-1R and LAW-PZ-8R, while the downgradient peak is located near well MW-29. The TCE concentration at IW-1R reduced from 150 µg/L in March/April 2015 to 100 µg/L in September/October 2015. At well MW-29, the TCE concentration increased slightly from 90 µg/L in March/April 2015 to 130 µg/L in September/October 2015. These shifts were accompanied by increases at nearby wells, particularly at MW-33. As such, the former separate plumes above the delineation criterion of 5 µg/L that were observed in March/April 2015, rejoined into a single plume. The slight increases in TCE concentrations observed may be attributed to the degradation of PCE.

In summary, the overall extent of the TCE plume has remained stable over time. Typically, TCE is produced from reductive dechlorination of PCE. The substantial transformation of PCE TCE is indicative that MNA is effective in reducing the PCE to TCE.

**DCE Plume:**

Figure 3-6 illustrates the horizontal extent of the DCE plume during the September/October 2015 sampling event. Consistent with the other CVOC plumes, the DCE plume is divided into two distinct peaks with concentrations above the RRS of 1,022 µg/L. The upgradient area of peak concentration is located near IW-1R, while the downgradient peak is located near MW-29. The DCE concentration at IW-1R reduced from 9,900 µg/L in March/April 2015 to 8,800 µg/L in September/October 2015. At MW-29, the TCE concentration increased from 5,900 µg/L in March/April 2015 to 9,000 µg/L in September/October 2015. The increase in concentration near MW-29 is most likely attributed to the attenuation of its parent CVOC products which produce DCE as a degradation product.

In summary, the overall extent of the DCE plume has reduced or has remained stable over time and concentrations within it are generally decreasing and trending downwards towards RRS values. Considering that DCE is a second-step transformation product from the reductive dechlorination of PCE, substantial reduction in PCE concentration and production of DCE is confirming that the MNA is effective in reducing the DCE concentrations. The relatively minor increases in DCE concentration may be attributed to degradation of PCE and TCE over time.

**VC Plume:**

Figure 3-7 illustrates the horizontal extent of the VC plume during the September/October 2015 sampling event. The plume area is consistent with previously plotted CVOC plumes, however, it does not exhibit separate upgradient and downgradient portions of the plume, as with other COC plumes. The peak concentration of the downgradient plume occurs near MW-29, where the concentration increased from 790 µg/L in March/April 2015 to 1,000 µg/L in September/October 2015.

In summary, the VC plume has remained stable in the short term and significantly reduced in both areal extent and in concentration relative to the original footprint. As with the other CVOC daughter product plumes, minor increases in concentration of VC may be attributed to the transformation from the parent products.

#### 4.4.2.2 VOC Plume

The COCs monitored within the collective VOC plume consist of Benzene, Toluene, Ethylbenzene, and Total Xylenes (BTEX). Since the first VIRP sampling event, conducted in October 2011, the VOC plume concentrations within the original VOC plume footprint have declined substantially. The following subsections describe spatial and temporal changes of individual VOC constituents since VIRP sampling was initiated in October 2011.

**Benzene Plume:**

Figure 3-8 illustrates the horizontal extent of the benzene plume during the September/October 2015 sampling event. The benzene plume is composed of two isolated areas of concentrations above RRS and the delineation criterion near the upgradient and down-gradient portions of the original VOC plume footprint. The upgradient benzene plume continues to maintain stability and increased very slightly in LAW-PZ-8R from 1,100 µg/L in March/April 2015 to 1,200 µg/L in September/October 2015. The down-gradient plume, centered near MW-29, has remained relatively stable over time as compared to the original footprint.

In summary, the Benzene plume has reduced significantly in concentration and extent as compared to the original plume footprint and continues to trend downward towards RRS values.

**Toluene Plume:**

Figure 3-9 illustrates the horizontal extent of the toluene plume from the September/October 2015 sampling event. The Toluene plume has been centered in the area between wells IW-1R and LAW-PZ-8R and has remained below RRS for the duration of the VIRP. At IW-1R the Toluene concentration decreased from 260 µg/L in March/April 2015 to 200 µg/L in September/October

2015. This indicates a continued downward trend in concentration and demonstrates the effectiveness of MNA in remediating Toluene.

**Ethylbenzene Plume:**

Figure 3-10 illustrates the horizontal extent of the ethylbenzene plume from the September/October 2015 sampling event. The ethylbenzene plume is divided into distinct upgradient and downgradient portions. The upgradient portion is centered near LAW-PZ-8R while the downgradient portion is centered near MW-29. The Ethylbenzene concentration at LAW-PZ-8R decreased from 6,900 µg/L in March/April 2015 to 6,200 µg/L in September/October 2015. The Ethylbenzene concentration at MW-29 decreased by almost one half from 3,300 µg/L in March/April 2015 to 1,700 µg/L in September/October 2015.

In summary, the Ethylbenzene plume has significantly reduced in concentration and extent in comparison to the original plume footprint and continues to trend downward towards RRS values. This indicates that MNA is effective in reducing Ethylbenzene concentrations.

**Total Xylenes Plume:**

Figure 3-11 illustrates the horizontal extent of the total xylenes plume from the September/October 2015 sampling event. Similar to the ethylbenzene plume, the total xylenes plume is divided into upgradient and downgradient portions centered near wells LAW-PZ-8R and MW-29, respectively. The total xylenes concentration at LAW-PZ-8R decreased from 87,000 µg/L in March/April 2015 to 78,000 µg/L in September/October 2015. The total xylenes concentration at MW-29 decreased from 7,300 µg/L in March/April 2015 to 4,700 µg/L in September/October 2015. This indicated a trend reversal of a previously increasing trend in concentrations and a slight horizontal plume extents expansion observed up until the March/April 2015 event.

In summary, the total xylenes plume has significantly reduced in concentration and extent, as compared to the original plume footprint, and remains stable in concentration and extent.

### 3.4.3 Vertical Extent of COC Plumes

The historical groundwater sampling results of samples from the single deep well MW-14 within the original COCs footprint through September/October 2015 are tabulated in Table 3-4. Since the redevelopment and integration of well MW-14 into the regular CVOC and VOC sampling schedule in October 2013, EIC confirmed that all monitored COC concentrations in the well have remained below delineation standards and all but one parameter were below method detection limits - MDLs. In the EPD's comment letter to VOPAK dated April 3, 2014, the EPD concurred with EIC that vertical delineation is complete.

SECTION

4

# 4.0 SAVANNAH RIVER MIXING MODEL

To evaluate the potential impact of shallow groundwater contamination to the Savannah River (River) at the site, EIC developed a mixing model. This model estimates the maximum downstream concentrations of COC's in the Savannah River after mixing with potential COCs in the groundwater migrating from the VOPAK site.

## 4.1 Model Setup

As a primary criterion, EIC established the following assumptions to evaluate the worst case scenario:

H. The entire mass of groundwater is uniformly contaminated with same concentration of COCs.

- Groundwater enters the River along the entire length of the site.
- Groundwater mixes with surface water in the River.

As such, the components of the model consist of the groundwater flow rate, the concentration of COCs in groundwater entering the River from the site, the flow rate in the River, and the resulting COC concentrations in the River upon mixing of the groundwater with the surface water in the Savannah River.

### 4.1.1 Groundwater Mass Flux Flow

The groundwater flux was estimated by utilizing the Dupuit equation shown below (Fetter, 2001).

$$q = \frac{1}{2}k\left(\frac{h_1^2 - h_2^2}{L}\right) = \frac{1}{2} * 0.88\frac{ft}{day} * \left(\frac{(48.71\,ft)^2 - (35.14\,ft)^2}{700\,ft}\right) = 0.71\frac{ft^2}{day} = 259.84\frac{ft^2}{year}$$

$$q = groundwater\ flow\ per\ unit\ width\ \left(\frac{ft^2}{day}\ \&\ \frac{ft^2}{year}\right)$$

$k = hydraulic\ conductivty\ \left(\frac{ft}{day}\right)$
$h_1 = hydraulic\ head\ at\ source\ (ft)$
$h_2 = hydraulic\ head\ at\ groundwater/river\ interface\ (ft)$
$L = distance\ between\ source\ and\ river\ (ft)$

As a worst case scenario, hydraulic conductivity was assumed to be the largest value in the range presented in the Site Conceptual Model (EIC, 2015b). Figure 4-1 illustrates the points selected for $h_1$ *and* $h_2$with the September/October 2015 groundwater contours. Considering that the initial release originated from Tank No. 24, EIC selected that area as $h_1$for the location of the hydraulic head at the source. Since groundwater discharges to the river, EIC utilized a point along the shoreline as $h_2$.

The confining unit from which hydraulic head was calculated is assumed to be the Hawthorne formation described in Table 1 of the 1963 USGS report titled *Subsurface Geology of the Georgia Coastal Plain* (USGS, 1963). From this report, the depth of the Hawthorn formation below ground surface is apparently 50 feet near the Savannah, Georgia area. Using this depth, the value of $h_1$ was derived from the groundwater contours shown in Figure 4-1, while the value of $h_2$ was determined as the height of the water in the Savannah River from data collected from by a United States Geologic Survey (USGS) gauging station on the Savannah River (USGS, 2016). The distance $L$ was computed using a trace line along the groundwater flow path between the source and the point where the channel intersects with the Savannah River.

EIC then calculated total groundwater flow to the river utilizing the following equation.

$$Q = q * L_R = 259.84 \frac{ft^2}{year} * 530\ ft = 1.38 * 10^5 \frac{ft^3}{year}$$

$Q = groundwater\ flowrate\ \left(\frac{ft^3}{year}\right)$
$q = grounderwater\ flow\ per\ unit\ width\ \left(\frac{ft^2}{day}\ \&\ \frac{ft^2}{year}\right)$
$L_R = Length\ of\ site\ \ along\ the\ Savannah\ riverfront\ (ft)$

### 4.1.2 Groundwater Concentration

For the purposes of this model, the selected groundwater concentrations were assumed to be consistent throughout the entire cross-section along the shoreline of the Savannah River. EIC chose three sets of concentrations, presented in Table 4-1, to compute different mixing scenarios. For the first scenario, EIC utilized the maximum concentrations measured at MW-16 from the latest sampling event, September/October 2015, to represent the current leading edge of the plume. For the second scenario, EIC utilized the maximum concentrations measured for each COC during the

September/October 2015 sampling event to represent a current worst case scenario. For the third scenario, EIC utilized the historical maximum concentrations of each constituent from Table 3-4 (that includes a compilation of VIRP and pre-VIRP groundwater analytical data), as an absolute worst case scenario.

### 4.1.3 Savannah River Flow

Georgia instream water quality standards are described in Georgia administrative code 391-3-6-.03 *Water Use Classifications and Water Quality Standards* (EPD, 2013). Referring to Chapter 4.e.iv, the COCs should not exceed the maximum allowable concentrations during annual average or higher stream flow conditions. As such, EIC computed a flow rate of the Savannah River, adjacent to the site, which was slightly less than the average flow rate. This computation is described in the following paragraphs.

#### 4.1.3.1 River Velocity

To compute the average velocity of the river flow, EIC first tabulated the river height gauging data from USGS gauging station 021989773 for the period from November 2008 to November 2015 (Attachment D). To establish a worst case analysis, EIC used the tidal elevation data (Attachment E) to first derive the mean low water (MLW) elevation, referenced to the NAVD88 datum (NOAA, 2015). EIC then computed the gauge height at the MLW elevation to be -4.38 feet, NAVD88.

Once EIC established the worst case MLW elevation, EIC segregated all velocity data corresponding to the MLW elevation from the original dataset. Next, EIC further segregated the data by only considering positive values of river velocities, which represent river flow towards the mouth of the river, and that represent a subset of river velocities at mean low water elevation. The average value of this subset of data was computed to be 1.24 feet per second (fps).

#### 4.1.3.2 Cross-sectional Area of Flow

To determine the cross-sectional area of flow, EIC researched publications that document the channel configuration in the vicinity of the VOPAK site. Based on this research, EIC found a United States Army Corps of Engineers (USACE) publication pertaining to the Savannah Harbor Expansion Project (SHEP) that includes various illustrations of the channel design for the area. An excerpt from this document that illustrates the channel design for the area that includes the VOPAK site is included as Attachment F and illustrates the channel width near the site. Referring to this illustration, it is apparent that a channel width of approximately 500 feet is maintained along the shipping channel for the navigation of container ships. The illustration also indicates that the current depth of the channel along the Savannah River within this navigable strip is 42 feet at mean low water. When the depth is extended to 47 feet under the SHEP program and the cross-sectional area flow will further increase over time. Also, the portion of the river on either side of the shipping channel adds additional areas of flow to the overall cross-sectional area of flow. For a conservative

estimate of the river discharge, however, EIC utilized a channel width of 500 ft. and the current depth of 42 feet for the mixing zone computations described in the following paragraphs.

#### 4.1.3.3 River Discharge

Utilizing the average low stage river velocity and the cross-sectional area of the river flow, EIC computed the river discharge as shown below:

$$Q_R = v_R * A_R = v_R * (w_R * d_R) = 1.24\ \frac{ft}{s} * 500\ ft * 42\ ft = 26{,}040\ \frac{ft^3}{s} = 8.21 * 10^{11}\ \frac{ft^3}{year}$$

where,

$Q_R = river\ discharge\ \left(\frac{ft^3}{year}\right)$

$v_R = average\ low\ stage\ river\ velocity\ \left(\frac{ft}{s}\right)$

$A_R = River\ cross\ sectional\ area\ (ft^2)$

$w_R = River\ width\ (ft)$

$d_R = River\ depth\ (ft)$

### 4.1.4 Upstream River Concentration

To estimate the potential effect of groundwater contamination from the VOPAK site entering the Savannah River, EIC assumed the initial concentration ($C_{Ru}$) of zero (0) as an upstream concentration of the respective COC in the River. For the purposes of the model, the mixing zone analysis only accounts for the potential impact of groundwater discharging from the VOPAK site.

## 4.2 Mixing Zone Calculation

EIC utilized the following equations to compute the potential downstream River concentrations based on the variables defined in Section 4.1. This equation utilizes the principle of conservation of mass and assumes complete mixing of contaminants from groundwater to the River to calculate the downstream River concentration.

$$C_{gw}Q_{gw} + C_{Ru}Q_{Ru} = C_{Rd}Q_{Rd}$$

$C_{gw} = groundwater\ COC\ concentration\ \left(\frac{\mu g}{L}\right)$

$Q_{gw} = groundwater\ flowrate\ \left(\frac{ft^3}{year}\right)$

$C_{Ru} = upstream\ river\ concentration\ \left(\frac{\mu g}{L}\right)$

$$Q_{Ru} = Q_R = upstream\ river\ flowrate\ \left(\frac{ft^3}{year}\right)$$

$$C_{Rd} = downstream\ river\ concentration\ \left(\frac{\mu g}{L}\right)$$

$$Q_{Rd} = Q_{gw} + Q_{Ru} = downstream\ river\ flowrate$$

Since,

$$C_{Ru} = 0$$

The mixing equation can be simplified to:

$$C_{gw}Q_{gw} = C_{Rd}Q_{Rd} = C_{Rd}(Q_{gw} + Q_{Ru})$$

Thus,

$$C_{Rd} = C_{gw}\left(\frac{Q_{gw}}{Q_{gw} + Q_{Ru}}\right) = C_{gw} * DF$$

*where DF serves as the Dilution factor*

Based on the Groundwater Mass Flux Flow (Section 4.1.1) and the river flow (Section 4.1.3):

$$DF = \left(\frac{Q_{gw}}{Q_{gw}+Q_{Ru}}\right) = \left(\frac{1.38*10^5\frac{ft^3}{year}}{1.38*10^5\frac{ft^3}{year} + 8.21*10^{11}\frac{ft^3}{year}}\right) = 1.68 * 10^{-7}$$

EIC utilized the dilution factor to compute the downstream river concentration for each COC for all three scenarios.

### 4.3 Results

Table 4-2 lists the results of the conservation of mass calculations as well as the state and national regulatory levels for each COC. The regulatory levels considered for this evaluation are the Georgia Instream Water Quality Standard (EPD, 2013) and the National Primary Drinking Water Standard (EPA, 2009).

Referring to the estimated downstream river concentrations listed in Table 4-2, it is apparent that the potential impact from groundwater discharge from the site into the Savannah River would be negligible. Also, these downstream river concentrations are several orders of magnitude lower than

the state or federal regulatory standards. Considering that this is a conservative worst-case scenario, potential COC migration to the River from this site would not result in downstream river concentrations in excess of both federal and state surface water quality standards.

SECTION

5

# 5.0 REMEDIAL PROGRESS

To determine the remedial progress, EIC performed a spatial and temporal analysis of the COC plumes and an evaluation of COC trends in individual wells. The following subsections discuss the remedial progress.

## 5.1 COC Degradation

The spatial and temporal analysis of the COC plumes, discussed in Section 3, provides a clear insight into the overall remedial progress and the plume stability. The following subsections discuss the degradation of the COCs.

### 5.1.1 CVOC Plume

As discussed in the previous semi-annual progress report, the prevailing PCE, TCE, DCE, and VC plumes have degraded significantly in comparison to the footprints of the original COC plumes (EIC, 2015b). Since the inception of the VIRP program and subsequent to the first sampling event in October 2011, EIC has delineated the leading edge of each CVOC plume.

Referring to the October 2015 analytical data, COC concentrations from the following monitoring wells exceed the established RRS values as of the time of the October 2015 groundwater monitoring event.

- **PCE** – IW-1R, IW-18, LAW-PZ-8R, MW-28, MW-29, MW-33, MW-37, and PAN-MW-9
- **TCE** – IW-1R, MW-29, and MW-33
- **DCE** – IW-1R, LAW-PZ-8R, MW-29, and PAN-MW-9
- **VC** – IW-1R, IW-18, LAW-PZ-8R, MW-16, MW-24R, MW-27, MW-28, MW-29, MW-33, MW-37, and PAN-MW-9

### 5.1.2 VOC Plume

Following a similar trend as the CVOC plume, the collective VOC plume has also reduced substantially in the center and at the leading edge of the VOC baseline footprint. This has resulted in two isolated pockets of VOC plumes, one in the trailing edge of the original VOC footprint with peak concentrations near well LAW-PZ-8R and a second pocket at the leading edge of the original VOC footprint with lower peak concentrations near well MW-29. EIC has delineated the leading edge of each COC of the VOC plume.

Referring to the October 2015 analytical data, it is apparent that concentrations of the monitored VOC COCs in groundwater at the following monitoring wells exceed the established RRS concentrations for the COCs.

- **Benzene** – IW-1R, IW-18, LAW-PZ-8R, MW-26R, and MW-29
- **Toluene** – none
- **Ethylbenzene** – IW-1R, LAW-PZ-8R, and MW-29
- **Total Xylenes** – IW-1R and LAW-PZ-8R

## 5.2 COC Trends in Individual Wells

Pursuant to EPD's requirements, discussed in the Seventh VIRP Semi-annual Progress Report, EIC prepared trend line graphs for each COC for select wells (EIC, 2015b). These trend line graphs are presented as Figures 5-1 through 5-14.

In general, all graphs illustrate an initial increase in PCE concentrations but then a gradual decline in PCE concentrations during subsequent sampling events. By contrast, the degradation products of PCE have increased in some areas and have remained persistent in other areas of the PCE footprint – confirming natural attenuation of PCE. A more detailed analysis of fluid flow hydrodynamics, as well as a fate and transport evaluation of CVOC and VOC concentrations is included in the revised site conceptual model submitted as Appendix A in the Eighth VIRP Semi-annual Progress Report.

## 5.3 Remedial Progress

As discussed in the previous Eighth Semiannual Progress Report, significant remedial progress has occurred at the site since the initiation of the VIRP and the aerial extent of the PCE plume is now confined to two small areas within the original plume footprint. The significant reduction in the leading edge of the PCE plume, discussed in the previous semiannual report, has been confirmed during two consecutive sampling events in April and October 2015 respectively. Additionally, in comparing the April and October 2015 events, concentrations of COCs remained relatively stable between the two events.

## 5.4 Final Remediation Plan

Based on the remedial progress discussed in Section 5.3, it is apparent that the PCE plume has reduced significantly and is only recalcitrant in isolated small areas within the site. Based on the historic trends, it appears that the isolated pockets of the TCE plume will likely degrade over time. In addition, the overall extent of the plume is stable or shrinking and remains stable within the site. As such, VOPAK will propose Type 5 RRS at the site to manage the potential exposure risks with environmental covenants.

SECTION

6

# 6.0 SUMMARY

Data from the recent September/October 2015 sampling event continues to support natural attenuation as the most practical solution for remediating the COCs at the site. The data also confirms the substantial reduction in COC concentrations at the leading edge of the prevailing contaminant plume. Nevertheless, it is apparent that relatively low concentrations the COCs are persistent within the pre-VIRP foot-print. At the current COC reduction trends, however, the concentrations will not be reduced to less than the Type 4 RRS within the August 31, 2016 deadline established in the VIRP program.

Clearly, the historical sampling data confirms that the plume is stable and shrinking. As an additional step in addressing potential impact to hydraulically downgradient receptors, VOPAK performed a mixing zone analysis to determine the potential impact from migration of contaminated groundwater into the Savannah River. The results of the mixing zone analysis indicate that the downstream concentrations upon mixing would be substantially lower than the state and federal water quality standards.

In summary, the plume is contained within the site and does not present a potential risk to downgradient receptors. Based on a meeting with EPD and GPA, VOPAK will prepare and utilize an EPD approved UEC to manage the prevailing groundwater contamination with institutional and engineering controls under Type 5 RRS. Explicit details of the controls and supporting material will be provided in the UEC and CSR to be submitted to EPD for review and approval.

**Notes:**

ID = Identity

mL = Milliliter

TOC = Well Top of Casing

* During well purging, the Teflon-lined tubing was lowered as needed when the water level fell to the depth of the intake, causing air to be recovered.

**Notes:**
Field parameters were recorded by EIC from 09/28/2015 to 10/01/2015 after parameters had stabilized and prior to sample collection.

Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell.
ID= Identity
SU= Standard Unit
mV= Millivolts
mS/cm= Microsiemens per centimeter
NTU= Nephelometric Turbidity Unit
mg/L= Milligrams per liter

**Notes:**

NI - Not Installed

NS - Not Surveyed, TOC elevation information is not available for well

NL - Not Located

NA - Not Applicable

NG - Not Gauged

*** = Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

*[2] = MW-14 is considered a deep well at the Site and is not considered for the shallow potentiometric surface at the Site.

***[3] = MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from October 2011 to October 2015 where available.

***[4]= Global Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from October 2011 to October 2015

# Table 4-1: Mixing Model Initial Groundwater Concentrations

| Constituents of Concern | Leading Edge Concentration, $C_{gw1}$ (µg/L) | Maximum Concentration Recorded During the September/October 2015 Sampling Event $C_{gw2}$ (µg/L) | Maximum Concentration Ever Recorded at the Site $C_{gw3}$ (µg/L) |
|---|---|---|---|
| PCE | 1.50E+00 | 7.40E+02 | 1.40E+04 |
| TCE | 9.60E-01 | 4.80E+02 | 3.20E+03 |
| DCE | 1.50E+02 | 9.00E+03 | 3.10E+04 |
| VC | 7.50E+01 | 1.00E+03 | 1.90E+03 |
| Benzene | 1.70E+00 | 1.20E+03 | 3.40E+03 |
| Toluene | 9.60E-01 | 4.80E+02 | 1.20E+03 |
| Ethylbenzene | 6.60E-01 | 6.20E+03 | 1.30E+04 |
| Xylenes | 4.60E-01 | 7.80E+04 | 1.80E+05 |

**Notes:**

Leading edge is assumed to be the concentration at MW-16 derived from EIC September/October 2015 groundwater sampling results, recorded in the 9th Semi-annual report, Table 3-4

Maximum Site Concentration September/October 2015 is the highest observed concentration for each constituent at the site during the September/October 2015 groundwater sampling event, recorded in the 9th Semi-annual report, Table 3-4

Maximum Concentration Ever Recorded is the maximum concentration of each constituent recorded at any well for any event as reported in the 9th Semi-annual report, Table 3-4

## Table 4-2: Modeled Downstream River Concentrations Compared to Water Quality Standards

| Constituents of Concern | Georgia Instream Water Quality Standards (µg/L)* | National Primary Drinking Water Standards (µg/L)*[2] | Estimated Downstream River Concentrations | | |
|---|---|---|---|---|---|
| | | | Utilizing Leading Edge $C_{gw1}$, $C_{Rd1}$ (µg/L) | Utilizing Event Maximum $C_{gw2}$, $C_{Rd2}$ (µg/L) | Utilizing Maximum Recorded $C_{gw3}$, $C_{Rd3}$ (µg/L) |
| PCE | 3.30E+00 | 5.00E+00 | 2.52E-07 | 1.24E-04 | 2.35E-03 |
| TCE | 3.00E+01 | 5.00E+00 | 1.61E-07 | 8.05E-05 | 5.37E-04 |
| DCE | NA | 7.00E+01 | 2.52E-05 | 1.51E-03 | 5.20E-03 |
| VC | 2.40E+00 | 2.00E+00 | 1.26E-05 | 1.68E-04 | 3.19E-04 |
| Benzene | 5.10E+01 | 5.00E+00 | 2.85E-07 | 2.01E-04 | 5.70E-04 |
| Toluene | 5.98E+03 | 1.00E+03 | 1.61E-07 | 8.05E-05 | 2.01E-04 |
| Ethylbenzene | 2.10E+03 | 7.00E+02 | 1.11E-07 | 1.04E-03 | 2.18E-03 |
| Xylenes | NA | 1.00E+04 | 7.71E-08 | 1.31E-02 | 3.02E-02 |

**Notes:**

Downstream river concentrations are based on the mixing formula below. The formula assumes that the groundwater flow discharging to the river from the entire length of the site is uniformly contaminated at each of the respective groundwater concentrations (Cgw)

NA = not applicable

$$C_{Rd} = C_{gw} * \left( \frac{Q_{gw}}{Q_{gw} + Q_{Ru}} \right) = C_{gw} * DF \text{ , where } DF = 1.68 * 10^{-7}$$

* EPD 2013. *Rules and Regulations for Water Quality Control, Chapter 391-3-6-.03*. Atlanta, Georgia. August 27, 2013.

COMMENTS:

SAMPLE COLLECTION TIME: 11:20

PREPARED BY: amelia Grant

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

10:43 began purging

COMMENTS:

SAMPLE COLLECTION TIME: 19:01

PREPARED BY: Amelia Grant

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

SAMPLE COLLECTION TIME: 10:05

PREPARED BY: Amelia Grant

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:

SAMPLE COLLECTION TIME: 11:02

PREPARED BY: amelia Graft

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.
Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:

SAMPLE COLLECTION TIME: 18:29

PREPARED BY: Amelia Grant

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| * | LCS or LCSD is outside acceptance limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Job ID: 680-117408-1

**Laboratory: TestAmerica Savannah**

**Narrative**

# CASE NARRATIVE

## Client: Environmental International Corporation

## Project: VOPAK Savannah Terminal/390020

## Report Number: 680-117408-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

**RECEIPT**

The samples were received on 10/02/2015; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.2 C.

**VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples IW-IR (680-117408-1), IW-18 (680-117408-2), LAW-PZ-8R (680-117408-3), MW-14 (680-117408-4), MW-16 (680-117408-5), MW-17R (680-117408-6), MW-18R (680-117408-7), MW-19 (680-117408-8), MW-23 (680-117408-9), MW-24R (680-117408-10), MW-25 (680-117408-11), MW-26R (680-117408-12), MW-27 (680-117408-13), MW-28 (680-117408-14), MW-29 (680-117408-15), MW-30 (680-117408-16), MW-31 (680-117408-17), MW-32 (680-117408-18), MW-33 (680-117408-19), MW-34 (680-117408-20), MW-35 (680-117408-21), MW-36 (680-117408-22), MW-37 (680-117408-23), PAN-MW-9 (680-117408-24), PAN-MW-10 (680-117408-25) and Trip Blank (680-117408-26) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 10/09/2015, 10/10/2015, 10/12/2015, 10/13/2015 and 10/14/2015.

Bromomethane, Chloromethane and Tetrachloroethene failed the recovery criteria high for LCS 680-405241/4. Carbon tetrachloride failed the recovery criteria high for LCS 680-405400/4. Bromomethane, Chloromethane and Tetrachloroethene failed the recovery criteria high for LCSD 680-405241/5. Carbon tetrachloride failed the recovery criteria high for LCSD 680-405400/5. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Several analytes failed the recovery criteria high for the MS of sample 680-117585-3 in batch 680-405413.

Several analytes exceeded the RPD limit for the MSD of sample 680-117585-3 in batch 680-405413.

Refer to the QC report for details.

Samples IW-IR (680-117408-1)[200X], IW-18 (680-117408-2)[25X], LAW-PZ-8R (680-117408-3)[1000X], MW-16 (680-117408-5)[2X], MW-24R (680-117408-10)[5X], MW-26R (680-117408-12)[5X], MW-28 (680-117408-14)[2X], MW-29 (680-117408-15)[100X], MW-33 (680-117408-19)[5X], MW-37 (680-117408-23)[5X] and PAN-MW-9 (680-117408-24)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

# Login Sample Receipt Checklist

Client: Environmental International Corporation

Job Number: 680-117408-1

**Login Number: 117408**
**List Number: 1**
**Creator: White, Menica R**

**List Source: TestAmerica Savannah**

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | N/A | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time. | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

# Certification Summary

Client: Environmental International Corporation
Project/Site: VOPAK Savannah Terminal/390020

TestAmerica Job ID: 680-117408-1

## Laboratory: TestAmerica Savannah

The certifications listed below are applicable to this report.

| Authority | Program | EPA Region | Certification ID | Expiration Date |
|---|---|---|---|---|
| Georgia | State Program | 4 | 803 | 06-30-16 |

| **Average River Velocity (feet per second) -->** | | **1.24** |

**Notes:**

Selected stream velocities were obtained by Environmental International Corporation (EIC) from USGS Waterdata database from Gauging Station 021989773. The dates of the data EIC obtained ranged from 2008 to 2015, which included all years with complete gauge and stream velocity data from this gauging station.

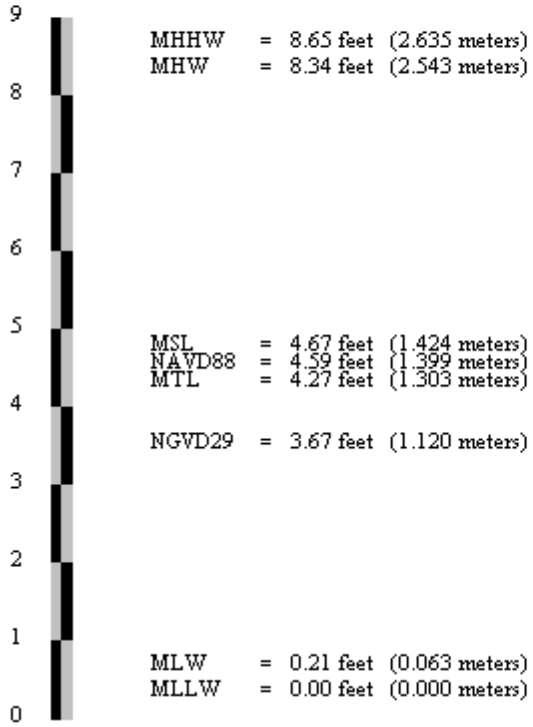
## ELEVATION INFORMATION, NATIONAL GEODETIC SURVEY – TIDAL EVALUATION

# National Geodetic Survey - Tidal Elevation

ngs.noaa.gov/Tidal_Elevation/diagram.jsp

ELEVATION INFORMATION

PID: CK0429
VM: 16682
STATION ID: 8670424
EPOCH: 1983-2001
DATE: Tuesday, July 28, 2015 3:04:50 PM EST



The NAVD 88 and the NGVD 29 elevations related to MLLW were computed from Bench Mark, A 3, at the station.

Displayed tidal datums are Mean Higher High Water(MHHW), Mean High Water (MHW), Mean Tide Level(MTL), Mean Sea Level (MSL), Mean Low Water(MLW), and Mean Lower Low Water(MLLW) referenced on 1960-1978 Epoch.

# 1.0 INTRODUCTION

On behalf of VOPAK Terminal Savannah, Inc. (VTSI), Environmental International Corporation (EIC) is pleased to submit the April 2016 Groundwater Monitoring Report for review by the Georgia Environmental Protection Division Response and Remediation Program (EPD). This report was prepared to describe the semi-annual sampling specified in the April 2, 2011 "Revised Voluntary Investigation and Remediation Plan (VIRP) and Application" that was approved by the EPD on August 31, 2011 under the Voluntary Remediation Program (VRP) (EIC, 2011a).

## 1.1 Primary Objectives

The primary objective of this report is to present the semi-annual groundwater monitoring event conducted in April 2016. This report documents the following subjects:

- Well Survey
- April 2016 Semi-annual Groundwater Monitoring Event

The following sections describe each task related to these subjects.

A site layout map is included as Figure 1-1.

SECTION

2

# 2.0 WELL SURVEY

In April 2016, EIC retained a professional land surveyor licensed in the State of Georgia to survey various features at VTSI. For the VIRP, the primary objective achieved was the measurement of the horizontal and vertical coordinates of the top of casing (TOC) of wells IW-1R and MW-28. The surveyor also measured the vertical coordinates of the ground surface adjacent to the two aforementioned wells. This data allowed for the accurate placement of wells IW-1R and MW-28 on site maps and enabled calculation of the groundwater potentiometric surface elevation at each of these wells for all events in which the wells were gauged. The survey report is included as Attachment A.

SECTION

3

# 3.0 GROUNDWATER MONITORING

The semi-annual groundwater monitoring (sampling) event documented in this section was conducted from April 4 to 7, 2016. This was the first semi-annual sampling event of 2016 under the VIRP program. The sampling event entailed the collection of groundwater samples, for laboratory analysis of dissolved constituents (or contaminants) of concern (COCs), from wells within the previously established area of concern. COCs that EIC monitored included dissolved chlorinated volatile organic compounds (CVOCs) and volatile organic compounds (VOCs).

During this event, all available monitoring wells and two selected former injection wells within and adjacent to the CVOC/VOC contaminant plumes were utilized for groundwater sampling. Accordingly, EIC collected groundwater samples for CVOC/VOC analysis from a total of 25 wells.

The analytical data from the April 2016 sampling event was compared to the first quarterly sampling event (EIC, 2011b) and all other subsequent sampling events (EIC, 2012a, 2012b, 2012c, 2012d, 2013a, 2013b, 2013c, 2014a, 2014b, 2015a, 2015b, and 2016) to track prevailing contaminant concentration trends.

## 3.1 Groundwater Monitoring Objective

The primary goal of the April 2016 groundwater monitoring event was to meet the groundwater monitoring objectives set forth in the VIRP. The following subsections document the sampling process and an evaluation of the analytical results from the samples collected at the site.

## 3.2 Groundwater Monitoring Field Program

During the April 2016 groundwater monitoring event, EIC conducted groundwater monitoring utilizing 22 shallow monitoring wells, two shallow injection wells, and one deep monitoring well. The site layout is illustrated in Figure 1-1 with the locations of each well. The following sub-sections describe EIC's technical approach regarding this event.

### 3.2.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. Region 4 EPA groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

### 3.2.2 Site Access

Prior to EIC's site visit, EIC coordinated the sampling activities with the Georgia Ports Authority (GPA) and GAF Materials Corp. (GAF) for gaining access to collect groundwater samples from a total of seven off-site monitoring wells consisting of MW-17R, MW-28, MW-32, MW-34, MW-35, MW-36, and MW-37. Monitoring wells MW-28 and MW-37 are located on GAF property and wells MW-17R, MW-32, MW-34, MW-35, and MW-36 are located on GPA property.

### 3.2.3 Groundwater Gauging

During the sampling event, EIC first gauged each well with a Solinst Model 122 interface meter ("oil/water interface probe") to determine the static depth to groundwater below the top-of-casing (TOC) of each well. The gauging data is tabulated in Table 3-1. In preparing this table, EIC utilized surveyed TOC elevations to determine the groundwater elevation at each well during this event.

### 3.2.4 Groundwater Sampling Field Procedures

To containerize investigative-derived waste (IDW) purged groundwater , EIC utilized a structurally competent 55-gallon drum supplied by VTSI. During the April 2016 event, the 55-gallon drum was placed on the west shoulder of Hart Street, which lies between Tank Farm #2 and Tank Farm #3, near well MW-27. EIC placed a non-hazardous waste label on the drum and marked the contents on it as "IDW well purge water" and the accumulation date with a black permanent marker. The drum was later properly disposed of by VTSI.

EIC followed the "low-flow" purge technique, noted in Section 3.2.1, to conduct all groundwater sampling. EIC used a peristaltic pump with disposable 1/4-inch internal diameter (ID) Teflon®-lined tubing and a 6-inch segment of 3/16-inch ID silicon tubing at the pump head to purge each well until groundwater quality parameters reached stabilization prior to sampling. The length of Teflon® tubing necessary to place the intake at the center of the wetted screened interval was determined from measuring water levels and utilizing available well construction data noted in EIC well purging and sampling data field logs (Attachment B). Purging data is summarized in Table 3-2.

Groundwater stabilization parameters were monitored during direct transfer of the pumped groundwater through a multi-parameter field water quality meter equipped with a flow-through cell. These parameters were recorded at approximately five-minute intervals on EIC's field logs

(Attachment B). Additionally, purge volumes and depth-to-water (DTW) measurements were recorded at the same five-minute intervals when possible. At each well, the pumping rate and tubing depth were adjusted accordingly if excessive drawdown was observed. In 1-inch and ¾-inch ID cased wells, where the installed tubing restricted the access of the interface probe, the depth to water could not be gauged during purging. In these wells, gauging was performed only just prior to inserting the tubing and immediately after the tubing was removed.

EIC considered that stabilization was reached when 3 consecutive stabilization parameter readings were within ± 0.1 for pH and ± 5% for specific conductivity. Reasonable attempts were made at each well to reach 0.2 mg/L dissolved oxygen (DO) and a turbidity reading below 10 Nephelometric Turbidity Units (NTUs) prior to sampling. Groundwater quality field parameters (Temperature, pH, oxygen reduction potential (ORP), conductivity, turbidity, and DO) after stabilization and prior to sample collection are summarized in Table 3-3. Note, however, that during the April 2016 sampling event, the turbidity levels at 12 wells could not be lowered below 10 NTUs and the DO levels could not be lowered below 0.2 mg/L at any of the wells sampled. All samples were collected using the "soda straw method" specified in SOP SESDPROC-301-R3.

### 3.2.5 Sample Custody and Laboratory Analysis

Immediately after each sample set was collected, the sample bottles were sealed and labeled in the field. Each sample set was then placed in padded sealable plastic bags to prevent breakage and stored with ice in insulated cooler containers provided by the laboratory. Complete and signed chain-of-custody forms accompanied all samples. EIC delivered and relinquished the samples to Test America Laboratories, a Georgia-certified laboratory located in Savannah, Georgia, prior to returning to EIC headquarters.

The laboratory conducted analysis of volatile organic compounds via EPA method 8260B. The laboratory report for the April 2016 event is included as Attachment C. The results of COC analysis of samples collected during this event, along with historical COC analytical data, are summarized in Table 3-4.

## 3.3 Quality Assurance and Quality Control

For quality assurance and quality control purposes during the groundwater sampling process, EIC submitted one trip blank set, provided by the laboratory, with each sample container for analysis via EPA Method 8260B. The trip blanks were kept in the same thermal cooler as the collected CVOC/VOC samples until they were relinquished to the laboratory.

To prevent cross-contamination, new disposable 1/4-inch inner diameter and 3/8-inch outer diameter Teflon®-lined tubing was used to collect samples at each well, which were later properly disposed of. EIC's oil/water interface meter, 2,000 mL graduated cylinder, and Teflon® tubing cutter were field decontaminated prior to use and between sampling locations by washing with a phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. After each

sample was collected, the water quality parameters instrument was also decontaminated with DI water.

### 3.4 Data Evaluation

EIC conducted an evaluation of the data compiled from field and laboratory analyses of groundwater samples collected during this event to determine the groundwater potentiometric surface and to determine the horizontal and the vertical extent of the prevailing COC plumes. Data from the current sampling event was compared with the data from the baseline sampling event and from each of the subsequent sampling events.

#### 3.4.1 Groundwater Potentiometric Map

Table 3-5 tabulates the historical groundwater elevations for all gauging events at the site since groundwater monitoring was initiated under the VIRP in October 2011. From this table, it is apparent that during the April 2016 gauging event, the overall potentiometric surface was similar in elevation to the previous gauging event in September/October 2015. In general, the potentiometric surface elevation at the site during the April 2016 event was slightly above the historic average groundwater elevation.

Figure 3-1 illustrates the April 2016 potentiometric surface map. Referring to Figure 3-1, the prevailing groundwater flow direction in the vicinity of the COCs plume footprint remains from the southwest to the northeast as it has since October 2011.

#### 3.4.2 Horizontal Extent of COC Plumes

Figure 3-2 summarizes the analytical results of the monitored dissolved COCs from the April 2016 sampling event for each well sampled. Figures 3-3 through 3-10 illustrate each of the eight monitored COC plumes. Table 3-4 is a compilation of available analytical data from groundwater monitoring events conducted since February 1991. The following sub-sections describe the spatial and temporal analysis of the horizontal extent of the COC plumes.

#### 3.4.2.1 CVOC Plume

The CVOC plume consists of Tetrachloroethylene or Perchloroethylene (PCE), Trichloroethylene (TCE), cis-1, 2 Dichloroethylene (DCE), and Vinyl Chloride (VC) COCs. Based on current analytical results, it is apparent that the overall extent and concentration of the collective CVOC plume at the site has significantly decreased since the inception of the VIRP sampling program in October 2011. Some residual CVOC concentrations are present in certain areas. The following subsections describe spatial and temporal changes of monitored individual CVOC constituents since October 2011.

**PCE Plume:**

Figure 3-3 illustrates the horizontal extent of the PCE plume during the April 2016 sampling event. The current PCE plume is composed of two distinctly separated areas of contamination, with the peak concentration of the first area centered near IW-1R at the up-gradient southwestern end of the original CVOC plume footprint, and the peak concentration of the second area centered near MW-29 near the down-gradient northeastern end of the original CVOC plume footprint.

Within the up-gradient portion of the original CVOC plume footprint, the peak PCE concentration at IW-1R increased from 230 µg/L to 300 µg/L during the September/October 2015 and April 2016 sampling events, respectively. It is noteworthy that PCE concentration at MW-26R, near well IW-1R, remained below detection limits.

Within the down-gradient portion of the original CVOC plume footprint, the overall extent and concentration in this area has fluctuated since the first VIRP sampling event in October 2011, however, overall, there has been a decreasing concentration trend. In particular, the PCE concentration remains below detection limits at MW-32, where the plume leading edge was formerly located, and has decreased at MW-33. However, the PCE concentration increased at MW-29 from 110 µg/L to 200 µg/L.

In summary, the overall extents of the PCE plume have reduced substantially or remained stable over time and concentrations at sampled wells are generally trending downward towards RRS values. This indicates that MNA is effective in reducing the PCE mass concentrations especially at the down-gradient leading edge of the plume closest to the Savannah River.

**TCE Plume:**

Figure 3-4 illustrates the horizontal extent of the TCE plume during the April 2016 sampling event. Similar to the PCE footprint, the TCE plume is also composed of two distinct peaks of contamination. The up-gradient area of peak concentration is located between wells LAW-PZ-8R and IW-18, while the downgradient peak is located near well MW-29. The TCE concentration at IW-1R increased from 100 µg/L in September/October 2015 to 140 µg/L in April 2016. At well MW-29, the TCE concentration increased from 130 µg/L in September/October 2015 to 230 µg/L

in April 2016. These shifts were accompanied by decreases at nearby wells, particularly at MW-33. As such, the formerly connected plumes -above the delineation criterion of 5 µg/L – has split into two distinct plumes. The increases in TCE concentrations observed are likely attributable to the degradation of PCE.

In summary, the overall extent of the TCE plume has remained stable over time. Typically, TCE is produced from reductive dechlorination of PCE. The substantial transformation of PCE to TCE is indicative that MNA is effective in reducing the PCE to TCE.

**DCE Plume:**

Figure 3-5 illustrates the horizontal extent of the DCE plume during the April 2016 sampling event. Consistent with the other CVOC plumes during this sampling event, the DCE plume is divided into two distinct peaks with concentrations above the RRS of 1,022 µg/L. The up-gradient area of peak concentration is located near IW-1R, while the downgradient peak is located near MW-29. The DCE concentration at IW-1R increased from 8,800 µg/L in September/October 2015 to 9,500 µg/L in April 2016. At MW-29, the TCE concentration increased from 9,000 µg/L in September/October 2015, doubling to 18,000 µg/L in April 2016. Despite the increase in concentration at the peaks of the DCE plume, the overall extents reduced corresponding to reductions in concentration at wells MW-33 and MW-28.

In summary, the overall extent of the DCE plume has reduced or has remained stable over time and concentrations are generally decreasing and trending downwards towards RRS values. Considering that DCE is a second-step transformation product from the reductive dechlorination of PCE, substantial reduction in PCE concentration and production of DCE is confirming that MNA is effective in reducing the DCE concentrations. The increases in DCE concentration are likely attributable to the degradation of PCE and TCE over time.

**VC Plume:**

Figure 3-6 illustrates the horizontal extent of the VC plume during the April 2016 sampling event. The plume area is consistent with previous CVOC plumes and exhibits up-gradient and down-gradient peaks, as with other COC plumes during this sampling event. The up-gradient peak occurs at IW-18, where the concentration increased from 710 µg/L in September/October 2015 to 1,000 µg/L in April 2016. The peak down-gradient concentration occurs near MW-29, where the concentration increased from 1,000 µg/L in September/October 2015 to 1,500 µg/L in April 2016. Notably, the concentration observed at MW-33 decreased in April 2016, causing the portion of the plume with concentrations above 100 µg/L to split into two areas.

In summary, the VC plume has remained stable and has significantly reduced in both areal extent and in concentration relative to the original October 2011 footprint. As with the other CVOC daughter product plumes, minor increases in concentration of VC are attributable to the degradation of parent CVOC products.

#### 4.4.2.2 VOC Plume

The COCs monitored within the collective VOC plume consist of Benzene, Toluene, Ethylbenzene, and Total Xylenes (BTEX). Since the first VIRP sampling event, conducted in October 2011, the VOC plume concentrations within the original VOC plume footprint have declined substantially. The following subsections describe spatial and temporal changes of individual VOC constituents since VIRP sampling was initiated in October 2011.

**Benzene Plume:**

Figure 3-7 illustrates the horizontal extent of the benzene plume during the April 2016 sampling event. The benzene plume is composed of two isolated areas of concentrations above RRS and the delineation criterion near the up-gradient and down-gradient portions of the original VOC plume footprint. The up-gradient benzene plume continues to maintain stability and increased slightly at LAW-PZ-8R from 1,200 µg/L in September/October 2015 to 1,500 µg/L in April 2016. The down-gradient plume, centered near MW-29, has remained relatively stable over time as compared to the original footprint.

In summary, the Benzene plume has reduced significantly in concentration and extent as compared to the original plume footprint in October 2011 and continues to trend downward towards RRS values.

**Toluene Plume:**

Figure 3-8 illustrates the horizontal extent of the toluene plume from the April 2016 sampling event. The peak concentration of the toluene plume has been centered in the area between wells IW-1R and LAW-PZ-8R since the April 2014 sampling event and has remained below RRS for the duration of the VIRP. At IW-1R the toluene concentration decreased from 200 µg/L in September/October 2015 to 190 µg/L in April 2016. This indicates a continued downward trend in concentration and demonstrates the effectiveness of MNA in remediating toluene.

**Ethylbenzene Plume:**

Figure 3-9 illustrates the horizontal extent of the ethylbenzene plume from the April 2016 sampling event. The ethylbenzene plume is divided into distinct up-gradient and down-gradient portions. The up-gradient portion was centered near LAW-PZ-8R, while the downgradient portion was centered near MW-29. The Ethylbenzene concentration at LAW-PZ-8R decreased from a concentration of 6,200 µg/L in September/October 2015 to 6,900 µg/L in April 2016. The ethylbenzene concentration at MW-29 increased from 1,700 µg/L in September/October 2015 to 2,500 µg/L in April 2016.

In summary, the Ethylbenzene plume has significantly reduced in concentration and extent in comparison to the original plume footprint in October 2011 and continues to trend downward

towards RRS values. This indicates that MNA has been effective in reducing ethylbenzene concentrations.

**Total Xylenes Plume:**

Figure 3-10 illustrates the horizontal extent of the total xylenes plume from the April 2016 sampling event. Similar to the ethylbenzene plume, the total xylenes plume is divided into up-gradient and downgradient portions centered near wells LAW-PZ-8R and MW-29, respectively. The total xylenes concentration at LAW-PZ-8R increased from 78,000 µg/L in September/October 2015 to 96,000 µg/L in April 2016. The total xylenes concentration at MW-29 increased from 4,700 µg/L in September/October 2015 to 7,200 µg/L in April 2015.

In summary, the total xylenes plume has significantly reduced in concentration and extent, as compared to the original plume footprint in October 2011, and remains stable in concentration and extent.

### 3.4.3 Vertical Extent of COC Plumes

The historical groundwater sampling results for the deep well MW-14, located within the original COCs footprint, are tabulated in Table 3-4. Since the redevelopment and integration of well MW-14 into the regular CVOC and VOC sampling schedule in October 2013, EIC confirmed that all monitored COC concentrations in the well have remained below delineation standards and all but one parameter were below method detection limits - MDLs. In the EPD's comment letter to VTSI, dated April 3, 2014, the EPD concurred with EIC that vertical delineation is complete (EPD, 2014).

SECTION

4

# 4.0 SUMMARY

Following the schedule included in the approved VIRP, EIC conducted the final VIRP semi-annual groundwater monitoring event in April of 2016. This event was accompanied by a survey that defined the vertical and horizontal locations of wells IW-1R and MW-28, which had recently been added to the monitoring well network. During this event, the overall extent of the COC plumes either reduced or remained stable. However, the peak concentrations within some of the plumes increased. Nevertheless, the overall extent of the plume, relative to the October 2011 baseline VIRP monitoring event, has reduced.

**Notes:**
ID = Identity
TOC = Top of Casing
UNK = Unknown
NM = Not Measured
ND = Not Detected
* TOC elevations are based on well surveys conducted by EMC Engineering on June 30, 2011, January 24, 2013, and on January 20, 2014 and Mock Surveying in April 2016 and are of the NGVD 29 Datum convention
** DTW measurements were recorded by EIC from 4/4/2016 to 4/7/2016 prior to purging using a Solinst Oil/Water Interface Meter (probe), Model: 122

**Notes:**

ID = Identity

mL = Milliliter

TOC = Well Top of Casing

* During well purging, the Teflon-lined tubing was lowered as needed when the water level fell to the depth of the intake, causing air to be recovered.

**Notes:**
**0.79** = Concentration above Minimum Detection Limit (MDL)
**39** = Concentration above RRS
NR = Not Reported by Laboratory
NS = Not Sampled
NL = Not Located
NU = Not Useable due to siltation
NA = Not Avaliable
All data prior to October 2011 tabulated by ERM

**Notes:**

NI - Not Installed

NS - Not Surveyed, TOC elevation information is not available for well

NL - Not Located

NA - Not Applicable

NG - Not Gauged

*** = Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

*[2] = MW-14 is considered a deep well at the Site and is not considered for the shallow potentiometric surface at the Site.

***[3] = MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from October 2011 to October 2015 where available.

***[4]= Global Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from October 2011 to October 2015

PCE REMEDIATION, VOPAK TERMINAL SAVANNAH, SAVANNAH GEORGIA

NOTES: ALL MONITORING WELLS ("MW") EAST OF OFFICE (EXCEPT "NL","FC","KMW" WELLS, AND MW-15), IW-18, FENCE LINES BTWN VOPAK AND GPA, GPA EASEMENT AND TANKS 32, 34, 37, AND 52 WERE DRAWN BASED ON SURVEY CONDUCTED BY EMC ENGINEERING SERVICES, INC. (EMC) ON 6/30/2011. MONITORING WELLS, MW-14, MW-26R, MW-30, MW-33, AND INJECTION WELLS ("IW"), IW2-R, IW5-R, IW-6, IW-7, IW-8, AND IW-21 WERE ADJUSTED BASED ON SURVEY CONDUCTED BY EMC ON 1/24/2013. PILINGS, STORMWATER PIPES, RAIL ROAD AND CHANNEL FEATURES WERE DRAWN BASED ON AS-BUILT DRAWINGS PROVIDED BY THE GEORGIA PORTS AUTHORITY. WELLS MW-35, MW-36, AND MW-37 WERE PLOTTED BASED ON SURVEY CONDUCTED BY EMC ON 1/20/2014. MW-28 AND IW-1R WERE PLOTTED BASED ON APRIL 2016 SURVEY BY MOCK SURVEYING.
GROUNDWATER POTENTIOMETRIC SUREFACE ELEVATIONS ARE IN NGVD29 DATUM

## WELL PURGING AND SAMPLING DATA LOG

WELL/SAMPLE NO: IW-1R

DATE: 4/6/16 | PROJECT NAME: VOPAK Savannah | PROJECT NO: 390020

WEATHER CONDITIONS: 69°F Partly cloudy WM

SAMPLE TYPE: [X] GROUNDWATER [ ] WASTEWATER [ ] SURFACE WATER [ ] OTHER

WELL DIAMETER (IN.) [X] 1 [ ] 2 [ ] 4 [ ] 6 [ ] OTHER | BGS WELL SCREEN INTERVAL: 9.90 FT. to 19.90 FT.

INITIAL WATER LEVEL (BTOC): 3.00 FT. | TIME: 14:15 | BTOC WELL SCREEN INTERVAL: 8.90 FT. to 18.90 FT.

HISTORICAL TOTAL WELL DEPTH (BTOC): 18.9 FT. | MEASURED TOTAL WELL DEPTH (BTOC FT. | HEIGHT OF STICK-UP: -1 FT.

PURGING DEVICE: Pegasus Alexis Peristaltic Pump [ ] DEDICATED [ ] DISPOSABLE [ ] DECONTAMINATED

SAMPLING DEVICE: 1/4" Teflon lined tubing [ ] DEDICATED [X] DISPOSABLE [ ] DECONTAMINATED

EQUIP. DECON. [X] ALCONOX WASH [ ] ISOPROPANOL [X] DIST/DEION 1 RINSE [ ] DIST/DEION FINAL RINSE [X] AIR DRY

[ ] LIQUINOX WASH [ ] DIST/DEION 2 RINSE [ ] OTHER SOLVENT [ ] TAP WATER WASH [ ] TAP WATER FINAL RINSE

PID/FID READINGS (ppm): BACKGROUND: — BENEATH OUTER CAP: — BENEATH INNER CAP: —

CONTAINER PRESERVATION: [X] LAB PRESERVED [ ] FIELD PRESERVED

ANALYTICAL PARAMETERS: 8260 B

LABORATORY PERFORMING ANALYSIS: Test America | WATER ANALYZER MODEL: Horiba U-52 | SERIAL # UDRU5DA9

| TIME | VOLUME PURGED (mL) | TEMP (°C) | pH | ORP (mV) | SPEC. COND. (mS/cm) | TURBIDITY (NTU) | DISS. OXYGEN. (mg/L) | DTW (FT) | REMARKS (COLOR, ODOR, ETC.) |

| | | | | | | | | 3.90 | |

COMMENTS:

SAMPLE COLLECTION TIME: 14:50

PREPARED BY: Sterling

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:

SAMPLE COLLECTION TIME: 18:41

PREPARED BY: SHelms

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

# Method Summary

Client: Environmental International Corporation
Project/Site: Vopak, P.N. 390020

TestAmerica Job ID: 680-123918-1

| Method | Method Description | Protocol | Laboratory |
|---|---|---|---|
| 8260B | Volatile Organic Compounds (GC/MS) | SW846 | TAL SAV |

**Protocol References:**

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

**Laboratory References:**

TAL SAV = TestAmerica Savannah, 5102 LaRoche Avenue, Savannah, GA 31404, TEL (912)354-7858

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Job ID: 680-123918-1

**Laboratory: TestAmerica Savannah**

**Narrative**

# CASE NARRATIVE

## Client: Environmental International Corporation

## Project: Vopak, P.N. 390020

## Report Number: 680-123918-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

**RECEIPT**

The samples were received on 04/08/2016; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 3.5 C.

**VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples IW-1R (680-123918-1), IW-18 (680-123918-2), LAW-PZ-8R (680-123918-3), MW-14 (680-123918-4), MW-16 (680-123918-5), MW-17R (680-123918-6), MW-18R (680-123918-7), MW-19 (680-123918-8), MW-23 (680-123918-9), MW-24R (680-123918-10), MW-25 (680-123918-11), MW-26R (680-123918-12), MW-27 (680-123918-13), MW-28 (680-123918-14), MW-29 (680-123918-15), MW-30 (680-123918-16), MW-31 (680-123918-17), MW-32 (680-123918-18), MW-33 (680-123918-19), MW-34 (680-123918-20), MW-35 (680-123918-21), MW-36 (680-123918-22), MW-37 (680-123918-23), PAN-MW-9 (680-123918-24), PAN-MW-10 (680-123918-25) and Trip Blank (680-123918-26) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/14/2016, 04/15/2016, 04/17/2016, 04/18/2016 and 04/19/2016.

Samples IW-1R (680-123918-1)[200X], IW-18 (680-123918-2)[100X], IW-18 (680-123918-2)[25X], LAW-PZ-8R (680-123918-3)[1000X], MW-16 (680-123918-5)[2X], MW-16 (680-123918-5)[5X], MW-24R (680-123918-10)[5X], MW-26R (680-123918-12)[100X], MW-26R (680-123918-12)[5X], MW-29 (680-123918-15)[100X], MW-37 (680-123918-23)[10X] and PAN-MW-9 (680-123918-24)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

# Login Sample Receipt Checklist

Client: Environmental International Corporation

Job Number: 680-123918-1

**Login Number: 123918**
**List Number: 1**
**Creator: Banda, Christy S**

**List Source: TestAmerica Savannah**

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | N/A | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | N/A | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | N/A | |
| Samples do not require splitting or compositing. | N/A | |
| Residual Chlorine Checked. | N/A | |

# Certification Summary

Client: Environmental International Corporation
Project/Site: Vopak, P.N. 390020

TestAmerica Job ID: 680-123918-1

## Laboratory: TestAmerica Savannah

The certifications listed below are applicable to this report.

| Authority | Program | EPA Region | Certification ID | Expiration Date |
|---|---|---|---|---|
| Georgia | State Program | 4 | 803 | 06-30-16 |
