

Drought Indicators Report

Georgia Environmental Protection Division
October 2019

Background

Pursuant to the Rules for Drought Management, Section 391-3-3-.04 Drought Indicators and Triggers, the Director of EPD monitors climatic indicators and water supply conditions to assess drought occurrence and severity, and its impact upon the ability of public water systems to provide adequate supplies of water. These indicators and conditions September include, but not be limited, to the following:

- U.S. Drought Monitor;
- Precipitation;
- Streamflow;
- Groundwater;
- Reservoir levels;
- Short term climate predictions;
- Soil moisture; and
- Water supply conditions.

Background

- The Rules require EPD to report on current climatic indicators at least semi-annually or monthly when any part of the state has experienced at least two consecutive months of severe drought.
- This reports compare current conditions to historical levels (and/or reservoir rule curves) for each of the following indicators:
 - Precipitation during the prior 3, 6, and 12 months;
 - Streamflow at the select United States Geological Survey gages;
 - Groundwater levels at select United States Geological Survey monitoring wells; and
 - Reservoir levels at Allatoona Lake, Lake Hartwell, Clarks Hill Lake, and Lake Lanier.
- The following sections of this presentation provide the data and information sources analyzed by EPD in developing this drought indicators report for conditions as of October 3, 2019.

Drought Indicator Analysis Summary (slide 1 of 2)

- **U.S. Drought Monitor** – Drought has progressed to different levels statewide. Extreme Drought (D3) exists in part or entirety of Bartow, Pickens, Cherokee, Forsyth, Hall, Coweta, Fulton, Fayette, Clayton, Wilkinson counties and their surrounding areas. Severe Drought (D2) exists in the vicinity of D3 areas and isolated areas in central and southeastern GA. Moderate Drought (D1) exists in the periphery of D2 and D3 areas. Abnormally dry (D0, the least intense level) covers the rest of the state.
- **Precipitation** - Three-month precipitation is below normal statewide with 25% to 50% of normal precipitation in south metro and surrounding area. Six-month precipitation is below normal statewide with some isolated area being slightly above normal. Twelve-month precipitation is normal or above normal in northwest half of the state and below normal in southeast half of the state.
- **Soil Moisture** – Soil moisture conditions show different levels of dryness statewide. Some extreme dryness (2th - 5th percentiles) exists in upper Chattahoochee basin, mid Flint-Ocmulgee basin, and a large area in southeast GA. Some severe dryness (5th - 10th percentiles) exists in the vicinity of the extreme dry area. Less severe dryness (10th - 30th percentiles) exists in the rest of the state.

Drought Indicator Analysis Summary (slide 2 of 2)

- **Streamflow** – Stream flows observed at all selected USGS gages have been below normal. Most of gage flows are between driest 10th and 20th percentiles. Four gages flows are between driest 5th and 10th percentiles (each in mid Flint, mid Oconee, lower Savannah and Satilla basins). Six gages flows are below driest 5th percentile (one in Tennessee, four in upper-mid Flint, one in lower Oconee, and one in lower Suwanee basins).
- **Groundwater Level** – One third of the groundwater levels observed at selected wells are above normal and the other two thirds are below normal, with three being below driest 20th percentiles (one in Crystalline Rock Aquifer in Chattahoochee basin, two in Floridan Aquifer in Flint and Oconee basins), and rest being between lowest 20th percentile and median.
- **Reservoir Levels** – In September 2019, all federal reservoir levels in Georgia (ACF, ACT, and Savannah River Basins) are below their respective top of conservation (normal) pools but above the Zone 1, except Lake Hartwell being near the bottom of its Level 1, Lake Allatoona and Lake Clark Hill being below their respective Zone1\Level 1 since the late September 2019.
- **Short-term Climate Prediction** – National Climatic Prediction Center projects above normal temperature statewide and above normal precipitation in southeast half of the state in October – December 2019. U.S. Drought Outlook predicts drought persists in current D3 and D2 areas, and drought development likely in northwest half of the state in October – December 2019.
- **Water Supplies** – EPD has granted a Drought Level 1 Variance to City of Griffin and a Drought Level 2 Variance to Coweta County.

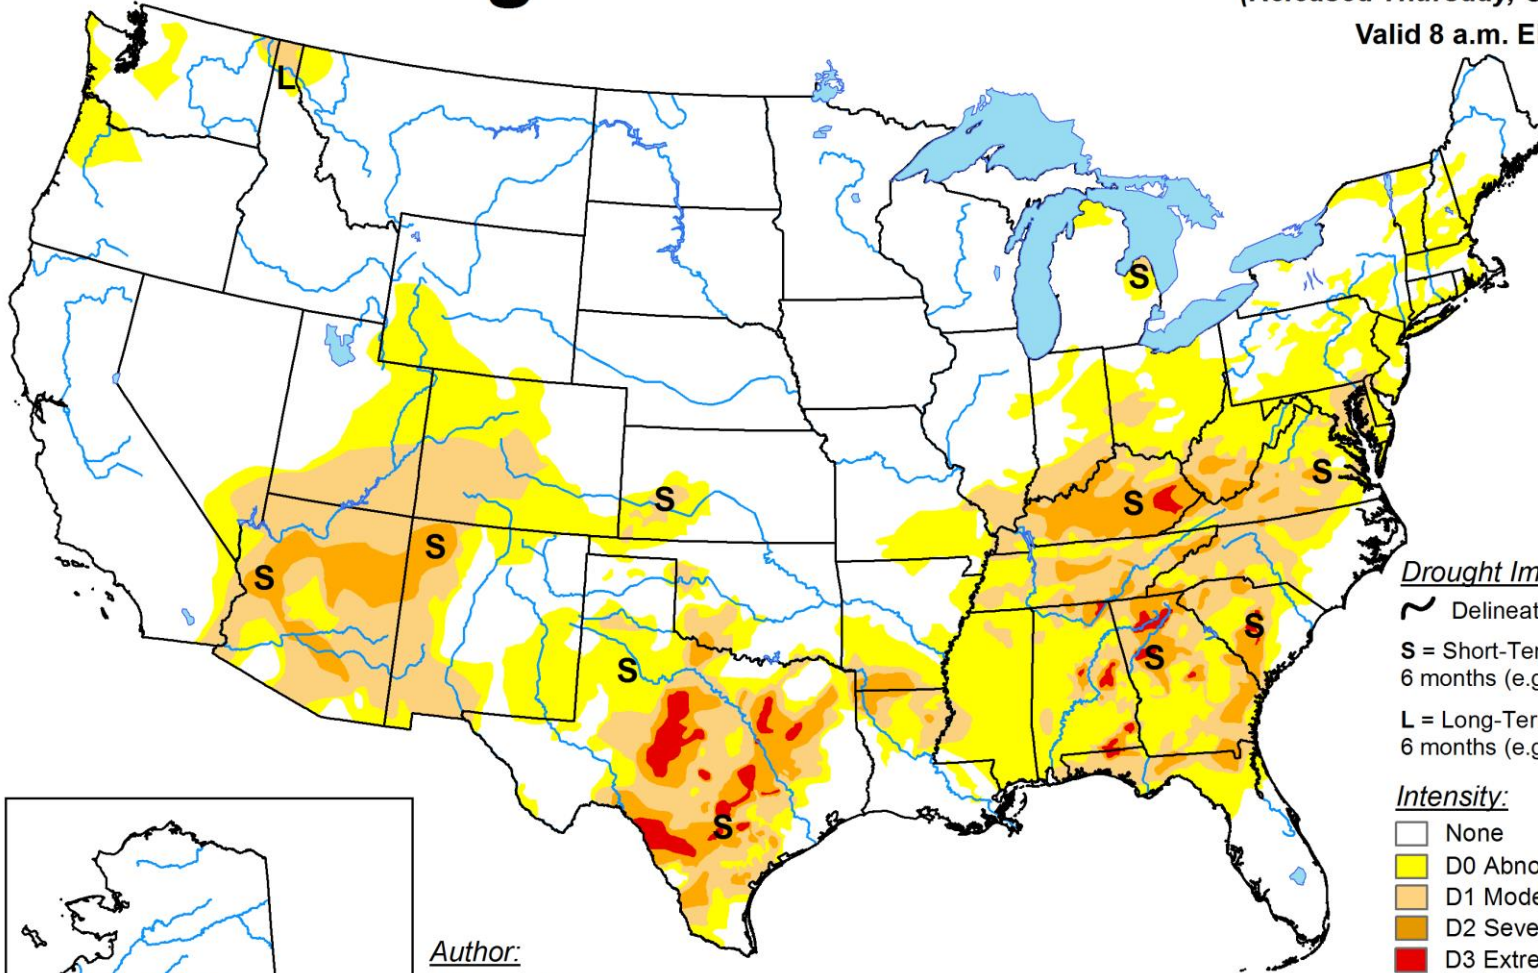

US Drought Monitor

U.S. Drought Monitor

October 1, 2019
(Released Thursday, Oct. 3, 2019)
Valid 8 a.m. EDT

Drought Impact Types:

- ~ Delineates dominant impacts
- S = Short-Term, typically less than 6 months (e.g. agriculture, grasslands)
- L = Long-Term, typically greater than 6 months (e.g. hydrology, ecology)

Intensity:

- None
- D0 Abnormally Dry
- D1 Moderate Drought
- D2 Severe Drought
- D3 Extreme Drought
- D4 Exceptional Drought

Streamflow Conditions

Data Source: USGS

Streamflow Monitoring

- As shown on the following slide, EPD Monitors 34 USGS stream gages in 13 of the State's major river basins to assess drought conditions.
- These gages were selected because each has:
 - Long-term and relatively complete records for recent decades; and
 - Relatively low consumptive water use implications and streamflows are not heavily influenced by dams.
- Note: Hydrologic conditions of major rivers with streamflows that are heavily influenced by dams can be assessed by reviewing status of major storage reservoirs

Georgia's 14 River Basins

USGS Stream Gages Monitored by EPD to Assess Drought Conditions

<u>GAGE#</u>	<u>BASIN</u>	<u>GAGE NAME</u>
1	TENNESSEE	LOOKOUT CREEK NEAR NEW ENGLAND
2	TENNESSEE	NOTTELY RIVER NEAR BLAIRSVILLE
3	COOSA	CHATTOOGA RIVER AT SUMMERVILLE
4	COOSA	TALKING ROCK CREEK NEAR HINTON
5	COOSA	ETOWAH RIVER AT CANTON
6	CHATTAHOOCHEE	CHATTAHOOCHEE RIVER AT CORNELIA
7	CHATTAHOOCHEE	CHESTATEE RIVER NEAR DAHLONEGA
8	CHATTAHOOCHEE	NEW RIVER AT GA 100 NEAR CORINTH
9	CHATTAHOOCHEE	UPATOI CREEK AT COLUMBUS
10	FLINT	FLINT RIVER AT GA26 NEAR MONTEZUMA
11	FLINT	FLINT RIVER AT ALBANY
12	FLINT	ICHAWAYNOCHAWAY CREEK AT MILFORD
13	FLINT	SPRING CREEK NEAR IRON CITY
14	OCMULGEE	ALCOVY RIVER ABOVE COVINGTON
15	OCMULGEE	OCMULGEE RIVER AT MACON
16	OCMULGEE	TUBESOFKEE CREEK NEAR MACON
17	OCMULGEE	TUCSAWHATCHEE CREEK NEAR HAWKINSVILLE
18	OCONEE	MIDDLE OCONEE RIVER NEAR ATHENS
19	OCONEE	LITTLE RIVER NEAR EATONTON
20	OCONEE	OCONEE RIVER AT DUBLIN
21	ALTAMAHA	OHOOPEE RIVER NEAR REIDSVILLE
22	SAVANNAH	CHATTOOGA RIVER NEAR CLAYTON
23	SAVANNAH	BROAD RIVER NEAR BELL
24	SAVANNAH	BEAVERDAM CREEK NEAR SARDIS
25	SAVANNAH	BRIER CREEK AT MILLHAVEN
26	OGEECHEE	CANOOCHEE RIVER NEAR CLAXTON
27	OGEECHEE	OGEECHEE RIVER NEAR EDEN
28	OCHLOCKONEE	OCHLOCKONEE RIVER NEAR THOMASVILLE
29	SUWANEE	WITHLACOOCHEE RIVER NEAR PINETTA FL
30	SUWANEE	ALAPAHA RIVER AT STATENVILLE
31	SUWANEE	SUWANNEE RIVER AT US 441, AT FARGO
32	SATILLA	SATILLA RIVER NEAR WAYCROSS
33	SATILLA	LITTLE SATILLA RIVER NEAR OFFERMAN
34	ST MARY	ST MARYS RIVER NEAR MACCLENNY FL

Streamflow Graphs

- For each of the 34 gages, EPD has prepared a graph that shows monthly average streamflow from January 2019 through September 2019;
- To help put these streamflow conditions into perspective, for comparison purposes, each graph also shows:
 - Monthly average streamflows for the years 2007 and 2011 when streamflows were at or near recorded low levels across much of the state; and
 - A statistical composite of historical conditions showing the “driest” 50, 20, 10, and 5 percent of all recorded monthly average stream flows at the same gage.

How to Read the Streamflow Graphs

Example #1: [Etowah River at Canton](#)

The streamflow graph for Gage #5, [USGS Etowah River gage at Canton](#) shows :

- Average stream flow for September 2019 was 350 cfs. The statistical composite of all historical data for this gage shows that average streamflow in September has historically been lower than September 2019 about 10-20% of the time; about 80-90% of the time in September it has been higher.
- Average stream flow in September 2011 was 341 cfs. The statistical composite of all historical data for this gage shows that average streamflow in September has historically been lower than September 2011 only 10-20% of the time; 80-90% of the time in September it has been higher.
- Average stream flow in September 2007 was 130 cfs. The statistical composite of all historical data for this gage shows that average streamflow in September has historically been lower than September 2007 only 0.1% of the time; 99.9% of the time in September it has been higher.

How to Read the Streamflow Graphs

Example #2: [Flint River at Albany](#)

The streamflow graph for Gage #11, [USGS Flint River gage at Albany](#) shows:

- Average stream flow for September 2019 was 1,268 cfs. The statistical composite of all historical data for this gage shows that average streamflow in September has historically been lower than September 2019 about 5~10% of the time; about 90-95% of the time in September it has been higher.
- Average stream flow in September 2011 was 764 cfs. The statistical composite of all historical data for this gage shows that average streamflow in September has historically been lower than September 2011 about 0.01% of the time; about 99.99% of the time in September it has been higher.
- Average stream flow in September 2007 was 1,385 cfs. The statistical composite of all historical data for this gage shows that average streamflow in September has historically been lower than September 2007 about 5~10% of the time; about 90~95% of the time in September it has been higher.

Groundwater Levels

Data Source: USGS

Rationale for Choosing USGS Monitoring Wells

EPD monitors 17 groundwater USGS monitoring wells shown on the following slide to assess drought conditions. These wells were selected for monitoring because they have:

- Long-term monitoring records consisting of three decades or more of data; and
- Real-time monitoring that represents the most up-to-date conditions.

USGS Wells Monitored

Chattahoochee Basin

1. 16MM03

Flint Basin

2. 11AA01
3. 13L180
4. 12M017
5. 08K001
6. 11K003
7. 12K014
8. 13J004
9. 08G001
10. 10G313
11. 09F520
16. 11J011

Oconee Basin

12. 21T001

Tennessee Basin

13. 03PP01

Suwanee Basin

14. 19E009
17. 27E004

Ogeechee Basin

15. 35P094

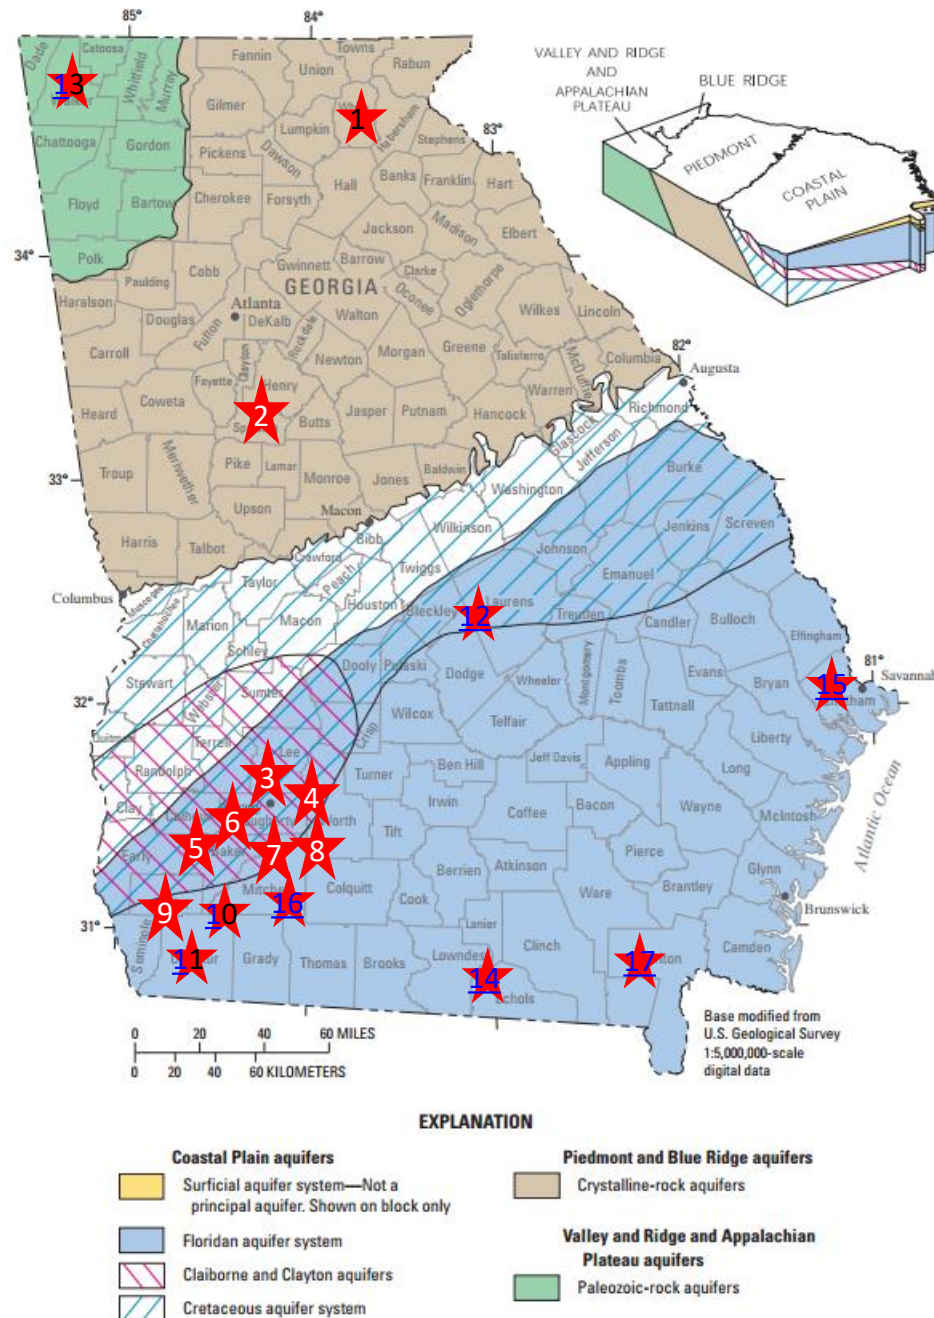

Figure 2. Area of use of principal aquifers and physiographic provinces in Georgia (modified from U.S. Geological Survey, 2006).

Groundwater Level Graphs

- For each of the 17 groundwater wells, EPD has prepared a graph that shows monthly average groundwater levels from January 2019 through September 2019;
- To help put these levels into perspective, for comparison purposes, each graph also shows:
 - Monthly average levels at that same well for the years 2007 and 2011 when groundwater levels were at or near recorded low levels across much of the state; and
 - And a statistical composite of historical conditions at that same gage showing the “lowest” 50, 20, 10, and 5 percent of all recorded monthly average levels at the same well.

How to Read the Groundwater Level Graphs

Example: [Well #11, 09F520, Flint River Basin](#)

The groundwater level graph for Well #11, USGS 09F520 shows:

- The average monthly groundwater level for September 2019 was 48.7ft below land surface. The statistical composite of all historical data for this well shows that monthly average groundwater levels in September have historically been lower than September 2019 about 30% of the time; about 70% of the time in September they have been higher.
- The average monthly groundwater level in September 2011 was 51ft below land surface. The statistical composite of all historical data for this well shows that monthly average groundwater levels in September have historically been lower than September 2011 about 5% of the time; about 95% of the time in September they have been higher.
- The average monthly groundwater level in September 2007 was 51.1ft below land surface. The statistical composite of all historical data for this well shows that monthly average groundwater levels in September have historically been lower than September 2007 about 2~5% of the time; about 95~98% of the time in September they have been higher.

Climate Prediction Center 3-month Temperature and Precipitation Probability Outlook and Seasonal Drought Outlook

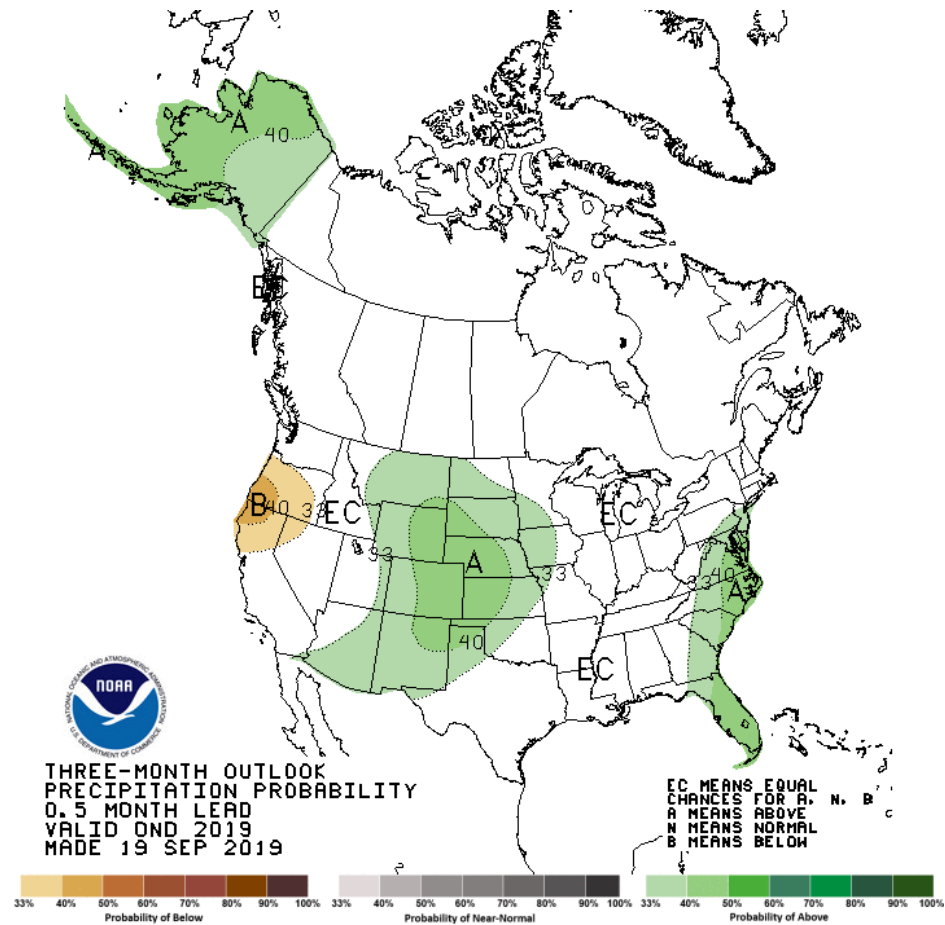

Data Source:

<http://www.cpc.ncep.noaa.gov/>

Temperature Outlook

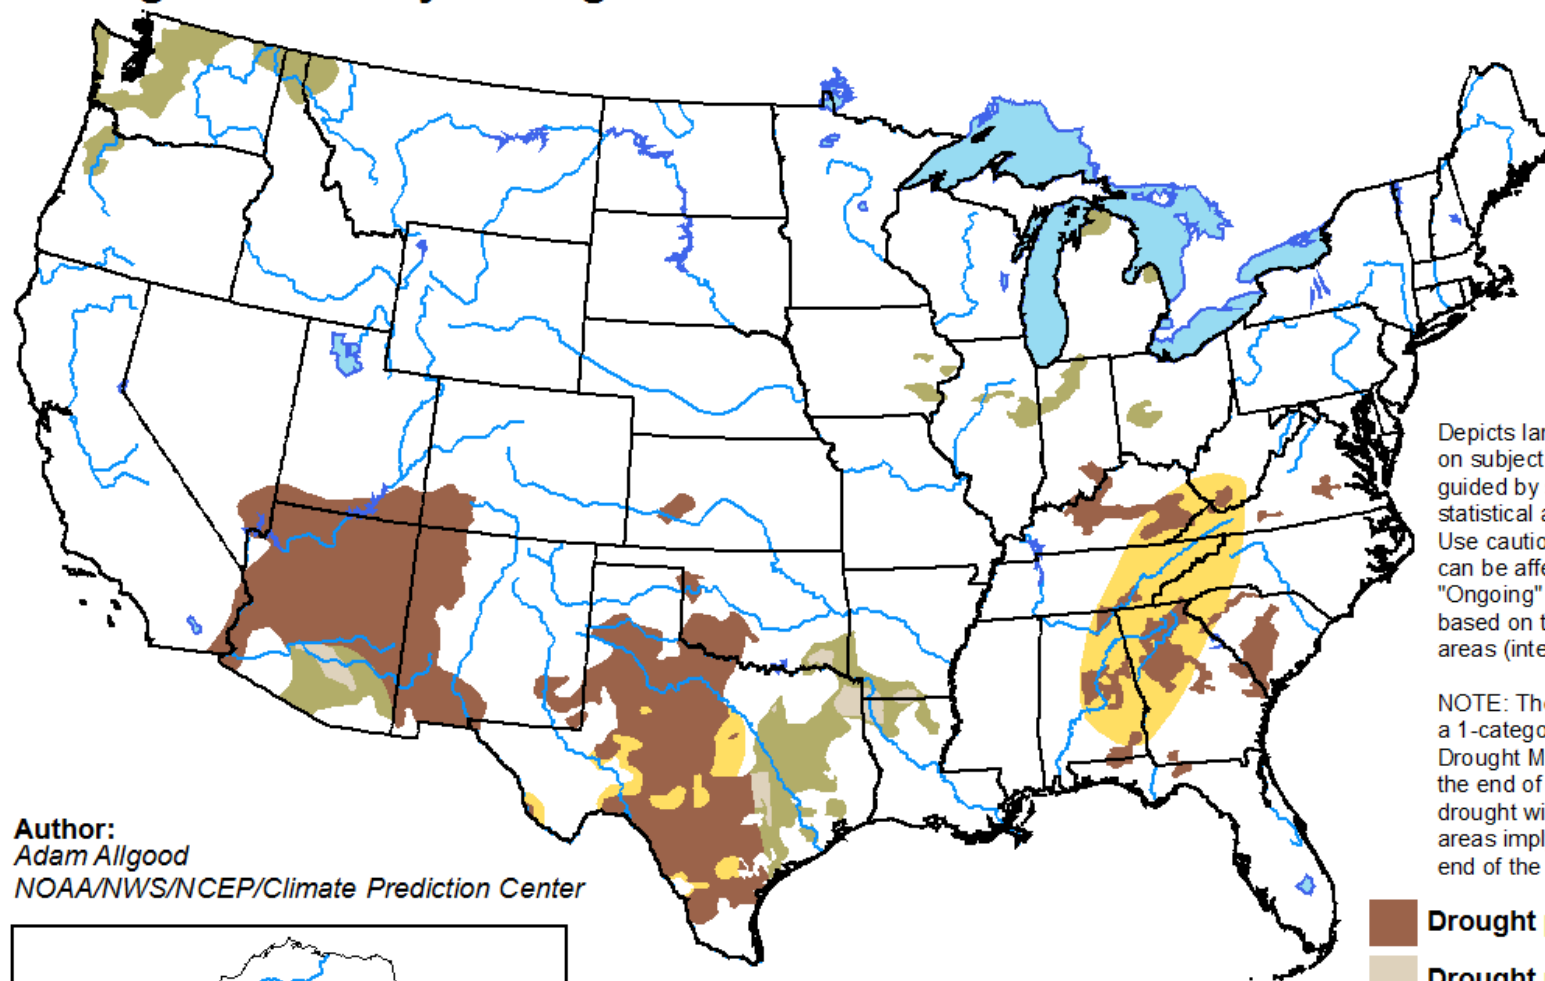

Precipitation Outlook

U.S. Seasonal Drought Outlook

Drought Tendency During the Valid Period

Valid for September 19 - December 31, 2019
Released September 19

Depicts large-scale trends based on subjectively derived probabilities guided by short- and long-range statistical and dynamical forecasts. Use caution for applications that can be affected by short lived events. "Ongoing" drought areas are based on the U.S. Drought Monitor areas (intensities of D1 to D4).

NOTE: The tan areas imply at least a 1-category improvement in the Drought Monitor intensity levels by the end of the period, although drought will remain. The green areas imply drought removal by the end of the period (D0 or none).
