Subject: Sixth VIRP Semi-annual Progress Report
Georgia Ports Authority-Bainbridge Terminal
HSI Site No. 10071
1321 Spring Creek Road,
Land Lot 373, Parcels: 20, 21A, and portion of Parcel 19,
Bainbridge, Decatur County, Georgia

Dear Mr. McPherson:

On behalf of Georgia Ports Authority (GPA), Environmental International Corporation (EIC) is pleased to submit the attached documents as the Sixth Voluntary Investigation and Remediation Plan (VIRP) Semi-annual Progress Report for the above referenced site.

Enclosed are the following material:

1. One signed and sealed certification page for the Semi-annual Report.
2. One copy of EIC's Sixth VIRP Semi-annual Progress Report.
3. Two Compact Discs each with the report in searchable PDF format.

If you have any questions regarding this submittal, please contact Mr. Christopher Novack of GPA at 912-964-3922 or me at the above location.

Sincerely,

ENVIRONMENTAL INTERNATIONAL CORPORATION

CERTIFICATION AND SUPPORTING DOCUMENTS
Sixth VIRP Semi-annual Progress Report
Georgia Ports Authority-Bainbridge Terminal
HSI Site No. 10071
November 2, 2015

"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

Basavaraj Mahadevaiah, GA PE No. 23198

1. Introduction

On behalf of the Georgia Ports Authority (GPA), Environmental International Corporation (EIC) is pleased to submit the Sixth Semi-annual Progress Report to the Georgia Environmental Protection Division (EPD). This report was prepared as outlined in the Voluntary Investigation and Remediation Plan (VIRP) dated July 27, 2012 that EPD subsequently approved on November 2, 2012 under the Voluntary Remediation Program (VRP).

1.1 PRIMARY OBJECTIVES

The primary objectives of this report is to present a compilation of tasks conducted by EIC during the sixth-month time frame covering the period from May 2015 to October 2015. This report documents the following tasks, which EIC completed to create a better understanding of Site conditions and constituents of concern (COC) trends and to address concerns from the EPD:

- Addressing comments from EPD
- Continued evaluation of COC trends in groundwater
- Groundwater Modeling
- Management of Contaminated Soils

SECTION 2

2. EPD Comment Letter

GPA received a letter from the EPD, dated October 6, 2015 (EPD, 2015), that commented on GPA's Fourth and Fifth VIRP Semi-Annual Progress Reports. The following sections address each EPD comment.

EPD Comment 1

EPD concurs that the North Parcel has been remediated and meets Type 4 risk reduction standards (RRS). EPD is in the process of evaluating Georgia Gulf Sulfur's response from a previous EPD request that soil and groundwater data be provided for the area north of the road on their property to complete delineation to the north.

Response: Noted.

EPD Comment 2

Laboratory analytical results for soil samples collected at MW-22 were not submitted in the previous or current Progress Reports as requested in Comment # 8 of EPD's November 2, 2012 comment letter; please submit these results.

Response: The subject report with these analytical results was included in the Second VIRP Semi-annual Progress Report submitted to EPD dated October 30, 2013.

EPD Comment 3

Figure 4-1 in the 5th VIRP Progress Report - The southwest portion of warehouse 3 in AOC 2 at location NW-SB-06 has not been horizontally delineated for alpha, beta and delta-BHC. However, as discussed in the August 25, 2015 meeting, further horizontal delineation may not be required if the Uniform Environmental Covenant (UEC) extends and defines the area subject to engineering controls (ECs) and institutional controls (ICs) as all concrete covered areas surrounding the exterior of the warehouses up to the fence installed around AOC 1. This area would need to be defined in a surveyed legal description, defined in the UEC and subject to annual Maintenance and Monitoring inspections and reporting.

Response: GPA is currently in the process of preparing a Uniform Environmental Covenant (UEC) that extends and defines the area subject to engineering controls (ECs)

and institutional controls (ICs). This area will comprise Warehouses number 2 and 3 and all concrete and asphalt covered surfaces surrounding the exterior of these warehouses and leading up to the fence installed around AOC 1. This area will be defined in a surveyed legal description, defined in the UEC and subject to annual Maintenance and Monitoring inspections and reporting. Additional discussions in this regard, are included in Section 4.

EPD Comment 4

In both reports, EPD has noted that MW-13 and newly installed well MW-23 have exceedances above Type 4 RRS for beta-BHC and concurs that delineation is not completed in this area near the Flint River. To demonstrate that no negative surface water impacts or exceedances of the current Georgia In Stream Water Quality Standards (ISWQSs), as provided in Section 391 -3-6-.03(5) of the Georgia Water Quality Control Act, are occurring in the Flint River, site-specific mixing zone calculations should be developed that show the maximum concentrations in the plume predicted to reach the Flint River. The source concentration that might be used in the mixing zone calculations could be the same maximum concentration for beta BHC (5,000 µg/L) that has been used in the Analytical Contaminant Transport Analysis System (ACTS) modeling, or a more representative value.

Response: EIC is in the process of conducting mixing zone calculations as required by the EPD. However, the maximum concentrations for beta BHC at 5,000 µg/L that was used in the ACTS model would not be representative of the concentrations along the river shoreline of the Flint River. A review of the historic plume maps clearly substantiates much lower concentrations near the river. EIC will therefore utilize the maximum leading edge concentrations from the data collected from MW-23 to calculate the mixing zone values.

EPD Comment 5

EPD does not agree with the plumes drawn in Figures 3-6 (March 2014), Figure 3-7 (September 2014) and Figure 6-4 (May 2015) for the beta-BHC plume. These data do not represent two distinct plumes and the isoconcentration contours should be drawn as one plume.

Response: In response to EPD's comments, EIC completed a further evaluation of the plume contours. As part of the evaluation, EIC prepared Figure 2-1, which superimposes the beta-BHC COC concentration contours over the groundwater potentiometric surface map for the September 2015 sampling event. Based on this evaluation, it is apparent that a separate beta-BHC plume exists in the area of MW-13. GPA will further evaluate the historical data and hydrogeological data to determine the plume configuration.

EPD Comment 6

Based on Comment # 1 in EPD's November 2, 2012 letter and subsequent to discussions during the August 25, 2015 meeting, consideration should be given to including Agrium parcels with pesticide impacts in groundwater as qualifying properties under the Act and a streamlined groundwater UEC be developed for these parcels as part of the final site remedy.

Response: Considering that a substantial source of BHC has originated from a source hydraulically upgradient of the GPA property – as consistently defined in numerous sampling events – GPA does not believe that GPA was contributory to the pesticide impacts on Agrium parcels. As such, as explained during our meeting on August 25, 2015, the GPA does not plan to include Agrium parcels under its groundwater UEC currently in preparation

3. Groundwater Monitoring

During the third quarter of 2015, EIC conducted a semi-annual groundwater monitoring event. Under the approved VIRP (EIC, 2012), all available monitoring wells are being utilized for the monitored natural attenuation (MNA) remedial approach. In addition, EIC conducted groundwater modeling to evaluate the fate and transport of BHC constituents. The following subsections describe the monitoring and the modeling programs.

3.1 GROUNDWATER MONITORING FIELD PROGRAM

In September 2015, EIC conducted groundwater monitoring at all 25 available monitoring wells. Two of the monitoring wells (MW-14 and MW-17) are historically defined as “deep wells”, as the top of the well screen of each well lies at a depth at or greater than 50 feet below ground surface (bgs). The groundwater samples collected from site monitoring wells were analyzed for pesticide COCs. The analyses included the primary COC benzenehexachloride (BHC) composed of isomers, α -BHC, β -BHC, δ -BHC, and γ -BHC (Lindane). A site layout map including monitoring well locations is illustrated in Figure 3-1. In preparing this map, EIC plotted the monitoring well locations based on the latest monitoring well survey conducted in March of 2015 (EIC, 2015).

3.1.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. EPA Field Branches Quality System and Technical Procedures (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the “low-flow” purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

3.1.2 Site Access

Prior to EIC’s site visit, EIC coordinated with the GPA regarding on-site field activities. EIC also contacted surrounding property owners for permission to access wells located near or on the surrounding properties. EIC contacted Agrium U.S., Inc. (Agrium) for permission to access and conduct off-site well monitoring on the adjacent property to the northeast of the GPA site where wells MW-15, MW-16, MW-18, MW-19, MW-20, and MW-21 are located. EIC contacted the

Georgia Department of Transportation (DOT) to obtain permission to access monitoring well MW-22, located on the north right-of-way of Georgia State Highway 253/Spring Creek Road. Upon arrival at the site, EIC acquired access permission from Ergon, Inc., whose property, to the west of the site, must be utilized to access wells MW-2 and MW-11.

3.1.3 Field Procedures

3.1.3.1 Groundwater Gauging

Prior to sampling, EIC gauged each well with a Solinst Model 122 interface meter (“oil/water interface probe”) to determine the static depth to groundwater. EIC utilized top-of-casing (TOC) elevations from the most recent well survey to determine the current groundwater elevations. The gauging data from the September 2015 monitoring event is summarized in Table 3-1.

3.1.3.2 Groundwater Sampling

Prior to initiating well monitoring field activities in September, EIC placed a non-hazardous label on an empty 55-gallon drum that was previously staged on the north side of the T-Shed by GPA. This drum was labeled with the shipper noted as “Georgia Ports Authority”, contents noted as “IDW Well Purge Water”, and accumulation date noted as “09/14/2015” and was used to containerize investigative derived waste (IDW) purge water throughout the event.

EIC utilized a peristaltic pump for purging and for sampling groundwater. Disposable 1/4-inch inner diameter (ID) Teflon-lined tubing and 3/16-inch ID silicon tubing at the pump head was utilized in all wells for purging. Groundwater from each monitoring well was pumped via the peristaltic pump through a multi-parameter field water quality instrument equipped with a flow-through cell.

EIC calculated the appropriate Teflon tubing length and intake depth for each well by considering the following monitoring well characteristics: the field-measured depth to groundwater, the field-measured height of the well TOC relative to the ground surface, the established field-measured depth-to-bottom, and the documented well total depth and screened interval from well construction logs.

Following the SOP SESDPROC-301-R3 (EPA, 2013), EIC set the tubing intake at approximately the center of the wetted screen interval. The initial pump speed was set based on well recharge and time for groundwater quality standards to reach stabilization, based on previous sampling events, to limit drawdown and purge time at each well. In the event that the recharge rate was anomalous compared to previous sampling events, the pump speed was adjusted accordingly and noted on the field purging data forms.

Purging continued at each well until stabilization occurred with applicable water quality parameters as defined in the SOP SESDPROC-301-R3 or until three to five well volumes were purged from the each well. After water quality parameters stabilized at each accessible well, EIC cut the Teflon-lined tubing connecting the peristaltic pump to the flow-through cell.

Groundwater samples were then collected by filling sample bottles with water discharged directly from the pump.

All sample bottles were properly sealed and labeled in the field. Each sample was then stored with double-bagged ice in insulated cooler containers provided by the laboratory. Completed chain-of-custody forms accompanied all samples.

EIC relinquished all samples to Test America laboratory immediately after EIC personnel returned from the site. Laboratory analysis included organochlorine pesticides contaminants using EPA Method 8081B/3660B (with sulfur cleanup). The field forms associated with each groundwater sample are included as Attachment A. The groundwater quality field parameters after stabilization and prior to sample collection are summarized in Table 3-2. The laboratory report for the September sampling event is included as Attachment B. The results of these analyses are summarized in Table 3-3 along with historical groundwater analysis.

3.2 QUALITY ASSURANCE AND QUALITY CONTROL

During the groundwater sampling event in September 2015, EIC collected additional samples for quality assurance (QA) and for the validation of analytical results. For organochlorine pesticides laboratory matrix spike analysis, one additional sample each from wells MW-19 and MW-22 was collected. A duplicate sample from well MW-10, and an equipment rinsate (blank) sample were also collected. The equipment blank sample was collected by pumping de-ionized water through a 10-foot section of Teflon-lined tubing and approximately 6-inches of silicone tubing.

Each QA sample collected at the site was stored with ice in coolers and delivered to the laboratory along with the groundwater samples. These samples were analyzed via EPA method 8081B/3660B. All sample bottles were properly sealed and labeled in the field.

To prevent cross-contamination, new disposable Teflon-lined tubing and disposable silicone tubing were used to collect all samples. EIC's oil/water interface probe and tubing cutter tool were field decontaminated prior to use and between sample locations by washing with pressurized phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. After each sample was collected, the multi-parameter water quality meter, the parameter sensors, and the flow-through cell were decontaminated by disassembling and cleaning with pressurized DI water and, if needed, also with pressurized phosphate-free detergent.

3.2.1 QA Evaluation

The analytical results of all of the parameters in the equipment blank were below the method detection limit (MDL). In the duplicate MW-10 sample, alpha-, beta-, delta-, and gamma-BHC constituents were all above the MDL, in concurrence with the primary MW-10 sample, and both the primary as well as duplicate samples had similar concentrations.

3.3 DATA EVALUATION

EIC conducted an evaluation of the data compiled from field measurements and laboratory analyses to determine the groundwater potentiometric surface and the horizontal and vertical extent of the prevailing groundwater COC plumes occurring during the September 2015 monitoring event. Data from the sampling event was compared to the data from the baseline sampling event in March 2013 and with each of the subsequent sampling events to determine if monitored natural attenuation is in progress at the site and if it is likely to lead to remedial endpoints. (EIC 2012, 2013a, 2013b, 2014a, 2014b, and 2015)

3.3.1 Groundwater Potentiometric Map

Utilizing gauging data summarized in Table 3-1 from the September 2015 groundwater monitoring event, EIC prepared a groundwater potentiometric surface map, illustrated in Figure 3-2. For comparative purposes, the contour interval utilized for the groundwater potentiometric surface analyses was identical to those prepared from previous sampling events documented in previous semi-annual reports. Referring to Figure 3-2, it is apparent that groundwater continues to flow to the southeast towards the Flint River.

Table 3-4 shows historical and current groundwater potentiometric surface elevations for all wells at the site as well as statistical data for each monitoring event. Referring to Table 3-4, the average calculated groundwater elevation across the site for the September 2015 gauging event was 77.25 ft. This value is slightly below the calculated global average groundwater elevation (77.98 ft.) listed in Table 3-4 and is approximately the same as the previous September 2014 event. This continues to support the general trend of seasonal groundwater fluctuation apparent at the site since the initiation of the VIRP monitoring program. The total range of elevation difference for this event was calculated to be 0.80 ft. whereas the previous September 2014 total range was 1.13 ft. This indicates that the overall gradient occurring during the September 2015 event was lower than the September 2014 event.

3.3.2 Horizontal Extent of COC Plumes

Figures 3-3 through 3-5 illustrate the horizontal extent of the BHC plumes comprised of alpha-BHC, beta-BHC, and delta-BHC isomers during September 2015. For trend analysis, EIC utilized the same isoconcentration contour intervals as those illustrated in the VIRP submittal and in subsequent plume renderings. Additionally, the contours that illustrate delineation criterion and the RRS limits define the horizontal extent of pesticides and the extent of COC plumes that require remediation.

3.3.2.1 Alpha-BHC Plume

From Figure 3-3, both the concentration and horizontal extent of the alpha-BHC plume have remained relatively stable over time compared to the March 2013 baseline. During the September 2015 sampling event, there were two apparent peaks in concentration above RRS. The highest concentration was determined to be in the area of MW-6 ($0.92 \mu\text{g/L}$) and MW-5A ($0.59 \mu\text{g/L}$) with the second comparable concentration in the area of MW-22 ($0.580 \mu\text{g/L}$). The outer limits

of the plume were defined by surrounding relatively low concentrations at wells MW-1, MW-1A, MW-3, MW-7, MW-12, MW-13, MW-15, MW-16, MW-18, and MW-23. As such, it is apparent from Figure 3-3, that the alpha-BHC plume above RRS is horizontally delineated towards the southwest, south towards the Flint River, southeast, and northeast. However, the plume is not horizontally defined to the northwest and upgradient beyond Spring Creek Road.

3.3.2.2 Beta-BHC Plume

Figure 3-4 illustrates the horizontal extent of the beta-BHC plume during the September 2015 monitoring event. From Figure 3-4, both the concentration and horizontal extent of the alpha-BHC plume have remained relatively stable over time compared to the March 2013 baseline. The highest concentrations of beta-BHC plume was detected near MW-22 (32 µg/L), which is located hydraulically up-gradient of the GPA property and to the north of Spring Creek Road.

As discussed in previous semi-annual reports, concentrations of beta-BHC continue to fluctuate in a seasonal pattern in the area of MW-5A and MW-5D. Typically, concentrations increase during lower water table months such as in September and decrease during higher water table months such as in March. During the September 2015 sampling event, concentrations at wells MW-5A and MW-5D followed the same historical trend with increases in detected concentrations from the March 2015 event that are comparable to the concentrations detected during the September 2014 event.

Near the Flint River at MW-23, the Beta-BHC concentrations were again above RRS. The concentrations near this area, however, have remained relatively stable over time with slight decreases in concentration compared to the September 2014 sampling event, which was the first event in which MW-23 was sampled.

In September 2015, a smaller secondary plume was observed in the vicinity of MW-13 with a concentration of 3.8 µg/L. Since the baseline sampling event in March 2013, EIC has considered this to be a secondary plume separate from the larger primary plume at the site, as the location of this plume relative to known source areas and the groundwater flow direction at the site do not indicate that the plume is associated with the primary plume. Groundwater sampled from the newly installed well MW-24 during the March 2015 and September 2015 sampling events suggests that the secondary plume surrounding MW-13 does not reach MW-24.

Referring to Figure 3-4, it is apparent that the horizontal extent of the beta-BHC plume above RRS is defined to the northeast and southwest, however, the horizontal extent remains undefined to the northwest and upgradient beyond Spring Creek Road and to the south of MW-23 towards the Flint River.

3.3.2.3 Delta-BHC Plume

Figure 3-5 illustrates the horizontal extent of the delta-BHC plume during the September 2015 monitoring event. Compared to the baseline sampling event, the delta-BHC plume has remained relatively stable over time. In September 2015, the highest concentration detected of the delta-

BHC plume occurred near MW-22 (4.5 µg/L). Figure 3-5 illustrates that the horizontal delineation of the delta-BHC plume relative to RRS is complete, except to the north beyond Spring Creek Road.

3.3.3 Vertical Extent of COC Plumes

There are two deep wells at the site, designated as wells MW-14 and MW-17. According to historical well construction logs, the screened intervals in monitoring wells MW-14 and MW-17 range in depth from 67 to 72 feet bgs and from 50 to 60 feet bgs, respectively. EIC has therefore utilized the aforementioned wells to monitor the vertical migration of COCs.

Referring to Table 3-3, following historical trends, the concentrations of alpha-BHC, beta-BHC, and delta-BHC at wells MW-14 and MW-17, have remained below RRS through the September 2015 sampling event. As discussed in the Fourth Semi-annual report (EIC, 2014), EPD concurs with EIC that the vertical limit of the BHC plume has been defined.

3.3.4 BHC Plume Stability

Based on the findings in Sections 3.3.1 through 3.3.3, it is apparent that the BHC plume has remained stable in vertical and horizontal extent over time. EIC will continue to evaluate data from subsequent groundwater monitoring events to further define plume trends and to determine the potential impact from groundwater fluctuations.

3.4 GROUNDWATER MODELING

GPA has completed vadose zone and groundwater transport modeling tasks utilizing the Analytical Contaminant Transport Analysis System (ACTS). The results of this modeling program were presented during a progress report meeting held at EPD on August 25, 2015. A follow-up meeting is currently pending with the EPD to further review the modeling process and obtain concurrence with EIC's findings.

In the August 25, 2015 meeting, EPD also required GPA to conduct a mixing zone analysis to determine whether potential groundwater seepage would impair the water quality in the Flint River in excess of the instream water quality criteria. EIC has completed this task utilizing the maximum leading edge concentrations and aquifer parameters from seven sampling events since the initiation of the VIRP. Based on this analysis, it was apparent that the resulting river concentrations of potential mixing of contaminated groundwater would be substantially lower than the instream water quality standards. EIC will present these findings during the EPD meeting being scheduled.

SECTION

4

4. Management of Contaminated Soils

The EPD approved management of contaminated soils in the South Parcel using site covenants and engineering controls - thus eliminating the need for further excavation, avoiding exposure of site workers, visitors, on-site employees, and of the general public to BHC contamination. Based on previous sampling events, soil contamination was limited to three distinct areas of concern known as AOC-1, AOC-2, and AOC-3. The following subsections define the status of each AOC and the follow-up tasks defined in the VIRP.

4.1 AREA OF CONCERN 1 (AOC-1)

The GPA defined the horizontal extent of soil contamination within AOC 1. As discussed in the third VIRP Semi-annual progress report dated April 30, 2014, GPA installed security fencing with a 20-foot buffer zone around the aerial extent of AOC 1 as an engineering control.

4.2 AREA OF CONCERN 2 (AOC-2)

Completed additional soil sampling to delineate the horizontal extent of soil contamination within AOC 2. The horizontal extent was delineated in all directions - except to the south where a small area lies beneath paved areas and buildings. Since contaminated soil in AOC-2 lies beneath a concrete slab and asphalt pavement, potential exposure to visitors is already eliminated. Direct exposure to site workers and employees will be controlled with site covenants, as discussed in Section 4.5 below.

4.3 AREA OF CONCERN 3 (AOC-3)

As stated in the Third VIRP Semi-annual Report, dated April 2014 (EIC, 2014a), GPA conducted additional soil sampling activities in AOC-3 area and determined that the soils were delineated below the risk reduction standards. In a follow-up letter, EPD concurred that no additional remedial actions were required in this area and that AOC-3 was effectively no longer a concern.

4.4 SITE COVENANTS

As discussed in Section 2, GPA is currently in the process of preparing a Uniform Environmental Covenant (UEC) pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-

16-1, et seq. as institutional controls. The UEC will clearly outline the area subject to engineering controls (ECs) and institutional controls (ICs). The AOC-1 area includes the entire parcel within a 20-foot buffer of the fenced in area. The AOC-2 area includes the area beneath Warehouse numbers 2 and 3 and the surrounding concrete and asphalt covered surfaces leading up to the fence installed around AOC-1. The limits of the concrete/asphalt covered surfaces included in AOC-2 was defined from the original boundaries drawn in the VIRP document and soil sampling data derived from historical reports (Law 1999, 2001, and 2002), prepared under previous site investigations identified in Figure 4-1 entitled: Proposed Horizontal Covenant Limits for AOC-2. All restricted areas will be defined in a surveyed legal description, defined in the UEC and subject to annual Maintenance and Monitoring inspections and reporting.

4.5 MAINTENANCE AND MONITORING PLAN

GPA included an Operations and Maintenance (O&M) plan for the fence line installed around AOC-1 in the Third VIRP Semi-annual Report of April 2014 (EIC, 2014a) and included a description of a Health and Safety Briefing for GPA employees regarding AOC-1 in the Fourth Semi-annual report of October 2014 (EIC, 2014a). GPA is currently preparing a Maintenance and Monitoring Plan for both AOCs 1 and 2. In this plan, the AOCs will be defined according to a UEC and the plan will incorporate the fence line O&M plan for AOC-1, as well as health and safety considerations for GPA employees, contractors, and visitors at both AOCs 1 and 2. The plan will also include a Soil Management Plan for both AOCs 1 and 2. The plan will include a description of a UEC monument to be installed by GPA (see Section 4.6 following). This plan is currently being prepared and will be included in a subsequent semi-annual report.

4.6 MONUMENT

Consistent with the UEC requirements, GPA will install a permanent monument in a conspicuous location notifying GPA employees, contractors, and visitors about the site covenants and restrictions pertaining to BHC soil contamination. The area covenants and restrictions will be incorporated into all land disturbance contracts issued by GPA for future site redevelopment actions. This mechanism will be utilized to eliminate exposure via routine surficial contact, as well as exposure to construction workers or underground utility workers conducting soil excavation activities.

SECTION
5

5. Summary

During the six-month period from May 2015 through October 2015, EIC has successfully completed various tasks to meet the primary objectives set forth in the VIRP. The following is a summary of various tasks conducted during this six-month period.

EIC has responded to all of the EPD's comments presented in a letter dated October 6, 2015. As stated in Section 2, additional tasks are currently being performed to address EPD's comments.

In September 2015, EIC completed the second 2015 semi-annual sampling program. The results of the sampling program indicate that the site conditions are consistent with previous site observations concerning the measurements of COC concentrations and groundwater flow characteristics. As of the September 2015 sampling event, the alpha-BHC and delta-BHC groundwater plumes above RRS remain delineated within the site boundaries except to the north of the site boundary beyond Spring Creek Road. The beta-BHC plume above RRS is delineated towards the east and west of the site but remains undefined to the south towards the Flint River in the vicinity of MW-23 and to the north beyond Spring Creek Road. Based on EPD's October 6, 2015 comments, GPA will switch to an annual groundwater sampling program.

Based on several groundwater sampling events, it is apparent that the BHC groundwater plume is relatively stable. EIC conducted vadose zone and groundwater transport modeling to further evaluate the long-term migration potential. A meeting is currently being scheduled with EPD to obtain concurrence with the modeling approach and results. In addition, EPD required GPA to conduct a mixing zone analysis to determine whether the BHC contaminated groundwater plume presents a risk to the instream water quality in the Flint River. The results of this analysis will be presented in the EPD modeling meeting to obtain concurrence.

Consistent with the steps outlined in the VIRP, GPA has completed the horizontal delineation of the soil contamination in all three areas of concern. GPA has also installed a fence around AOC-1, prepared a Fence line Operation and Maintenance Plan, conducted a health and safety briefing for GPA employees regarding AOC-1, and is in the process of preparing a Management and Monitoring Plan for both AOCs 1 and 2. Currently, GPA is in the process of preparing site covenants consistent with UEC format for AOCs 1 and 2. The GPA is also in the process of procuring a monument to be installed in a conspicuous location within AOCs 1 and 2. Upon

completion of these tasks, GPA will have accomplished all of the milestones outlined in the VIRP for the management of contaminated soils.

Notes:

All DTW measurements were recorded prior to purging utilizing a Solinst interface meter, Model:122.

* TOC elevations are based on a survey conducted by Donaldson, Garrett, & Associates, Inc. in April 2015.

** Depth to bottom of all wells except MW-17 were measured utilizing the interface meter after purging in March 2015. MW-17 was similarly gauged on 9/14/15.

*** Well Not Located

TOC = Top of Casing

DTW = Depth to Water below TOC

NA = Not Applicable

DTB = Depth to Bottom below TOC

NM = Not Measured

Sources: Analytical results for samples collected in April 2012 and earlier are from CH2M Hill 2012, AccuTest 2012, and ECT 2012

Notes:

Field parameters were recorded by EIC from December 2013 to September 2015, after parameters had stabilized and prior to sample collection.

Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell.

SU = Standard Unit

mV = Millivolts

mS/cm = Microsiemens per centimeter

NTU = Nephelometric Turbidity Unit

mg/L = Milligrams per liter

NL = Well not located

NS = Well not sampled

NM = Field Parameter not measured

DRY = Well was dry and therefore not sampled

Sources: Analytical results from March 2013 to September 2015 are from samples directly collected by EIC. Historical data prior to March 2013 from CH2MHill 2008, 2009, and 2012 Groundwater Reports and Law Engineering 2001-2003 Compliance Status Reports and Addendums

Notes:

MNA = Monitored Natural Attenuation.

1.60 = Results above detection limit.

J = Target analyte concentration was positively identified below the quantitation limit and above the detection limit.

U = Analyte was not detected.

UBL = Value not certain because of detection in equipment blank.

D = The sample was diluted due to targets detected over the highest point of the calibration curve.

D – The sample was diluted due to targets detected over the highest point of the calibration curve
X = A laboratory QC deficiency was observed in quality control review of data

X = A laboratory QC deficiency was observed in quality control review of data
E = Relative percent difference exceeded lab control limits

F = Relative percent difference exceeded lab control limits

P = The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

Well not located

Well not sampled

Contaminant not measured.

= Well was dry and therefore could not be sampled

Table 1 lists dry and moisture content results from Run #2.

results from Run #3

Primary and confirmation results differ by more than 40%. Lower value reported due to possible correlation.

result for beta-BHC was adjusted based on tubing rinsate sample, see Xenco lab report number 492804

Notes:

NI - Not Installed

NL - Not Located

NA - Not Applicable

* = Event Min., Max., Range, Avg., and Var. - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

*² = MW Min., Max., Range, Avg., and Var. - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from March 203 to March 2015 where available.

*³= Global Min., Max., Range, Avg., and Var. - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from March 2013 to March 2015

Groundwater elevations prior to March 2013 are derived from historical groundwater monitoring reports by previous consultants

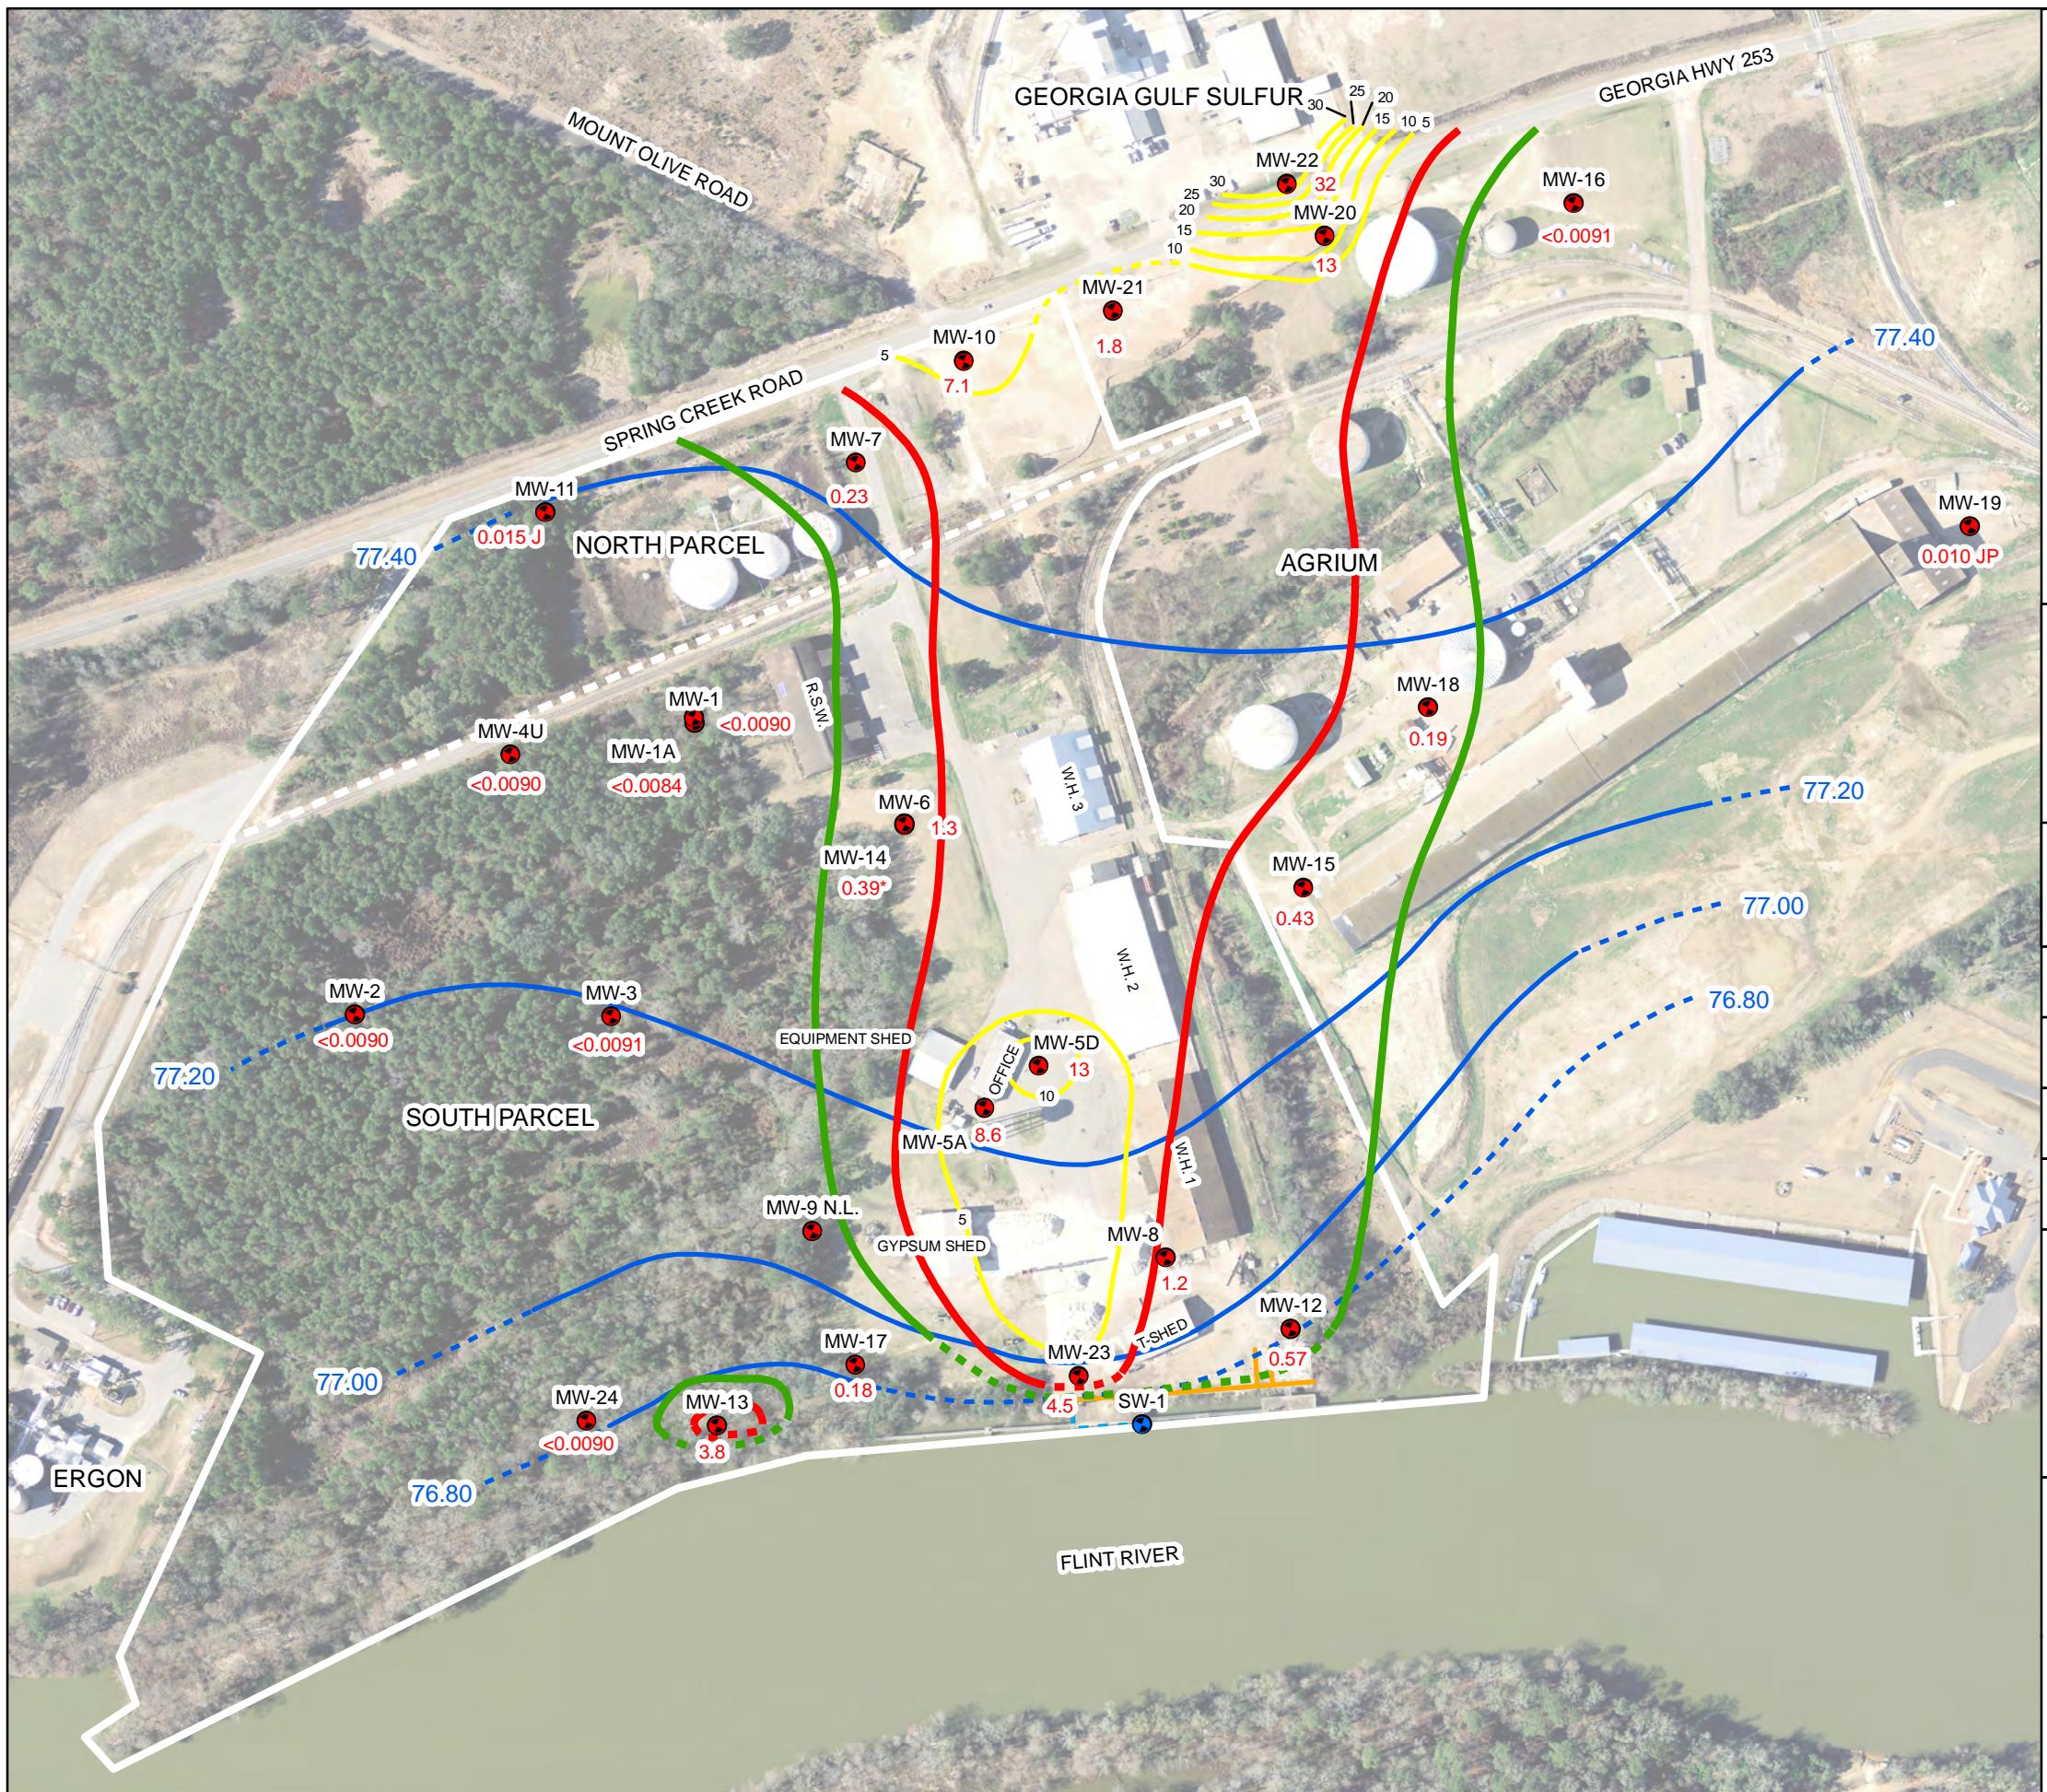

Top of casing (TOC) elevations are based on the most recent survey by Donaldson Garrett and Associates in April 2015

COMMENTS:			SAMPLE COLLECTION TIME: <u>17:17</u>						
			PREPARED BY: <u>Amelia Grant</u>						

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and $\pm 5\%$ for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the.

Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

COMMENTS:				SAMPLE COLLECTION TIME: <u>16:53</u>					
				PREPARED BY: <u>Amelia Grant</u>					

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and $\pm 5\%$ for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Method Summary

Client: Environmental International Corporation

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
X	Surrogate is outside control limits
F2	MS/MSD RPD exceeds control limits
F1	MS and/or MSD Recovery is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

CASE NARRATIVE

Client: Environmental International Corporation

Project: GPA Bainbridge

Report Number: 680-116914-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

RECEIPT

The samples were received on 09/19/2015; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt were 2.2° C, 2.4° C and 2.6° C. 2.4 C.

PESTICIDES AND PCBs

Samples MW-1 (680-116914-1), MW-1A (680-116914-2), MW-2 (680-116914-3), MW-3 (680-116914-4), MW-4U (680-116914-5), MW-5A (680-116914-6), MW-5D (680-116914-7), MW-6 (680-116914-8), MW-7 (680-116914-9), MW-8 (680-116914-10), MW-10 (680-116914-11), MW-11 (680-116914-12), MW-12 (680-116914-13), MW-13 (680-116914-14), MW-14 (680-116914-15), MW-15 (680-116914-16), MW-16 (680-116914-17), MW-17 (680-116914-18), MW-18 (680-116914-19), MW-19 (680-116914-20), MW-20 (680-116914-21), MW-21 (680-116914-22), MW-22 (680-116914-23), MW-23 (680-116914-24), MW-24 (680-116914-25), MW-10 Duplicate (680-116914-26) and Equipment Blank (680-116914-27) were analyzed for Pesticides and PCBs in accordance with EPA SW-846 Method 8081B_8082A. The samples were prepared on 09/21/2015 and 09/22/2015 and analyzed on 09/23/2015, 09/24/2015 and 09/25/2015.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-11 (680-116914-12). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-17 (680-116914-18). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-18 (680-116914-19). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-19 (680-116914-20). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-21 (680-116914-22). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-5D (680-116914-7). These results have been reported and qualified.

Heptachlor epoxide failed the recovery criteria high for the MS of sample MW-19MS (680-116914-20) in batch 680-402414.

Dieldrin exceeded the RPD limit for the MSD of sample MW-19MSD (680-116914-20) in batch 680-402414.

alpha-BHC, gamma-BHC (Lindane), delta-BHC and beta-BHC failed the recovery criteria low for the MS of sample MW-22MS (680-116914-23) in batch 680-402715. Several analytes failed the recovery criteria high.

alpha-BHC, gamma-BHC (Lindane), delta-BHC and beta-BHC failed the recovery criteria low for the MSD of sample MW-22MSD (680-116914-23) in batch 680-402715. Several analytes failed the recovery criteria high.

The presence of the '4' qualifier indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Job Number: 680-116914-1

Login Number: 116914

List Source: TestAmerica Savannah

List Number: 1

Creator: Banda, Christy S

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
