Subject: **Seventh VIRP Semi-annual Progress Report**
Georgia Ports Authority - Bainbridge Terminal
HSI Site No. 10071
1321 Spring Creek Road
Land Lot 373, Parcels: 20, 21A, and portion of Parcel 19
Bainbridge, Decatur County, Georgia

Dear Mr. McPherson:

On behalf of Georgia Ports Authority (GPA), Environmental International Corporation (EIC) is pleased to submit the attached documents as the Seventh Voluntary Investigation and Remediation Plan (VIRP) Semi-annual Progress Report for the above referenced site.

Enclosed are the following material:

1. One signed and sealed certification page for the Semi-annual Report
2. One copy of EIC's Seventh VIRP Semi-annual Progress Report
3. Two Compact Discs each with the report in searchable PDF format

If you have any questions regarding this submittal, please contact Mr. Christopher Novack of GPA at 912-964-3922 or me at the above location.

Sincerely,

ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.
President & CEO

Cc: Christopher Novack, GPA

CERTIFICATION AND SUPPORTING DOCUMENTS
Seventh VIRP Semi-annual Progress Report
Georgia Ports Authority-Bainbridge Terminal
HSI Site No. 10071
April 29, 2016

"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

SECTION

1

1. Introduction

On behalf of the Georgia Ports Authority (GPA), Environmental International Corporation (EIC) is pleased to submit the Seventh Semi-annual Progress Report to the Georgia Environmental Protection Division (EPD). This report was prepared as outlined in the Voluntary Investigation and Remediation Plan (VIRP) dated July 27, 2012 that EPD subsequently approved on November 2, 2012 under the Voluntary Remediation Program (VRP).

1.1 PRIMARY OBJECTIVES

The primary objectives of this report is to present a compilation of tasks conducted by EIC during the sixth-month time frame covering the period from November 2015 to April 2016. This report documents the following tasks, which EIC completed to create a better understanding of Site conditions and constituents of concern (COC) trends and to address concerns from the EPD:

- Addressing comments from EPD
- Continued evaluation of COC trends in groundwater
- Flint River mixing model
- Site closure activities

SECTION

2

2. EPD Comment Letter

GPA received a letter from the EPD, dated February 16, 2016 (EPD, 2016a), that commented on GPA's Sixth VIRP Semi-Annual Progress Report. This letter was the last official response that GPA received from EPD. On behalf of GPA, EIC addresses each of these comments with the following responses:

EPD Comment 1

EPD concurs that since the Universal Environmental Covenant (UEC) has been expanded to include the AOC 2 area and has been extended to include all concrete and asphalt covered surfaces surrounding Warehouses 2 and 3, including up to the fence installed around AOC 1, no further horizontal delineation is required.

Response:

Noted

EPD Comment 2

EPD, as previously stated in the October 6, 2015 comment letter concurs that delineation is incomplete near the Flint River where MW-13 and MW -23 are located. EPD will await the Georgia Ports Authority (GPA) modeling demonstration (in a proposed meeting by GPA that no negative surface water impacts or exceedances of the current Georgia In Stream Water Quality Standards (ISWQSs), as provided in Section 391-3-6-.03(5) of the Georgia Water Quality Control Act, are occurring into the Flint River.

Response:

To address any potential impacts of COCs found at MW-13 and MW-23, EIC has developed a mixing zone model for the exposure area along the Flint River. The results from the mixing zone analysis indicate that there would be no negative surface water impacts or exceedances of the current Georgia In-Stream Water Quality Standards (ISWQSs) even with the highest concentration of BHCs historically detected at the site. Please refer to Section 4 for explicit details on the results of the mixing zone analysis.

EPD Comment 3

In response to EPD's Comment # 6 in the October 6, 2015 comment letter, GPA stated that they do not plan to include Agrium parcels under a groundwater UEC. However, GPA has historically stored pesticides on its property and cannot exempt itself from being a Responsible Party for the release of pesticides on the property. EPD believes that since Agrium did not have a history of using or storing pesticides as part of their business operations, Agrium parcels with pesticide impacts in groundwater should be included as qualifying properties under the Act and a streamlined groundwater UEC be developed for these parcels as part of the final site remedy.

Response:

The BHC storage at GPA took place at a location topographically sidegradient and downgradient of the Agrium parcel in question. Furthermore, none of GPA's historical operations involved storage of pesticides on the Agrium parcels. By contrast, the groundwater COC plumes and the groundwater flow directions chronicled in all VIRP progress reports consistently indicate that the groundwater contamination found in the wells within Agrium parcel would have clearly originated from a hydraulically upgradient source.

As noted in EIC's historical site maps, included in the VIRP, the Georgia Gulf Sulfur (GGS) facility is located on property hydraulically upgradient of the Agrium Parcel. Referring to Exhibit A, derived from GGSs website, GGS has chronicled the company history as follows:

"The Georgia Gulf Sulfur manufacturing plant, in Bainbridge Georgia, was conceived and built in the late 1950's to expand Mr. R.A. Griffin's seed and chemical formulation business into the manufacture of sulfur fungicides and miticides. A plant site was purchased on Spring Creek Road, adjacent to the Texas Gulf Sulfur storage facility, at Georgia's inland port facility, on the Flint River. Production commenced in 1959 using dry bulk sulfur from the Texas Gulf Sulfur terminal. Sulfur supply was changed to molten sulfur in 1974. In 1983 a fluid sulfur production unit was added to the site, currently operating as Bainbridge Chemical Corporation."

Based on the aforementioned findings, GPA does not concur with the EPD that the Agrium Parcel should be included as qualifying properties within the groundwater UEC currently being developed for the GPA property under the EPD approved VIRP.

EPD Comment 4

EPD noted that there were no turbidity readings of monitoring wells sampled and the pump intake readings were too low on most wells during sampling. In future Reports please submit turbidity readings for each monitoring well sampled and make appropriate adjustments to correct the low intake readings.

Response:

We are uncertain why EPD believes that there were no turbidity readings in the report. In fact, EIC has submitted turbidity data with each sampling event conducted throughout the VIRP. Referring to "Table 3-2: Chronological Groundwater Quality Field Parameters Summary" of the sixth Semi-annual Progress Report (EIC, 2015b); please note that turbidity readings are listed here as well. The field notes for the data tabulated in this table are included on EIC's purging and sampling field logs.

With regard to the question on the pump intake, please note that EIC places the tubing intake at the midpoint of the available wetted portion of the screen at each monitoring well during groundwater sampling events. Since the well screens in many of the wells at the site are not fully submerged, EIC adjusts the tubing level such that the intake lies at the midpoint of the water column.

SECTION

3

3. Groundwater Monitoring

During the first quarter of 2016, EIC conducted a semi-annual groundwater monitoring event. Under the approved VIRP (EIC, 2012), all available monitoring wells are being utilized for the monitored natural attenuation (MNA) remedial approach. The following subsections describe the monitoring program for the April 2016 sampling event and compare the data from this event to the data from previous sampling events since the VIRP was approved.

3.1 GROUNDWATER MONITORING FIELD PROGRAM

In March 2016, EIC conducted groundwater monitoring at all 25 available monitoring wells. Two of the monitoring wells (MW-14 and MW-17) are historically defined as "deep wells", as the top of the well screen of each well lies at a depth at or greater than 50 feet below ground surface (bgs). The groundwater samples collected from site monitoring wells were analyzed for pesticide COCs. The analyses included the primary COC benzenehexachloride (BHC) composed of isomers, α-BHC, β-BHC, δ-BHC, and γ-BHC (Lindane). A site layout map including monitoring well locations is illustrated in Figure 3-1.

3.1.1 Sampling Protocol

The groundwater sampling program was conducted in accordance with the current U.S. EPA Field Branches Quality System and Technical Procedures (FBQSTP) per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

3.1.2 Site Access

Prior to EIC's site visit, EIC coordinated with the GPA regarding on-site field activities. EIC also contacted surrounding property owners for permission to access wells located near or on the surrounding properties. EIC contacted Agrium U.S., Inc. (Agrium) for permission to access and conduct off-site well monitoring on the adjacent property to the northeast of the GPA site where wells MW-15, MW-16, MW-18, MW-19, MW-20, and MW-21 are located. EIC contacted the

Georgia Department of Transportation (DOT) to obtain permission to access monitoring well MW-22, located on the north right-of-way of Georgia State Highway 253/Spring Creek Road. Upon arrival at the site, EIC acquired access permission from Ergon, Inc., whose property, to the west of the site, is utilized to more easily access wells MW-2 and MW-11.

3.1.3 Field Procedures

3.1.3.1 Groundwater Gauging

Prior to sampling, EIC gauged each well with a Solinst Model 122 interface meter ("oil/water interface probe") to determine the static depth to groundwater. EIC utilized top-of-casing (TOC) elevations from the most recent well survey to determine the current groundwater elevations. Gauging data from the March 2016 monitoring event is summarized in Table 3-1.

3.1.3.2 Groundwater Sampling

Prior to initiating well monitoring field activities, EIC placed a non-hazardous label on an empty 55-gallon drum that EIC had previously staged on the north side of the T-Shed on GPA property. This drum was labeled with the shipper noted as "Georgia Ports Authority", contents noted as "IDW Well Purge Water", and the accumulation date noted as "03/03/2016." This drum was used in addition to a previously similarly labeled drum to containerize investigative derived waste (IDW) purge water throughout the event.

EIC utilized a peristaltic pump for purging and for sampling groundwater. Disposable 1/4-inch inner diameter (ID) Teflon-lined tubing and 3/16-inch ID silicon tubing at the pump head was utilized in all wells for purging. Groundwater from each monitoring well was pumped via the peristaltic pump through a multi-parameter field water quality instrument equipped with a flow-through cell.

EIC calculated the appropriate Teflon tubing length and intake depth for each well by considering the following monitoring well characteristics: the field-measured depth to groundwater, the field-measured height of the well TOC relative to the ground surface, the established field-measured depth-to-bottom, and the documented well total depth and screened interval from well construction logs. Following the SOP SESDPROC-301-R3 (EPA, 2013), EIC set the tubing intake at approximately the center of the wetted screen interval.

Purging continued at each well until stabilization occurred as defined in the SOP SESDPROC-301-R3 or until three to five well volumes were purged from the each well. After water quality parameters stabilized at each accessible well, EIC cut the Teflon-lined tubing connecting the peristaltic pump to the flow-through cell. Groundwater samples were then collected by filling sample bottles with water discharged directly from the pump.

All sample bottles were properly sealed and labeled in the field. Each sample was then stored with double-bagged ice in insulated containers ("coolers") provided by the laboratory. Completed chain-of-custody forms accompanied all samples.

EIC relinquished all samples to Test America laboratory immediately after EIC personnel returned from the site. Laboratory analysis included organochlorine pesticides contaminants using EPA Method 8081B/3660B (with sulfur cleanup). The field forms associated with each groundwater sample are included as Attachment A. The groundwater quality field parameters after stabilization and prior to sample collection are summarized in Table 3-2. The laboratory report for the September sampling event is included as Attachment B. The results of these analyses are summarized in Table 3-3 along with historical groundwater analysis.

3.2 QUALITY ASSURANCE AND QUALITY CONTROL

During the groundwater sampling event, EIC collected additional samples for quality assurance (QA) and for the validation of analytical results. For organochlorine pesticides laboratory matrix spike analysis, one additional sample each from wells MW-5D and MW-22 was collected. A duplicate sample from well MW-10 and an equipment rinsate (blank) sample were also collected. The equipment blank sample was collected by pumping laboratory-supplied de-ionized water through a 10-foot section of Teflon-lined tubing and approximately 6-inches of silicone tubing.

Each QA sample collected at the site was stored with ice in coolers and delivered to the laboratory along with the groundwater samples. These samples were analyzed via EPA method 8081B/3660B. All sample bottles were properly sealed and labeled in the field.

To prevent cross-contamination, new disposable Teflon-lined tubing and disposable silicone tubing were used to collect all samples. EIC's oil/water interface probe and tubing cutter tool were field decontaminated prior to use and between sample locations by washing with pressurized phosphate-free detergent solution and rinsing with pressurized de-ionized (DI) water. After each sample was collected, the multi-parameter water quality meter, the parameter sensors, and the flow-through cell were decontaminated by disassembling and cleaning with pressurized DI water and, if needed, also with pressurized phosphate-free detergent.

3.2.1 QA Evaluation

From Attachment B, the analytical results of all of the parameters in the equipment blank were below the method detection limit (MDL). In the duplicate MW-10 sample, alpha-, beta-, delta-, and gamma-BHC constituents were all above the MDL, in concurrence with the primary MW-10 sample, and both the primary as well as duplicate samples had similar concentrations.

3.3 DATA EVALUATION

EIC conducted an evaluation of the data compiled from field measurements and laboratory analyses to determine the groundwater potentiometric surface and the horizontal and vertical extent of the prevailing groundwater COC plumes occurring during the March 2016 monitoring event. Data from the sampling event was compared to the data from the baseline sampling event in March 2013 and with each of the subsequent sampling events to determine if monitored natural attenuation is in progress at the site and if it is likely to lead to remedial endpoints (EIC 2012, 2013a, 2013b, 2014a, 2014b, 2015a, and 2015b).

3.3.1 Groundwater Potentiometric Map

Utilizing gauging data summarized in Table 3-1 from the March 2016 groundwater monitoring event, EIC prepared a groundwater potentiometric surface map, illustrated in Figure 3-2. Referring to Figure 3-2, it is apparent that groundwater continues to flow to the southeast towards the Flint River.

Table 3-4 tabulates historical and current groundwater potentiometric surface elevations for all wells at the site as well as statistical data for each monitoring event. Referring to Table 3-4, the average calculated groundwater elevation across the site during the March 2016 gauging event was 79.91 ft. This value is above the calculated average groundwater elevation of 78.10 ft. listed in Table 3-4. This continues to support the seasonal groundwater fluctuation apparent at the site since the initiation of the VIRP monitoring program. The total range of elevation difference for this event was calculated to be 1.54 ft. whereas the previous March 2015 total range was 1.03 ft. This indicates that the overall gradient observed during the March 2016 event was greater than that observed during the March 2015 event.

3.3.2 Horizontal Extent of COC Plumes

Figures 3-3 through 3-5 illustrate the horizontal extent of the BHC plumes comprised of alpha-BHC, beta-BHC, and delta-BHC isomers during March 2016. The following subsections describe the extent of each COC in groundwater at the site.

3.3.2.1 Alpha-BHC Plume

From Figure 3-3, both the concentration and horizontal extent of the alpha-BHC plume have remained relatively stable over time compared to the March 2013 baseline. From the March 2016 sampling event, the highest concentration of alpha-BHC was detected in MW-6 (0.77 µg /L) and the second highest concentration was found in MW-22 (0.61 µg/L). It is apparent from Figure 3-3, that the alpha-BHC plume relative to RRS is horizontally delineated towards the southwest, south towards the Flint River, southeast, and northeast. However, the plume is not horizontally defined to the northwest and upgradient offsite beyond Spring Creek Road.

3.3.2.2 Beta-BHC Plume

Figure 3-4 illustrates the horizontal extent of the beta-BHC plume during the March 2016 monitoring event. From Figure 3-4, both the concentration and horizontal extent of the beta-BHC plume have remained relatively stable over time compared to the March 2013 baseline. The highest concentration of beta-BHC was detected in MW-22 (19 µg/L), which is located hydraulically up-gradient of the GPA and Agrium properties and to the north of Spring Creek Road. The Beta-BHC concentration in MW-22 has historically been noted as the highest within the Beta-BHC plume since the March 2013 VIRP baseline event.

As discussed in previous semi-annual reports, concentrations of beta-BHC continue to fluctuate in a seasonal pattern in the area of wells MW-5A and MW-5D. During the March 2016 sampling event, concentrations at wells MW-5A and MW-5D followed the same historical trend, with detected concentrations decreasing, as compared to the previous September 2015 event, and with concentrations that are comparable to those detected during the March 2015 event.

Near the Flint River at MW-23, the Beta-BHC concentration was again above RRS, as it has been since September 2014, which was the first event in which MW-23 was sampled after it was installed. The concentration near this area, however, have remained relatively stable over time since the September 2014 sampling event.

Referring to Figure 3-4, it is apparent that the horizontal extent of the beta-BHC plume relative to RRS is defined to the northeast and southwest, however, the horizontal extent remains undefined to the northwest and upgradient offsite beyond Spring Creek Road and to the south of MW-23 towards the Flint River.

3.3.2.3 Delta-BHC Plume

Figure 3-5 illustrates the horizontal extent of the delta-BHC plume during the March 2016 monitoring event. Compared to the baseline sampling event, the delta-BHC plume has remained relatively stable over time. In March 2016, the highest concentration detected of the delta-BHC plume occurred near MW-22 (1.9 µg/L). Figure 3-5 illustrates that the horizontal delineation of the delta-BHC plume relative to RRS is complete, except to the northwest offsite beyond Spring Creek Road.

3.3.3 Vertical Extent of COC Plumes

There are two deep wells at the site, designated as wells MW-14 and MW-17. According to historical well construction logs, the screened intervals in monitoring wells MW-14 and MW-17 range in depth from 67 to 72 feet bgs and from 50 to 60 feet bgs, respectively. EIC has therefore utilized the aforementioned wells to monitor the vertical migration of COCs.

Referring to Table 3-3, following historical trends, the concentrations of alpha-BHC, beta-BHC, and delta-BHC at wells MW-14 and MW-17, have remained below RRS as of the March 2016 sampling event. As discussed in the Fourth Semi-annual report (EIC, 2014), EPD concurs with EIC that the vertical limit of the BHC plume above RRS has been defined.

3.3.4 BHC Plume Stability

Based on the findings in Sections 3.3.1 through 3.3.3, it is apparent that the BHC plume has remained stable in vertical and horizontal extent since the March 2013 baseline sampling event. EIC will continue to evaluate data from subsequent groundwater monitoring events to further define plume trends.

SECTION

4

4. Flint River Mixing Model

To evaluate the potential impact of contaminated groundwater flow from the site to the Flint River (River), EIC developed a mixing model. This model utilizes groundwater flow, groundwater COC concentrations, and river flow rates to estimate the maximum potential COC concentrations in the Flint River downstream of the site. The model was executed under several different river flow rate and groundwater COC concentration scenarios to evaluate and compare the resultant concentrations to national and state level regulatory limits. The following subsections discuss the general approach to the mixing model.

4.1 MODEL SETUP

As a primary criterion, EIC established the following assumptions to evaluate the worst-case scenario:

- The entire mass of groundwater is uniformly contaminated with same concentration of COCs.
- Groundwater enters the River along the entire length of the site property along the River.
- Groundwater completely mixes with surface water in the River.

As such, the components of the model consist of:

- The flow rate of groundwater entering the River from the site
- The concentration of COCs in groundwater entering the River from the site
- The flow rate of the River
- The resulting COC concentrations in the River upon mixing of the groundwater with the surface water in the River

4.1.1 Groundwater Mass Flux

The groundwater flux was estimated by utilizing the Dupuit equation shown below (Fetter, 2001).

$$q = \frac{1}{2}k\left(\frac{h_1^2 - h_2^2}{L}\right) = \frac{1}{2} * 66.47\,\frac{ft}{day} * \left(\frac{(31.93\,ft)^2 - (30.31\,ft)^2}{989.32\,ft}\right) = 3.39\,\frac{ft^2}{day} = 1{,}237\,\frac{ft^2}{year}$$

$$q = groundwater\ flow\ per\ unit\ width\ \left(\frac{ft^2}{day}\ \&\ \frac{ft^2}{year}\right)$$

$$k = hydraulic\ conductivty\ \left(\frac{ft}{day}\right)$$

$$h_1 = hydraulic\ head\ at\ source\ (ft)$$

$$h_2 = hydraulic\ head\ at\ groundwater/river\ interface\ (ft)$$

$$L = distance\ between\ source\ and\ river\ (ft)$$

Hydraulic conductivity was assumed to be the average value presented in the 2015 Site Conceptual Model included as Appendix A of the Fifth VIRP Semi-annual Report for the site (EIC, 2015a). Figure 4-1 illustrates the points selected for h_1 *and* h_2 as well as the distance L overlaid on top of the March 2016 groundwater potentiometric surface map. Considering that the closest known potential source is the soil pile in AOC-1, EIC selected that area as h_1 for the location of the hydraulic head at the source. Since groundwater discharges to the river, EIC utilized the hydraulic head at the stilling well SW-1, which is attached to the pier at the site and is installed to the bottom of the Flint River, as h_2.

The confining unit from which hydraulic head was calculated is assumed to be the upper semi-confining unit described in the 2006 USGS report titled *Geohydrology of the Lower Apalachicola–Chattahoochee Flint River Basin, Southwestern Georgia, Northwestern Florida, and Southeastern Alabama* (USGS, 2006). From this report, the elevation of the bottom of this formation is apparently 48 ft. NAVD88 near the Bainbridge, Georgia area. This value is supported by lithological logs from the site, which do not indicate a confining unit above this elevation. Using this elevation as a baseline, the value of h_1 was computed from the groundwater contours shown in Figure 4-1, while the value of h_2 was determined as the height of the water in the Flint River from SW-1 gauging data. The distance L was derived using a trace line along the groundwater flow path between the source and the point where the surficial aquifer intersects the Flint River.

EIC then calculated total groundwater flow to the river utilizing the following equation:

$$Q = q * L_R = 1{,}237\,\frac{ft^2}{year} * 1{,}056\,ft = 1.31 * 10^6\,\frac{ft^3}{year}$$

$Q = groundwater\ flowrate\ \left(\frac{ft^3}{year}\right)$

$q = grounderwater\ flow\ per\ unit\ width\ \left(\frac{ft^2}{day}\ \&\ \frac{ft^2}{year}\right)$

$L_R = Length\ of\ site\ \ along\ the\ Flint\ riverfront\ (ft)$

4.1.2 Groundwater Concentration

For the purposes of this model, the selected groundwater concentrations were assumed to be consistent throughout the entire cross-section along the shoreline of the Flint River. EIC chose three sets of concentrations ranging from current site conditions (i.e. at the leading edge) to a worst-case scenario (i.e. maximum concentration ever recorded at the site), presented in Table 4-1, to compute varying degrees of potential downstream concentrations.

For the first scenario, EIC utilized the maximum concentrations measured at MW-23 from the latest sampling event, March 2016, to represent the current leading edge of the plume. For the second scenario, EIC utilized the maximum concentrations measured for each COC during the March 2016 sampling event to represent a current worst-case scenario. For the third scenario, EIC utilized the historical maximum concentrations of each constituent from Table 3-4 (that includes a compilation of VIRP and pre-VIRP groundwater analytical data), as an absolute worst-case scenario.

4.1.3 Flint River Flow Rate

Georgia instream water quality standards are described in Georgia administrative code 391-3-6-.03 *Water Use Classifications and Water Quality Standards* (EPD, 2013). Referring to Chapter 5.e.iv, the COCs should not exceed the maximum allowable concentrations during annual average or higher stream flow conditions. Additionally, referring to Chapter 5.e.ii, Gamma-BHC (Lindane) specifically should not exceed acute criteria during 1Q10 stream flow conditions. As such, EIC utilized discharge flow rates of the Flint River, measured at USGS gauging station in Bainbridge GA. These values are described in the following sections.

4.1.3.1 Average River Discharge

Utilizing the annual average discharge data from the USGS river gauging station 02356000 recorded from 2005 to 2015 (Attachment C), EIC estimated the average discharge for the Flint River. According to this estimate, the average discharge in the river was 6,873 cubic feet per second (cfs).

4.1.3.2 1Q10 River Discharge

According to the annual water report for 2015 (from USGS gauging station 02356000), the lowest daily mean discharge of the Flint River was recorded on September 5, 2011. EIC utilized a value, 1,010 cfs reported for that date as an estimate for 1Q10 river flow in computing the mixing zone values for Lindane.

4.1.4 Upstream River Concentration

As a conservative estimate of the potential effect of groundwater contamination from the GPA site - entering the Flint River - EIC assumed as an upstream concentration (C_{Ru}) of the respective COC in the River would be zero (0). For the purposes of the model, the mixing zone analysis only accounts for the potential impact of groundwater discharging from the GPA site.

4.2 MIXING ZONE CALCULATION

EIC utilized the following equations to compute the potential downstream River concentrations based on the variables defined in Section 4.1. This equation utilizes the principle of conservation of mass and assumes complete mixing of contaminants from groundwater to the River to calculate the downstream River concentration.

$$C_{gw}Q_{gw} + C_{Ru}Q_{Ru} = C_{Rd}Q_{Rd}$$

$$C_{gw} = groundwater\ COC\ concentration\ \left(\frac{\mu g}{L}\right)$$

$$Q_{gw} = groundwater\ flowrate\ \left(\frac{ft^3}{year}\right)$$

$$C_{Ru} = upstream\ river\ concentration\ \left(\frac{\mu g}{L}\right)$$

$$Q_{Ru} = Q_R = upstream\ river\ flowrate\ \left(\frac{ft^3}{year}\right)$$

$$C_{Rd} = downstream\ river\ concentration\ \left(\frac{\mu g}{L}\right)$$

$$Q_{Rd} = Q_{gw} + Q_{Ru} = downstream\ river\ flowrate$$

Since,

$$C_{Ru} = 0$$

The mixing equation can be simplified to:

$$C_{gw}Q_{gw} = C_{Rd}Q_{Rd} = C_{Rd}(Q_{gw} + Q_{Ru})$$

Thus,

$$C_{Rd} = C_{gw}\left(\frac{Q_{gw}}{Q_{gw} + Q_{Ru}}\right) = C_{gw} * DF$$

where DF serves as the Dilution factor

Based on the Groundwater Mass Flux Flow (Section 4.1.1) and the river flow rates (Section 4.1.3):

For average river flow conditions:

$$DF_{avg} = \left(\frac{Q_{gw}}{Q_{gw}+Q_{Ru}}\right) = \left(\frac{1.31*10^6 \frac{ft^3}{year}}{1.31*10^6 \frac{ft^3}{year} + 2.17*10^{11} \frac{ft^3}{year}}\right) = 6.03 * 10^{-6}$$

And for 1Q10 river flow conditions:

$$DF_{1Q10} = \left(\frac{Q_{gw}}{Q_{gw}+Q_{Ru}}\right) = \left(\frac{1.31*10^6 \frac{ft^3}{year}}{1.31*10^6 \frac{ft^3}{year} + 3.19*10^{10} \frac{ft^3}{year}}\right) = 4.10 * 10^{-5}$$

EIC utilized the dilution factor to compute the downstream river concentration for each COC for all three concentration scenarios.

4.3 RESULTS

Tables 4-2 and 4-3 list the results of the conservation of mass calculations as well as the state and national regulatory levels for each COC. The regulatory levels considered for this evaluation are the Georgia Instream Water Quality Standard (EPD, 2013) and the National Primary Drinking Water Standard (EPA, 2009). Table 4-2 considers the Georgia Standards under average river flow conditions, while Table 4-3 considers the special case of acute criteria for Gamma-BHC under 1Q10 river flow conditions.

Referring to the estimated downstream river concentrations listed in Table 4-2 and 4-3, it is apparent that the potential impact from groundwater discharge from the site into the Flint River would be negligible. In addition, these downstream river concentrations are several orders of magnitude lower than the state or federal regulatory standards. Considering that this is a conservative worst-case scenario, potential COC migration to the River from this site would not result in downstream river concentrations in excess of either federal or state surface water quality standards.

5

5. Site Closure

In conformance with VIRP requirements, GPA has completed the soil delineation tasks. The following subsections discuss the remainder of the tasks pertaining to the management of contaminated soils.

5.1 SITE COVENANTS

As discussed in Section 2, GPA is currently in the process of preparing a Uniform Environmental Covenant (UEC) pursuant to the Georgia Uniform Environmental Covenants Act, OCGA § 44-16-1, et seq. as an institutional control. The UEC will clearly outline the area subject to engineering controls (ECs) and institutional controls (ICs). As discussed in the Sixth VIRP Semi-annual Progress Report, there are currently two AOCs subject to the UEC namely, AOC-1 and AOC-2. The following subsection discusses the general location of each AOC.

5.1.1 AOC Locations and Legal Descriptions

AOC-1 is designated as the entire parcel within the fenced in area, shown in Figure 5-1, lying adjacent to and south of the storage building known as the former Rock Salt Warehouse (RSW). AOC-2 previously was defined to include only the area under and near Warehouse 3 (WH3). In response to EPD's comments, noted in Section 2, the AOC-2 boundary was redrawn to include the area beneath Warehouse 2 (WH2) and the northwestern portion of Warehouse 3 (WH3). In addition, AOC-2 also was redefined to include the surrounding concrete and asphalt covered surfaces extending west/southwest and reaching the fence installed around AOC-1. The limits of the concrete/asphalt covered surfaces included in AOC-2 were defined from the original boundaries drawn in the VIRP document and from soil sampling data derived from historical reports (Law 1999, 2001, and 2002), prepared under previous site investigations.

The new boundary for AOC-2 was surveyed in February 2016 by a Georgia licensed surveyor. Figure 5-1 illustrates the surveyed boundary for AOC-2. Following the February 2016 survey, the surveyor developed a legal description for both AOC-1 and AOC-2. The legal description for AOC-1 was derived from a previous survey performed by Donald Garrett and Associates in 2014. The certified legal descriptions for AOC-1 and AOC-2 are included as Attachment D and Attachment E, respectively. A certified survey map including both AOCs is included as Attachment F.

5.2 MAINTENANCE AND MONITORING PLAN

As discussed in the Sixth VIRP Semi-annual Progress Report, GPA will prepare a maintenance and monitoring plan (M&MP) which will include a soil management plan for AOC-1 and AOC-2. This plan will be included in the UEC submittal to EPD.

5.3 MONUMENTS

Consistent with the UEC requirements, GPA has installed permanent monuments to identify the UEC restrictions at the site. The monuments were installed by EIC in February 2016 as shown in Photographs 5-1 and 5-2. The monuments are installed in conspicuous locations within each of the respective AOCs notifying GPA employees, contractors, and visitors about the site covenants and restrictions pertaining to BHC soil contamination.

The dimensions of each granite monument was approximately 24-inch long, 12-inch wide, and 6-inch high. The monuments were installed by first excavating soil and asphalt in the proposed location and setting the monument in quick dry concrete. In order to protect the monument, EIC set each marker in a concrete pad consisting of 6000-psi rated concrete. Approximately two (2) cubic feet of soil and asphalt was removed while installing both monuments. All IDW soil generated during monument installation activities was containerized in steel 55-gallon drums labeled with "GPA" as the shipper, "soil IDW" as the contents, and the generation date.

5.4 COMPLIANCE STATUS REPORT

In accordance with the VIRP requirements, EIC has initiated preparation of a CSR for the site, as defined in EPD Rule 391-3-19-.06(3) (EPD, 2016b). The CSR will document the current compliance status of the site with Type 5 RRS. The CSR will be referenced in the UEC discussed in Section 5.1.

SECTION

6

6. Summary

During the six-month period from November 2015 through March 2016, EIC has successfully completed various tasks to meet the primary objectives set forth in the VIRP and other follow up tasks related to site closure activities.

EIC has continued semi-annual groundwater sampling to define the extents of BHC constituents within the site. The March 2016 groundwater monitoring event provided continued evidence of plume delineation and stability within the site. Delineation, however, remains incomplete offsite to the northwest for the monitored constituents alpha-BHC, beta-BHC, and delta-BHC and to the south towards the Flint River for beta-BHC.

To determine the potential impact of COCs on surface water quality, EIC developed a mixing zone model of the groundwater seepage into the Flint River. From the model analysis, potential groundwater seepage of the COCs would not result in exceedance of Georgia Instream Water Quality Standards.

Consistent with the VIRP requirements for management of contaminated soils, GPA has defined the areas subject to site covenants and completed installation of monuments notifying the environmental site conditions. Since GPA has met all requirements specified in the VIRP, EIC has initiated preparation of a CSR and UEC to provide site closure.

Notes:

All DTW measurements were recorded prior to purging utilizing a Solinst interface meter, Model:122.

* TOC elevations are based on a survey conducted by Donaldson, Garrett, & Associates, Inc. in April 2015.

** Depth to bottom of all wells except MW-17 were measured utilizing the interface meter after purging in March 2016. MW-17 was similarly gauged on 9/14/15.

*** Well Not Located

TOC = Top of Casing

DTW = Depth to Water below TOC

DTB = Depth to Bottom below TOC

NA = Not Applicable

NM = Not Measured

Table 3-2: Chronological Groundwater Quality Field Parameters Summary

Well ID # (Well Diameter, in.)	Sample Date	Groundwater Quality Field Parameters					
		Temp (Celsius)	pH (SU)	ORP (mV)	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)
MW-23 (2)	7/8/2014	24.94	3.74	358.00	1.310	0.00	1.34
	9/2/2014	26.47	4.67	154.00	1.040	0.00	0.55
	3/5/2015	23.11	4.47	177.00	1.470	0.00	0.93
	9/17/2015	24.95	5.33	216.00	0.925	0.00	0.53
	3/3/2016	21.48	4.60	187.00	0.899	0.00	0.29
MW-24 (2)	3/3/2015	20.86	5.72	189.00	0.214	0.00	2.14
	9/14/2015	19.62	6.30	188.00	0.260	0.00	2.56
	3/2/2016	17.82	5.50	167.00	0.204	0.00	3.58

Sources: Analytical results for samples collected in April 2012 and earlier are from CH2M Hill 2012, AccuTest 2012, and ECT 2012

Notes:

Field parameters were recorded by EIC from December 2013 to March 2016, after parameters had stabilized and prior to sample collection.

Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell.

SU = Standard Unit
mV = Millivolts
mS/cm = Microsiemens per centimeter
NTU = Nephelometric Turbidity Unit
mg/L = Milligrams per liter
NL = Well not located
NS = Well not sampled
NM = Field Parameter not measured
DRY = Well was dry and therefore not sampled

Table 3-3: Groundwater Pesticides Data Summary

Sources: Analytical results from March 2013 to March 2016 are from samples directly collected by EIC. Historical data prior to March 2013 from CH2MHill 2008, 2009, and 2012 Groundwater Reports and Law Engineering 2001-2003 Compliance Status Reports and Addendums

Notes:

MNA = Monitored Natural Attenuation.
RRS = Risk Reduction Standard.
TOC = Total Organic Carbon.
ug/L = Micrograms per liter.
mg/L = Milligrams per liter.
NA = Not Applicable.
18.8 = Results exceeds RRS.

1.60 = Results above detection limit.
J = Target analyte concentration was positively identified below the quantitation limit and above the detection limit.
U = Analyte was not detected.
UBL = Value not certain because of detection in equipment blank.
D = The sample was diluted due to targets detected over the highest point of the calibration curve
X = A laboratory QC deficiency was observed in quality control review of data
F = Relative percent difference exceeded lab control limits
P = The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
F1 = MS and/or MSD recovery is outside acceptance limits
F2= MS/MSD RPD exceeds control limits

NL = Well not located
NS = Well not sampled
NM = Contaminant not measured.
DRY = Well was dry and therefore could not be sampled
*= Results from Run #2.
**= Results from Run #3.
***= Primary and confirmation results differ by more than 40%. Lower value reported due to possible correlation.
*[4] = Result for beta-BHC was adjusted based on tubing rinsate sample, see Xenco lab report number 492804

Table 3-4: Historical Groundwater Potentiometric Surface Elevations

Notes:

NI - Not Installed

NL - Not Located

NA - Not Applicable

*** = Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

***[2] = MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from March 2013 to March 2016 where available.

***[3]= Global Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from March 2013 to March 2016

Groundwater elevations prior to March 2013 are derived from historical groundwater monitoring reports by previous consultants

Top of casing (TOC) elevations are based on the most recent survey by Donaldson Garrett and Associates in April 2015

Table 4-1: Mixing Model Initial Groundwater Concentrations

Constituents of Concern	Leading Edge Concentration, C_{gw1} (µg/L)	Maximum Concentration Recorded During the March 2016 Sampling Event C_{gw2} (µg/L)	Maximum Concentration Ever Recorded at the Site C_{gw3} (µg/L)
Alpha-BHC	1.70E-02	7.70E-01	2.05E+01
Beta-BHC	5.10E+00	1.90E+01	3.74E+01
Delta-BHC	1.10E-02	1.90E+00	2.24E+01
Gamma-BHC (Lindane)	4.80E-02	3.50E-01	2.66E+00

Notes:

Leading edge is assumed to be the concentration at MW-23 derived from the EIC March 2016 groundwater sampling results, recorded in the Seventh VIRP Semi-annual Report, Table 3-3

Maximum Site Concentration March 2016 is the highest observed concentration for each constituent at the site during the March 2016 groundwater sampling event, recorded in the Seventh VIRP Semi-annual Report, Table 3-3

Maximum Concentration Ever Recorded is the maximum concentration of each constituent recorded at any well for any event as reported in the Seventh VIRP Semi-annual Report, Table 3-3

Table 4-2: Modeled Downstream River Concentrations Under Average River Flow Conditons Compared to Water Quality Standards

Constituents of Concern	Georgia Instream Water Quality Standards (µg/L)*	National Primary Drinking Water Standards (µg/L)*[2]	Estimated Downstream River Concentrations		
			Utilizing Leading Edge C_{gw1}, C_{Rd1} (µg/L)	Utilizing Event Maximum C_{gw2}, C_{Rd2} (µg/L)	Utilizing Maximum Recorded C_{gw3}, C_{Rd3} (µg/L)
Alpha-BHC	4.90E-03	NA	1.02E-07	4.64E-06	1.24E-04
Beta-BHC	1.70E-02	NA	3.07E-05	1.15E-04	2.25E-04
Delta-BHC	NA	NA	6.63E-08	1.15E-05	1.35E-04
Gamma-BHC	1.80E+00	2.00E-01	2.89E-07	2.11E-06	1.60E-05

Notes:

Downstream river concentrations are based on the mixing formula below. The formula assumes that the groundwater flow discharging to the river from the entire length of the site is uniformly contaminated at each of the respective groundwater concentrations (Cgw).

NA = not applicable

$$C_{Rd} = C_{gw} * \left(\frac{Q_{gw}}{Q_{gw} + Q_{Ru}} \right) = C_{gw} * DF_{avg} \text{ , where } DF_{avg} = 6.03 * 10^{-6}$$

* EPD 2013. *Rules and Regulations for Water Quality Control, Chapter 391-3-6-.03*. Atlanta, Georgia. August 27, 2013. Standards considered under average river flow conditions per Chapter 4.e.iv

*[2] EPA, 2009. National Primary Drinking Water Regulations. Washington, DC. May 2009

Table 4-3: Modeled Downstream River Concentrations Under 1Q10 River Flow Conditions Compared to Water Quality Standards

Constituents of Concern	Georgia Instream Water Quality Standards (µg/L)*	National Primary Drinking Water Standards (µg/L)*[2]	Estimated Downstream River Concentrations		
			Utilizing Leading Edge C_{gw1}, C_{Rd1} (µg/L)	Utilizing Event Maximum C_{gw2}, C_{Rd2} (µg/L)	Utilizing Maximum Recorded C_{gw3}, C_{Rd3} (µg/L)
Gamma-BHC	9.50E-01	2.00E-01	1.97E-06	1.44E-05	1.09E-04

Notes:

Downstream river concentrations are based on the mixing formula below. The formula assumes that the groundwater flow discharging to the river from the entire length of the site is uniformly contaminated at each of the respective groundwater concentrations (Cgw).

$$C_{Rd} = C_{gw} * \left(\frac{Q_{gw}}{Q_{gw} + Q_{Ru}} \right) = C_{gw} * DF_{1Q10}, where\ DF_{1Q10} = 4.10 * 10^{-5}$$

* EPD 2013. *Rules and Regulations for Water Quality Control, Chapter 391-3-6-.03*. Atlanta, Georgia. August 27, 2013. Standards considered under 1Q10 river flow conditions per Chapter 4.e.ii

- N.L. NOT LOCATED

SITE FEATURES

- BULKHEAD
- NORTH AND SOUTH PARCEL DIVISION
- BAINBRIDGE PARCEL LINES
- PIER

AREAS OF CONCERN (AOC)

CURRENT AOC EXTENTS

- AOC-1 FENCELINE
- AOC-1 BOUNDARY
- AOC-2 BOUNDARY
- UNIFORM ENVIRONMENTAL COVENANT GRANITE MONUMENT

NOTES:

AERIAL PHOTO WAS PROVIDED BY GPA. ABOVE GROUND STORAGE TANKS ON GPA NORTH PARCEL AND ON AGRIUM PROPERTY, AS WELL AS THE WAREHOUSE AND OTHER BUILDINGS ON AGRIUM PROPERTY HAVE SINCE BEEN DEMOLISHED.

PROPERTY LINES PROVIDED BY GEORGIA PORTS AUTHORITY. WELL LOCATIONS PLOTTED FROM MULTIPLE SURVEYS AT SITE. GRANITE MONUMENT LOCATIONS AND AOC-2 BOUNDARY ARE PLOTTED FROM A SURVEY CONDUCTED BY MOCK SURVEYING INC. ON FEBRUARY 16, 2016.

COMMENTS:

SAMPLE COLLECTION TIME: 1158

PREPARED BY: Kenneth Rose

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.

Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

Length of tubing cut (ft.)	71
Initial tubing depth (ft.) BTOC	69
Final tubing depth (ft.) BTOC	69
Initial pump speed	8.01
Time pump speed was initialized	1102
Pump speed at flow into cylinder	8.01
Started new roll of tubing at	—
Three well volume (mL)	—

2,000 mL volume poured into bucket:

Time	1112	1120	1128	1137	1146	1153			
Cummulative Volume (mL)	2000	4000	6000	8000	10000	12,000

COMMENTS:

SAMPLE COLLECTION TIME: 1603

PREPARED BY: Kenneth Reese

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant.
Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

Length of tubing cut (ft.)	28.5
Initial tubing depth (ft.) BTOC	27
Final tubing depth (ft.) BTOC	27
Initial pump speed	6.50
Time pump speed was initialized	1522
Pump speed at flow into cylinder	6.50
Started new roll of tubing at	—
Three well volume (mL)	—

2,000 mL volume poured into bucket:

Time	1533	1544	1552						
Cummulative Volume (mL)	2000	4000	6000

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
X	Surrogate is outside control limits
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 680-122659-1

Laboratory: TestAmerica Savannah

Narrative

CASE NARRATIVE

Client: Environmental International Corporation

Project: 400007-4.5/Bainbridge, GA

Report Number: 680-122659-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

RECEIPT

The samples were received on 03/05/2016; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 0.4º C, 1.3º C and 1.4º C

PESTICIDES AND PCBS

Samples MW-1 (680-122659-1), MW-1A (680-122659-2), MW-2 (680-122659-3), MW-3 (680-122659-4), MW-4U (680-122659-5), MW-5A (680-122659-6), MW-5D (680-122659-7), MW-6 (680-122659-8), MW-7 (680-122659-9), MW-8 (680-122659-10), MW-10 (680-122659-11), MW-10 Duplicate (680-122659-12), MW-11 (680-122659-13), MW-12 (680-122659-14), MW-13 (680-122659-15), MW-14 (680-122659-16), MW-15 (680-122659-17), MW-16 (680-122659-18), MW-17 (680-122659-19), MW-18 (680-122659-20), MW-19 (680-122659-21), MW-20 (680-122659-22), MW-21 (680-122659-23), MW-22 (680-122659-24), MW-23 (680-122659-25), MW-24 (680-122659-26) and Equipment Blank (680-122659-27) were analyzed for Pesticides and PCBs in accordance with EPA SW-846 Method 8081B_8082A. The samples were prepared on 03/07/2016, 03/09/2016 and 03/10/2016 and analyzed on 03/09/2016, 03/10/2016 and 03/11/2016.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-18 (680-122659-20). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MW-7 (680-122659-9). These resutls have been reported and qualified.

Endosulfan I failed the recovery criteria low for the MS of sample MW-22MS (680-122659-24) in batch 680-424738. alpha-BHC, Endosulfan II, beta-BHC and delta-BHC failed the recovery criteria high.

Several analytes failed the recovery criteria high for the MSD of sample MW-22MSD (680-122659-24) in batch 680-424738. Heptachlor exceeded the RPD limit.

Aldrin failed the recovery criteria low for the MS of sample MW-5DMS (680-122659-7) in batch 680-424738. beta-BHC and delta-BHC failed the recovery criteria high.

beta-BHC and delta-BHC failed the recovery criteria high for the MSD of sample MW-5DMSD (680-122659-7) in batch 680-424738.

Refer to the QC report for details.

Samples MW-5A (680-122659-6)[10X], MW-5D (680-122659-7)[10X], MW-6 (680-122659-8)[10X], MW-8 (680-122659-10)[4X], MW-10 (680-122659-11)[20X], MW-10 Duplicate (680-122659-12)[20X], MW-13 (680-122659-15)[10X], MW-20 (680-122659-22)[5X], MW-21 (680-122659-23)[5X], MW-22 (680-122659-24)[40X] and MW-23 (680-122659-25)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Job ID: 680-122659-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Login Sample Receipt Checklist

Client: Environmental International Corporation

Job Number: 680-122659-1

Login Number: 122659
List Number: 1
Creator: Kicklighter, Marilyn D

List Source: TestAmerica Savannah

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

USGS Water-Year Summary 2015

02356000 FLINT RIVER AT BAINBRIDGE, GA

LOCATION - Lat 30°54'41", long 84°34'48" referenced to North American Datum of 1927, Decatur County, GA, Hydrologic Unit 03130008, on downstream side of bridge on US 27 (Business Route), 0.2 mi downstream from Seaboard Coast Line Railroad bridge, and 29.2 mi upstream from Jim Woodruff Dam, 5.19 mi upstream from confluence with Fourmile Creek, 2.37 mi downstream from confluence with Big Slough Creek, 0.6 mi northwest of Bainbridge, and at mile 29.0.

DRAINAGE AREA - 7,570 mi².

SURFACE-WATER RECORDS

PERIOD OF RECORD -
DISCHARGE: October 1907 to December 1913, October 1928 to September 1971, October 1971 to September 1996(annual peaks only), October 2001 to current year.
GAGE-HEIGHT: October 2001 to current year.
WATER VELOCITY: April 2001 to current year.

GAGE - Satellite telemetry with a water-stage recorder and an acoustic velocity meter. Datum of gage is 57.7 feet above North American Vertical Datum (NAVD) of 1988. Prior to December 31, 1913, a non-recording gage was located at same site at datum 0.3 feet higher. From October 1, 1928 to January 14, 1929, a non-recording gage was located at present site and datum. An auxiliary water-stage recorder was located at a site 6.4 miles upstream January 15, 1957 to September 1971.

COOPERATION - Georgia Department of Natural Resources, Environmental Protection Division.

REMARKS -
10/01/2013-09/30/2014: Discharge records fair, except for days of estimated discharge, which are poor. Gage-height and water velocity records are good.

10/01/2014-09/30/2015: Discharge records fair, except for days of estimated discharge, which are poor. Gage-height and water velocity records are good.

10/01/2015-01/05/2016: Discharge records fair, except for days of estimated discharge, which are poor. Gage-height and water velocity records are good.
Water velocity data represent water velocity at the downstream cross-section of the bridge with positive values in the downstream direction. Flow regulated by power plants at Flint River Reservoir since 1921, with a capacity of 7,500 acre-feet; and at Warwick Reservoir since 1930, with a capacity of about 35,000 acre-feet. Normal operation of power plants does not materially affect figures of monthly runoff.

EXTREMES OUTSIDE PERIOD OF RECORD - Maximum stage known since at least 1893, 40.9 feet, present datum, Jan. 24, 1925, discharge 101,000 cfs, from rating curve extended above 70,000 cfs on the basis of slope-conveyance studies.

EXTREMES FOR PERIOD OF RECORD - Maximum discharge recorded, 108,000 cfs, July 14, 1994; maximum gage height recorded, 37.20 feet, July 14, 1994; minimum daily discharge, 1,010 cfs, September 5, 2011.

U.S. Department of the Interior

Company History

The Georgia Gulf Sulfur manufacturing plant, in Bainbridge Georgia, was conceived and built in the late 1950's to expand Mr. R.A. Griffin's seed and chemical formulation business into the manufacture of sulfur fungicides and miticides. A plant site was purchased on Spring Creek Road, adjacent to the Texas Gulf Sulfur storage facility, at Georgia's inland port facility, on the Flint River. Production commenced in 1959 using dry bulk sulfur from the Texas Gulf Sulfur terminal. Sulfur supply was changed to molten sulfur in 1974. In 1983 a fluid sulfur production unit was added to the site, currently operating as Bainbridge Chemical Corporation.

Travel Directions:

From Interstate 10, Tallahassee FL

Exit onto U.S. 27 North from Tallahassee, Florida. When reaching Bainbridge, Georgia at the junction of U.S. 27 and U.S. 84, turn left onto U.S. 27 North / U.S. 84 West. Proceed to the first exit past the Flint River crossing and exit on State Road 253 / Spring Creek Road. Turn left and proceed one mile. Georgia Gulf Sulfur Corporation and Bainbridge Chemical Corporation are located on the right.

From Interstate 75, Valdosta GA

Exit west on U.S. 84 Valdosta, Georgia. Proceed west 82 miles to Bainbridge, Georgia. Turn left on U.S. 84 West Bypass on the east side of Bainbridge. Proceed to the first exit past the Flint River crossing and exit at State Road 253 / Spring Creek Road. Turn left and proceed on State Road 253 one mile. Georgia Gulf Sulfur Corporation and Bainbridge Chemical Corporation are located on the right.
