Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics
Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL	0.044

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

gamma-BHC (Lindane) (4)

General Statistics

Total Number of Observations	36	Number of Distinct Observations	23
Number of Detects	0	Number of Non-Detects	36
Number of Distinct Detects	0	Number of Distinct Non-Detects	23

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable gamma-BHC (Lindane) (4) was not processed!

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Adjusted Gamma UCL 6182

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% H-UCL 1192

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% KM (t) UCL 555.4

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% H-UCL 482

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Maximum	8.6	Median	2.5
SD	2.683	Std. Error of Mean	0.948
Coefficient of Variation	0.854	Skewness	1.265

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Nonparametric Distribution Free UCL Statistics
Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

Gamma Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	**2.825**

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

Gamma Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	**24.83**

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean of Logged Detects	3.392	SD of Logged Detects	0.498

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean of Logged Detects	-2.186	SD of Logged Detects	1.029

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Total Number of Observations	8	Number of Distinct Observations	8
Number of Detects	4	Number of Non-Detects	4
Number of Distinct Detects	4	Number of Distinct Non-Detects	4
Minimum Detect	0.081	Minimum Non-Detect	0.21
Maximum Detect	2.1	Maximum Non-Detect	0.5
Variance Detects	0.918	Percent Non-Detects	50%
Mean Detects	0.69	SD Detects	0.958
Median Detects	0.289	CV Detects	1.389
Skewness Detects	1.791	Kurtosis Detects	3.186
Mean of Logged Detects	-1.207	SD of Logged Detects	1.525

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.765	Shapiro Wilk GOF Test	
5% Shapiro Wilk Critical Value	0.748	Detected Data appear Normal at 5% Significance Level	
Lilliefors Test Statistic	0.337	Lilliefors GOF Test	
5% Lilliefors Critical Value	0.375	Detected Data appear Normal at 5% Significance Level	
Detected Data appear Normal at 5% Significance Level

nu hat (MLE)	5.763	nu star (bias corrected)	2.774
Mean (detects)	0.69		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.356
Maximum	2.1	Median	0.069

95% t UCL (Assumes normality)	0.0769	95% H-Stat UCL	0.117

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics
Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use
97.5% KM (Chebyshev) UCL 0.14

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Heptachlor (3)

General Statistics

Total Number of Observations	22	Number of Distinct Observations	17
Number of Detects	1	Number of Non-Detects	21
Number of Distinct Detects	1	Number of Distinct Non-Detects	17

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Heptachlor (3) was not processed!

Heptachlor (4)

General Statistics

Total Number of Observations	25	Number of Distinct Observations	17
Number of Detects	1	Number of Non-Detects	24
Number of Distinct Detects	1	Number of Distinct Non-Detects	16

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Heptachlor (4) was not processed!

Maximum	551	Median	321.5
SD	176.8	Std. Error of Mean	62.5
Coefficient of Variation	0.593	Skewness	-0.114

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Suggested UCL to Use
95% Adjusted Gamma UCL 508.5

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	3.368		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	2.657
Maximum	82	Median	0.3

D.1 Introduction

A screening level ecological risk assessment (SLERA), previously termed a preliminary risk evaluation (PRE), was initially conducted in 2007 as required under HSRA for the former Estech General Chemicals site (site) and the un-named stream to the east of the site on the CSX property. The results of the PRE were submitted in the Revised Compliance Status Report (MACTEC Engineering and Consulting, Inc., 2007). The PRE findings indicated the potential for unacceptable risk to ecological receptors from exposure to site surface soils. Exposure to the un-named stream did not present the potential for unacceptable risk to ecological receptors and additional study of the stream was not warranted. Additional ecological risk evaluation was not recommended for site surface soils because site remediation was anticipated to involve excavation, consolidation, and capping of impacted soils, which would have served to control or remove ecological exposures. The PRE results were submitted within the 2010 Voluntary Remediation Program Application for the Site (MACTEC Engineering and Consulting, Inc., 2010). The PRE was updated in 2011 in response to Georgia EPD comments on the VRP Application (MACTEC Engineering and Consulting, Inc., 2011). The updates did not change the overall conclusions of the PRE.

An updated SLERA is being submitted herein to quantify ecological exposures and address ecological risk for the site and nearby un-named stream. This updated SLERA is based on current conditions at the site and current regulatory guidance for risk assessment. The SLERA also addresses a Georgia EPD comment from 2010 on evaluating risk based on exposure domains applicable to the ecological receptors. Recent data collection at the site allows for characterization of the site based on current conditions and smaller exposure domains for the ecological receptors. The initial ecological risk evaluation was based on one exposure domain covering the entire 18 acres of the site and the adjacent CSX property and used historical data over ten years old. The updated SLERA will use more recent data and will be used to identify specific areas of the site driving risk that would require removal of soils or application of engineered exposure controls to comply with the remediation plans.

D.2 Screening Level Ecological Risk Assessment

This SLERA evaluates the potential environmental risks and/or effects associated with current site conditions and the un-named stream located on the adjacent CSX railroad property. The un-named stream located on the CSX railroad property is the discharge boundary for site groundwater. The SLERA identifies substances that might pose a hazard to ecological receptors, and evaluates the magnitude of potential adverse impacts to ecological receptors due to exposure to those substances. The methodology used in the SLERA is presented herein. The SLERA was conducted in accordance with USEPA's Region 4 Ecological Risk Assessment Supplemental Guidance (USEPA, 2018) and USEPA's Ecological Risk Assessment for Superfund: Process for Designing and Conducting Ecological Risk Assessment (ERAGS; USEPA, 1997). The SLERA consists of the following six steps:

1. Data Evaluation and COPC Selection (including identification of the risk assessment dataset and ecological screening value comparison)
2. Screening-level Problem Formulation
3. Screening-level Ecological Effects Assessment
4. Screening-level Ecological Exposure Estimate
5. Screening-level Ecological Risk Characterization
6. Identification of Uncertainties

In accordance with guidance requirements, the SLERA was designed to produce risk estimates that conservatively estimate risk. The media of concern to ecological receptors is surface soil at the site and sediment and surface water in the un-named stream located on the adjacent CSX property. Ecological receptors may contact these media directly and may be secondarily exposed to constituents through the food web (i.e., ingestion of biotic media that have accumulated constituents through direct contact with these media).

D.2.1 Data Evaluation and COPC Selection

The SLERA focused on evaluation of hazards and risks associated with previously identified four site-related metals (arsenic, copper, lead, and zinc) and thirteen pesticides.

D.2.1.1 Identification of PCOPCs

The first step of the SLERA is to select preliminary chemicals of potential concern (PCOPCs) in soil, sediment, and surface water that may affect ecological receptors by comparing the maximum detected concentration with USEPA's Region 4 media-specific ecological screening values (ESVs) (USEPA, 2018). USEPA Region 4 soil ESVs and sediment ESVs were used for soil and sediment screening, respectively. For surface water, the more conservative of the USEPA Region 4 chronic ESVs (USEPA, 2018) or the chronic Georgia Instream Water Quality Criteria (Georgia EPD 2015) were used as the surface water ESVs, per USEPA (2018) guidance. USEPA Region 4 has established ESVs based on contaminant levels associated with a low probability of unacceptable risks to ecological receptors. This approach assumes that the most sensitive receptors are those that live in direct contact with affected media and thus are exposed to contaminants through multiple pathways. Constituents with maximum detected concentrations exceeding the ESVs were selected as PCOPCs. If no PCOPCs are identified, no further evaluation is necessary.

PCOPCs were selected from the dataset in accordance with USEPA's Region 4 Ecological Risk Assessment Supplemental Guidance Interim Draft (USEPA, 2018). Per USEPA (2018) guidance, PCOPCs were selected using maximum screening hazard quotients (HQs). A maximum screening HQ was calculated using the maximum detected concentration or ½ the detection limit as a surrogate concentration (if the constituent was non-detect) of each constituent and comparing that value to the USEPA Region 4 soil ESV using the following formula:

$$Maximum\ Screening\ HQ\ = \frac{Maximum\ Detected\ Concentration\ (or\ surrogate\ concentration\ of\ {}^{1}/_{2}\ detection\ limit\ for\ non-detects)}{USEPA\ Region\ 4\ ESV}$$

USEPA (2018) guidance states that a screening HQ will determine if a constituent is a PCOPC and should be retained for further evaluation. A constituent was selected as a PCOPC if:

1. HQ ≥ 1. The maximum detected concentration was greater than or equal to the ESV.
2. The chemical was detected, but no ESV was available.
3. The chemical was not detected, but the surrogate concentration was greater than or equal to the ESV (HQ≥1).
4. The chemical was not detected, and no ESV was available.

Constituents were retained as PCOPCs if the screening HQs were equal to or greater than 1. A HQ equal to or greater than 1, the USEPA threshold value, indicates a potential for adverse effects. Those constituents without applicable screening values or appropriate surrogate screening values were retained as PCOPCs in the SLERA as a conservative measure. Furthermore, detected bioaccumulative constituents

that do not have a wildlife-based ESV were retained as PCOPCs, but on-detected bioaccumulative chemicals that do not have a wildlife-based ESV were not retained as PCOPCs, per USEPA (2018) guidance.Those constituents selected as PCOPCs based on the maximum screening were further evaluated in the refinement process of PCOPCs, per USEPA (2018) guidance (See Section 1.1.2).

Surface Soil

Surface soil samples (0 to 1 foot in depth) collected on the site in February 2018 were used for the surface soil dataset in this SLERA (refer to Attachment A-1 for the soil dataset; Figure D-1). Four site-related metals (arsenic, lead, copper, and zinc) and twelve pesticides were detected in the surface soil dataset. Methoxychlor was the only other analyzed pesticide not detected above reporting limits in surface soil. The maximum detected surface soil concentration, or if non-detect, a surrogate concentration based on the maximum detection limit, was compared to the USEPA Region 4 soil ESVs (USEPA, 2018) to generate a maximum screening HQ (Table D-1). Screening HQs equal to or greater than 1 yielded the following PCOPCs for surface soil:

Metals	
Arsenic	Lead
Copper	Zinc

Pesticides			
alpha-BHC	4,4'-DDD	Dieldrin	Heptachlor
beta-BHC	4,4'-DDE	alpha-Chlordane	Methoxychlor
gamma-BHC (lindane)	4,4'-DDT	gamma-Chlordane	Toxaphene
delta-BHC			

Sediment

Historical sediment samples (0 to 1 foot in depth) collected in 2000 and 2004 from the un-named stream on the CSX property were used for the sediment dataset in this SLERA (refer to Attachment A-2 for the sediment dataset; Figure D-1). Two site-related metals (arsenic and lead) and ten pesticides were detected in the sediment dataset. Methoxychlor and toxaphene were not detected above reporting limits in sediment. Toxaphene's reporting limit was above the sediment ESV. The maximum detected sediment concentration, or if non-detect, a surrogate concentration based on the maximum detection limit, was compared to the USEPA Region 4 sediment ESVs (USEPA, 2018) to generate a maximum screening HQ (Table D-2). Screening HQs equal to or greater than 1 yielded the following PCOPCs for sediment:

Metals	
Arsenic	Lead

Pesticides		
alpha-BHC	4,4'-DDD	Dieldrin
beta-BHC	4,4'-DDE	Chlordane
gamma-BHC (lindane)	4,4'-DDT	Heptachlor
delta-BHC		Toxaphene

Surface Water

Surface water samples collected semi-annually from 2016 through 2018 from the un-named stream on the CSX property were used for the surface water dataset in this SLERA (refer to Attachment A-3 for the surface water dataset; Figure D-1). Three site-related metals (arsenic, copper, and zinc) and four pesticides (alpha-BHC, beta-BHC, delta-BHC, and gamma-BHC [lindane]) were detected in the surface water dataset. The maximum detected surface water concentration, or if non-detect, a surrogate concentration based on half of the maximum detection limit (i.e., DDT and dieldrin), was compared to the more conservative of the USEPA Region 4 chronic ESVs (USEPA, 2018) or the chronic Georgia Instream Water Quality Criteria (Georgia EPD 2015) to generate a maximum screening HQ (Table D-3a). Hardness-dependent water quality criteria were calculated for three of the site–related metals using measured hardness data from the un-named stream (Table D-3b). Screening HQs equal to or greater than 1 yielded the following PCOPCs for surface water:

Metals	
Copper	Zinc

Pesticides	
alpha-BHC	4,4'-DDT
beta-BHC	Dieldrin
gamma-BHC (lindane)	
delta-BHC	

D.2.1.2 Refinement of PCOPCs

Those constituents selected as PCOPCs were further refined to identify chemicals of potential concern (COPCs) per the USEPA (2018) guidance. The goal of PCOPC refinement is to evaluate the conservative assumptions used in the selection of PCOPCs and determine if any of the PCOPCs would pose negligible risk if more realistic conservative assumptions were used. This helps to focus the SLERA on identifying a realistic list of COPCs that are more likely to pose risk to ecological receptors. Those constituents selected as COPCs based on the screening are then further evaluated in the SLERA using food web modeling to evaluate potential risk to ecological receptors per ERAGS (USEPA, 1997).

USEPA (2018) guidance provides refinement screening values (RSVs) for comparison to the 95 percent upper confidence limit of the arithmetic mean (95% UCL) as the exposure point concentration (EPC), instead of the maximum concentration. The 95% UCL concentrations were calculated using ProUCL 5.1 (USEPA, 2015). The soil RSVs used were the lower of the avian and mammalian ESVs provided in USEPA (2018) guidance as these receptors are the receptors of interest for the SLERA. The sediment RSVs are from the USEPA (2018) guidance. For surface water, ESVs were used as the RSVs because the values are primarily based on State water quality standards so exposure durations relevant to the numerical standard apply.

Constituents with 95% UCL concentrations exceeding the RSVs were selected as COPCs. Per USEPA (2018) guidance, COPCs were selected using 95% UCL HQs. A 95% UCL HQ was calculated by dividing the 95% UCL concentration of each constituent by the RSV. COPCs were retained if the 95% UCL HQs were equal to or greater than 1. Constituents frequently detected, bioaccumulative, and with no RSV available were

carried forward into food web modeling. Non-detect constituents were not carried forward into food web modeling. A qualitative evaluation of those constituents is provided below.

Surface Soil

Table D-4 presents the results of the refinement screening for surface soil. The four site-related metals and six pesticides were retained as COPCs in surface soil based on the 95% UCL HQs. Methoxychlor was the only non-detect pesticide in surface soil with elevated reporting limits above the ESV and RSV (Table D-1). Methoxychlor was not retained as a COPC. The SLERA focuses on the other pesticides detected in site surface soil with consideration that potential corrective action addressing other COPCs with unacceptable risk would also address methoxychlor.

Sediment

Table D-5 presents the results of the refinement screening for sediment. One site-related metal (arsenic) and nine pesticides were retained as COPCs in sediment based on the 95% UCL HQs. Toxaphene was non-detect in sediment with elevated reporting limits above the ESV and RSV (Table D-2). Toxaphene was not retained as a COPC in sediment, and it was screened out as a PCOPC in surface water. The SLERA focuses on the other pesticides detected in sediment with consideration that potential corrective action addressing other COPCs with unacceptable risk would also address toxaphene.

Surface Water

Table D-6 presents the results of the refinement screening for surface water. Two site-related metals (copper and zinc) and four pesticides were retained as COPCs in surface water based on the 95% UCL HQs. 4,4-DDT and dieldrin were non-detect in surface water with elevated reporting limits above the ESV (Table D-3). 4,4-DDT and dieldrin were not retained as COPCs in surface water. The SLERA focuses on the other four pesticides detected in surface water with consideration that potential corrective action addressing other COPCs with unacceptable risk would also address 4,4-DDT and dieldrin.

D.2.1.3 Selection of COPCs

The following constituents were retained as COPCs:

	Soil COPCs	Sediment COPCs	Surface Water COPCs
Metals	Arsenic Copper Lead Zinc	Arsenic	Copper Zinc
Pesticides	beta-BHC gamma-BHC (lindane) 4,4'-DDD 4,4'-DDE 4,4'-DDT Dieldrin	alpha-BHC beta-BHC gamma-BHC (lindane) delta-BHC 4,4'-DDD 4,4'-DDE 4,4'-DDT Dieldrin Chlordane	alpha-BHC beta-BHC gamma-BHC (lindane) delta-BHC

D.2.2 Screening-Level Problem Formulation

The screening-level problem formulation identifies ecological receptors that may be affected by COPCs at the site or in the un-named stream on the CSX property. Potential pathways of exposure, assessment endpoints, and surrogate species representative of ecological receptors were selected for evaluation in the screening-level risk characterization.

D.2.2.1 Environmental Setting

The Site is located in the Piedmont Physiographic province of north central Georgia. The site is densely vegetated. Dominant land use characteristics observed within a 0.5-mile radius of the site include railroad facilities (CSX Transportation and Norfolk Southern Railway) in the immediate vicinity of the site and heavy commercial use surrounding the area. The site has rolling topography and slopes from the southwest to the northeast. The low portion of the site is along the eastern boundary. Railroad tracks, which entirely surround the site, have been reported to prevent the flow of surface water from the site (NUS, 1988). The site supports terrestrial and semi-aquatic wildlife.

D.2.2.2 Fate and Transport Mechanisms

During problem formation, pathways for migration of a contaminant are considered for the development of a conceptual site model (USEPA, 1997). COPCs have been detected in soils and groundwater on the site at elevated concentrations. Groundwater from the site is considered to discharge to the surface water in the un-named stream, creating a potential pathway for dissolved constituent migration to surface water. Surface runoff may also contribute surface soil constituents to surface water. The ecological conceptual site model (CSM) is presented as Figure D-3. The CSM identifies potential exposure pathways, including known and/or suspected sources of contamination, release mechanisms, contaminated media, exposure routes, and receptors. The CSM includes terrestrial and avian receptors and is based on the food web model. Potentially contaminated media of ecological significance at the site include surface soil, surface water, and sediment. Ecological receptors may be exposed to contaminants directly by ingestion or absorption of these media or indirectly through the food web.

D.2.2.3 Exposure Pathways

The identification of exposure pathways is necessary for the completion of the conceptual model for a Site (USEPA, 1997b). Due to diverse life cycle characteristics, wildlife exposure to metals and pesticides at the site is species-dependent. Birds and reptiles that live in and/or forage in the stream may be exposed to constituents via direct contact and the food web. Aquatic organisms, such as fish, aquatic invertebrates, and aquatic vegetation, are more exposed to contaminants in the water column or that move through the food web than contaminants in the sediments. However, the un-named stream is located adjacent to two concrete plants with drain pipes that flow into the stream. These drains feed concrete residues from the plants and the characteristic powder has coated the bottom of the streambed and associated benthic habitat. Thus, no significant aquatic life resides in the un-named stream and aquatic life was not further addressed in this SLERA. However, terrestrial and semi-aquatic wildlife which might drink from the stream or wash food in the stream (i.e., raccoons) were quantified.

The exposure media considered for the site and un-named stream are surface soil, sediment, and/or surface water. The un-named stream located on the CSX railroad property is considered the discharge boundary for site groundwater. Groundwater discharge to surface water is assessed in the SLERA in surface water exposures. The SLERA focuses on potential exposures of terrestrial and semi-aquatic wildlife.

Terrestrial and semi-aquatic wildlife that reside and/or forage at the site and un-named stream may be exposed to constituents detected in soil, sediment, and/or surface water via direct contact (i.e., incidental ingestion or uptake through the skin) and/or through the food web. The various wildlife trophic levels present at the site are illustrated by the food web model in Figure D-4.

D.2.2.4 Assessment Endpoints

Assessment endpoints identify the overarching ecological values in need of protection (USEPA, 1997b). The assessment endpoints identified for the SLERA are intended to encompass the receptors most likely to be impacted by COPCs. Therefore, the specific assessment endpoints identified for this SLERA are:

1. Survival and reproduction of terrestrial birds that are exposed to site surface soil and surface water in the un-named stream through direct contact, incidental ingestion, and the food web
2. Survival and reproduction of terrestrial birds that are exposed to water (only) in the un-named stream through direct contact, incidental ingestion, and the food web
3. Survival and reproduction of mammals that are exposed to site surface soil and surface water/sediments in the un-named stream through direct contact, incidental ingestion, and the food web
4. Survival and reproduction of mammals that are exposed to surface water and sediments (only) in the un-named stream through direct contact, incidental ingestion, and the food web

The receptors used to represent surrogate species for assessment endpoints 1 and 2 are the northern bobwhite and, for assessment endpoints 3 and 4, are the short-tailed shrew and the raccoon. These wildlife species favor habitats consistent with conditions of the site and may potentially be found in the area. The northern bobwhite is representative of gallinaceous birds which have been observed to forage at the site. The northern bobwhite was selected as the surrogate species because it is a species known to be present at the site. The short-tailed shrew was selected as a lower trophic level surrogate species because it is a small carnivorous mammal which may forage and nest at the site. The raccoon was selected as a higher trophic level surrogate species because it is an omnivorous species known to be present at the site and known to wash its food in streams similar to the un-named stream. The life history and behavior of these species ensure a conservative estimate of risk per USEPA (1997) guidance. Exposure assumptions for each receptor are presented in Table D-7. The measurement endpoints developed using this set of surrogate receptors were daily dietary intake concentrations (representative of No Observed Adverse Effects Level [NOAEL] and Lowest Observed Adverse Effects Level [LOAEL] for survival, reproduction, and/or growth).

D.2.3 Screening-Level Ecological Effects Evaluation

The screening-level ecological effects evaluation identifies the toxicity values for use in risk calculations to estimate potential risks to ecological receptors. Toxicity reference values (TRVs) are identified as toxicological benchmarks for laboratory test species, which have been extrapolated to represent surrogate receptor species. Chronic NOAELs are the preferred toxicity values used in the SLERA. LOAEL TRVs are also included in the SLERA as an additional line of evidence when further evaluation is necessary. The TRVs for the SLERA were primarily based on USEPA (2018) guidance, citing the primary source for each value. The TRVs are based on survival, reproduction, and/or growth for mammalian and avian species.

TRVs for the receptor species are presented in Table D-8 for mammalian species and Table D-9 for avian species. These TRVs were used in the estimation of risk to receptor species arising from potential exposure to COPCs in abiotic and biotic media at the site and un-named stream.

D.2.4 Screening-Level Ecological Exposure Estimate

The screening-level ecological exposure estimate evaluates the potential pathways of exposure appropriate to the assessment endpoints and ecological receptors at the site and un-named stream. In the screening-level ecological exposure estimate, exposure assumptions are summarized to present the conservative parameters used for each surrogate species in the food web model.

Exposure assumptions for the surrogate species are identified for use in the food web model calculations to estimate risk. Typically, a SLERA is performed using conservative assumptions for exposure to COPCs (USEPA, 1997). Thus, a site foraging factor and exposure frequency are set to 1, assuming that the receptor spends its entire life and obtains 100 percent of its diet at the site. The SLERA also assumes that bioavailability of COPCs is 100 percent. Body weights, dietary compositions, water ingestion rates, and foraging ranges were based on USEPA (2018) guidance and USEPA's Wildlife Exposure Factors Handbook (1993). The food ingestion rates (on a wet weight basis) and the soil/sediment ingestion rates (on a dry weight basis) were obtained from Nagy's Food Requirements of Wild Animals: Predictive Equations for Free-living Mammals, Reptiles, and Birds (2001). These exposure assumptions are summarized in Table D-7.

Bioconcentration factors (BCFs) were used to estimate tissue concentrations for plants, soil invertebrates, birds, and small mammals. BCFs were primarily obtained from USEPA's Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities (1999). Plant BCFs were not available for most of the pesticides for vegetation. Therefore, plant BCFs were calculated using the following regression equation:

> Log BCF = 1.588 – 0.578 x log Kow (Travis and Arms, 1988), where Kow is the octanol-water partitioning coefficient

Prey item EPCs were calculated on a wet weight basis. Plant BCFs were converted to wet weight using typical percentage of solids in vegetative tissue obtained from scientific literature (USEPA, 1993). Table D-10 presents the BCFs used for plants, soil invertebrates, birds, and small mammals.

Surface water metal EPCs were converted from dissolved concentrations to total concentrations for use in the food web modeling risk estimates because ecological receptors are exposed to total concentrations. Refer to Attachment B for the conversion calculations.

Ecological exposure was evaluated using two different scenarios, depending on the receptor: 1) exposure to site surface soil and surface water and/or sediment from the un-named stream; and 2) exposure to surface water from the un-named stream and/or site surface soil. Exposure areas used for the food web modeling were based on the home ranges of the ecological receptor. The shrew's home range of one acre was used as the exposure unit for the shrew with a total of 18 exposure units evaluated at the site. Due to the larger home ranges for the raccoon and northern bobwhite, exposure was evaluated on a site-wide basis for these two receptors. In addition, exposure for the raccoon included soil and sediment incidental ingestion for scenario 1 above with 50 percent of the exposure allocated to soil and 50 percent to sediment. Table D-11 presents the soil exposure unit EPCs for the shrew, which includes the maximum detected and 95% UCL concentrations. Table D-12 presents the site wide soil, sediment, and surface water EPCs for each receptor, which include the maximum detected and 95% UCL concentrations. Attachment C presents the ProUCL inputs and outputs for the 95% UCL surface soil concentrations for the shrew by exposure unit. Site-wide soil, sediment, and surface water ProUCL inputs and outputs are presented in Attachment A. For non-detect constituents in abiotic media that require an EPC for food web modeling, the maximum reporting limit and one-half the maximum reporting limit are provided in the tables.

D.2.5 Screening-Level Ecological Risk Characterization

The screening-level ecological risk characterization integrates the results of the screening-level ecological exposure estimation and screening-level ecological effects evaluation to determine the potential risk to ecological receptors arising from potential exposure to COPCs detected at the site and un-named stream. The screening-level ecological risk calculations for wildlife were performed using the HQ method that compares exposure concentrations (e.g., maximum detected concentrations in soil) and estimated exposure levels to the analyte-specific TRVs (i.e., NOAEL). The HQ method compares the estimated exposure levels to the toxicity reference value and is expressed as:

HQ = Intake/TRV

Where: Intake = daily intake (ingestion) (milligrams per kilogram body weight per day [mg/kg bw-day])
TRV = toxicity reference value (mg/kg bw-day)

A HQ value equal to or below 1.0 is considered unlikely to cause adverse ecological effects. A HQ value greater than 1.0 generally indicates a potential for adverse ecological effects. The HQs calculated for individual constituents for each receptor were added to generate a hazard index (HI). The summation of the HQs yields a conservative estimate used to indicate whether multiple constituents at a site might pose a potential risk even when an individual COPC may not. A HQ or HI greater than 1.0 generally indicates a potential for adverse effects. In choosing to add HQs for individual COPCs, it is assumed that the effects of the individual chemicals are additive. The following subsections discuss the risk estimates. Tables D-13 through D-15 present the NOAEL risk estimates based on maximum EPCs presented on Tables D-11 and D-12. Table D-19 presents a summary of the NOAEL risk estimates.

D.2.5.1 Screening-Level Ecological Risk Characterization - NOAEL Analysis

The NOAEL HQs and HIs for the representative receptors are summarized below.

Short-tailed Shrew

Table D-13a provides the risk calculations for the short-tailed shrew exposed to site surface soils and surface water from the un-named stream, and Table D-13b presents potential risks for the short-tailed shrew exposed to the un-named stream only. NOAEL HIs for the short-tailed shrew from exposure to COPCs detected in surface soil and surface water ranged from 11 (exposure unit S14) to 4,100 (exposure unit S09) across the site. HQs were above 1 for the four site-related metals and eight pesticides. Risk drivers across the site were primarily lead, 4,4-DDT, and dieldrin. The NOAEL HI for the short-tailed shrew exposed to surface water only from the un-named stream is 0.098. Thus, there is the potential for unacceptable risk for the short-tailed shrew across the site associated with surface soil exposure. Surface water exposure to COPCs in the un-named stream does not pose unacceptable risk to small terrestrial mammals.

Raccoon

Table D-14a provides the risk calculations for the raccoon exposed to site surface soils and surface water and sediments from the un-named stream, and Table D-14b presents potential risks for the raccoon exposed to surface water and sediments from the un-named stream only. The NOAEL HI for the raccoon from exposure to COPCs detected in surface soil, surface water, and sediment was 855. HQs were above 1 for the four site-related metals and five pesticides. Risk drivers were lead, 4,4-DDT, and dieldrin. The

NOAEL HI for the raccoon exposed to surface water and sediment only from the un-named stream is 0.22. Thus, there is the potential for unacceptable risk for the raccoon associated with surface soil exposure. Surface water and sediment exposure to COPCs in the un-named stream do not pose unacceptable risk to semi-aquatic omnivorous mammals.

Northern Bobwhite

Table D-15a provides the risk calculations for the northern bobwhite exposed to site surface soils and surface water from the un-named stream, and Table D-15b presents potential risks for the northern bobwhite exposed to the un-named stream only. The NOAEL HI for the northern bobwhite from exposure to COPCs detected in surface soil and surface water was 1,100. HQs were above 1 for the four site-related metals and five pesticides. Risk drivers were lead, 4,4-DDT, and dieldrin. The NOAEL HI for the northern bobwhite exposed to surface water only from the un-named stream is 0.0085. Thus, there is the potential for unacceptable risk for the northern bobwhite associated with surface soil exposure. Surface water exposure to COPCs in the un-named stream does not pose unacceptable risk to terrestrial birds.

D.2.5.2 Refined Ecological Risk Characterization - LOAEL Analysis

HQs based on LOAEL TRVs can be calculated as additional lines of evidence for the risk manager when further evaluation is necessary based on NOAEL-based TRVs in the SLERA. Thus, LOAEL HQs and HIs were calculated to provide additional information to risk managers for determining whether there will be unacceptable risk once a site specific evaluation is performed. In this case, the addition of the LOAEL risk characterization is beneficial to the risk managers' decision as to whether further action or a more formal ERA should be considered. The LOAEL risk characterization was included to evaluate a more realistic scenario using site home ranges for the receptors evaluated. The short-tailed shrew was quantified on a one acre basis while the raccoon and the bob-white quail were quantified on a site wide basis due to larger home ranges for these receptors.

The LOAEL HQs/HIs were calculated using LOAEL TRVs and the 95% UCL concentrations (calculated using ProUCL 5.1.002; USEPA, 2015) as the EPCs for each COPC with a NOAEL HQ ≥1, where applicable. The 95% UCL concentrations used in the LOAEL risk estimates are presented on Tables D-11 and D-12. Tables D-16 through D-18 present the LOAEL risk estimates. Table D-19 presents a summary of the LOAEL risk estimates.

The resultant LOAEL HQs and HIs for the representative receptors are summarized below.

Short-tailed shrew

Table D-16 provides the risk calculations for the short-tailed shrew exposed to site surface soils and surface water from the un-named stream. LOAEL HIs for the short-tailed shrew from exposure to COPCs detected in surface soil and surface water ranged from 0.78 (exposure unit S14) to 127 (exposure unit S09) across the site. HQs were above 1 for the three site-related metals and five pesticides. Primary risk drivers included arsenic (exposure units S01, S02, S04, S06, S12, and S15), beta-BHC (exposure units S02 and S07), 4,4-DDT (exposure units S02, S07, S09, S11, S13, and S18), dieldrin (exposure units S07 and S16), lead (exposure units S03, S15, and S16), and zinc (exposure units S06 and S08). Thus, there is the potential for unacceptable risk for the short-tailed shrew associated with surface soil exposure.

Raccoon

Table D-17 provides the risk calculations for the raccoon exposed to site-wide surface soils and surface water and sediments from the un-named stream. The LOAEL HI for the raccoon from exposure to COPCs

detected in surface soil, surface water, and sediment was 1.3. None of COPC HQs were above a HQ of 1; however, the risk drivers were 4,4-DDT (HQ of 0.74) and arsenic (HQ of 0.26) which was primarily driven by surface soil exposure. Thus, potential site-wide surface soil exposure poses a low to borderline level of risk to raccoons.

Northern Bobwhite

Table D-18 provides the risk calculations for the northern bobwhite exposed to site-wide surface soils and surface water from the un-named stream. The LOAEL HI for the northern bobwhite from exposure to COPCs detected in surface soil and surface water was 5.4. The primary risk drivers were lead (HQ of 2.9), 4,4-DDT (HQ of 1.3), and arsenic (HQ of 0.51). Thus, there is the potential for unacceptable risk for the northern bobwhite associated with site-wide surface soil exposure.

D.2.5.3 Risk Summary

NOAEL and LOAEL HIs were above 1 for the three receptors evaluated due to surface soil exposure. NOAEL risk drivers included the four site-related metals and eight pesticides. Primary LOAEL risk drivers for the shrew included arsenic, beta-BHC, 4,4-DDT, dieldrin, lead, and zinc based on 1-acre soil exposure units. LOAEL risk drivers for the raccoon and bobwhite included arsenic, lead, and 4,4-DDT based on site-wide soil exposure but only DDT exceeded an HQ of 1 and the others were only near on HQ of 1 which contributed to additive risk. There is the potential for unacceptable risk for terrestrial mammals, terrestrial birds, and semi-aquatic mammals exposed to site surface soil. Surface water and/or sediment exposure to COPCs in the un-named stream do not pose unacceptable risk to ecological receptors. Further evaluation of ecological exposure to the un-named steam is not warranted. However, based on the NOAEL and LOAEL HIs for site surface soil exposure, calculation of preliminary remedial goals (PRGs) for site surface soils are necessary.

D.2.6 Identification of Uncertainties

The SLERA is designed to be conservative to assure that no constituents that might adversely impact ecological receptors will be eliminated in the screening analysis. The screening values used in this SLERA are designated to be conservative and screen out only those substances for which there is little probability of posing a hazard to ecological receptors. Therefore, HQs and HIs for constituents below 1 indicate no unacceptable risk to the ecological receptors. However, because of the conservatism built into the derivation of TRVs and exposure estimates, HQs above 1 do not necessarily mean that ecological receptors are at risk of ecologically significant population level adverse effects. Key uncertainties associated with this SLERA that may have the most impact on the results of the SLERA are the following:

- ***Sediment data included in SLERA*** – Sediment data collected in 2000 and 2004 were available for use in the SLERA. Use of historical sediment data to estimate exposure under current conditions may result in either overestimation or underestimation of risk.
- ***Non-detect constituents*** – EPCs used for non-detect COPCs were the maximum reporting limit in NOAEL-based risk calculations and one-half the maximum reporting limit for LOAEL-based risk calculations. Use of these values for non-detect COPCs may overestimate risk for those COPCs.
- ***Intraspecies extrapolation*** – Species differ with respect to absorption, metabolism, distribution, and excretion of constituents. The body weight scaling used to extrapolate between species assumes that an organism's ability to metabolize COPCs is inversely related to body size. The need to extrapolate between species may result in either overestimation or underestimation of risk.

- ***Use of a NOAEL as the toxicological benchmark*** – The NOAEL is used as the toxicological benchmark in the SLERA and is expected to result in an overestimation of risk.
- ***Ecotoxicity data used for TRV calculation*** – Toxicity data used to calculate a TRV consisted of available NOAELs and LOAELs reported in literature and are not site-specific. The use of these values is expected to have the potential to result in an underestimate or overestimation of risk.
- ***Exposure assumptions*** – In the SLERA, a site foraging factor and exposure frequency are set to 1, assuming that the receptor spends its entire life at the site and obtains 100 percent of its diet at the site. The SLERA also assumes that bioavailability of COPCs is 100 percent. These conservative assumptions may overestimate risk.
- ***Use of maximum concentration*** – Maximum detected concentrations were used in the ingestion calculations with NOAEL TRVs. The use of maximum detected concentrations is expected to result in an overestimation of risk.
- ***Calculations of constituent concentrations in biotic media*** – Bioconcentration factors from scientific literature were used to derive plant, soil invertebrate, bird, and small mammal tissue concentrations for COPCs. The use of empirical data from controlled laboratory tests may underestimate or overestimate risk. Surrogate BCFs were used for those constituents without available data. Use of surrogate BCFs may underestimate or overestimate risk.
- ***Additive HI calculation*** - The HIs were calculated by adding chemical-specific HQs, assuming the additive effect of the individual chemicals. Metals and pesticides have distinct modes of toxicity and effects endpoints; therefore, an assumption of additive effects may overestimate the total risk to mammals and birds.

D.2.7 SLERA Conclusions

This SLERA evaluates the potential environmental risks and/or effects associated with current site conditions and the un-named stream located on the adjacent CSX railroad property. The un-named stream located on the CSX railroad property is the discharge boundary for site groundwater. The SLERA identifies substances that might pose a hazard to ecological receptors, and evaluates the magnitude of potential adverse impacts to ecological receptors due to exposure to those substances. The SLERA focused on evaluation of hazards and risks associated with previously identified four site-related metals (arsenic, copper, lead, and zinc) and thirteen pesticides from the PRE.

Ecological exposure was evaluated using two different scenarios, depending on the receptor: 1) exposure to site surface soil and surface water and/or sediment from the un-named stream; and 2) exposure to surface water from the un-named stream and/or site surface soil. In addition, exposure areas used for the food web modeling were based on the home ranges of the ecological receptor. The shrew's home range of one acre was used as the exposure unit for the shrew with a total of 18 exposure units evaluated at the site. Due to the larger home ranges for the raccoon and northern bobwhite, exposure was evaluated on a site-wide basis for these two receptors. NOAEL and LOAEL HIs were above 1 for the short-tailed shrew, raccoon, and northern bobwhite due to surface soil exposure. NOAEL risk drivers included the four site-related metals and eight pesticides. Primary LOAEL risk drivers for the shrew included arsenic, beta-BHC, 4,4-DDT, dieldrin, lead, and zinc based on 1-acre soil exposure units. LOAEL risk drivers for the raccoon and bobwhite included arsenic, lead, and 4,4-DDT based on site-wide soil exposure; however, only DDT exceeded an HQ of 1 for these two receptors. There is the potential for unacceptable risk for terrestrial mammals, terrestrial birds, and semi-aquatic mammals exposed to site surface soil. Surface water and/or sediment exposure to COPCs in the un-named stream do not pose unacceptable risk for ecological receptors. Further evaluation of ecological exposure to the un-named steam is not warranted. However,

based on the NOAEL and LOAEL HIs for site surface soil exposure, calculation of preliminary remedial goals (PRGs) for site surface soils are necessary.

D.3 Preliminary Remedial Goal Development

Ecological risk-based PRGs for surface soil were developed for the site to facilitate planning of corrective actions. The ecological PRGs were calculated to represent acceptable exposure-point concentration estimates for representative ecological receptors to each COPC with LOAEL-based unacceptable risk identified in the SLERA. PRGs for the protection of wildlife were compiled from the food web modeling by back-calculating to obtain the surface soil concentrations representing a HQ of 1 for the NOAEL and LOAEL TRVS for those COPCs posing unacceptable risk, per USEPA Region 4 guidance (USEPA, 2018). PRGs were calculated for those COPCs with LOAEL-based HQs above 1 and for those COPCs that are primary contributors to an overall LOAEL-based HI above 1.

Table D-20 presents the surface soil PRG calculations for the short-tailed shrew, raccoon, and northern bobwhite. Surface soil PRGS were calculated for 1-acre soil exposure units based on the shrew and for site-wide soil exposure based on the raccoon and northern bobwhite.

Ecological PRGs based on 1-acre surface soil exposure units for the shrew were developed for three site-related metals (arsenic, lead, and zinc) and five pesticides (beta-BHC, 4,4-DDD, 4,4-DDE, 4,4-DDT, and dieldrin). The 1-acre soil exposure unit NOAEL- to LOAEL-based PRG range for the shrew are as follows:

- Arsenic – 32 to 139 mg/kg
- Lead – 334 to 5,692 mg/kg
- Zinc – 548 to 2,170 mg/kg
- beta-BHC – 1.2 to 5.9 mg/kg
- DDT and metabolites – 0.49 to 15 mg/kg
- Dieldrin – 0.045 to 3.8 mg/kg

Ecological PRGs based on site-wide surface soil exposure for the raccoon and northern bobwhite were developed for arsenic, lead, and 4,4-DDT. The raccoon only showed risk for arsenic and DDT. The northern bobwhite PRGs were the lower of the two site-wide receptors (presented below). The site-wide soil NOAEL- to LOAEL-based PRG range protective of both the raccoon and the Northern bobwhite are as follows:

- Arsenic – 159 to 319 mg/kg
- Lead – 152 to 1,051 mg/kg
- DDT – 3.1 to 48 mg/kg

Comparison of site soil concentrations to the LOAEL PRGs would require corrective action to be protective of ecological receptors. Sampling points associated with higher concentrations of ecological COPCs were contributing to the majority of the potential ecological risks. This step was accomplished by sorting the site-wide soil data set from low to high concentrations. The high concentrations were systematically removed and UCLs were recalculated repeatedly until the UCL was less than the LOAEL PRG (see Attachment D-1).

Systematic removal of higher concentrations on a 1-acre soil exposure unit basis is confounded by the number of samples located in each given exposure unit (average of 8 sampling points per exposure unit). Potential reductions in sample size may not provide a representative UCL concentration for the exposure

unit. Determination of site soils requiring corrective action based on 1-acre soil exposure units for the shrew was achieved by identifying sampling points with one or more COPC concentrations exceeding respective COPC LOAEL PRGs. Identified sampling points were excluded from subsequent UCL calculations to confirm that the estimated post corrective action soil EPCs were less than respective COPC LOAEL PRGs (see Attachment D-2).

No corrective action is needed regarding site-wide surface soil COPC exposures for the raccoon. Current site-wide surface soil arsenic and DDT EPCs are below respective LOAEL PRGs (see Tables D-12 and D-20).

Corrective action to address site-wide exposure to COPCs for the Northern bobwhite is needed to reduce site-wide surface soil UCL concentrations for lead and 4,4'-DDT below the site-wide LOAEL PRGs as illustrated in Figure D-5.

- Lead-related corrective action is needed for 15 sampling points to achieve a site-wide surface soil lead UCL below the respective LOAEL PRG.
- DDT-related corrective action is needed for only one sampling point (C20) to achieve a site-wide surface soil DDT UCL below the respective LOAEL PRG.

Corrective action to address 1-acre surface soil exposure units for the short-tailed shrew is needed to reduce surface soil UCL concentrations for several metals and pesticides to concentrations below the 1-acre soil exposure unit LOAEL PRGs as illustrated in Figure D-6.

- Arsenic-related corrective action is needed for 34 sampling points across 10 exposure units.
- Lead-related corrective action is needed for 11 sampling points across 7 exposure units.
- Zinc-related corrective action is needed for 5 sampling points across 4 exposure units.
- Beta-BHC-related corrective action is needed for 3 sampling points across 3 exposure units.
- DDT-related corrective action is needed for 13 sampling points across 9 exposure units.
- DDD-related corrective action is needed for 2 sampling points across 2 exposure units.
- DDE-related corrective action is needed for 1 sampling point in 1 exposure unit.
- Dieldrin-related corrective action is needed for 8 sampling points across 6 exposure units.
- Corrective action for exposure units S07, S08, and S13 are limited to one sampling point per exposure unit (D17, E15, and E25; respectively).
- Exposure units S05, S10, S14, and S17 do not require corrective action.

A summary of the estimated post corrective action soil EPCs based on 1-acre surface soil exposure units for the shrew and site-wide exposure for the Northern bobwhite is provided in Table D-21.

If corrective action is undertaken for human health related risk (See Appendix C), then the corrective action footprint would address site-wide risk for the Northern bobwhite If corrective action is undertaken for human health related risk and expanded to include six additional sampling points (A22, B23, C25, C28, E15, and F31), then the footprint would address site-related risk for the short-tailed shrew and Northern bobwhite (See Figures D-5, D-6, and Appendix C Figure HH-2).

(a) Includes soil samples (0' to 1') collected in 2018.
(b) Range of reporting limits for non-detect samples.
(c) USEPA Region 4 ERA Supplemental Guidance; Table 3 Soil Ecological Screening Values (ESVs) [USEPA, 2018].
(d) Hazard Quotient (HQ) = maximum detected concentration (if non-detect, a surrogate concentration based on one-half the detection limit) / Region 4 ESV for soil
(e) Frequency of detected concentrations exceeding ESV includes detected concentrations only.
(f) Frequency of concentrations exceeding ESV includes detected concentrations and reporting limits for non-detect concentrations.
(g) ESV is for DDD/DDE/DDT (total).
(h) One-half the maximum reporting limit used to calculate screening HQs for non-detect constituents.

Prepared By/Date: LO 05/03/18
Checked By/Date: NSR 06/05/18

Bolded rows indicate constituents selected as PCOPCs.
mg/kg = milligrams per kilogram
PCOPC = Preliminary Chemical of Potential Concern
ESV = Ecological Screening Value
HQ = Hazard Quotient
MDC = Maximum Detected Concentration
NA = Not Applicable

Basis for PCOPC Selection:
(1) Maximum detected concentration exceeds ESV.
(2) Constituent is detected, but no ESV is available.
(3) Constituent is not detected, but the surrogate concentration (i.e., one-half the maximum detection limit) is greater than the ESV. Constituent is bioaccumulative and has wildlife ESVs available.

Notes:
(a) Includes 2016-2018 surface water samples from five monitoring events.
(b) Range of reporting limits for non-detect samples.
(c) USEPA Region 4 ERA Supplemental Guidance; Table 1a Freshwater Ecological Screening Values (ESVs) for chronic exposure (USEPA, 2018).
(d) Georgia Administrative Code Rule 391-3-6-.03 (5)(e)(i-iii) Water Use Classifications and Water Quality Standards of the Rules and Regulations for Water Quality Control (2015).
(e) Site-specific ESV calculated for hardness-dependent metals. See Table D-3b.
(f) Hazard Quotient (HQ) = maximum detected concentration (if non-detect, a surrogate concentration based on one-half the detection limit) / Region 4 ESV
(g) Frequency of detected concentrations exceeding ESV includes detected concentrations only.
(h) Frequency of concentrations exceeding ESV includes detected concentrations and reporting limits for non-detect concentrations.
(i) One-half the maximum detection limit used to calculate screening HQs for non-detect constituents.

Prepared By/Date: LO 06/19/2018
Checked By/Date: IMR 06/21/2018

Bolded constituents selected as COPCs.
µg/L = micrograms per liter
PCOPC = Preliminary Chemical of Potential Concern
ESV = Ecological Screening Value
HQ = Hazard Quotient
MDC = Maximum Detected Concentration
NA = Not Applicable
aq = Protective of aquatic life (does not account for bioaccumulation in upper trophic levels)
aqwl = Aquatic life and wildlife based criterion (bioaccumulative constituent)

Basis for PCOPC Selection:
(1) Maximum detected concentration exceeds ESV.
(2) Constituent is detected, but no ESV is available.
(3) Constituent is not detected, but the surrogate concentration (i.e., one-half the maximum detection limit) is greater than the ESV.
(4) Constituent is not detected and the surrogate concentration (i.e., one-half the maximum detection limit) is less than the ESV.
(5) Maximum detected concentration is less than ESV.
(6) Per Region 4 guidance (USEPA, 2018), non-detected bioaccumulative chemicals that do not have a wildlife-based ESV are not retained as PCOPCs.

Table D-3b
Calculation of National Recommended Water Quality Criteria for Select Hardness-Dependent Metals
Former Estech Chemicals Site
Atlanta, GA

Parameter	USEPA Formula for Determining Hardness-Dependent CCC (µg/L)[a, b]	Freshwater Conversion Factor (CF)[a, b]	Hardness (mg/L)[c]	CCC for Dissolved Metals (µg/L)
Copper	$e^{[0.8545(ln\ hardness)]-1.702} * CF$	0.96	250	19.6
Lead	$e^{[1.273(ln\ hardness)]-4.705} * CF$	1.46203-[(*ln* hardness)(0.145712)]	250	6.72
Zinc	$e^{[0.8473(ln\ hardness)]+0.884} * CF$	0.986	250	257

Notes:

Notes:
(a) Includes soil samples (0' to 1') collected in 2018.
(b) USEPA Region 4 ERA Supplemental Guidance; Table 3 Soil Ecological Screening Values (2018). RSV is the lower of the avian and mammalian ESVs.
(c) Max. Hazard Quotient (HQ) = maximum detected concentration (if non-detect, a surrogate concentration based on one-half the detection limit) / Region 4 RSV for soil
(d) UCL Hazard Quotient (HQ) = 95% UCL concentration / Region 4 RSV for soil

Prepared By/Date: LO 06/12/18
Checked By/Date: NSR 06/13/18

Bolded rows indicate constituents selected as COPCs.
mg/kg = milligrams per kilogram
COPC = Chemical of Potential Concern
ESV = Ecological Screening Value
RSV = Refined Screening Value
HQ = Hazard Quotient
NA = Not Applicable
A = Avian
M = Mammalian
surr = Surrogate RSV used

Basis for COPC Selection:
(1) Constituent was frequently detected and 95% UCL HQ was greater than 1.
(2) 95% UCL HQ was less than 1.
(3) Constituent is a member of a class of compounds. The total concentration is screened against the RSV for the total compound in that class.
(4) Constituent was not detected in any sample. Qualitative evaluation conducted in SLERA.

Notes:
(a) Includes 2000 and 2004 sediment samples.
(b) USEPA Region 4 ERA Supplemental Guidance; Table 2a Freshwater Sediment Ecological Refinement Screening Values (RSVs) [USEPA, 2018].
(c) Max. Hazard Quotient (HQ) = maximum detected concentration (if non-detect, a surrogate concentration based on one-half the detection limit) / Region 4 RSV for sediment
(d) UCL Hazard Quotient (HQ) = 95% UCL concentration / Region 4 RSV for sediment
(e) One-half the maximum detection limit used to calculate screening HQ for non-detect constituent.

Prepared By/Date: LO 06/12/18
Checked By/Date: NSR 06/13/18

Bolded rows indicate constituents selected as COPCs.
mg/kg = milligrams per kilogram
COPC = Chemical of Potential Concern
ESV = Ecological Screening Value
RSV = Refined Screening Value
HQ = Hazard Quotient
NA = Not Applicable
surr = Surrogate RSV used
aq = Aquatic life criteria (bioaccumulative constituent)
wl = Wildlife based criteria (bioaccumulative constituent)
aqwl = Aquatic life and wildlife based criterion (bioaccumulative constituent)

Basis for PCOPC Selection:
(1) Constituent was frequently detected and 95% UCL HQ was greater than 1.
(2) 95% UCL HQ was less than 1.
(3) 95% UCL HQ was greater than 1 for the RSV protective of aquatic life (bioaccumulative constituent).
(4) Constituent was not detected in any sample. Qualitative evaluation conducted in SLERA.

Table D-6
Refinement of Ecological Chemicals of Potential Concern (COPCs) in Surface Water
Former Estech Chemicals Site
Atlanta, GA

Constituent	Frequency of Detection [a]	Maximum Detected Concentration [a]	Mean Detected Concentration [a]	Applicable Surface Water ESVs [b]	Number of Detected Concentrations Exceeding ESV	Max. Notes:
(a) Includes 2016-2018 surface water samples from five monitoring events.
(b) ESVs used in refinement of COPCs because values are primarily based on State water quality standards so exposure durations relevant to the numerical standard apply.
(c) USEPA Region 4 ERA Supplemental Guidance; Table 1a Freshwater Ecological Screening Values (ESVs) for chronic exposure (USEPA, 2018).
(d) Georgia Administrative Code Rule 391-3-6-.03 (5)(e)(i-iii) Water Use Classifications and Water Quality Standards of the Rules and Regulations for Water Quality Control (2018).
(e) Site-specific ESV calculated for hardness-dependent metals. See Table X.
(f) Max. Hazard Quotient (HQ) = maximum detected concentration (if non-detect, a surrogate concentration based on one-half the detection limit) / Region 4 ESV
(g) Frequency of concentrations exceeding ESV includes detected concentrations and reporting limits for non-detect concentrations.
(h) UCL Hazard Quotient (HQ) = 95% UCL concentration / Region 4 ESV
(i) One-half the maximum detection limit used to calculate screening HQs for non-detect constituents.

Prepared By/Date: LO 06/25/2018
Checked By/Date: IMR 06/25/2018

Bolded constituents selected as COPCs.
mg/L = micrograms per liter
COPC = Chemical of Potential Concern
ESV = Ecological Screening Value
HQ = Hazard Quotient
NA = Not Applicable
aq = Protective of aquatic life (does not account for bioaccumulation in upper trophic levels)
aqwl = Aquatic life and wildlife based criterion (bioaccumulative constituent)

Basis for COPC Selection:
(1) Constituent was frequently detected and 95% UCL HQ was greater than 1.
(2) Constituent was not detected in any sample. Qualitative evaluation conducted in SLERA.
(3) Constituent is frequently detected, is bioacummulative, and no ESV is available.

Table D-11
Summary of Surficial Soil[1] EPCs by Exposure Unit for the Short-tailed Shrew
Screening Level Ecological Risk Assessment
Former Estech Chemicals Site
Atlanta, GA

Ecological Receptor	COPC	Exposure Area	Maximum Soil Concentration[2] (mg/kg, dw)	95% UCL Soil Concentration[3] (mg/kg, dw)	95% UCL Statistic Used

Notes:

Prepared by: LO 06/04/2018
Checked by: IMR 06/19/2018

1. Surficial soil samples collected from 0 to 1-feet below ground surface; February 2018
2. For non-detect COPCs, the maximum reporting limit was used for the maximum concentration.
3. For non-detect COPCs, 1/2 the maximum reporting limit (1/2 Max RL) was used for the EPC.
4. ProUCL recommended UCL exceeds maximum.
5. ProUCL recommends to avoid use of H-statistics based 95% UCLs; nonparameteric methods are prefered.
6. For COPCs with < 4 detections, the maximum detected concentration was used for the EPC.

Indicates COPC reported as non-detect for medium.

Abbreviations:
mg/kg, dw = milligrams per kilogram, dry weight
EPC = exposure point concentration
95% UCL = 95% upper confidence limit

Table D-12

Notes:

Prepared by: LO 06/04/2018
Checked by: IMR 06/19/2018

1. Surficial soil samples collected from 0 to 1-feet below ground surface; February 2018.
2. Surface water samples collected in 2016-2018.
3. Sediment samples collected in 2000 and 2004.
4. For non-detect COPCs, the maximum reporting limit was used for the maximum concentration.
5. For non-detect COPCs, 1/2 the maximum reporting limit (1/2 Max RL) was used for the EPC.
6. ProUCL suggested H-statistic based UCL (computed for historical reasons only), but recommends the use of nonparameteric based UCLs instead.
7. ProUCL recommended UCL exceeds maximum.
8. For COPCs with < 4 detections, the maximum detected concentration was used for the EPC.
9. Total surface water metals concentrations calculated from dissolved concentrations; see Table X.

Indicates COPC reported as non-detect for medium.

Abbreviations:
mg/kg, dw = milligrams per kilogram, dry weight
mg/L = milligrams per liter
EPC = exposure point concentration
95% UCL = 95% upper confidence limit

4,4'-DDE	0.15	4.6	0.49	**15**
4,4'-DDT	0.15	4.6	0.49	**15**
Dieldrin	0.015	1.3	0.045	**3.8**
Site-Wide Mammal PRGs - Racoon[(a,b)]				
Metals				
Arsenic	1.0	4.6	128	559
Pesticides				
4,4'-DDT	0.15	4.6	2.5	80
Site-Wide Avian PRGs - Northern Bobwhite[(a,c,d)]				
Metals				
Arsenic	2.2	4.5	159	**319**
Lead	1.6	11	152	**1,051**
Pesticides				
4,4'-DDT	0.23	3.5	3.1	**48**

Notes:
PRGs are calculated for those COPCs with LOAEL HQs above 1, unless otherwise noted.
Bolded PRGs used in comparison to 1-acre exposure area or site-wide surface soil 95% UCL concentrations.
(a) PRG for mammals/birds:

Prepared By/Date: LO 07/25/18
Checked By/Date: IMR 07/25/18

$$PRG\ (mg/kg) = \frac{(TRV*THQ)}{[SFF*EF*[(NIR_F*[(BCF_I*P_I)+(BCF_V*P_V)+(BCF_M*P_M)+(BCF_B*P_B)])+(NIR_S*P_S)]}$$

Where:	Shrew	Racoon	Bobwhite
SFF = Site Foraging Frequency	1	1	1
NIR_F = Normalized Food Ingestion Rate (kg/kg-bw-d) wet wt.	0.30	0.093	0.38
NIR_S = Normalized Soil/Sediment Ingestion Rate (kg/kg-bw-d) dry wt.	0.18	0.030	0.051
EF = Exposure Frequency (unitless)	1	1	1
THQ = Target Hazard Quotient	1	1	1
P_S = Proportion of Incidential Soil/Sediment Ingestion (unitless)	0.037	0.094	0.093
P_I = Proportion of Diet Comprised of Invertebrates/Insects (unitless)	0.78	0.47	0.14
P_v = Proportion of Diet Comprised of Vegetation (unitless)	0.14	0.50	0.86
P_M = Proportion of Diet Comprised of Mammals (unitless)	0.08	0	0
P_B = Proportion of Diet Comprised of Birds (unitless)	0	0.03	0

(b) Although arsenic and 4,4-DDT LOAEL HQs were below 1 for the raccoon, PRGs were calculated because they are primary contributors to the overall LOAEL HI above 1.
(c) Although arsenic and lead LOAEL HQs were below 1 for the northern bobwhite, PRGs were calculated because they are primary contributors to the overall LOAEL HI above 1.
(d) The lower of the site-wide PRGs for the raccoon or bobwhite were used in the comparison to site-wide surface soil 95% UCL concentrations.
NOAEL = No Observable Adverse Effects Level
LOAEL = Lowest Observable Adverse Effects Level
TRV = Toxicity Reference Value
PRG = Preliminary Remedial Goal
mg/kg = milligrams per kilogram
mg/kg-bw-d = milligrams per kilogram body weight per day

Prepared By/Date: IMR 06/26/18
Checked By/Date: NSR 06/28/18

Table D-21
Comparison of Post Corrective Action Surface Soil Exposure Point Concentrations to Preliminary Remediation Goals
Former Estech Chemical Site
Atlanta, GA

Receptor	Exposure Unit	Constituent Group	Constituent	Post Corrective Action EPC[(a)]	Post Corrective Action EPC Statistic	LOAEL PRG[(b,c)]
Racoon	Site-wide	Existing surface soil EPCs below respective LOAEL PRGs				
Northern Bobwhite	Site-wide	Metals	Lead	1,005	95% Chebyshev (Mean, Sd) UCL	1,051
		Pesticides	4,4'-DDT	40	95% KM H-UCL	48

Notes:

a) Exposure point concentrations based on cumulative remaining soil sampling locations. Select soil samples removed to achive a 95% upper confidence limit of the mean (UCL) or a maximum detected concentration below respective lowest adverse effect level (LOAEL) preliminary remedial goals (PRGs). Units in milligram per kilogram (mg/kg).

b) Refer to Table D-20 for additional details on PRG calculations; units in mg/kg

c) COPCs with current EPCs less than applicable respective LOAEL PRGs for a given receptor and exposure unit are not presented.

d) No detected concentrations in remaining soil sample locations.

e) ProUCL suggested UCL exceeds maximum detected concentration.

f) For constituents with < 4 detections, the maximum detected concentration was used for the EPC.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL	0.0497

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Methoxychlor

General Statistics

Total Number of Observations	144	Number of Distinct Observations	55
Number of Detects	0	Number of Non-Detects	144
Number of Distinct Detects	0	Number of Distinct Non-Detects	55

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Methoxychlor was not processed!

Suggested UCL to Use

95% H-UCL 57.03

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL 0.185

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Number of Detects	1	Number of Non-Detects	5
Number of Distinct Detects	1	Number of Distinct Non-Detects	2

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Heptachlor was not processed!

Methoxychlor

General Statistics

Total Number of Observations	6	Number of Distinct Observations	3
Number of Detects	0	Number of Non-Detects	6
Number of Distinct Detects	0	Number of Distinct Non-Detects	3

Attachment A-2c
ProUCL Output for Sitewide Pesticides in Sediment

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Methoxychlor was not processed!

5% A-D Critical Value	0.817	Data Not Gamma Distributed at 5% Significance Level	
K-S Test Statistic	0.277	**Kolmogorov-Smirnov Gamma GOF Test**	
5% K-S Critical Value	0.148	Data Not Gamma Distributed at 5% Significance Level	

Data Not Gamma Distributed at 5% Significance Level

Gamma Statistics

k hat (MLE)	0.484	k star (bias corrected MLE)	0.464
Theta hat (MLE)	262.9	Theta star (bias corrected MLE)	274
nu hat (MLE)	38.71	nu star (bias corrected)	37.14
MLE Mean (bias corrected)	127.2	MLE Sd (bias corrected)	186.7
		Approximate Chi Square Value (0.05)	24.19
Adjusted Level of Significance	0.044	Adjusted Chi Square Value	23.79

Attachment A-3b
ProUCL Output for Sitewide Metals in Surface Water

Assuming Gamma Distribution

95% Approximate Gamma UCL (use when n>=50))	195.3	95% Adjusted Gamma UCL (use when n<50)	198.5

Lognormal GOF Test

Shapiro Wilk Test Statistic	0.877	**Shapiro Wilk Lognormal GOF Test**	
5% Shapiro Wilk Critical Value	0.94	Data Not Lognormal at 5% Significance Level	
Lilliefors Test Statistic	0.191	**Lilliefors Lognormal GOF Test**	
5% Lilliefors Critical Value	0.139	Data Not Lognormal at 5% Significance Level	

Data Not Lognormal at 5% Significance Level

Lognormal Statistics

Minimum of Logged Data	1.55	Mean of logged Data	3.526
Maximum of Logged Data	6.804	SD of logged Data	1.559

Assuming Lognormal Distribution

95% H-UCL	250.4	90% Chebyshev (MVUE) UCL	212.5
95% Chebyshev (MVUE) UCL	259.9	97.5% Chebyshev (MVUE) UCL	325.8
99% Chebyshev (MVUE) UCL	455.3		

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution (0.05)

Nonparametric Distribution Free UCLs

95% CLT UCL	187.5	95% Jackknife UCL	189
95% Standard Bootstrap UCL	188.4	95% Bootstrap-t UCL	213.9
95% Hall's Bootstrap UCL	189.3	95% Percentile Bootstrap UCL	192
95% BCA Bootstrap UCL	208.2		
90% Chebyshev(Mean, Sd) UCL	237.2	95% Chebyshev(Mean, Sd) UCL	287.1
97.5% Chebyshev(Mean, Sd) UCL	356.3	99% Chebyshev(Mean, Sd) UCL	492.2

Suggested UCL to Use

95% Chebyshev (Mean, Sd) UCL	287.1

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% H-UCL 3974

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Detected Data Not Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	7.885	k star (bias corrected MLE)	7.119
Theta hat (MLE)	0.0157	Theta star (bias corrected MLE)	0.0174
nu hat (MLE)	473.1	nu star (bias corrected)	427.1
Mean (detects)	0.124		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.101
Maximum	0.25	Median	0.1
SD	0.0586	CV	0.581

Suggested UCL to Use

95% H-UCL 4.03

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Notes:

1) An average hardness of 250.3 mg/L as $CaCO_3$ was used for Lead; refer to Table D-3b for details.

Conversion factors (CFs) based on US EPA (2018) Region 4 ERA Guidance Table 1b CFs for freshwater chronic values.

Italicized values indicates a non-detect; value is the reporting limit

mg/L = milligrams per liter

Total Metals = Dissolved Metals (CF^{-1})

Prepared by/Date: LO 06/21/2018
Checked by/Date: IMR 06/21/2018

Minimum Detect	23	Minimum Non-Detect	10.2
Maximum Detect	871	Maximum Non-Detect	10.2
Variance Detects	124156	Percent Non-Detects	12.5%
Mean Detects	264.8	SD Detects	352.4
Median Detects	51.2	CV Detects	1.331
Skewness Detects	1.266	Kurtosis Detects	-0.204
Mean of Logged Detects	4.654	SD of Logged Detects	1.5

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

nu hat (MLE)	9.226	nu star (bias corrected)	6.605
Mean (detects)	264.8		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	231.7

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL	47.56

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	127		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	95.24

Suggested UCL to Use

95% H-UCL 6977

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% Student's-t UCL 1835

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	6.891

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 15.5

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL Output for Surficial Soil - Metals (Total) by Shrew Exposure Unit

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Copper (sts-15)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
		Number of Missing Observations	0
Minimum	22.1	Mean	228.7
Maximum	750	Median	130
SD	262.8	Std. Error of Mean	92.91
Coefficient of Variation	1.149	Skewness	1.525

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

97.5% Chebyshev(Mean, Sd) UCL	1114	99% Chebyshev(Mean, Sd) UCL	1321

Suggested UCL to Use

95% Student's-t UCL 871.8

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	5	Number of Distinct Observations	5
		Number of Missing Observations	0
Minimum	101	Mean	286.8
Maximum	677	Median	173
SD	231.6	Std. Error of Mean	103.6
Coefficient of Variation	0.808	Skewness	1.672

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean of Logged Detects	-2.312	SD of Logged Detects	0.416

Warning: Data set has only 3 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Attachemnt C-1c

ProUCL Output for Surficial Soil - Pesticides by Shrew Exposure Unit

Suggested UCL to Use

95% KM (t) UCL	0.128	KM H-UCL	0.181
95% KM (BCA) UCL	N/A		

Warning: One or more Recommended UCL(s) not available!

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

alpha-Chlordane (sts-02)

General Statistics

Total Number of Observations	7	Number of Distinct Observations	6
Number of Detects	1	Number of Non-Detects	6
Number of Distinct Detects	1	Number of Distinct Non-Detects	5

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable alpha-Chlordane (sts-02) was not processed!

alpha-Chlordane (sts-03)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
Number of Detects	2	Number of Non-Detects	6
Number of Distinct Detects	2	Number of Distinct Non-Detects	5
Minimum Detect	0.037	Minimum Non-Detect	0.012
Maximum Detect	0.2	Maximum Non-Detect	0.11
Variance Detects	0.0133	Percent Non-Detects	75%
Mean Detects	0.119	SD Detects	0.115
Median Detects	0.119	CV Detects	0.973
Skewness Detects	N/A	Kurtosis Detects	N/A
Mean of Logged Detects	-2.453	SD of Logged Detects	1.193

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

99% KM (Chebyshev) UCL 37.17

Warning: Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Heptachlor (sts-08)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Heptachlor (sts-08) was not processed!

Heptachlor (sts-09)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
Number of Detects	3	Number of Non-Detects	5
Number of Distinct Detects	3	Number of Distinct Non-Detects	5
Minimum Detect	0.13	Minimum Non-Detect	0.002
Maximum Detect	41	Maximum Non-Detect	2.2
Variance Detects	522.8	Percent Non-Detects	62.5%
Mean Detects	14.64	SD Detects	22.86
Median Detects	2.8	CV Detects	1.561
Skewness Detects	1.706	Kurtosis Detects	N/A
Mean of Logged Detects	0.901	SD of Logged Detects	2.879

Warning: Data set has only 3 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Mean (detects)	14.64		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	5.498
Maximum	41	Median	0.01

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Median Detects	0.66	CV Detects	0.167
Skewness Detects	-1.713	Kurtosis Detects	N/A
Mean of Logged Detects	-0.51	SD of Logged Detects	0.176

Warning: Data set has only 3 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Warning: Data set has only 3 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL 7.521

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Skewness Detects	N/A	Kurtosis Detects	N/A
Mean of Logged Detects	-3.129	SD of Logged Detects	2.284

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Toxaphene (sts-10) was not processed!

Toxaphene (sts-11)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
Number of Detects	2	Number of Non-Detects	6
Number of Distinct Detects	2	Number of Distinct Non-Detects	6
Minimum Detect	0.49	Minimum Non-Detect	0.45
Maximum Detect	1.4	Maximum Non-Detect	130
Variance Detects	0.414	Percent Non-Detects	75%
Mean Detects	0.945	SD Detects	0.643
Median Detects	0.945	CV Detects	0.681
Skewness Detects	N/A	Kurtosis Detects	N/A
Mean of Logged Detects	-0.188	SD of Logged Detects	0.742

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL 2.341

Warning: Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Theta hat (MLE)	3.141	Theta star (bias corrected MLE)	11.87
nu hat (MLE)	91.43	nu star (bias corrected)	24.19
Mean (detects)	35.9		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	7.301	Mean	30.18
Maximum	51.2	Median	29.9

Suggested UCL to Use

Attachment D-1b
Post Corrective Action ProUCL Output for Surficial Soil by Shrew Exposure Unit

95% Student's-t UCL 57.35

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

General Statistics

Total Number of Observations	3	Number of Distinct Observations	3
		Number of Missing Observations	5
Number of Detects	1	Number of Non-Detects	2
Number of Distinct Detects	1	Number of Distinct Non-Detects	2

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Arsenic (so-15) was not processed!

Arsenic (so-16)

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	2

Suggested UCL to Use

95% Student's-t UCL 520.6

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	22.37	Mean	451.1

Suggested UCL to Use

95% Student's-t UCL 531.7

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Lead (so-02)

General Statistics

Total Number of Observations	1	Number of Distinct Observations	1
		Number of Missing Observations	6
Minimum	1190	Mean	1190
Maximum	1190	Median	1190

Warning: This data set only has 1 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Lead (so-02) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Lead (so-03)

General Statistics

Total Number of Observations	5	Number of Distinct Observations	5
		Number of Missing Observations	3
Minimum	107	Mean	626.2
Maximum	1820	Median	301
SD	711.4	Std. Error of Mean	318.2
Coefficient of Variation	1.136	Skewness	1.656

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Suggested UCL to Use

95% Student's-t UCL 3275

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Dieldrin (so-04)

General Statistics

Total Number of Observations	2	Number of Distinct Observations	2
		Number of Missing Observations	6
Minimum	0.1	Mean	0.205
Maximum	0.31	Median	0.205

Attachment D-1b
Post Corrective Action ProUCL Output for Surficial Soil by Shrew Exposure Unit

Warning: This data set only has 2 observations!

Data set is too small to compute reliable and meaningful statistics and estimates!

The data set for variable Dieldrin (so-04) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!

If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Dieldrin (so-05)

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	1.067

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Dieldrin (so-10x)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Dieldrin (so-10x) was not processed!

Dieldrin (so-11)

General Statistics

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Coefficient of Variation	0.702	Skewness	1.07

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

4,4'-DDD (so-01)

General Statistics

Total Number of Observations	5	Number of Distinct Observations	5
		Number of Missing Observations	3
Number of Detects	1	Number of Non-Detects	4
Number of Distinct Detects	1	Number of Distinct Non-Detects	4

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4,4'-DDD (so-01) was not processed!

4,4'-DDD (so-02)

General Statistics

Total Number of Observations	1	Number of Distinct Observations	1
		Number of Missing Observations	6
Number of Detects	0	Number of Non-Detects	1
Number of Distinct Detects	0	Number of Distinct Non-Detects	1

Warning: This data set only has 1 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable 4,4'-DDD (so-02) was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Attachment D-1b
Post Corrective Action ProUCL Output for Surficial Soil by Shrew Exposure Unit

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

4,4'-DDD (so-07)

General Statistics

Total Number of Observations	7	Number of Distinct Observations	6
		Number of Missing Observations	1
Number of Detects	1	Number of Non-Detects	6
Number of Distinct Detects	1	Number of Distinct Non-Detects	5

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4,4'-DDD (so-07) was not processed!

4,4'-DDD (so-08)

General Statistics

Total Number of Observations	7	Number of Distinct Observations	6
		Number of Missing Observations	1
Number of Detects	1	Number of Non-Detects	6
Number of Distinct Detects	1	Number of Distinct Non-Detects	5

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4,4'-DDD (so-08) was not processed!

4,4'-DDD (so-09)

General Statistics

Total Number of Observations	5	Number of Distinct Observations	5
		Number of Missing Observations	3
Number of Detects	1	Number of Non-Detects	4
Number of Distinct Detects	1	Number of Distinct Non-Detects	4

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4,4'-DDD (so-09) was not processed!

Attachment D-1b
Post Corrective Action ProUCL Output for Surficial Soil by Shrew Exposure Unit

4,4'-DDD (so-10x)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4,4'-DDD (so-10x) was not processed!

4,4'-DDD (so-11)

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	2
Number of Detects	2	Number of Non-Detects	4
Number of Distinct Detects	2	Number of Distinct Non-Detects	4
Minimum Detect	0.051	Minimum Non-Detect	0.009
Maximum Detect	0.078	Maximum Non-Detect	0.049
Variance Detects	3.6450E-4	Percent Non-Detects	66.67%
Mean Detects	0.0645	SD Detects	0.0191
Median Detects	0.0645	CV Detects	0.296
Skewness Detects	N/A	Kurtosis Detects	N/A
Mean of Logged Detects	-2.763	SD of Logged Detects	0.3

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Theta hat (MLE)	0.123	Theta star (bias corrected MLE)	0.365
nu hat (MLE)	15.51	nu star (bias corrected)	5.211
Mean (detects)	0.238		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0242	Mean	0.195
Maximum	0.49	Median	0.19

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.

For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.764	**Shapiro Wilk GOF Test**	
5% Shapiro Wilk Critical Value	0.767	Detected Data Not Normal at 5% Significance Level	
Lilliefors Test Statistic	0.379	**Lilliefors GOF Test**	
5% Lilliefors Critical Value	0.425	Detected Data appear Normal at 5% Significance Level	

Detected Data appear Approximate Normal at 5% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

KM Mean	0.24	KM Standard Error of Mean	0.244

97.5% KM Chebyshev UCL	1.764	99% KM Chebyshev UCL	2.669

Gamma GOF Tests on Detected Observations Only

Not Enough Data to Perform GOF Test

Gamma Statistics on Detected Data Only

k hat (MLE)	0.333	k star (bias corrected MLE)	N/A
Theta hat (MLE)	0.955	Theta star (bias corrected MLE)	N/A
nu hat (MLE)	2	nu star (bias corrected)	N/A
Mean (detects)	0.318		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0037	Mean	0.195
Maximum	0.93	Median	0.01
SD	0.411	CV	2.108

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.76

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

beta-BHC (so-10x)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	7

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable beta-BHC (so-10x) was not processed!

beta-BHC (so-11)

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	2
Number of Detects	0	Number of Non-Detects	6
Number of Distinct Detects	0	Number of Distinct Non-Detects	6

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable beta-BHC (so-11) was not processed!

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

Attachment D-2b
Post Corrective Action ProUCL Output for Sitewide Surface Soil

UCL Statistics for Data Sets with Non-Detects

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	8.739
Maximum	340	Median	0.625
SD	40.74	CV	4.662

Suggested UCL to Use

KM H-UCL 40.08

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

APPENDIX E

RESPONSE TO EPD JUNE 29, 2018 COMMENTS

RESPONSE TO GEORGIA ENVIRONMENTAL PROTECTION DIVISION JUNE 29, 2018
COMMENTS ON VRP STATUS REPORTS #10, #11, #12
FORMER ESTECH GENERAL CHEMICAL SITE – ATLANTA, GEORGIA

Response to EPD September 22, 2016 Comments on Status Reports# 6 through# 9 in Appendix C of the VRP Status Report# 10

1. Response to Comment # 1:
Note and accepted

Response to Response to Comment # 1:
BFEL has noted this.

2. Response to Comment # 2:
EPD concurs with deferring the installation of vertical delineation well until after groundwater remediation is implemented.

Response to Response to Comment #2:
BFEL has noted this.

3. Response to Comment # 3:
EPD concurs with removing monitoring well MW-105 from point of demonstration (POD) well list and using MW-117 as an alternative. While it is not ideal to have constituents at POD wells exceed concentrations at the point of exposure (POE), based on their hydraulically upgradient position and near surface water level screen intervals, EPD concurs with the use of monitoring wells MW-119 and MW-120 as POD wells. EPD requests that MW-121 continue to be used as a POD well based on its close proximity to the POE and hydraulically upgradient position. Please adjust figures to show the four POD wells in future reports.

Response to Response to Comment # 3:
In Status Report No. 13, Figures 3 through 6 show wells MW-117, MW-119, MW-120, and MW-121 as POD wells for the site. Monitoring well MW-117 is a replacement POD for well MW-105. Status Reports going forward will continue to show these 4 POD wells.

4. Response to Comment #4 and # 5:
Decisions related to area averaging will be made by the newly assigned compliance officer and manager from the VRP unit. The transfer of this site to the VRP unit will be effective July 1, 2018.

Response to Comment #4 and #5:
BFEL acknowledges that the site regulatory unit transfer will have commenced on this date.

Response to EPD Comments on VRP Status Reports# 10, # 11 and # 12:

5. Groundwater Concentrations in the former pond area in the vicinity of monitoring wells OW-1, OW-2 and OW-3 may be indicative of a separate source area not linked to offsite contamination from the adjacent M&J Solvents HSI site. Please continue to monitor the wells in the former pond area and wells hydraulically downgradient of the former pond area for VOCs. Should this be a separate source area, plume monitoring and source area/groundwater remediation will need to be addressed separately from the offsite contamination to the north.

Response to Comment #5:
BFEL will continue to monitor wells in the vicinity of the former pond area and those downgradient of it in an effort to better understand the presence of VOCs in the vicinity of OW-1, OW-2, and OW-3.

6. Monitoring well MW-120 detected cis-1 ,2-dichloroethene and trichloroethene, and MW-121 detected trichloroethene during the most recent November 2017 sampling event. Should VOC concentrations increase in wells MW-120 and MW-121 to levels that exceed Georgia Instream Water Quality Standards (ISWQS), VOCs may need to be added to the surface water sampling analyte list. [Comment 4c] This response is acceptable.

Response to Comment #6:
BFEL will continue to monitor the VOC trends in groundwater from wells MW-120 and MW-121. Sample results for the May 2018 sampling event showed VOC concentrations returning to levels more consistent with recent historical concentrations levels from anomalously high concentrations of trichloroethene (TCE) and cis-1,2-dichloroethene (cis-DCE) during the November 2017 groundwater sampling event as shown in the table below.

	MW-120 5/16/2018	MW-120 11/7/2017	MW-121 5/11/2018	MW-121 11/7/2017
cis-1,2-Dichloroethene	14	16	<5.0	<5.0
Trichloroethene	6.8	9.3	<5.0	5.4

The TCE groundwater concentrations are below the Georgia In-Stream Water Quality Criteria (ISWQC) of 30 µg/L. There is no ISWQC for cis-1,2-dichloroethene.

7. EPD concurs with the proposed future actions presented in VRP Status Reports #10, #11, and #12 and the revised remediation approach presented in Section 3.4 of the VRP Status Report #12.

Response to Comment# 7:
BFEL has noted this.

8. Please be advised that the submittal of the final Compliance Status Report has far exceeded the 5-year time frame of February 8, 2017. Therefore, EPD may issue a VRP Consent Order to establish a compliance schedule for continued participation in the VRP in accordance with the Act. This would be sent to BFEL under separate letter by the VRP unit.

Response to Comment# 8:
BFEL would like to schedule a meeting with EPD to discuss the current site conditions and the path forward for the site.
