Subject: **Eighth VIRP Semi-annual Progress Report**
Former McKenzie Tank Lines Site
HSI Site No. 10406
111 Grange Road, Port Wentworth, Georgia
Tax Parcels: 1-0729-01-007 and 1-0729-01-009

Dear Mr. Marbury:

On behalf of McKenzie Tank Lines, Inc. (MTL), Environmental International Corporation (EIC) is pleased to submit the attached Eighth VIRP Semi-annual Progress Report for the above referenced site.

Enclosed are the following:

1. One signed and sealed certification page for the report.
2. One bound paper copy of the report.
3. Two Compact Discs, each with the report in searchable PDF format.

If you have any questions regarding this submittal, please contact Mr. Thomas F. Panebianco of MTL at 1-800-828-6495 or me at the above location.

Sincerely,

ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.
President & CEO

CERTIFICATION AND SUPPORTING DOCUMENTATIONS
Eighth VIRP Semi-annual Progress Report
Former McKenzie Tank Lines Site, Port Wentworth, Georgia
HSI Site No. 10406
May 18, 2018

"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

1.0 Introduction

On behalf of McKenzie Tank Lines, Inc. (MTL), Environmental International Corporation (EIC) is pleased to submit this "Eighth VIRP Semi-annual Progress Report" to Georgia Environmental Protection Division (EPD). This report chronicles project activities concerning the former MTL, Hazardous Site Inventory (HSI) site 10406, located at 111 Grange Road, Land Lot 30, Tax Parcel IDs 1-0729-01-007 and 1-0729-01-009, Port Wentworth, Georgia, (site). This report was prepared as specified in the January 29, 2014 "Voluntary Investigation and Remediation Plan (VIRP) Application" that was approved by the EPD on May 20, 2014 under the Voluntary Remediation Program (VRP) (EIC, 2014a).

1.1 Primary Objective

The primary objective of this report is to chronicle the tasks completed by MTL during the six-month time frame during the period of November 2017 through April 2018. This report documents the following tasks:

- Follow-up responses to the February 26, 2018 EPD Comment letter;
- The fifth semi-annual groundwater monitoring event;
- Hot spot removal, including the excavation of source material from AOC-3 and AOC-4.

A site map is included as Figure 1-1. The following sections describe the aforementioned tasks.

SECTION

2

2.0 Response to EPD Comment Letter

2.1 Responses to February 26, 2018 Comment Letter

The following is a response on behalf of MTL to EPD's review and list of comments letter, dated February 26, 2018 (EPD, 2018).

Comments and Responses

EPD Comment 1:

Groundwater sampling results from the Seventh VRP Progress Report indicate that groundwater north and east of MW-46S and MW-47D is not horizontally delineated. EPD understands that delineation wells north and east of MW-46S, MW-44D and MW-47D could not be installed due to flowing sand conditions complicating the well installation. Considering groundwater flows across the site to the southwest, EPD would not expect groundwater constituents to begin migrating upgradient beyond the eastern most wells. Please continue with the scheduled groundwater monitoring to observe whether constituents in wells MW-46s and MW-47D will attenuate to levels below delineation criteria.

Response to EPD Comment 1:

EPD's comment is noted. Accordingly, MTL will continue monitoring constituents of concern (COC) concentrations in these wells to determine if the concentrations are trending below the delineation criteria and report its findings.

EPD Comment 2:

Section 4.0 in the Seventh VRP Progress Report states that collecting additional delineation soil samples further west of AOC-6 would be impractical due to a near ground surface water table making soil sample collection above the saturated depth impossible. Further, Section 4.0 states that existing shallow monitoring wells west of AOC-6 adequately address the constituents in that area. EPD does not concur that constituents west of AOC-6 have been adequately addressed or delineated, and requests the following be completed:

a) *McKenzie should determine whether the saturated area west of AOC-6 meets the definition of a wetland according to the USACE and/or meets the criteria of an ecological habitat. In addition, McKenzie should collect additional saturated soil/sediment samples and shallow groundwater samples to characterize that area west of AOC-6 and compare the results against the appropriate screening criteria (e.g., USEPA's Ecological Screening Values, calculated groundwater risk reduction standards, etc.).*

b) *Elevated concentrations of site constituents in soil, sediment and groundwater in the vicinity of AOC-6 may introduce contaminants to the North-South Stormwater Ditch. Please implement the collection of surface water samples in the North-South Stormwater Ditch and East-West Stormwater Ditch that coincide with groundwater sampling events to determine the presence/absence of site constituents in surface water, and to determine whether contaminated surface water is leaving the site through storm water pipes along the western property boundary.*

Response to EPD Comment 2:

a) The area to the west of the North-South ditch in AOC-6 typically becomes flooded when rainwater gets impounded due to pipes clogged with debris or due to artificial dams built by beavers. Is therefore uncertain whether the subject area would be considered a true wetland. Referring to the historical plat map of Attachment 2-1, EIC also observed that this area was previously utilized for residential use – further supporting our uncertainty whether the subject area was historically under wetland conditions. Nevertheless, GPA has obtained a permit from the US Army Corps of Engineers to redevelop the wetland area. The redevelopment plans entail the rerouting of the stormwater ditch to the west of AOC-6 along the existing earthen berm and backfilling of the wetland area with up to 5 feet of backfill material to construct a paved surface for a container storage area. These actions will resolve the aforementioned flooding issues.

   Additionally, EIC has observed that the groundwater elevations in the subject area is currently at or just below the soil surface – causing the shallow subsurface to get saturated. Upon completion of the site redevelopment program, the groundwater will be located approximately 5 feet below grade. Considering that the groundwater is being monitored from samples collected from the wells in this area as part of the semi-annual monitoring program, the collection of additional saturated soil/sediment samples would not add value.

b) Upon completion of the site redevelopment activities, EIC can collect surface water samples both upgradient and downgradient of the AOC-6 area from the stormwater ditch after it is realigned as EIC understands it will be from GPA's redevelopment plans.

EPD Comment 3:

According to Table 3-2 in the Seventh VRP Progress Report, the most recent samples collected from wells G-22R, MW-57S, MW-58D and RW-8 had turbidity readings that exceed 10 NTU. In future monitoring events, please attempt to reduce turbidity readings to 10 NTU or less prior to sample collection. If turbidity cannot be reduced to 10 NTU or less, please re-develop the well, and document the well development procedure.

Additionally, according to the Sixth VRP Progress Report, monitoring wells RW-1 and RW-4 were not used for contouring due to the effects of excessive siltation. Please attempt to redevelop wells RW-1 and RW-4 to remove any particulate that has settled in the well column. If the wells continue to produce silt and are determined to be damaged, please discuss with EPD whether reinstallation of monitoring wells RW-1 and RW-4 is necessary.

Response to EPD Comment 3:

Referring to Table 3-2 of this report, please note that the sampling event in July 2017 was the first sampling event following the installation of wells G-22R, MW-57S, and MW-58D. During the first subsequent sampling event in October 2017, with the exception of well MW-57S with a turbidity of 14.5, the turbidity levels in each of these wells, and also well RW-8, had fallen to below 10 NTUs. During future sampling events, MTL will attempt to reduce turbidity levels in each well to below 10 NTUs by purging. If purging alone cannot reduce the NTU level below 10, MTL will attempt to reduce the turbidity below 10 NTUs in these wells by redeveloping these wells before purging and sampling these wells. MTL will also document the well development procedure at each well where this is necessary.

Similar to the conditions found in the former recovery wells (RW-2, RW-3, RW-5, RW-6, and RW-7) that were abandoned, EIC has observed large silt accumulations (which possibly indicated well screen damage) in RW-1 and RW-4. Consequently, EIC plans to abandon these two recovery wells. Considering that there are an adequate number of wells in the immediate vicinity of these recovery wells, EIC does not find value in replacing these two recovery wells.

EPD Comment 4:

The updated Site Conceptual Model in the Sixth VRP Progress Report states that arsenic in groundwater will be investigated to confirm previously reported arsenic concentrations in the vicinity of former monitoring well MW-13S. Please include in future progress reports the former location of well MW-13 on the Site Layout Map Figure 1-1 and plans to investigate the area for arsenic in groundwater.

Response to EPD Comment 4:

As required by EPD, EIC will illustrate the approximate location of MW-13S on Figure 1-1 in future Semi-annual reports. Please note that, as survey data is not available to accurately plot the location of this well, however this will be approximated based on site landmarks included in environmental reports from historical environmental consultants. Also, EIC is planning to collect a round of groundwater samples for arsenic analysis from existing wells in the area surrounding the former MW-13S.

EPD Comment 5:

EPD concurs with the decision to not replace the recently abandoned monitoring well MW-U2 as MW-32 is in close proximity to the former MW-U2 monitoring well location and will adequately monitor shallow groundwater conditions in that area.

Response to EPD Comment 5:

EPD's comment is noted.

EPD Comment 6:

Data from the Fifth, Sixth, and Seventh VRP monitoring reports indicate that wells MW-2D, MW-4S, MW-50S and RW-8 have had exceedances of 1,1-dichloroethene above the Type 1RRS delineation criteria of 7.0 µg/L. Please add 1,1-dichloroethene to the list of site constituents of concern and include groundwater monitoring results in the groundwater constituents of concern tables.

Response to EPD Comment 6:

Please note that the analytical results for 1,1-dichloroethene from all wells sampled have been added to the COC analytical results tables, Table 3-3 and Table 3-4 for all sampling events during the VIRP program. MTL will include the results for 1,1-dichloroethene in such tables as a monitored COC in future semi-annual reports.

SECTION

3

3.0 Groundwater Monitoring

EIC conducted the ninth groundwater monitoring event of the VIRP in October 2017. During this monitoring event, EIC gauged the groundwater levels at all wells of the monitoring well network onsite, collected groundwater samples from each of these wells for laboratory analysis of targeted COCs, and conducted other related tasks.

3.1 Groundwater Monitoring Objectives

The primary objectives of the groundwater monitoring program are to meet the following goals set forth in the VIRP:

- Establish a baseline for COC plume stability analysis,
- Track the natural attenuation of COCs by monitoring the groundwater concentrations of COCs and water quality parameters within the existing COC plumes,
- Determine if the prevailing groundwater COC concentrations are meeting or trending towards meeting the established RRS, and
- Determine if the horizontal and vertical extents of the COCs have been defined.

3.2 Groundwater Monitoring Field Program

During the October 2017 monitoring event, EIC conducted groundwater monitoring activities at a total of 44 wells onsite. As noted in the VIRP, wells with screened intervals that are less than 20 feet below ground surface (bgs) were historically defined as shallow wells and those with screened intervals reaching greater than 20 feet bgs were defined as deep wells, regardless of the screened interval length (EIC, 2014a). For consistency, EIC has maintained this definition with newly installed wells. Consequently, 19 of the 44 wells onsite are defined as shallow wells and the remaining 25 are defined as deep wells.

Four of the 25 deep wells are recovery wells (RW-1, RW-4, RW-8, and RW-9). Each of these recovery wells consists of a 4-inch internal diameter (ID) well casing/screen, with the exception of RW-4, which has a 6-inch ID well casing/screen. Of the remaining 21 deep monitoring wells, the IDs of the well casings/screens range in size from 3/4-inch to 2-inches.

3.2.1 Sampling Protocol

EIC conducted the groundwater sampling program in accordance with the current U.S. EPA Region 4 groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP), per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

3.2.2 Site Access

Prior to the field visit, EIC coordinated with GPA in gaining access to the Site to conduct groundwater monitoring and related tasks. All work at the Site was completed under the supervision of EIC.

3.2.3 Groundwater Gauging

Prior to sampling, EIC gauged each well using a decontaminated oil-water interface meter (or "probe") to determine the static depth to groundwater from the well top-of-casing (TOC). EIC utilized TOC elevations documented in recent well surveys to determine the current groundwater elevations. The gauging data for the October 2017 monitoring event is tabulated in Table 3-1.

3.2.4 Groundwater Sampling

Following the "low-flow" purge technique, noted in Section 3.2.1, EIC utilized a peristaltic pump with variable lengths of disposable 1/4-inch ID Teflon-lined tubing and a 6-inch segment of 3/16-inch ID silicon tubing at the pump head to purge each well until groundwater quality parameters reached stabilization prior to sampling. EIC determined the length of Teflon-tubing necessary to initially place the intake at the center of the wetted screened interval of each well by considering water levels gauged just prior to purging during this monitoring event and the available well construction data, as noted in EIC's well purging and sampling data field logs (Attachment 3-1). To determine the tubing length, EIC also considering that additional tubing may be needed should it become necessary to lower the tubing below the initial intake depth due to drawdown causing the water level to reach the initial tubing intake.

Groundwater stabilization parameters were monitored via direct pumping to a multi-parameter field water quality meter equipped with a flow-through cell. These parameters were recorded at approximately five-minute intervals on EIC field logs during the October 2017 monitoring event (Attachment 3-1). Additionally, purge volumes and depth-to-water (DTW) measurements were

recorded at the same five-minute intervals when possible. At each well, the pumping rate was decreased, and/or the tubing depth increased when drawdown lowered the water level to the tubing intake level, causing air to be pumped.

When purging 1-inch and 3/4-inch diameter wells with Teflon tubing (that has a 3/8-inch outer diameter (OD), the oil-water interface probe (that has a 5/8-inch OD) could not be simultaneously inserted into the well to gauge the depth to water due to space limitations. At these wells, gauging could only be performed just prior to inserting the tubing and immediately after the tubing was removed.

EIC collected all samples using the "soda straw method" specified in the SOP SESDPROC-301-R3 under the FBQSTP (EPA, 2013). Under this SOP, EIC considered that stabilization was reached when 3 consecutive groundwater quality parameter readings were within ± 0.1 standard units for pH and ± 5% for specific conductivity during purging. EIC made reasonable attempts at each well to reach 0.2 mg/L of dissolved oxygen (DO) and a turbidity reading at or below 10 Nephelometric Turbidity Units (NTUs) prior to sampling. Groundwater quality field parameters (Temperature, pH, oxygen reduction potential (ORP), conductivity, turbidity, and DO) after stabilization and prior to sample collection are summarized in Table 3-2.

3.2.5 Sample Custody and Laboratory Analysis

Immediately after each sample set was collected, the sample bottles were labeled, and the samples were stored with ice in double-sealed bags in laboratory-provided insulated containers ("coolers") provided by the contracted laboratory. EIC maintained the temperature of the samples in these containers with sufficient ice, kept completed chain-of-custody forms with all samples, and kept custody of the samples at all times until EIC relinquished the samples to the laboratory.

EIC delivered the samples to Analytical Environmental Services, Inc. in Atlanta, Georgia - a Georgia Department of Natural Resources (DNR) certified laboratory. The laboratory conducted analysis of volatile organic compounds according to EPA method 8260B. The laboratory report for the October 2017 monitoring event is included as Attachment 3-2. The analytical results of samples collected from both the shallow and deep wells are summarized in Tables 3-3 and 3-4, respectively, along with historical analytical results.

3.3 Quality Assurance and Quality Control

To prevent cross-contamination, new disposable Teflon-lined tubing was utilized to collect a groundwater sample at each well. EIC decontaminated its oil/water interface meter and any of its other reusable field equipment that came in contact with groundwater prior to use and between sample locations. EIC accomplished this by first washing this equipment with a pressurized phosphate-free detergent solution and then rinsing with pressurized de-ionized (DI) water. EIC also utilized brushes and/or wipes if necessary.

After each sample was collected, the water quality parameters instrument flow-through cell was opened and decontaminated with pressurized DI water. In the event of gross contamination, EIC

used detergent solution in addition to DI water in cleaning this instrument.

For sample quality assurance and quality control, EIC maintained a laboratory-provided trip blank set in each of the sample coolers. The laboratory analyzed each trip blank via EPA method 8260B as with the groundwater samples collected at the Site.

3.4 Data Evaluation

EIC conducted an evaluation of the data compiled and tabulated from field measurements and laboratory analyses. This evaluation enabled the depiction of the groundwater potentiometric surface, as well as the extents of the prevailing COC plumes at the time of the October 2017 monitoring event.

As established in the VIRP, EIC has continued to distinguish between unconfined shallow and apparently partially confined deep aquifers in illustrating groundwater potentiometric surfaces and COC plumes. The following subsections describe EIC's evaluation of the shallow and deep potentiometric surfaces and the four COC plumes monitored at the Site.

3.4.1 Groundwater Potentiometric Surfaces

3.4.1.1 Shallow Groundwater Potentiometric Surface

The October 2017 groundwater gauging event data is summarized in Table 3-1. In addition, all historical shallow groundwater gauging data collected at the site following the initiation of the VIRP program is summarized in Table 3-5. EIC compared the shallow well gauging data from the October 2017 monitoring event to each of the historical monitoring events.

Referring to Table 3-5, on average, the surface groundwater elevations at each utilized well across the site for the October 2017 event, which define the shallow groundwater potentiometric surface, were lower than those of the April 2017 gauging event and lower than the historical average observed since VIRP monitoring began in July 2014.

Utilizing the data presented in Table 3-1, EIC prepared a shallow groundwater potentiometric surface map, illustrated in Figure 3-1. Due to the historically anomalous groundwater elevation observed at well MW-2S, relative to the groundwater elevations at surrounding wells, the data from this well was not considered for potentiometric surface contouring. The anomaly observed at this well may have resulted from this well having a relatively shallow depth of completion (which is less than 10 feet bgs) relative to other shallow wells onsite and may represent perched groundwater conditions caused by confining and/or partially confining strata underlying this well.

EIC compared Figure 3-1 to previous shallow potentiometric surface maps included in all previous VIRP semi-annual progress reports (EIC 2014b, 2015a, 2015b, 2016a, 2016b, 2017a and 2017b). Based on the potentiometric surface during each of the eight gauging events under the VIRP, it is clearly evident that the groundwater generally flows from east-northeast to west-southwest across the site and the shallow unconfined potentiometric surface remains relatively

stable in elevation over time.

3.4.1.2 Deep Groundwater Potentiometric Surface

As with EIC's evaluation of the shallow wells at the site, EIC compared gauging data from the deep wells from the October 2017 monitoring events to those of the previous eight gauging events that are summarized in Table 3-6. Referring to Table 3-6, the average potentiometric surface elevations in deep wells in October 2017 were lower than those of the previous April 2017 monitoring event and lower than the historical average.

Utilizing the gauging data in Table 3-1, EIC prepared a deep groundwater potentiometric surface map, Figure 3-2. EIC then compared the potentiometric surface in Figure 3-2 to previous deep potentiometric surface maps included in all previous VIRP semi-annual progress reports. In comparing the potentiometric surface from the October 2017 event with those of previous eight groundwater monitoring events, it is apparent that groundwater generally flows from east-northeast to west-southwest across the site. Additionally, it is apparent that the deep potentiometric surface has remained relatively stable in elevation over time.

3.4.2 Horizontal Extent of COC Plumes

The COCs at the site established in the VIRP consist of the chlorinated volatile organics (CVOCs) tetrachloroethene or perchloroethene (PCE), trichloroethene (TCE), cis-1, 2 dichloroethene (DCE), and vinyl chloride (VC). Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared Figures 3-3 through 3-10, which illustrate the horizontal extent of the four COC constituent plumes within both the defined shallow and deep aquifer horizons. In addition, the figures illustrate the horizontal extent of the plumes with concentrations both above RRS and above delineation criteria. The following four subsections describe the concentrations of each of the four COCs and the extents of the plumes in both the shallow and deep aquifer horizons, respectively.

3.4.2.1 PCE Plume

Utilizing the analytical results of samples collected during the October 2017 monitoring event, that are summarized in Tables 3-3 and 3-4, EIC prepared PCE isoconcentration maps to illustrate the horizontal extent of the PCE plume. The following subsections describe the PCE concentrations in both the shallow and deep aquifer horizons.

Shallow PCE

Figure 3-3 illustrates the horizontal extent of the shallow PCE plume based on samples from shallow wells during the October 2017 monitoring event. Referring to Figure 3-3, the shallow plume is confirmed to be above delineation criterion at wells MW-31, MW-32, MW-40S, MW-50S and MW-57S. The shallow plume is also above RRS at MW-50S. PCE concentrations at all of the remaining monitoring wells were below the laboratory method detection limit (MDL) with the exception of MW-37S. PCE concentrations in MW-37S were detected below both the delineation

criterion and RRS. The November 2016 monitoring event is the first time - since the installation of MW-50S - that PCE concentrations at this well have been above RRS. During the April 2016 monitoring event, the PCE concentration observed at MW-50S was below MDL. EIC will continue to monitor the PCE concentration at MW-50S to determine if the respective concentrations persist above RRS.

Deep PCE

Figure 3-4 illustrates the horizontal extent of the deep PCE plume based on samples from deep wells during the October 2017 monitoring event. Referring to Figure 3-4, PCE concentrations at all wells sampled (apart from MW-14D and MW-47D) were below the laboratory MDL. PCE concentrations in MW-14D were detected below both the delineation criterion and RRS. PCE concentrations in MW-47D were detected above the delineation criterion, but below RRS. This represents an overall decrease in the concentrations and the extent of the plume, indicating that natural attenuation is progressively reducing the concentrations.

3.4.2.2 TCE Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared TCE isoconcentration maps to illustrate the horizontal extent of the TCE plume. The following subsections describe the TCE concentrations in both the shallow and deep aquifer horizons.

Shallow TCE

Figure 3-5 illustrates the horizontal extent of the shallow TCE plume based on samples from shallow wells during the October 2017 monitoring event. Shallow TCE concentrations in MW-37S were detected below both the delineation criterion and RRS. Concentrations that exceeded the RRS and the delineation criterion were detected at monitoring wells MW-31, MW-32, MW-40S and MW-50S. It is worth noting that the concentration observed at MW-50S (4,700 µg/L) and MW-40 (200 µg/L) have increased since the previous April 2017 monitoring event (MW-50S - 1,900 µg/L and MW-40S - <0.30 µg/L). The overall extent of the shallow TCE plume has remained relatively the same since April 2017.

Deep TCE

Figure 3-6 illustrates the horizontal extent of the deep TCE plume based on samples from deep wells during the October 2017 monitoring event. Deep TCE concentrations that exceeded the RRS and the delineation criterion were found at monitoring wells MW-14D, MW-44D and MW-47D. Concentrations at the remaining monitoring wells were below the MDL, indicating an overall decrease in concentrations from the April 2017 monitoring event.

Former recovery wells RW-1 and RW-4 were not considered for contouring due to the effects of excessive siltation (which EIC has determined exists in these wells), due to possibly corroded well screens, or due to possible other forms of screen interference.

3.4.2.3 cis-1, 2 DCE Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared DCE isoconcentration maps to illustrate the horizontal extent of the DCE plume. The following subsections describe the DCE concentrations in both the shallow and deep aquifer horizons.

Shallow DCE

Figure 3-7 illustrates the horizontal extent of the shallow DCE plume based on samples from shallow wells during the October 2017 monitoring event. Shallow DCE concentrations that exceeded the RRS occurred at monitoring wells MW-4S, MW-40S, and MW-50S. The overall extent of the shallow DCE plume during the October 2017 monitoring event was similar to that occurring during the April 2017 monitoring event. It should be noted, however, that the concentrations changed significantly within the plume, as compared with those of the April 2017 event, as follows: the concentration decreased by approximately 1,100 µg/L at MW-4S, increased by approximately one-quarter at MW-50S and increased by approximately 2-fold at MW-40S. Overall, the peak concentration shifted from the center of the plume to the leading edge of the plume.

Deep DCE

Figure 3-8 illustrates the horizontal extent of the deep DCE plume based on samples from deep wells during the October 2017 monitoring event. Deep DCE concentrations that exceeded the delineation criterion occurred at monitoring wells MW-2D, MW-49D, PAW-4, RW-8, and RW-9. The overall extent of the October 2017 deep DCE plume was similar to the DCE plume of the April 2017 monitoring event. Monitoring well MW-53D was not considered for contouring due to the close proximity to wells with concentrations above RRS, such as RW-8. Historically, groundwater concentrations in this area have been above RRS, but have decreased to below the delineation criterion at monitoring wells MW-2D, MW-49D, PAW-4, RW-8, and RW-9 since April 2017. Former recovery wells RW-1 and RW-4 were not considered for contouring due to the same reasons cited for the TCE plume.

3.4.2.4 VC Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared VC isoconcentration maps to illustrate the horizontal extent of the VC plume. The following subsections describe the VC concentrations in both the shallow and deep aquifer horizons.

Shallow VC

Figure 3-9 illustrates the horizontal extent of the shallow VC plume based on samples from shallow wells during the October 2017 monitoring event. Shallow VC concentrations that exceeded the RRS occurred at monitoring wells MW-4S, MW-33, MW-40S, MW-45S, MW-46S and MW-50S. The overall extent of the shallow VC plume during the October 2017 monitoring event was similar to that occurring during the April 2017 monitoring event. It should be noted,

however, that a concentration exceeded the RRS at MW-45S, as compared with the April 2017 event. Concentrations increased slightly within the plume at wells MW-40S, MW-45S and MW-50S since April 2017. These increases may be due to the degradation of the parent COCs.

Deep VC

Figure 3-10 illustrates the horizontal extent of the deep VC plume based on samples from deep wells during the October 2017 monitoring event. Deep VC concentrations that exceeded the RRS occurred at monitoring wells MW-2D, MW-44D, MW-49D, MW-51D, MW-53D, MW-54D, MW-55D, PAW-4, RW-8, and RW-9. The overall extent of the deep VC plume was similar to the VC plume of the April 2017 monitoring event, with the exception of MW-44D which exceeded the RRS during the October 2017 monitoring event. In general, the plume concentrations slightly increased when compared to those of the April 2017 monitoring event. Former recovery wells RW-1 and RW-4 were not considered for contouring for the same reasons they were not considered for the TCE plume.

Monitoring well MW-36R and former recovery wells RW-9 and RW-8 were not considered for contouring due to anomalous concentrations not representative of the overall plume conditions.

3.4.3 Horizontal Delineation of COC Plumes

Based on results from the October 2017 monitoring event, it is apparent that the horizontal delineation of both the PCE and DCE plumes are complete. However, the horizontal delineation of the TCE and VC plumes are not complete. From Figure 3-6, the horizontal delineation of the deep TCE plume is not complete to the east (hydraulically up-gradient) of MW-47D. From Figure 3-9, horizontal delineation of the shallow VC is not complete to the east and north (hydraulically up-gradient) of MW-46S.

As discussed in Section 2.0, MTL will continue monitoring COC concentrations in monitoring wells MW-44D and MW-47D to determine if the concentrations are trending below the delineation criteria and report its findings.

3.4.4 Vertical Delineation of COC Plumes

Of the current monitoring well network, well MW-35 is the deepest known well within the footprint of the COC plumes. This well is also located near the downgradient extent or leading edge of the COC plumes. Based on gauging measurements that EIC has collected and historical well data provided by a previous consultant, the total depth of MW-35 is 38.02 feet bgs. MW-35 has a 10-foot screen interval at the well bottom. Under the VIRP, EIC has sampled this well since February 2014. The associated analytical data for samples collected from the well is tabulated in Table 3-4.

Referring to Table 3-4, the concentrations of all monitored COCs in groundwater samples collected from MW-35 have consistently been below MDLs during all monitoring events since

February 2014, with the exception of a concentration of 0.58 µg/L of DCE in April 2016 - which is well below the established RRS limit of 204 µg/L for DCE. EIC will continue to include well MW-35 in the monitoring program, but it appears that the vertical delineation of the plume has been completed.

3.4.5 Plume Attenuation and Stability

Based on the relatively high concentrations and horizontal extent of dissolved PCE degradation products observed at the site, it is clearly evident that natural attenuation of COCs is progressively attenuating the PCE. Also, an overall comparison of the COC plume concentrations indicates that the plumes are confined to a relatively small area within the site and continue to decrease in concentration. This finding substantiates plume stability. EIC will continue to evaluate this trend and evaluate the extent of natural attenuation while implementing plans for active remediation.

SECTION

4

4.0 Source (Hot Spot) Removal

4.1 Background

As stated in the VIRP (EIC, 2014a), the EPD required that MTL conduct confirmatory sampling for previous soil source removal excavations. In addition, the EPD required MTL to conduct exploratory soil sampling in other areas of concern (AOCs) at the site. To complete these objectives, EIC identified 10 AOCs in the VIRP for further soil/sediment sampling and delineation.

Following the VIRP submittal, EIC collected and analyzed soil samples in each of the 10 AOCs to delineate the extents of any constituents of concern (COCs) above the delineation criteria or Risk Reduction Standards (RRS). Based on the laboratory analytical results, EIC determined that COCs in soil samples from seven of the ten AOCs were below delineation criteria and the RRS established in the VIRP. COCs in a number of soil samples collected from the remaining three AOCs (AOC-3, AOC-4, and AOC-6) were detected above the RRS. Figure 4-1 is a site layout diagram that illustrates the location of each of the three AOCs. In addition, sediment samples collected in AOC-6 indicated levels of COCs above the RRS. Since the contaminated soils in these AOCs are potentially source material for continued leachate of COCs to groundwater, EIC recommended that the source material that exceeds RRS be removed from the AOCs.

As a remedial action, EIC began the removal of contaminated material from targeted source areas in the remaining AOCs. The following subsections outline EIC's progress to complete the removal of contaminated material from the remaining AOCs.

4.2 Areas Targeted for Source Removal

Referring to Figure 4-1, the areas targeted for source removal are identified as AOC-3, AOC-4 and AOC-6. Figures 4-2 through 4-4 identify the soil boring locations in each of these three AOCs that were used for laboratory analysis in delineating the extent of contamination in each AOC. Soil boring locations that indicated the presence of soil contamination above the RRS are illustrated in red and those that were below the RRS are illustrated in green. These boring locations were used in defining the extent of source removal planned at each of the three AOCs.

4.3 Site Clearance and Preparatory Activities

The following sections describe the site clearance and preparatory activities for source removal of contaminated source material in the targeted AOCs. Since each source area has unique surface characteristics, different excavation procedures were required for each location. The excavation procedures followed for the respective source areas are described in Section 4.4.

4.3.1 Site Clearing & Preparation

Each of the three source areas required different levels of effort to conduct site clearing and preparation prior to excavation. The following subsections describe site clearing and preparatory activities required prior to initiating excavation in each AOC.

4.3.1.1 AOC-3

Figure 4-1 includes a plan view of AOC-3 that illustrates the boundaries of the AOC and the extent of the area targeted for excavation of source materials. Referring to Figure 4-1, this area required no site clearing prior to excavation. Prior to initiating excavation activities, an EIC representative positioned stakes and surveyor flags to identify the horizontal limits of the excavation area.

4.3.1.2 AOC-4

Figure 4-1 includes a plan view of AOC-4 that illustrates the boundaries of the AOC and the extent of the area targeted for excavation of source materials. The abandoned Tire Shop building (as shown in Figure 1-1) and associated above grade building materials were removed from the site prior to MTL's initiation of excavation activities. Prior to initiating excavation activities, an EIC representative positioned stakes and surveyor flags to identify the horizontal limits of the area to be excavated. During the excavation of soils in AOC-4, subsurface concrete structures associated with the former Tire Shop building were evaluated. No staining, hydrocarbon odors or PID readings above background levels were found on the concrete structures.

4.3.1.3 AOC-6

Figure 4-1 includes a plan view of AOC-6 that illustrates the boundaries of the AOC and the extent of the area targeted for excavation of source materials. Clearing & preparation activities in AOC-6 are expected to begin in concurrence with GPA site redevelopment, currently scheduled to start in June/July of 2018. Explicit details of the clearing & preparation activities pertaining to AOC-6 will be included in the subsequent semi-annual report to be submitted to the EPD during the second half of 2018.

4.4 Excavations

All site excavation was performed within the areas targeted for source removal as discussed in Section 4.2. The actual depth of each excavation was defined by the groundwater conditions at

the time of excavation.

At each excavation, the soil was screened for evidence of COCs with a photoionization detector (PID) and logged. Suspected hazardous and non-hazardous soils were segregated and staged within each individual AOC during soil removal activities. All excavated material was placed on plastic sheeting with a thickness of adequate thickness and strength and covered with plastic sheeting at the end of each work day.

4.4.1 AOC-3

Referring to Figure 4-5, the excavation within AOC-3 resulted in removal of soil material from an area of approximately 147 square feet and to depth of approximately 6 feet below grade. Excavated soil was placed onto plastic sheeting and temporarily stockpiled within the southern perimeter of AOC-3, prior to characterization and disposal. The excavation resulted in the removal of approximately 24 cubic yards of soil from AOC-3.

On March 23, 2018, excavation confirmation soil sampling was performed to confirm the removal of contaminated soil containing CVOC concentrations above the RRS. Four samples were collected from approximately three feet below the top of each excavation sidewall (AOC-3 1, AOC-3 2, AOC-3 3 and AOC-3 4) and analyzed for volatile organic compounds (VOCs) using EPA Method 8260B. The approximate excavated area, analytical results and confirmation sampling locations are shown on Figure 4-5.

A total of four confirmation sample sets and one duplicate sample set collected from the sidewalls of the excavation were submitted for laboratory analysis. Gloves worn for sample handling were discarded between sample collections as investigation-derived waste (IDW). All soil samples were appropriately packaged, placed in ice-filled coolers and delivered to Analytical Environmental Services of Atlanta, Georgia, a GA Department of Natural Resources-certified laboratory, for analysis. Samples were preserved by maintaining a temperature of 4°C in the sample coolers. The laboratory analytical results are provided in Attachment 4-1.

Referring to Table 4-1, the results of the excavation confirmation sampling indicated that CVOCs did not exceed the RRS and as such, no additional excavation and confirmation sampling would be required.

4.4.2 AOC-4

Referring to Figure 4-6, the excavation within AOC-3 resulted in removal of soil material from an area of approximately 1,508 square feet and to depth of approximately 6 feet below grade. Excavated soil was placed on plastic sheeting and temporarily stockpiled within the southern perimeter of AOC-4, prior to characterization and disposal. The excavation resulted in the removal of approximately 264 cubic yards of soil from AOC-4.

On March 27, 2018, excavation confirmation soil sampling was performed to confirm the removal of contaminated soil containing CVOC concentrations above the RRS. Two samples were collected from approximately three feet below the top of the southern excavation sidewall (AOC-4 2 & AOC-4 3) and four samples were collected from approximately three feet below the top of each northern, eastern and western excavation sidewalls (AOC-4 1, AOC-4 4, AOC-4 5 and AOC-4 6). Soil samples collected from the AOC-4 excavation sidewalls were analyzed for VOCs using EPA Method 8260B. The approximate excavated area, analytical results and confirmation sampling locations are shown on Figure 4-6.

Referring to Table 4-2, the results of the excavation confirmation sampling indicated that CVOC concentrations for the sample collected from the north-west sidewall (AOC-4 5) exceeded the RRS and as such, additional excavation and confirmation sampling would be required in this portion of the excavation. Additional excavation will therefore be conducted in during the AOC-6 source removal activities.

A total of 6 confirmation sample sets and one duplicate sample set collected from the sidewalls were sent for laboratory analysis. Gloves worn for sample handling were discarded between sample collections as IDW. All soil samples were appropriately packaged, placed in ice-filled coolers and delivered to Analytical Environmental Services of Atlanta, Georgia, a GA Department of Natural Resources-certified laboratory, for analysis. Samples were preserved by maintaining a temperature of 4°C in the sample coolers. The laboratory analytical results are provided in Attachment 4-1.

4.4.3 AOC-6

Excavation in AOC-6 is expected to begin in concurrence with GPA site redevelopment, currently scheduled to start in June/July of 2018. Details concerning the excavation within AOC-6 are expected to be included in the subsequent semi-annual report submitted to the EPD during the second half of 2018.

4.5 Backfilling

After excavating the targeted source material from AOC-3 & AOC-4, each excavation was backfilled and compacted with clean material to grade.

SECTION

5

5.0 Disposal of Contaminated Material

As discussed in section 4.4, the excavations resulted in the generation of approximately 24 cubic yards of soil and approximately 264 cubic yards of soil from AOC-3 and AOC-4, respectively. These soils were sampled and disposed of in regulated facilities as discussed in the following subsections.

5.1 Stockpile Sampling

As discussed in Section 4, the soils excavated from AOC-3 and AOC-4 areas were stockpiled in staging areas adjacent to the respective AOCs. On March 23rd, 2018 MTL collected one sample set from each of the 10 stockpiles in the AOC-3 staging area. One five-point composite sample was collected from each of the following stockpiles: P3, NP2 & SP5 and one grab sample was collected from each of the remaining stockpiles: 2812, N25134, N26030, N48000, N48304, N48544 & P1. The grab and composite samples were analyzed for TCLP VOCs (8260B), TCLP SVOCs (8270D) and TCLP Metals (6010C/7470A).

On March 28th, 2018, MTL collected one sample set from each of the 3 stockpiles located in the AOC-4 staging area. Three grab samples were collected from each of the following stockpiles: P4, P5 & P6. The grab samples were analyzed for TCLP VOCs (8260B), TCLP SVOCs (8270D) and TCLP Metals (6010C/7470A).

All thirteen samples from the two AOCs were submitted for laboratory analysis. Gloves worn for sample handling were discarded between sample collections. All soil samples were appropriately packaged, placed in ice-filled coolers and delivered to ENCO Laboratories of Jacksonville, Florida, a FL State Department of Health-certified laboratory, for analysis. Samples were preserved to maintain a temperature of 4°C. The laboratory analytical results are provided in Attachment 5-1.

5.2 Transportation and Disposal

Based on the results of the laboratory analysis, the excavated soils staged in the AOC-3 and AOC-4 areas were classified as non-hazardous or hazardous soils as appropriate. The following subsections provide more insight into the analysis and the disposition of the excavated soils.

5.2.1 Non-hazardous Soil

Based on the stockpile sampling laboratory results, an estimated 276 cubic yards (cu yds) of soil were categorized as non-hazardous. This non-hazardous soil was loaded into 25-cu yd roll-offs using excavation equipment.

MTL retained Atlantic Waste Services, Inc. to transport the soil to Superior Landfill & Recycling Center in Savannah, Georgia. Copies of the executed waste manifests will be included in the subsequent semi-annual report due in the second half of 2018.

5.2.2 Hazardous Soil

Based on the stockpile sampling laboratory results, an estimated 12 cu yds of soil were categorized as hazardous. This hazardous soil material was loaded into a single 25-cu yd roll-off using excavation equipment.

MTL staged roll-off, containing the hazardous material, along the northern end of AOC-4. MTL is currently awaiting approval of the transfer and disposal of the hazardous material by an approved hazardous waste disposal contractor. Copies of the executed waste manifests will be included in the subsequent semi-annual report due in the second half of 2018.

SECTION

6

6.0 GPA Redevelopment

Per EIC's understanding from GPA, GPA's redevelopment project affecting the site, as discussed in Section 2 and Section 4.4.3, includes the construction a paved area for additional container storage and a new access road. The proposed construction will consist of erosion, and sedimentation control, the installation of stormwater drainage utilities and structures, asphalt pavement and base material, asphalt milling and overlay, concrete paving and curb, pavement striping and road signage, electrical and fiber-optics utilities installation.

GPA plans to provide protection of all on-site monitoring and recovery wells during construction activities that are proposed to take place as part of the redevelopment.

SECTION

7

7.0 Summary

After the submittal of the Seventh Semi-annual Progress Report in May 2017, EIC continued the implementation of various tasks outlined in the VIRP and as directed by the EPD. The following paragraphs summarize these activities.

In October 2017, EIC conducted the second semi-annual groundwater monitoring event of 2017. This event served as the sixth round of groundwater monitoring after the installation of 20 new monitoring wells in February 2015. The data from this event was used for comparative analysis of characteristics of the monitored COC plumes of this event with the characteristics of the plumes during previous monitoring events. Based on the relatively high levels of PCE degradation products observed at the site that occurred during the October 2017 event, it is evident that natural attenuation is progressing well at the site. In general, the COC plume is stable and confined to a relatively small area within the site and it continues to decrease in overall concentration.

As reported in the previous semi-annual reports, only 3 of the 10 areas of concern required excavation for removal of hot-spot soil material. In March 2018, MTL completed excavation of contaminated material from AOC-3 and AOC-4. After collecting confirmation samples from the sidewalls, MTL backfilled both excavations with clean material. The results of the confirmation sampling confirmed that all contaminated soils exceeding the RRS levels were successfully removed from the AOC-3 area. One sidewall sample from the AOC-4, however, indicated that additional excavation would be required to remove contaminated material north of the northeast portion of the excavated area within AOC-4. Additional excavation will be conducted in this area during a separate mobilization to be performed in the removal of hot-spot source material removal in the AOC-6 area.

In addition to the hot spot removal remediation tasks, EIC has initiated the process for implementing a groundwater recovery and treatment system for the enhanced attenuation of dissolved COCs.

SECTION

8

8.0 Monthly Summary of Hours

A monthly summary of hours invoiced for the aforementioned tasks during the period from November 2017 through April 2018 is summarized in Attachment 9-1.

*Wells with screen intervals reaching depths greater than 20 feet below ground surface are considered deep wells, otherwise they are considered shallow wells. Note that, well G-22R is considered a shallow well, despite its total depth greater than 20 feet bgs due to its location on an earthen berm with a height of approximately 12 feet above the native ground surface.

Table 3-2: Chronological Groundwater Quality Field Parameters Summary

Well ID #	Sample Date	Temp (Celcius)	pH (SU)	ORP (mV)	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)

	4/25/2017	24.97	5.50	95	0.826	9.60	1.40
	10/3/2017	26.40	7.62	-18	0.236	6.00	0.90

Notes:

Field parameters were recorded by EIC during groundwater monitoring events after stabilization had been reached and prior to sample collection. Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell

SU - Standard Unit
mV - Millivolts
mS/cm - Microsiemens per centimeter
NTU - Nephelometric Turbidity Unit
mg/L - Milligrams per liter
ABD - Abandoned

McKenzie Tank Lines, Port Wentworth, GA

Table 4-1: Excavation Sidewall Sample Results - AOC-3

Constituents	CAS No.	Type 3 Soil RRS	AOC-3 1	AOC-3 2	AOC-3 3	AOC-3 4
		(µg/kg)	(µg/kg)	(µg/kg)	(µg/kg)	(µg/kg)
Tetrachloroethene	127-18-4	500	<1.9	**5.7 J**	**8.0**	<1.8
Trichloroethene	79-01-6	500	<1.7	<1.9	<1.4	<1.6
1,2-Dichloroethene (cis)	156-59-2	7,000	<2.3	<2.5	<1.9	<2.1
Vinyl chloride	75-01-4	200	<2.6	<2.9	<2.2	<2.5
Benzene	71-43-2	500	<0.74	<0.81	<0.62	**1.1 J**
Ethylbenzene	100-41-4	70,000	**0.7 J**	<0.68	<0.53	<0.58
Toluene	108-88-3	100,000	<0.66	**8.2**	**4.0 J**	**1.4 J**
Total Xylenes*	1330-20-7	1,000,000	**2.0 J**	<1.3	<0.99	**2.4 J**

Notes:

* = Total Xylenes is calculated based on the total sum of individual isomer concentrations, if a "J" value was assigned to any of the isomers, the "J" value was added to the sum presented in the table

Final RRS values derived from Type 3 values listed in revised Table 1-4 included in the First VIRP Semi-annual Progress Report (2014)

5 - Concentration is above Type 3 RRS criteria (No concentrations exceeded Type 3 RRS)

5 - Concentration is above method detection limits but below RRS criteria

<1.3 - Concentration is below method detection limits

J - Concentration is less than the recovery limit but greater than or equal to the method detection limit and therefore the concentration is an appr

B - Compound was found in method blank and sample

Table 4-2: Excavation Sidewall Sample Results - AOC-4

Constituents	CAS No.	Type 3 Soil RRS	AOC-4 1	AOC-4 2	AOC-4 3	AOC-4 4	AOC-4 5	AOC-4 6
		(µg/kg)	(µg/kg)	(µg/kg)	(µg/kg)	(µg/kg)	(µg/kg)	(µg/kg)
Tetrachloroethene	127-18-4	500	<1.7	**2.6 J**	**12**	<1.9	**3,600**	**13**
Trichloroethene	79-01-6	500	<1.5	<1.5	<1.6	<1.7	**9.7**	<1.6
1,2-Dichloroethene (cis)	156-59-2	7,000	<2.0	**6.5**	**13**	**4.5 J**	**2,900**	**4.9 J**
Vinyl chloride	75-01-4	200	<2.4	<2.3	<2.4	<2.6	**64**	<2.4
Benzene	71-43-2	500	<0.66	<0.64	<0.67	<0.73	<0.60	<0.68
Ethylbenzene	100-41-4	70,000	<0.56	<0.54	<0.56	**8.5**	**4.6 J**	<0.58
Toluene	108-88-3	100,000	<0.59	**1.4 J**	<0.60	**1.6 J**	**14**	<0.61
Total Xylenes*	1330-20-7	1,000,000	<1.1	<1.0	<1.1	**7.6 J**	**9.9 J**	<1.1

Notes:

* = Total xylenes is calculated based on the total sum of individual isomer concentrations, if a "J" value was assigned to any of the isomers, the "J" value was added to the sum presented in the table

Final RRS values derived from Type 3 values listed in revised Table 1-4 included in the First VIRP Semi-annual Progress Report (2014)

5 - Concentration is above Type 3 RRS criteria

5 - Concentration is above method detection limits but below RRS criteria

<1.3 - Concentration is below method detection limits

J - Concentration is less than the recovery limit but greater than or equal to the method detection limit and therefore the concentration is an approximate value

B - Compound was found in method blank and sample

NOTES: AERIAL PHOTO IS FROM USGS 0.15m RESOLUTION ORTHOIMAGERY DATABASE. FORMER MCKENZIE PROPERTY BOUNDARY IS DERIVED FROM HISTORICAL TAX PLAT MAPS AVAILABLE FROM THE CHATHAM COUNTY TAX ASSESSORS OFFICE. WELL LOCATIONS AND OTHER SITE FEATURES ARE BASED UPON SURVEYS CONDUCTED BY BREWER LAND SURVEYING COMPANY IN OCTOBER 2013, EMC ENGINEERING SERVICES IN JUNE 2015 AND MOCK SURVEYING IN JANUARY 2016 AND MAY 2017. OTHER FORMER SITE FEATURES WERE PLOTTED BASED UPON HISTORICAL SITE MAPS FROM McKENZIE TANK LINES. WELLS SCREENED AT INTERVALS APPROXIMATELY BETWEEN 10 AND 20 FEET BELOW GROUND SURFACE ARE CONSIDERED SHALLOW WELLS. WELLS SCREENED AT INTERVALS APPROXIMATELY 20 FEET OR GREATER BELOW GROUND SURFACE ARE CONSIDERED DEEP WELLS.

NOTES: AERIAL PHOTO IS FROM USGS 0.15m RESOLUTION ORTHOIMAGERY DATABASE. FORMER MCKENZIE PROPERTY BOUNDARY IS DERIVED FROM HISTORICAL TAX PLAT MAPS AVAILABLE FROM THE CHATHAM COUNTY TAX ASSESSORS OFFICE. SECURITY FENCE AND OTHER SITE FEATURES ARE BASED UPON SURVEY CONDUCTED BY BREWER LAND SURVEYING COMPANY IN OCTOBER 2013.

AOC SOIL SAMPLING RESULTS ARE FROM JANUARY AND MARCH 2015 SOIL SAMPLING EVENTS. CONSTIUENTS OF CONCERN (COCS) INCLUDE PCE, TCE, DCE, VC, AND BTEX. SAMPLES WERE COLLECTED AT BOTH SHALLOW (1-3 FT.) AND DEEP DEPTHS (3-5 FT.) BELOW GROUND SURFACE IN THE VADOSE ZONE.
