Subject: **Seventh VIRP Semi-annual Progress Report**
Former McKenzie Tank Lines Site
HSI Site No. 10406
111 Grange Road, Port Wentworth, Georgia
Tax Parcels: 1-0729-01-007 and 1-0729-01-009

Dear Mr. Metzger:

On behalf of McKenzie Tank Lines, Inc. (MTL), Environmental International Corporation (EIC) is pleased to submit the attached Seventh VIRP Semi-annual Progress Report for the above referenced site.

Enclosed are the following:

1. One signed and sealed certification page for the report.
2. One bound paper copy of the report.
3. Two Compact Discs, each with the report in searchable PDF format.

If you have any questions regarding this submittal, please contact Mr. Thomas F. Panebianco of MTL at 1-800-828-6495 or me at the above location.

Sincerely,

ENVIRONMENTAL INTERNATIONAL CORPORATION

Raj Mahadevaiah, P.E., C.G.W.P.
President & CEO

CERTIFICATION AND SUPPORTING DOCUMENTATIONS
Seventh VIRP Semi-annual Progress Report
Former McKenzie Tank Lines Site, Port Wentworth, Georgia
HSI Site No. 10406
November 20, 2017

"I certify under penalty of law that the accompanying report referenced above and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional engineer who is registered with the Georgia State Board of Registration for Professional Engineers and Land Surveyors/Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Investigation and Remediation Plan (VIRP) development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

1.0 Introduction

On behalf of McKenzie Tank Lines, Inc. (MTL), Environmental International Corporation (EIC) is pleased to submit this "Seventh VIRP Semi-annual Progress Report" to Georgia Environmental Protection Division (EPD). This report chronicles project activities concerning the former MTL, Hazardous Site Inventory (HSI) site 10406, located at 111 Grange Road, Land Lot 30, Tax Parcel IDs 1-0729-01-007 and 1-0729-01-009, Port Wentworth, Georgia, (Site). This report was prepared as specified in the January 29, 2014 "Voluntary Investigation and Remediation Plan (VIRP) Application" that was approved by the EPD on May 20, 2014 under the Voluntary Remediation Program (VRP) (EIC, 2014a).

1.1 Primary Objective

The primary objective of this report is to chronicle the tasks completed by MTL during the six-month time frame during the period of from April 2017 through November 2017. This report documents the following tasks:

- Follow-up responses to the October 6, 2016 EPD Comment letter;
- The fourth semi-annual groundwater monitoring event;
- Additional preliminary groundwater monitoring of newly installed wells
- Additional soil delineation sampling in AOC-6;
- Installation/abandonment of monitoring wells at the Site

A Site map is included as Figure 1-1. The following sections describe the aforementioned tasks.

SECTION

2

2.0 Response to EPD Comment Letter

2.1 Follow up Responses to the October 8, 2016 Comment Letter

The following are follow-up responses on behalf of MTL to selected comments from EPD's review and list of comments letter, dated October 6, 2016 (EPD, 2016).

Comments and Responses

EPD Comment 3:

EPD concurs with abandoning monitoring wells G-22 and MW-U2; however, EPD does not concur with removing these well locations from the monitoring well network. If G-22 and MW-U2 are abandoned, please replace each well as close to its original location, depth and screen interval as possible, and follow EPA Region 4 SESD guidance documents for installing and abandoning monitoring wells. EPD understands that no well construction data exists for MW-U2. If abandoned, please replace MW-U2 to a depth representative of shallow groundwater contamination conditions.

Follow-up Response to EPD Comment 3:

Referring to the follow-up response to EPD Comment 3 discussed in the Sixth VIRP Semiannual Report (EIC, 2017a), EIC has prepared a discussion in Section 5 of the report to document the abandonment process that EIC utilized for wells MW-U2 and G-22 as well as the well installation method utilized to replace MW-36.

EPD Comment 4:

EPD concurs with the proposed additional soil samples to complete delineation in AOC-6.

Follow-up Response to EPD Comment 4:

As a follow-up response to EPD Comment 4 (EIC, 2017a) EIC has proceeded with additional soil sampling conducted in late April 2017. Details and analytical results of this sampling event are discussed in Section 4.0 of this report.

2.2 Follow-up Responses to the January 8, 2016 Comment Letter

The following discussion is a follow-up response, on behalf of MTL, to select comments from the EPD's review and list of comments letter, dated January 8, 2016 (EPD, 2016a) that were originally addressed in the Fourth and Fifth Semi-annual Reports (EIC, 2016a, 2016b).

EPD Comment 6:

EPD does not concur with the conclusion that PCE and TCE have been delineated in groundwater to the Type I risk reduction standard (RRS). To complete the required delineation, please conduct additional groundwater investigations in the following locations:

To the south of MW-32 and MW-47D, between the wells and the surface water feature.

North of MW-44D, and east of MW-47D and MW-44D.

Follow-up Response to EPD Comment 6:

EIC has completed the installation of monitoring wells to the south of MW-32 and MW-47D. The installation of these monitoring wells is chronicled in Section 5.0. These wells were incorporated in the October 2017 groundwater monitoring event conducted by EIC. The results of the October 2017 monitoring event will be presented in the next VIRP Semiannual Report. For reasons discussed in Section 5.0, EIC was unable to complete the installations for proposed wells north of well MW-44D, and east of wells MW-47D and MW-44D.

SECTION

3

3.0 Groundwater Monitoring

EIC conducted the eighth groundwater monitoring event of the VIRP in April 2017. During this monitoring event, EIC gauged the groundwater levels at all wells of the monitoring well network onsite, collected groundwater samples from each of these wells for laboratory analysis of four chlorinated volatile organic compound (CVOCs) constituents of concern (COCs) established in the VIRP along with other CVOCs and VOCs, and conducted other related tasks.

3.1 Groundwater Monitoring Objectives

The primary objectives of the groundwater monitoring program are to meet the following goals set forth in the VIRP:

- Establish a baseline for COC plume stability analysis,
- Track the natural attenuation of COCs by monitoring the groundwater concentrations of COCs and water quality parameters within the existing COC plumes,
- Determine if the prevailing groundwater COC concentrations are meeting or trending towards meeting the established RRS, and
- Determine if the horizontal and vertical extents of the COCs have been defined.

3.2 Groundwater Monitoring Field Program

During the April 2017 monitoring event, EIC conducted groundwater monitoring activities at a total of 44 wells onsite. As documented in the VIRP, wells with screened intervals that are less than 20 feet below ground surface (bgs) were historically defined as shallow wells and those with screened intervals reaching greater than 20 feet bgs were defined as deep wells, regardless of the screened interval length (EIC, 2014a). Since this definition was accepted by the EPD, EIC has maintained this definition with newly installed wells. Accordingly, of the 44 wells monitored during this event, 19 are defined as shallow wells and 25 are defined as deep wells.

Four of the 25 deep wells are recovery wells (RW-1, RW-4, RW-8, and RW-9). Each of these recovery wells consists of a 4-inch internal diameter (ID) well casing/screen, with the exception of RW-4, which has a 6-inch ID well casing/screen. Of the remaining 21 deep monitoring wells, the IDs of the well casings/screens range in size from 3/4-inch to 2-inches.

In addition to the April 2017 monitoring event, that utilized all available wells onsite, EIC performed a subsequent onsite groundwater monitoring event in July 2017 utilizing three newly installed wells (G-22R, MW-57S, MW-58D) that EIC installed after the April 2017 monitoring event, as discussed in Section 5. As these wells are located in areas of the Site that are crucial for the delineation of the groundwater plumes at the Site, EIC gauged water levels and collected groundwater samples from each of these three wells during the July 2017 monitoring event. EIC referenced the groundwater levels and analytical results from the July 2017 event on the potentiometric surface and COC isoconcentration contour maps described in Sections 3.4.1 and 3.4.2, respectively, however, they were not considered by EIC in generating these maps, as this event occurred three months after the April monitoring event.

3.2.1 Sampling Protocol

EIC conducted the groundwater sampling program in accordance with the current U.S. EPA Region 4 groundwater sampling procedure "Field Branches Quality System and Technical Procedures" (FBQSTP), per EPD regulations. Each monitoring well was gauged, purged, and sampled following the "low-flow" purge technique established in the standard operating procedure (SOP) SESDPROC-301-R3 under the FBQSTP (EPA, 2013).

3.2.2 Site Access

Prior to the field visit, EIC coordinated with GPA in gaining access to the Site to conduct groundwater monitoring and related tasks. All work at the Site was completed under the supervision of EIC.

3.2.3 Groundwater Gauging

Prior to sampling, EIC gauged each well with a decontaminated oil-water interface meter (or "probe") to determine the static depth to groundwater from the well top-of-casing (TOC). EIC utilized TOC elevations documented in recent well surveys to determine the current groundwater elevations. The gauging data for the April 2017 and July 2017 monitoring events are tabulated in Table 3-1.

3.2.4 Groundwater Sampling

Following the "low-flow" purge technique, noted in Section 3.2.1, EIC utilized a peristaltic pump with variable lengths of disposable 1/4-inch ID Teflon-lined tubing and a 6-inch segment of 3/16-inch ID silicon tubing at the pump head to purge each well until groundwater quality

parameters reached stabilization prior to sampling. EIC determined the length of Teflon-tubing necessary to initially place the intake at the center of the wetted screened interval of each well by considering water levels gauged just prior to purging during this monitoring event and the available well construction data, as noted in EIC's well purging and sampling data field logs (Attachment 3-1). To determine the tubing length, EIC also considering that additional tubing may be needed should it become necessary to lower the tubing below the initial intake depth due to drawdown causing the water level to reach the initial tubing intake, as described following.

Groundwater stabilization parameters were monitored via direct pumping to a multi-parameter field water quality meter equipped with a flow-through cell. These parameters were recorded at approximately five-minute intervals on EIC field logs during both the April and July 2017 monitoring events (Attachments 3-1 and 3-2, respectively). Additionally, purge volumes and depth-to-water (DTW) measurements were recorded at the same five-minute intervals when possible. At each well, the pumping rate was decreased, and/or the tubing depth increased when drawdown lowered the water level to the tubing intake level, causing air to be pumped.

When purging 1-inch and 3/4-inch diameter wells, while the Teflon tubing (that has a 3/8-inch outer diameter (OD)) was inserted in the well, the oil-water interface probe (that has a 5/8-inch OD) could not be simultaneously inserted into the well to gauge the depth to water due to space limitations. At these wells, gauging could only be performed just prior to inserting the tubing and immediately after the tubing was removed.

EIC collected all samples using the "soda straw method" specified in the SOP SESDPROC-301-R3 under the FBQSTP (EPA, 2013). Under this SOP, EIC considered that stabilization was reached when 3 consecutive groundwater quality parameter readings were within ± 0.1 standard units for pH and ± 5% for specific conductivity during purging. EIC made reasonable attempts at each well to reach 0.2 mg/L of dissolved oxygen (DO) and a turbidity reading at or below 10 Nephelometric Turbidity Units (NTUs) prior to sampling. Groundwater quality field parameters (Temperature, pH, oxygen reduction potential (ORP), conductivity, turbidity, and DO) after stabilization and prior to sample collection are summarized in Table 3-2.

It is important to note that during the July 2017 monitoring event, when EIC collected groundwater samples from wells G-22R, MW-57S, and MW-58D, EIC measured turbidity levels above 10 NTUs at each well prior to collecting each sample. EIC could not sample after lower NTUs had been reached due to time constraints. The high turbidity was most likely due to well development activities conducted after each well was installed. All other parameters, however, had stabilized at each of these wells prior to sample collection.

3.2.5 Sample Custody and Laboratory Analysis

Immediately after each sample set was collected, the sample bottles were labeled, and the samples were stored with ice in double-sealed bags in laboratory-provided insulated containers ("coolers") provided by the contracted laboratory. EIC maintained the temperature of the samples in these containers with sufficient ice, kept completed chain-of-custody forms with all samples, and kept

custody of the samples at all times until EIC relinquished the samples to the laboratory.

EIC delivered the samples to Analytical Environmental Services, Inc. in Atlanta, Georgia - a Georgia Department of Natural Resources (DNR) certified laboratory. The laboratory conducted analysis of volatile organic compounds according to EPA method 8260B. The laboratory reports for both the April 2017 and July 2017 monitoring events are included as Attachment 3-3 and Attachment 3-4, respectively. The analytical results of samples collected from both the shallow and deep wells are summarized in Tables 3-3 and 3-4, respectively, along with historical analytical results.

3.3 Quality Assurance and Quality Control

To prevent cross-contamination, new disposable Teflon-lined tubing was utilized to collect a groundwater sample at each well. EIC decontaminated its oil/water interface meter and any of its other reusable field equipment that came in contact with groundwater prior to use and between sample locations. EIC accomplished this by first washing this equipment with a pressurized phosphate-free detergent solution and then rinsing with pressurized de-ionized (DI) water. EIC also utilized brushes and/or wipes if necessary.

After each sample was collected, the water quality parameters instrument flow-through cell was opened and decontaminated with pressurized DI water. In the event of gross contamination, EIC used detergent solution in addition to DI water in cleaning this instrument.

For sample quality assurance and quality control, EIC maintained a laboratory-provided trip blank set in each of the sample containers. The laboratory analyzed each trip blank via EPA method 8260B as with the groundwater samples collected at the Site.

3.4 Data Evaluation

EIC conducted an evaluation of the data compiled and tabulated from field measurements and laboratory analyses. This evaluation enabled the depiction of the groundwater potentiometric surface, as well as the extents of the prevailing COC plumes at the time of the April 2017 monitoring event.

It is important to note that the potentiometric surface maps and plume delineation maps presented in this report are based only on data EIC collected during the April 2017 monitoring event and don't include data EIC collected during the July 2017 monitoring event. EIC referenced the data EIC collected during the July 2017 monitoring event (regarding three wells) when preparing these maps, however, EIC did not consider this data to prepare either potentiometric surface contour nor COC isoconcentration contour maps.

As established in the VIRP, EIC has continued to distinguish between unconfined shallow and apparently partially confined deep aquifers in illustrating groundwater potentiometric surfaces and COC plumes. The following subsections describe EIC's evaluation of the shallow and deep potentiometric surfaces and the four COC plumes monitored at the Site.

3.4.1 Groundwater Potentiometric Surfaces

3.4.1.1 Shallow Groundwater Potentiometric Surface

The April 2017 groundwater gauging event data is summarized in Table 3-1. In addition, all historical shallow groundwater gauging data collected at the Site following the initiation of the VIRP program is summarized in Table 3-5. EIC compared the shallow well gauging data from the April 2017 monitoring event to each of the historical monitoring events.

Referring to Table 3-5, on average, the surface groundwater elevations at each utilized well across the Site for the April 2017 event, which define the shallow groundwater potentiometric surface, were higher than those of the November 2016 gauging event but, lower than the historical average observed since VIRP monitoring began in July 2014.

Utilizing the data presented in Table 3-1, EIC prepared a shallow groundwater potentiometric surface map, illustrated in Figure 3-1. Due to the historically anomalous groundwater elevation observed at well MW-2S, relative to the groundwater elevations at surrounding wells, the data from this well was not considered for potentiometric surface contouring. The anomaly observed at this well may have resulted from this well having a relatively shallow depth of completion (which is less than 10 feet bgs) relative to other shallow wells onsite and may represent perched groundwater conditions caused by confining and/or partially confining strata underlying this well.

EIC compared Figure 3-1 to previous shallow potentiometric surface maps included in all previous VIRP semi-annual progress reports (EIC 2014b, 2015a, 2015b, 2016a, 2016b, and 2017a). Based on the potentiometric surface during each of the seven gauging events under the VIRP, it is clearly evident that the groundwater generally flows from east-northeast to west-southwest across the Site and the shallow unconfined potentiometric surface remains relatively stable in elevation over time.

3.4.1.2 Deep Groundwater Potentiometric Surface

As with the gauging data from the shallow wells at the Site, EIC compared gauging data from the deep wells from the April 2017 monitoring events to those of the previous seven gauging events that are summarized in Table 3-6. Referring to Table 3-6, the average potentiometric surface elevations in deep wells in April 2017 were higher than those of the previous November 2016 monitoring event but, lower than the historical average.

Utilizing the gauging data in Table 3-1, EIC prepared a deep groundwater potentiometric surface map, Figure 3-2. EIC then compared the potentiometric surface in Figure 3-2 to previous deep potentiometric surface maps included in all previous VIRP semi-annual progress reports. In comparing the potentiometric surface from the April 2017 event with those of previous seven groundwater monitoring events, it is apparent that groundwater generally flows from east-northeast to west-southwest across the Site. Additionally, it is apparent that the deep potentiometric surface has remained relatively stable in elevation over time.

3.4.2 Horizontal Extent of COC Plumes

The COCs at the Site established in the VIRP consist of the CVOCs tetrachloroethene or perchloroethene (PCE), trichloroethene (TCE), cis-1, 2 dichloroethene (DCE), and vinyl chloride (VC). Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared Figures 3-3 through 3-10, which illustrate the horizontal extent of the four COC constituent plumes within both the defined shallow and deep aquifer horizons. In addition, the figures illustrate the horizontal extent of the plumes with concentrations both above RRS and above delineation criteria. The following four subsections describe the concentrations of each of the four COCs and the extents of the plumes in both the shallow and deep aquifer horizons, respectively.

3.4.2.1 PCE Plume

Utilizing the analytical results of samples collected during the April 2017 monitoring event, that are summarized in Tables 3-3 and 3-4, EIC prepared PCE isoconcentration maps to illustrate the horizontal extent of the PCE plume. The following subsections describe the PCE concentrations in both the shallow and deep aquifer horizons.

Shallow PCE

Figure 3-3 illustrates the horizontal extent of the shallow PCE plume based on samples from shallow wells during the April 2017 monitoring event. Referring to Figure 3-3, the shallow plume is confirmed to be above delineation criterion at wells MW-31, MW-32 and MW-50S. The shallow plume is also above RRS at MW-50S. PCE concentrations at all of the remaining monitoring wells were below the laboratory method detection limit (MDL). The November 2016 monitoring event is the first time - since the installation of MW-50S - that PCE concentrations at this well have been above RRS. During the previous April 2016 monitoring event, the PCE concentration observed at MW-50S was below MDL. EIC will continue to monitor the PCE concentration at MW-50S to determine if it persists above RRS.

Deep PCE

Figure 3-4 illustrates the horizontal extent of the deep PCE plume based on samples from deep wells during the April 2017 monitoring event. Referring to Figure 3-4, PCE concentrations at all wells sampled (apart from PAW-4) were below both the delineation criterion and RRS. PCE concentrations in PAW-4 were detected above the delineation criterion, but below the RRS. This represents an overall decrease in the concentrations and the extent of the plume, indicating that natural attenuation is occurring.

3.4.2.2 TCE Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared TCE isoconcentration maps to illustrate the horizontal extent of the TCE plume. The following subsections describe the TCE concentrations in both the shallow and deep aquifer horizons.

Shallow TCE

Figure 3-5 illustrates the horizontal extent of the shallow TCE plume based on samples from shallow wells during the April 2017 monitoring event. Shallow TCE concentrations that exceeded the RRS and the delineation criterion were detected at monitoring wells MW-31, MW-32, and MW-50S. It is worth noting that the concentration observed at MW-50S (1,900 µg/L) has increased slightly since the previous November 2016 monitoring event (1700 µg/L). The overall extent of the shallow TCE plume has remained relatively the same since November 2016.

Deep TCE

Figure 3-6 illustrates the horizontal extent of the deep TCE plume based on samples from deep wells during the April 2017 monitoring event. Deep TCE concentrations that exceeded the RRS and the delineation criterion were found at monitoring wells MW-2D, MW-47D, and PAW-4. The overall extent and concentrations of the April 2017 deep TCE plume are similar to those which occurred during the November 2016 event, with the exception of a decrease in concentration observed at MW-44D from 16 µg/L in November 2016 to 3.9 µg/L (estimated value).

Former recovery wells RW-1 and RW-4 were not considered for contouring due to the effects of excessive siltation (which EIC has determined exists in these wells), due to possibly corroded well screens, or due possible other forms of screen interferences.

3.4.2.3 cis-1, 2 DCE Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared DCE isoconcentration maps to illustrate the horizontal extent of the DCE plume. The following subsections describe the DCE concentrations in both the shallow and deep aquifer horizons.

Shallow DCE

Figure 3-7 illustrates the horizontal extent of the shallow DCE plume based on samples from shallow wells during the April 2017 monitoring event. Shallow DCE concentrations that exceeded the RRS occurred at monitoring wells MW-4S, MW-40S, and MW-50S. The overall extent of the shallow DCE plume during the April 2017 monitoring events were similar to that occurring during the November 2016 monitoring event. It should be noted, however, that the concentrations changed significantly within the plume, as compared with those of the November 2016 event, as follows: the concentration increased by approximately one-half at MW-4S, decreased by approximately one-third at MW-50S, and increased by approximately 3-fold at MW-40S. Overall, the peak concentration shifted from the trailing edge to the middle portion of the plume.

Deep DCE

Figure 3-8 illustrates the horizontal extent of the deep DCE plume based on samples from deep

wells during the April 2017 monitoring event. Deep DCE concentrations that exceeded the RRS occurred at monitoring wells MW-2D, MW-49D, MW-51D, PAW-4, RW-8, and RW-9. The overall extent of the April 2017 deep DCE plume was similar to the DCE plume of the November 2016 monitoring event. Monitoring well MW-53D was not considered for contouring due to the close proximity to wells with concentrations above RRS, such as RW-8. Historically, groundwater concentrations in this area have been above RRS and delineation criteria. Former recovery wells RW-1 and RW-4 were not considered for contouring due to the same reasons cited for the TCE plume.

3.4.2.4 VC Plume

Utilizing the analytical results summarized in Tables 3-3 and 3-4, EIC prepared VC isoconcentration maps to illustrate the horizontal extent of the VC plume. The following subsections describe the VC concentrations in both the shallow and deep aquifer horizons.

Shallow VC

Figure 3-9 illustrates the horizontal extent of the shallow VC plume based on samples from shallow wells during the April 2017 monitoring event. Shallow VC concentrations that exceeded the RRS occurred at monitoring wells MW-4S, MW-33, MW-40S, MW-46S, and MW-50S. The overall extent of the shallow VC plume decreased since November 2016, with concentrations decreasing below the RRS at wells MW-2S and MW-45S since November 2016. Concentrations increased slightly at wells MW-4S, MW-33, MW-40S, and MW-50S since November 2016. These increases may be due to the degradation of the parent COCs.

Deep VC

Figure 3-10 illustrates the horizontal extent of the deep VC plume based on samples from deep wells during the April 2017 monitoring event. Deep VC concentrations that exceeded the RRS occurred at monitoring wells MW-2D, MW-49D, MW-51D, MW-54D, MW-55D, PAW-4, RW-8, and RW-9. In general, the plume extent and concentrations were relatively similar to those of the November 2016 monitoring event, with the exception of an sharp increase in concentration at well RW-8 from 1.0 µg/L to 210 µg/L. Former recovery wells RW-1, RW-4 and monitoring well MW-53D were not considered for contouring for the same reasons they were not considered for the TCE plume. The overall extent of the deep VC plume slightly increased from the November 2016 to April 2017 groundwater monitoring events due to the increase in concentration at RW-8.

3.4.3 Horizontal Delineation of COC Plumes

As discussed further in Section 5.0, in April 2017, EIC attempted to install two additional monitoring wells up-gradient and east and northeast of wells MW-44D and MW-47D, respectively, for delineation purposes. However, due to flowing sand conditions encountered during drilling operations, EIC was unable to install the two additional monitoring wells and EIC had the boreholes grouted. In May 2017, EIC successfully installed three additional monitoring wells, G-22R (downgradient and southwest of G-22 – which was abandoned) and wells MW-57S

and MW-58D (down-gradient and southwest of wells MW-32 and MW-47D, respectively) for delineation purposes.

Based on results from the April 2017 monitoring event, it is apparent that the horizontal delineation of both the PCE and DCE plumes are complete. However, the horizontal delineation of the TCE and VC plumes are not complete. From Figure 3-6, the horizontal delineation of the deep TCE plume is not complete to the east (hydraulically up-gradient) of MW-47D. From Figure 3-9, horizontal delineation of the shallow VC is not complete to the east and north (hydraulically up-gradient) of MW-46S.

3.4.4 Vertical Delineation of COC Plumes

Of the current monitoring well network, well MW-35 is the deepest known well within the footprint of the COC plumes. This well is also located near the downgradient extent or leading edge of the COC plumes. Based on gauging measurements that EIC has collected and historical well data provided by a previous consultant, the total depth of MW-35 is 38.02 feet bgs. MW-35 has a 10-foot screen interval at the well bottom. Under the VIRP, EIC has sampled this well since February 2014. The associated analytical data for samples collected from the well is tabulated in Table 3-4.

Referring to Table 3-4, the concentrations of all monitored COCs in groundwater samples collected from MW-35 have consistently been below MDLs during all monitoring events since February 2014, with the exception of a concentration of 0.58 µg/L of DCE in April 2016 - which is well below the established RRS limit of 204 µg/L for DCE. EIC will continue to include well MW-35 in the monitoring program, but it appears that the vertical delineation of the plume has been completed.

3.4.5 Plume Attenuation and Stability

Based on the relatively high concentrations and horizontal extent of PCE degradation products observed at the Site in groundwater relative to PCE itself, it is clearly evident that natural attenuation of COCs dissolved in groundwater is occurring at the Site. Also, an overall comparison of the COC plume concentrations and horizontal extents between the July 2014 baseline monitoring event (that followed the installation of 20 new monitoring wells) and the April and July 2017 monitoring events indicates that the plumes are confined to a relatively small area within the Site and continue to decrease in concentration. This finding substantiates plume stability. EIC will continue to evaluate this trend and evaluate the extent of natural attenuation while implementing plans for active remediation.

4.0 Soil Delineation

4.1 Background

As discussed in previous semi-annual reports, EIC has completed the delineation of COCs in soil and sediments within nine of the ten areas of concern (AOCs) established in the VIRP for the Site, as well as two additional areas identified by the EPD, which are discussed in the Fifth VIRP Semiannual Progress Report. As discussed in the previous Fifth VIRP Semiannual Report, the horizontal delineation of AOC-6 was incomplete as of the July 2016 soil sampling event conducted by EIC. Following the submittal of the Fifth VIRP Semiannual Report, EIC conducted additional soil sampling within AOC-6 for delineation purposes in April 2017.

It is important to note that the water table in appears to be close to the ground surface at AOC-6. As such, there are areas west of AOC-6 where soil is fully saturated with groundwater up to ground surface, thus limiting the available area for soil sampling. EIC computed the depth to groundwater near AOC-6, utilizing historical groundwater gauging data from nearby wells, to determine where the soil is potentially saturated.

Based on this analysis, EIC determined that the soil, to the immediate west of the original AOC-6 boundary, is fully saturated up to ground surface. This site condition limits further horizontal extent delineation sampling in this area. Consequently, EIC utilized the eastern limit of saturated soils as the limits of sampling for collecting additional samples. The resulting sampling locations represent the farthest extent at AOC-6 where soil samples may be collected for delineation purposes. The soil saturation line near AOC-6 is illustrated in Figure 4-1 that includes the latest soil boring locations from April 2017.

The following subsections describe the soil sample locations and their collection, handling, and analysis regarding the April 2017 soil sampling event.

4.2 Sample Locations

Based on the results of previous soil and sediment sampling activities, EIC determined the locations for additional proposed soil delineation sampling. As discussed in Section 4.1, EIC identified boring locations west of AOC-6 and up to the soil saturation line illustrated in Figure 4-1.

At AOC-6, additional soil borings were conducted approximately 10 feet west from the locations of previous soil borings conducted in July 2016, where soil concentrations for COCs were above the delineation criteria. A survey map of the boring locations is included as Attachment 4-1. Figure 4-1 illustrates the new locations and previous soil and sediment sample locations within AOC-6 with COC concentrations, as well as the approximate limits of soil saturation line west of AOC-6.

Referring to Figure 5-7 of the Second VIRP Semi-annual Progress Report (EIC, 2015a), soil COC concentrations in one sample (AOC6-SD-3) collected within AOC-6, were above the delineation criteria. To further delineate the COCs in surrounding soil/sediment, EIC conducted additional soil and sediment borings within AOC-6 at sampling locations that extended westward from the most recent prior soil borings in the established grid pattern described in the Second VIRP Semi-annual Progress Report.

Considering that EIC extended horizontal soil delineation to the west of AOC-6, EIC encountered several large trees in these locations that block or impede sampling processes. As such, EIC collected samples as close to the original proposed boring locations as possible to stay away from large trees trunks.

4.3 Sampling Procedures

Following the soil sample collection guidelines specified in SESDPROC-300-R3 (EPA, 2014b), a hand-operated sand probe with disposable acetate sleeve inserts was utilized to collect soil cores at each boring location. Since the groundwater depth at AOC-6 typically ranges from 0 to 3 feet bgs, soil borings were conducted from 0 to 3 feet bgs or less if groundwater was reached.

As needed, EIC utilized a photo-ionization detector (PID) instrument to screen each core sample for VOCs prior to sample collection. If PID readings were elevated, EIC biased soil samples to the approximate location within the soil core where the PID readings most exceeded background concentrations. If PID readings did not indicate relatively high levels of VOCs, EIC collected samples at a discrete depth between 0-2 ft. bgs or just above the saturation point from each soil core utilizing Terra-core soil sampling kits. The collection depths and other related data for each soil sample is tabulated in Table 4-1.

EIC individually labeled all sample bottles and placed them, along with laboratory-supplied temperature blanks, in insulated coolers with ice, continuously maintained ice in the coolers, and then relinquished the samples to a Georgia-certified laboratory for analysis using EPA Method 8260B. EIC also submitted signed chain-of-custody forms to the laboratory with the samples.

4.3.1 Decontamination Procedures

To ensure that reusable equipment utilized to collect soil and sediment samples did not cause cross-contamination during sampling activities, EIC implemented an extensive decontamination procedure after the collection of samples from each location. The following subsections describe the decontamination procedure for each sampling equipment type.

4.3.1.1 Sand Probe

EIC conducted both the sediment and soil borings within the relatively soft/loose sediment and soils within AOC-6 utilizing a metallic sand probe, disposable acetate sleeve inserts, and a sliding hammer. Prior to and following the collection of these samples with the sand probe, EIC dismantled and decontaminated the probe. The probe tube was filled with an Alconox solution, temporarily sealed, and agitated to remove any gross contamination. The tube was then scrubbed with a pipe brush. Smaller parts of the probe, such as a removable probe tip and extension rod cotter connecting pins, were decontaminated by submerging in a phosphate-free detergent (Alconox) and scrubbing with a wire brush. After the sand probe assembly was thoroughly washed, the assembly was rinsed with deionized water and allowed to dry before reassembling for reuse.

4.4 Quality Assurance and Quality Control

To insure the quality of each soil/sediment sample collected, laboratory-supplied liquid trip blanks were kept with all sample bottle sets in each cooler container at all times throughout all sampling activities and these were submitted to a Georgia certified laboratory along with the soil/sediment samples collected for analysis using EPA method 8260B (VOC analysis). Each trip blank was also analyzed using EPA method 8260B. The laboratory results for the July 2017 sampling event are presented in Attachment 3-4 and include the results of the trip blanks. The analytical results of the trip blanks document that all VOCs were below detection limits. This finding indicates that no cross-contamination from volatile constituents occurred within each sample cooler.

4.5 Analysis and Analytical Results

Each soil and sediment sample was analyzed by a Georgia certified laboratory (Analytical Environmental Services (AES)) using EPA method 8260B. The laboratory results for all samples collected are included in Attachment 3-4. Results for each sample collected are also tabulated in Table 4-1 and illustrated in Figures 4-1. The following subsections describe the sample results and subsequent delineation status for each AOC.

4.5.1 AOC-6 Delineation

As discussed in Section 4.2, EIC conducted 7 additional soil borings at AOC-6 to complete soil delineation sampling. In general, the additional soil borings were conducted approximately 10

feet west from the locations of previous soil borings where sample concentrations of COCs were reportedly above the delineation criteria.

The results for each additional soil sample collected within AOC-6 are presented in Table 4-1 and the boring locations are illustrated in Figure 4-1. Referring to Figure 4-1, it is apparent that soil and sediment within AOC-6 has been horizontally delineated to the north, south, and east. However, the soil samples collected along the western side of AOC-6 during this sampling event were above the delineation criteria. Since soil samples just above the depth of saturated soil have been collected at all soil borings within AOC-6, the soil in the vadose zone within AOC-6 has been vertically delineated.

As previously discussed, sample concentrations of COCs were above the delineation criteria of samples collected along the western side of AOC-6 in July 2017. However, due to the shallow depth to groundwater west of AOC-6, further delineation by collecting soil samples farther to the west would not have been practical due to the likelihood that the water table would be at or near the ground surface, making sampling of soil above the saturated depth nearly impossible. Considering that several groundwater monitoring wells adequately address the COCs in that area, EIC considers that COCs in the saturated soils have been horizontally delineated within and to the west of AOC-6 up to the soil saturation point illustrated in Figure 4-1.

SECTION

5

5.0 Well Installation & Abandonment

5.1 Background

The following subsections described the activities performed at the Site from April to November 2017, to improve the current groundwater monitoring well network for COC plume delineation purposes. EIC contracted a Georgia professional drilling company to complete the well abandonment and installation tasks described in the subsections below.

5.1.1 Damaged Well Replacement

During the November 2016 groundwater monitoring event, EIC discovered that monitoring well MW-36 had been destroyed, apparently due to a falling tree branch during a storm. The unprotected PVC well stick-up was broken off below the ground surface and surface soil had fallen into and plugged the PVC casing. As such, MW-36 could not be utilized in the November 2016 monitoring event and EIC determined that it was irreparable. In April 2017, EIC abandoned the remnant of MW-36 and installed replacement well MW-36R in close proximity.

5.1.2 Replacement Monitoring Well

EIC had observed that the groundwater recharge in monitoring wells G-22 and MW-U2 was historically low relative to the well bottom during sampling events. Upon further review, EIC found that these wells were relatively shallow, leading to a question on whether groundwater samples collected from these wells would yield data that is of value to the overall monitoring program. Consequently, EIC had proposed the abandonment of these two wells, as noted in the Fourth VIRP Semi-annual Progress Report. The EPD concurred with EIC's abandonment recommendations in its October 2016 VIRP comments letter. However, the EPD requested that each well be replaced with a comparable new shallow groundwater monitoring well as close to their original locations, depths, and screen intervals as possible.

As discussed in the Fifth VIRP Semi-annual Progress Report, EIC agreed that a well of comparable depth and screened interval should be installed to replace G-22 after its abandonment. However, EIC did not concur with replacing MW-U2, as there are several shallow groundwater monitoring wells nearby to the former MW-U2 sampling location. Accordingly, EIC only installed a replacement well for G-22 in May 2017.

5.1.3 Additional Delineation Monitoring Well Installation

In response to the EPD VIRP Comments Letter dated January 18, 2016, EIC completed the installation of monitoring wells MW-57S and MW-58D to further delineate groundwater contamination to the south of MW-32 and MW-47D. In addition to the installation of MW-57S and MW-58D, EIC attempted to install two new monitoring wells to complete up-gradient delineation of groundwater COCs north of MW-44D and east of MW-44D and 47D. EIC was unable to install these wells, however, due to severe "flowing sand" conditions encountered during drilling operations. The logged soil data for the attempted well borings, SB-1 and SB-2, is included as Figures 5-1 and 5-2, respectively.

5.2 Site Mobilizations

EIC completed the abandonment of monitoring wells MW-U2, MW-36, and G-22, along with the subsequent installation of replacement monitoring wells MW-36R and G-22R during two mobilizations, one in April and one in May of 2017. Additionally, EIC installed monitoring wells MW-57S and MW-58D in May of 2017 during the second mobilization. During each mobilization, EIC marked the proposed location of each monitoring well and completed a buried utility check. Prior to the first mobilization, MTL cleared brush from the proposed locations of wells MW-57S and MW-58D. EIC supervised the same professional drilling company crew to complete the abandonment and/or installation of each monitoring well.

5.3 New Monitoring Well Locations

EIC installed replacement monitoring wells G-22R and MW-36R in the vicinity of abandoned wells G-22 and MW-36 to facilitate continued monitoring at these respective locations. Although EIC attempted to locate well G-22R as close to G-22 as possible, the drilling rig utilized could not reach the base of an approximately 12-foot high earthen berm with steep sides, where G-22 was located. As such, EIC installed G-22R at the top of this berm. EIC also considered overhead power lines and buried power and communication lines along the berm that posed safety concerns in selecting the final location of G-22R approximately 100 feet south and downgradient of G-22. As with other shallow monitoring wells that EIC has installed at the site, to ensure a sufficient water column for groundwater sampling, G-22R was installed to a depth of approximately 20 feet below the ground surface – which is at the base of the berm in this situation.

EIC installed monitoring wells MW-57S and MW-58D to the south of wells MW-32 and MW-47D, respectively, between the wells MW-32 and MW-47D and a storm water retention

pond. Monitoring wells MW-57S and MW-58D were installed at the locations EIC selected to delineate PCE, TCE and the other established COCs DCE and VC in groundwater to Type IV RRS.

Following the installation of the aforementioned wells, EIC contracted a Georgia licensed surveyor to survey the horizontal coordinates as well as the top of casing, ground surface, and top of concrete pad elevations for all of the newly installed wells. The horizontal coordinates for each well were surveyed in the Georgia State Plane East coordinate system. The elevations were recorded in the NAVD88 vertical datum. All new and replacement monitoring well locations, as well as two attempted wells that were abandoned (soil borings SB-1 and SB-2) are illustrated on the attached survey map included as Attachment 4-1.

5.4 Well Installations

In general, all of the aforementioned monitoring wells were installed in accordance with SESDGUID-101-R1 (EPA, 2013) and the Water Well Standards Act of 1985, O.C.G.A. 12-5-120 (GA, 2011). Well construction/lithological logs for all four wells are included as Figures 5-3 through 5-6.

All wells were installed utilizing a Geoprobe® 7822DT model hollow-stem auger drill rig. EIC installed all four wells with a 20/30 filter sand pack, which extends from two feet below the screened interval to two feet above the screened interval. EIC selected the filter pack considering the soil type previously characterized and logged by EIC during previous monitoring well installations and from sieve analysis of soil samples collected during the installation of previous monitoring wells. All well materials such as filter pack sand, bentonite, and grout were tremi-piped into the annulus space of each well to avoid smearing the screened interval with bentonite and to prevent bridging.

After allowing the installed well materials in the annulus space of each well to set for 24-hours, each well was developed utilizing the surge-and-block method. EIC developed each well until the water produced from each well was either visibly clear or translucent or until at least 55 gallons of water were purged from the well.

In addition to the four monitoring wells, discussed in the preceding section, EIC attempted to install 2 additional monitoring wells to complete up-gradient delineation of groundwater COCs at the eastern portion of the Site. Due to severe "flowing sand" conditions encountered during drilling, however, EIC was unable to install these wells, as described in Section 5.1.3. EIC also characterized and logged the lithology of the soil at each location where EIC either installed or abandoned the boreholes for these wells. The well logs of the attempted well locations are illustrated in Figures 5-1 and 5-2 as SB-1 and SB-2, respectively.

5.5 Investigation Derived Waste

Solid investigation derived waste (IDW) composed of soil cuttings generated from well installation activities were containerized into a total of nine sealed 55-gallon drums that EIC

labeled. Liquid IDW from well development and decontamination activities was containerized in a total of six sealed 55-gallon drums that EIC labeled. EIC staged both the solid and liquid IDW drums in an area on a concrete apron adjacent to the western wall of the former Tire Shop for future disposal.

SECTION

6

6.0 Remedial Action

As a remedial action, EIC proposed two key measures in the VIRP (EIC, 2014a). These measures entail implementation of the following tasks:

1. Removal of principal threats through soil hot spot removal or other cost-effective attenuation mechanisms accounting for GPA's site redevelopment program, and
2. Enhanced attenuation of residual groundwater integrating GPA's site redevelopment layout.

The following subsections outline EIC's progress in meeting these goals.

6.1 Source (Hot Spot) Removal

Following the approval of the VIRP, EIC has collected and analyzed soil/sediment samples from 10 AOCs to delineate the extents of COCs that were above delineation criteria or RRS. Based on the analytical results, EIC concluded that the soil samples from three of the ten AOCs indicated the presence of soil contamination above RRS. These AOCs include AOC-3, AOC-4, and AOC-6. Since the contaminated soils in these AOCs can be a potential source for groundwater contamination at the Site, EIC prepared a draft work plan entitled "Source Removal Work Plan (SRRP)." The SRRP identifies the extents of soil contamination above RRS and proposes a remedial strategy for the source areas within each of the three targeted AOCs. The work plan is currently under review by the GPA.

The primary tasks under the SRRP are to excavate source material composed of soil/sediments from the three AOCs. Per the SRRP, the stockpiled excavated material generated from the removal process will be sampled/characterized and segregated, waste manifests prepared, and the IDW soil transferred to an approved disposal facility. Also, the excavation will then be backfilled with clean fill. The SRRP addresses tree and brush clearing activities, confirmation sampling, sampling/characterization of stockpiled soils, and the relevant health and safety protocols. Upon GPA's review and approval of the work plan, EIC will revise and finalize this document.

6.2 Enhanced Attenuation of Residual Groundwater

In accordance with the approved VIRP, EIC is currently designing an Enhanced Attenuation System (EAS) to remediate the prevailing COCs in groundwater. The EAS will facilitate the extraction of contaminated water from a series of recovery wells within the CVOC foot-print and the reinjection of treated water with or without nutrient addition via an exfiltration system to promote attenuation.

The exfiltration system, located hydraulically up-gradient of the prevailing CVOC plume, will return the treated water to the subsurface through below-grade discharge pipes located hydraulically up-gradient of the treatment zone. For redundancy, the design will include additional pipes beyond the required flow capacity. This redundancy will ensure that additional standby convenience pipes are available in the event that the primary discharge pipe is blocked or is operating in reduced discharge efficiency.

In developing the design for the EAS, EIC conducted a shallow infiltration test utilizing a small two-foot deep trench lying within silt strata. Based on the results of the infiltration test, EIC explored the potential for discharging the treated water into deeper strata through an exfiltration system. This stratum appears to have a relatively highly-permeable zone beginning at a depth of approximately five feet or less below the ground surface. Currently, EIC is preparing a work plan for the installation of such an exfiltration system. The exfiltration system will be installed in two 300-foot long trenches that will extend approximately 5 feet below grade.

SECTION

7

7.0 Summary

After the submittal of the Sixth Semi-annual Progress Report in May 2017, EIC continued the implementation of various tasks outlined in the VIRP and as directed by the EPD. The following paragraphs summarize these activities.

In April 2017, EIC conducted the first semi-annual groundwater monitoring event of 2017. This event served as the fifth round of groundwater monitoring after the installation of 20 new monitoring wells in February 2015. The data from this event was used for comparative analysis of characteristics of the COC plumes of this event with the characteristics of the plumes during previous monitoring events. Based on the relatively high levels of PCE degradation products observed at the Site that occurred during the April 2017 event, it is evident that natural attenuation is ongoing at the Site. EIC has noted fluctuations in collective COC concentrations within the center of the plume and these will be further evaluated by EIC. However, in general, the COC plume is stable and confined to a relatively small area within the Site and it continues to decrease in concentration.

In April and May 2017, EIC also completed the abandonment of three monitoring wells, G-22, MW-U2, and MW-36, and the installation of two replacement monitoring wells, MW-36R and G-22R. In addition to abandoning and replacing wells, EIC installed two new monitoring wells, MW-57S and MW-58D, to further delineate dissolved. With the installation of the two new monitoring wells and subsequent groundwater monitoring in July 2017, it is apparent that the COC plumes are now delineated to the south of MW-32 and MW 47D for the shallow and deep aquifers, respectively.

In July 2017, EIC completed additional soil delineation tasks at AOC-6 which resulted in delineating soil west of AOC-6 up to a line where water table lies at or near the ground surface. Since the soil west of this line is fully saturated, EIC considers that groundwater in soil west of this point will be monitored and remediated under the groundwater monitoring and remediation program established in the VIRP, respectively.

Based on extensive soil sampling, EIC has determined that the soil samples from three of the ten AOCs indicated the presence of COCs in soil at concentrations above RRS. In October, EIC completed the preparation of a work plan for source (hot spot) removal of contaminated soil

from AOCs 3, 4, and 6. In addition to the hot spot removal remediation tasks, EIC has initiated the preparation of a work plan for implementing a groundwater recovery and treatment system for the enhanced attenuation of dissolved COCs.

	4/25/2017	24.97	5.50	95	0.826	9.60	1.40

Notes:

Field parameters were recorded by EIC during groundwater monitoring events after stabilization had been reached and prior to sampling

Parameters were measured with a Horiba U-52 Water Quality Meter with a Flow-Through Cell

* MW-35 was discovered during the July 2014 sampling event and the well formerly identified as MW-35 is considered to be MW-15S based on well design

SU - Standard Unit

mV - Millivolts

mS/cm - Microsiemens per centimeter

NTU - Nephelometric Turbidity Unit

mg/L - Milligrams per liter

McKenzie Tank Lines, Port Wentworth, GA

Notes:

110 - Value exceeds risk reduction standards

5 - Value exceeds delineation criteria

0.3 - Value exceeds detection limits

All data prior to August 2013 reported by previous environmental consultants

U - Value is below detection limits

NA - Well not accessible

NS - Well not sampled

NI - Well not installed

NU - Well not utilized in groundwater sampling program

NL - Well not located

< - less than method detection limit (MDL)

J - this is an estimated value that is above the MDL but below the practical quantitation limit

I* - not certain

Notes:

Top of casing (TOC) elevations are based on surveys conducted by Brewer Land Surveying in October 2013, EMC Engineering Services in June 2015, and Mock Surveying in January 2016.

*** - MW Min., Max., Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each monitoring well throughout all gauging events from July 2014 to April 2017 where available.

***[2] - Event Min, Max, Range, Avg., and Var.** - are the minimum, maximum, range, average, and total variance for each respective groundwater gauging event.

***[3]** - Global Min., Max., Range, Avg., and Var. - are the minimum, maximum, range, average, and total variance for all monitoring wells throughout all events from July 2014 to April 2017 where available.

NI - Not Installed N/A - Not Applicable ABD - Abandoned

NL - Not Located NM - Not Measured

Notes:

20,000 - Concentration is greater than RRS criteria

200 - Concentration is greater than delineation criteria

5 - Concentration is above method detection limits but below delineation and RRS criteria

<1.3 - Concentration is below method detection limits

J - Concentration is less than the recovery limit but greater than or equal to the method detection limit and therefore the concentration is an approximate value

B - Compound was found in method blank and sample

NOTES: AERIAL PHOTO IS FROM USGS 0.15m RESOLUTION ORTHOIMAGERY DATABASE. FORMER MCKENZIE PROPERTY BOUNDARY IS DERIVED FROM HISTORICAL TAX PLAT MAPS AVAILABLE FROM THE CHATHAM COUNTY TAX ASSESSORS OFFICE. WELL LOCATIONS AND OTHER SITE FEATURES ARE BASED UPON SURVEYS CONDUCTED BY BREWER LAND SURVEYING COMPANY IN OCTOBER 2013, EMC ENGINEERING SERVICES IN JUNE 2015 AND MOCK SURVEYING IN JANUARY 2016 AND MAY 2017. OTHER FORMER SITE FEATURES WERE PLOTTED BASED UPON HISTORICAL SITE MAPS FROM McKENZIE TANK LINES. WELLS SCREENED AT INTERVALS APPROXIMATELY BETWEEN 10 AND 20 FEET BELOW GROUND SURFACE ARE CONSIDERED SHALLOW WELLS. WELLS SCREENED AT INTERVALS APPROXIMATELY 20 FEET OR GREATER BELOW GROUND SURFACE ARE CONSIDERED DEEP WELLS.

SAMPLE COLLECTION TIME: 11:24

PREPARED BY: ADC

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

Length of tubing cut (ft.)	38.7
Initial tubing depth (ft.) BTOC	35.2
Final tubing depth (ft.) BTOC	35.2
Initial pump speed	low
Time pump speed was initialized	10:44
Pump speed at flow into cylinder	low
Started new roll of tubing at	~

	Time	Time	Time	Time	Time	Time	Time	Time
2,000 mL volume poured into bucket	11:15							
Actual Volume (ml)	2000

16:41	480	24.68	7.86	-107	0.262	0.0	0.75	1.08	

COMMENTS:

SAMPLE COLLECTION TIME: 16:43

PREPARED BY: ADC

* Parameters are stabilized when 3 consecutive readings are within ± 0.1 FOR pH and ± 5% for specific conductivity is constant. Reasonable attempts must be made to reach a 0.2 mg/L dissolved oxygen reading and a turbidity reading below 10 NTU as per the Groundwater Sampling Operating Procedure, US EPA, Region 4, # SESDPROC-301-R3.

Length of tubing cut (ft.)	20
Initial tubing depth (ft.) BTOC	15
Final tubing depth (ft.) BTOC	15
Initial pump speed	low
Time pump speed was initialized	16:22
Pump speed at flow into cylinder	low
Started new roll of tubing at	—

	Time	Time	Time	Time	Time	Time	Time	Time
2,000 mL volume poured into bucket								
Actual Volume (ml)								

Additional remarks: pump stopped in between 2nd and 3rd interval, restarted just before third interval.

SEVENTH SEMI-ANNUAL PROGRESS REPORT

ATTACHMENT 3-3 LABORATORY ANALYTICAL RESULTS FOR GROUNDWATER SAMPLES APRIL 2017

AES

ANALYTICAL ENVIRONMENTAL SERVICES, INC.

May 11, 2017

Alan Sanders
Environmental International Corp
161 Kimball Bridge Rd
Alpharetta GA 30009

TEL: (770) 772-7100
FAX:

RE: MTL

Dear Alan Sanders: Order No: 1704P57

Analytical Environmental Services, Inc. received 48 samples on 4/29/2017 11:48:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES's accreditations are as follows:
-NELAC/Florida State Laboratory ID E87582 for analysis of Non-Potable Water, Solid & Chemical Materials, and Drinking Water Microbiology, effective 07/01/16-06/30/17.
State of Georgia, Department of Natural Resources ID #800 for analysis of Drinking Water Metals, effective 07/01/16-06/30/17 and Total Coliforms and E. coli, effective 04/25/17-04/24/20.
-NELAC/Louisiana Agency Interest No. 100818 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 07/01/16-06/30/17.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Metals, PCM Asbestos, Gravimetric), Environmental Lead (Paint, Soil, Dust Wipes, Air), and

DATA PACKAGE: I II III IV

SAMPLES RECEIVED AFTER 3PM OR ON SATURDAY ARE CONSIDERED RECEIVED THE NEXT BUSINESS DAY. IF TURNAROUND TIME IS NOT INDICATED, AES WILL PROCEED WITH STANDARD TAT OF SAMPLES. SAMPLES ARE DISPOSED 30 DAYS AFTER REPORT COMPLETION UNLESS OTHER ARRANGEMENTS ARE MADE.

MATRIX CODES: A = Air GW = Groundwater SE = Sediment SO = Soil SW = Surface Water W = Water (Blanks) DW = Drinking Water (Blanks) O = Other (specify) WW = Waste Water

PRESERVATIVE CODES: H+I = Hydrochloric acid + ice I = Ice only N = Nitric acid S+I = Sulfuric acid + ice S/M+I = Sodium Bisulfate/Methanol + ice O = Other (specify) NA = None

Project: MTL
Lab ID: 1704P57

Case Narrative

Sample Receiving Nonconformance:

A Trip Blank was provided but not listed on the Chain of Custody. Trip blank analyzed at no cost to the client.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compounds Pentafluorobenzene, 1,4-Difluorobenzene, and Chlorobenzene-d5 on sample 1704P57-023A was outside control limits biased low due to suspected matrix interference.

Percent recovery for the internal standard compound Pentafluorobenzene on samples 1704P57-026A, & -030a was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on samples 1704P57-041A,-043A, -045A, & -046 A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recovery for the internal standard compounds Chlorobenzene-d5 and 1,4-Dichlorobenzene-d4 on sample 1704P57-044A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

SAMPLE/COOLER RECEIPT CHECKLIST

1. Client Name: **ENVIRONMENTAL INTERNATIONAL CORP** AES Work Order Number: **1704P57**

2. Carrier: FedEx ☐ UPS ☐ USPS ☐ Client ■ Courier ☐ Other _____

		Yes	No	N/A	Details	Comments
3.	Shipping container/cooler received in good condition?	●	○	○	damaged ☐ leaking ☐ other ☐	
4.	Custody seals present on shipping container?	○	●	○		
5.	Custody seals intact on shipping container?	○	○	●		
6.	Temperature blanks present?	●	○	○		
7.	Cooler temperature(s) within limits of 0-6°C? [See item 13 and 14 for temperature recordings.]	●	○	○	Cooling initiated for recently collected samples / ice present ☐	
8.	Chain of Custody (COC) present?	●	○	○		
9.	Chain of Custody signed, dated, and timed when relinquished and received?	●	○	○		
10.	Sampler name and/or signature on COC?	●	○	○		
11.	Were all samples received within holding time?	●	○	○		
12.	TAT marked on the COC?	●	○	○	If no TAT indicated, proceeded with standard TAT per Terms & Conditions. ☐	

13. Cooler 1 Temperature 0.8 °C Cooler 2 Temperature 0.4 °C Cooler 3 Temperature _____ °C Cooler 4 Temperature _____ °C

14. Cooler 5 Temperature _____ °C Cooler 6 Temperature _____ °C Cooler 7 Temperature _____ °C Cooler 8 Temperature _____ °C

15. Comments: _____

I certify that I have completed sections 1-15 (dated initials). MDP 4/29/17

		Yes	No	N/A	Details	Comments
16.	Were sample containers intact upon receipt?	●	○	○		
17.	Custody seals present on sample containers?	○	●	○		
18.	Custody seals intact on sample containers?	○	○	●		
19.	Do sample container labels match the COC?	●	○	○	incomplete info ☐ illegible ☐ no label ☐ other ☐	
20.	Are analyses requested indicated on the COC?	●	○	○		
21.	Were all of the samples listed on the COC received?	●	○	○	samples received but not listed on COC ☐ samples listed on COC not received ☐	
22.	Was the sample collection date/time noted?	●	○	○		
23.	Did we receive sufficient sample volume for indicated analyses?	●	○	○		
24.	Were samples received in appropriate containers?	●	○	○		
25.	Were VOA samples received without headspace (< 1/4" bubble)?	●	○	○		
26.	Were trip blanks submitted?	●	○	○	listed on COC ☐ not listed on COC ■	

27. Comments: _____

I certify that I have completed sections 16-27 (dated initials). BB 5/1/17

		Yes	No	N/A	Details	Comments
28.	Have containers needing chemical preservation been checked?	○	○	●		CHECKED AT ANALYSIS
29.	Containers meet preservation guidelines?	○	○	●		CHECKED AT ANALYSIS
30.	Was pH adjusted?	○	○	●		CHECKED AT ANALYSIS

I certify that I have completed sections 28-30 (dated initials). BB 5/1/17

SEVENTH SEMI-ANNUAL PROGRESS REPORT

ATTACHMENT 3-4 LABORATORY ANALYTICAL RESULTS FOR GROUNDWATER SAMPLES JULY 2017

AES

ANALYTICAL ENVIRONMENTAL SERVICES, INC.

July 20, 2017

Ameila Grant
Environmental International Corp

161 Kimball Bridge Rd
Alpharetta GA 30009

RE: MTL

Dear Ameila Grant: Order No: 1707919

Analytical Environmental Services, Inc. received 11 samples on 7/13/2017 7:33:00 AM for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.
AES's accreditations are as follows:
-NELAC/Florida State Laboratory ID E87582 for analysis of Non-Potable Water, Solid & Chemical Materials, and Drinking Water Microbiology, effective 07/01/17-06/30/18.
State of Georgia, Department of Natural Resources ID #800 for analysis of Drinking Water Metals, effective 07/01/17-06/30/18 and Total Coliforms and E. coli, effective 04/25/17-04/24/20.
-NELAC/Louisiana Agency Interest No. 100818 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 07/01/17-06/30/18.
-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Metals, PCM Asbestos, Gravimetric), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 09/01/17.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Jessica Shilling

Jessica Shilling

Case Narrative

Sample Receiving Nonconformance:

A Trip Blank was provided but not listed on the Chain of Custody. Trip blank analyzed at no cost to the client.

Volatile Organic Compounds Analysis by Method 8260B:

Percent recovery for the internal standard compound 1,4-Dichlorobenzene-d4 on samples 1707919-004A, -008A, -009A, & -010A was outside control limits biased low due to suspected matrix interference. All other internal standard recoveries were within control limits.

Percent recovery for the internal standard compounds Chlorobenzene-d5 and 1,4-Dichlorobenzene-d4 on samples 1707919-005A,006A, & -007A was outside control limits biased low due to suspected matrix interference. The samples were ran twice.

SAMPLE/COOLER RECEIPT CHECKLIST

1. Client Name: **Environmental International Corp** AES Work Order Number: **1707919**

2. Carrier: FedEx ☐ UPS ☐ USPS ☐ Client ■ Courier ☐ Other DROPBOX

		Yes	No	N/A	Details	Comments
3.	Shipping container/cooler received in good condition?	◉	○	○	damaged ☐ leaking ☐ other ☐	
4.	Custody seals present on shipping container?	◉	○	○		
5.	Custody seals intact on shipping container?	◉	○	○		
6.	Temperature blanks present?	◉	○	○		
7.	Cooler temperature(s) within limits of 0-6°C? [See item 13 and 14 for temperature recordings.]	◉	○	○	Cooling initiated for recently collected samples / ice present ☐	
8.	Chain of Custody (COC) present?	◉	○	○		
9.	Chain of Custody signed, dated, and timed when relinquished and received?	◉	○	○		
10.	Sampler name and/or signature on COC?	◉	○	○		
11.	Were all samples received within holding time?	◉	○	○		
12.	TAT marked on the COC?	◉	○	○	If no TAT indicated, proceeded with standard TAT per Terms & Conditions. ☐	

13. Cooler 1 Temperature 4.9 °C Cooler 2 Temperature _____ °C Cooler 3 Temperature _____ °C Cooler 4 Temperature _____ °C

14. Cooler 5 Temperature _____ °C Cooler 6 Temperature _____ °C Cooler 7 Temperature _____ °C Cooler 8 Temperature _____ °C

15. Comments:

I certify that I have completed sections 1-15 (dated initials). TD 7/13/17

		Yes	No	N/A	Details	Comments
16.	Were sample containers intact upon receipt?	◉	○	○		
17.	Custody seals present on sample containers?	○	◉	○		
18.	Custody seals intact on sample containers?	○	○	◉		
19.	Do sample container labels match the COC?	◉	○	○	incomplete info ☐ illegible ☐ no label ☐ other ☐	
20.	Are analyses requested indicated on the COC?	◉	○	○		
21.	Were all of the samples listed on the COC received?	◉	○	○	samples received but not listed on COC ☐ samples listed on COC not received ☐	
22.	Was the sample collection date/time noted?	◉	○	○		
23.	Did we receive sufficient sample volume for indicated analyses?	◉	○	○		
24.	Were samples received in appropriate containers?	◉	○	○		
25.	Were VOA samples received without headspace (< 1/4" bubble)?	◉	○	○		
26.	Were trip blanks submitted?	◉	○	○	listed on COC ☐ not listed on COC ■	

27. Comments:

I certify that I have completed sections 16-27 (dated initials). AJ 7/13/17

This section only applies to samples where pH can be checked at Sample Receipt.

		Yes	No	N/A	Details	Comments
28.	Have containers needing chemical preservation been checked? *	○	○	◉		
29.	Containers meet preservation guidelines?	○	○	◉		
30.	Was pH adjusted at Sample Receipt?	○	○	◉		

* Note: Certain analyses require chemical preservation but must be checked in the laboratory and not upon Sample Receipt such as Coliforms, VOCs and Oil & Grease/TPH.

I certify that I have completed sections 28-30 (dated initials). AJ 7/13/17
