Re: Responses to January 26, 2018 Letter from EPD
Rheem Manufacturing Company
138 Roberson Mill Road
Milledgeville, Georgia

Dear Mr. Hayes:

In conjunction with the submittal of the attached Voluntary Remediation Program (VRP) May 2018 Progress Report #9 for the above-reference site (the “Site”), this letter provides a response to EPD’s January 26, 2018 comment letter addressing several previously submitted progress reports for the Site. The Site encompasses the former Rheem facility property (the “Facility”) and other parcels affected by the trichloroethene (TCE) groundwater plume, some of which were recently acquired by Rheem as discussed in the attached progress report.

EPD Comment #1

According to Section 4.4 of the *June 2016 Progress Report*, MW-47 is proposed as a Point of Demonstration (POD) well and MW-36 is proposed as the Point of Exposure (POE). Based on the discussions held during the above referenced meeting, EPD requests that MW-34 be established as the POD well. In addition, EPD recommends that groundwater modeling data and empirical data be used to support future conclusions that the groundwater POE (MW-36) and the groundwater to surface water POE (pond adjacent to MW-36) have not and will not be impacted in the future.

Response

As requested by EPD, MW-34 will be established as the POD well. A Water Well Survey was recently conducted to evaluate the applicability of the groundwater pathway under the VRP for the Site and was submitted to EPD in a letter dated March 26, 2018. The surface water POE has been established as the pond inlet, which is the closest portion of the pond to the groundwater plume and is where flowing and/or standing water generally occur year-

round. The surface water and groundwater POEs, as required, will be evaluated in the CSR using groundwater modeling and empirical data for the Site.

EPD Comment #2

According to the most recent data, deep well MW-3B shows that the concentration of TCE in the source area is 1,600 ug/l at approximately 200 feet below ground surface (bgs). In addition, the data presented in the November 2016 report indicates a concentration of 120,000 ug/l TCE in MW-3A, which was installed to a depth of 135 feet bgs. Based on this groundwater data within the source area, vertical delineation in accordance with the Act and the referenced Consent Order is not complete. However, EPD understands that the ongoing remediation activities for groundwater are focused on the residual DNAPL within this source area, and that further groundwater monitoring data may potentially represent a reduction in the overall concentration trends in the source area. Based on the discussions held during the above referenced meeting, EPD has agreed to defer our final determination regarding compliance with the vertical delineation requirements until the completion of the in-situ bioremediation and further groundwater assessment activities.

Response

TCE detections in MW-3A (screen interval 125-135 feet deep) and MW-3B (screen interval 199-209 feet deep) represent a localized pocket of elevated concentrations, which is bounded vertically and horizontally by bedrock exhibiting a very low transmissivity. These wells appear to have been impacted by the vertical migration of TCE through nearby recovery well RW-3, which was installed to a depth of 181 feet with a long screen interval extending continuously through the saprolite, partially weathered rock, and bedrock. Data collected from other bedrock wells at the Property, including MW-12A, MW-24, MW-25, MW-26, and MW-27, indicate that the TCE plume is not migrating vertically or horizontally through bedrock at the Property and establish vertical delineation for purposes of the VRP. The localized impact of RW-3 on MW-3A and MW-3B is supported by groundwater sampling data from bedrock zones showing no significant TCE concentrations outside of the release area, pilot test injections conducted in January 2017 resulting in significantly low flow rates relative to the saprolite and partially weathered rock zones. Bioremediation media will be injected into RW-3 to reduce the elevated TCE concentrations in its immediate vicinity, prior to plugging the recovery well.

EPD Comment #3

Based on the discussions held during the above referenced meeting, in-situ bioremediation is in the beginning stages of implementation for groundwater TCE mass reduction in the Release Area Zone and the Plume Zone. Regarding the bioremediation remedy, please address the following:

- a) Please establish the remedial action objective for groundwater and provide the target VOC concentrations to be achieved after execution of the remedy. In addition, please provide the estimated timeframe to achieve the remedial target concentrations.

- b) Please provide an estimate of the quantity of injections that will be needed to achieve the target groundwater concentrations.
- c) TCE concentrations in nearby wells range from 120,000 ug/l in MW-3A at a depth of 135 feet bgs to 1,600 ug/l in MW-3B at a depth of 209 feet bgs. Please provide additional information regarding the design strategy for the bioremediation remedy, including an explanation of why the injections did not encompass the maximum depths that contamination was detected within the Release Area and Plume Zones.

Response

- a) The objective of groundwater remediation is to reduce source material to the extent practicable and reduce the potential for vapor intrusion at the Facility in the source area over the long term. The target VOC concentration is an average concentration of 10,000 µg/L in the vicinity of the source area, within three years of the injection event.
- b) The target injection volume includes 679 liters of dehalococcoides mccartyi bioremediation culture and 440,000 gallons of 6.6% emulsified vegetable oil substrate.
- c) As discussed in Response #2, TCE detections in MW-3A and MW-3B represent a localized pocket of elevated concentrations in bedrock and concentrations decrease significantly between the two depths. Bioremediation will focus on potential source material in the saprolite and the partially weathered rock zones, since these zones exhibit the highest TCE concentrations and the highest transmissivity. Bioremediation media will, however, also be injected into RW-3 to reduce the elevated TCE concentrations in nearby MW-3A and MW-3B.

EPD Comment #4

Please ensure that the final comprehensive groundwater monitoring event that will be used for the final compliance certification is conducted in accordance with EPA's approved standard sampling techniques.

Response

A comprehensive groundwater sampling event will be conducted during the summer of 2018, in lieu of the previously planned semi-annual sampling event of the monitoring wells located downgradient of the Facility and the quarterly ART performance well sampling event. During this comprehensive event, samples will be collected from a series of monitoring wells located outside the bioremediation area in accordance with the low-flow methods specified in Section 3.5 of the EPA Region 4 SESDPROC-301-R4, April 26, 2017. The specific wells to be sampled are listed in Section 7.2.1 of the May 2018 Progress Report. Wells within the area of bioremediation influence will be separately sampled as part of the performance monitoring.

EPD Comment #5

Per Comment #4 of EPD's December 14, 2015 letter to Rheem and Consent Order EPD-VRP-007, note that within 6 months of discovery, impacted parcels should be added to the VRP application as qualifying properties or EPD must be notified of the properties non-qualifying status. As part of the final VRP CSR, please explain the reasoning for not incorporating any downgradient affected properties as qualifying properties.

Response

Based on the Water Well Survey submitted to EPD for the Site, it is believed that the groundwater pathway is not required to be addressed for these properties. In addition, a vapor intrusion evaluation, included in Appendix G of the May 2018 Progress Report, indicates that the vapor pathway for properties downgradient from the Facility is incomplete. As such, no downgradient properties have been identified that would need to be incorporated into the VRP application as qualifying properties. As discussed during our meeting, however, in January 2018 Rheem acquired an approximately 45-acre parcel downgradient of the Facility that could be added as qualifying property to the Site. A survey and legal description of this additional property are included as Appendix A in the May 2018 Progress Report.

EPD Comment #6

Although the concentrations of chlorinated VOCs in off-property soil gas samples were deemed to be minimal, Section 3.2.2.3 of the *June 2017 Progress Report* indicates low levels of BTEX compounds detected in many of the off-property soil gas samples. The BTEX compounds were attributed to a documented petroleum product release from a nearby gas station. As part of the final VRP CSR, please provide the documentation associated with the release, if available, including the extent of the BTEX plume and its proximity to the Rheem chlorinated solvent plume.

Response

Available information regarding this off-Site petroleum release will be included in the CSR.

EPD Comment #7

EPD requests that the draft Uniform Environmental Covenant (UEC) referenced in Section 6.1.5 of Progress Report #5 be submitted along with the next progress report so that review of the document can be initiated. EPD's new draft UEC template is attached for your reference. At a minimum, the UEC should include the following activity and use limitations:

- a.) A requirement to implement a monitoring and maintenance plan, which should include the activities necessary to maintain the operation of engineering controls [sub-slab depressurization (SSD) system] related to onsite vapor intrusion mitigation.
- b.) Should future land use change and/or onsite structures be modified or developed in areas on the property overlying groundwater and/or soil contamination, additional vapor

intrusion assessments may be completed at that time to determine the need for any additional engineering controls and/or preconstruction mitigation.

Response

A draft Environmental Covenant is included as Appendix D in the May 2018 Progress Report.

EPD Comment #8

Groundwater flow for off-property wells presented in Figure 3 of each of the progress reports appears to be consistent; however, EPD requests that a potentiometric surface map be included in future progress reports to include groundwater elevation data from onsite wells in order to present a more comprehensive illustration of groundwater flow from the source area to the downgradient wells.

Response

A potentiometric surface map incorporating Facility and downgradient monitoring wells is included as Figure 7 in the May 2018 Progress Report.

EPD Comment #9

EPD concurs with the decommissioning of the pump and treat recovery wells and the Accelerated Remediation Technology (ART) wells, which was requested during the above referenced meeting. Please provide justification for decommissioning the wells in the next progress report.

Response

Section 7.3 of the May 2018 Progress Report discusses the decommissioning of these systems.

EPD Comment #10

It was noted during the above referenced meeting that the SVE system onsite has been shut down and that no further soil remediation is planned. Please collect and analyze soil samples throughout the source area in order to evaluate the performance of the SVE remedy and to determine the final compliance status for onsite soils.

Response

This sampling was conducted in April 2018 and is discussed in the May 2018 Progress Report. Based on the results, soils are in compliance with direct exposure Type 4 RRS. Furthermore, modeled leaching results do not exceed the target TCE groundwater clean-up concentration of 10,000 µg/L.

EPD Comment #11

Section 3.3.3.2.2 of the *June 2017 Progress Report* discusses the sub-slab soil gas sampling effort in which only 20 of the previously installed sub-slab soil gas probe locations were sampled during the December 2016 event as opposed to the 47 probes sampled during the background sampling event conducted in 2014. EPD is agreeable to the collection of 20 samples but recommends that the sample locations be located such that the results can be compared to previous results. EPD requests that the follow-up sampling event include all of the baseline locations in order to establish the trend of TCE reductions underneath the footprint of the building.

Response

EPS will collect 20 soil gas samples during the Summer or Fall of 2018. Sample locations are discussed in Section 7.2.3 of the May 2018 Progress Report.

EPD Comment #12

Please ensure that the final VRP CSR includes a comparison of off-site soil gas results to residential use criteria to address all potential off-property land use scenarios.

Response

A vapor intrusion evaluation comparing soil gas results to the appropriate use criteria is included as Appendix G in the May 2018 Progress Report.

EPD Comment #13

EPD concurs with the Risk Reduction Standards (RRS) proposed in Section 5 and Appendix F of the June 2016 Progress Report and the Off-Property VI Risk Evaluation presented in the June 2016 Progress Report, with the following stipulations:

- a.) 1,2-Dichloropropane - Please note that the toxicity factors for this regulated substance has been updated since the submittal of this document. Please refer to the most current Regional Screening Level (RSL) Table (updated June 2017) for the updated toxicity factors. Please note that this impacts the Risk Assessment Guidance for Superfund (RAGS) equation results and the soil and groundwater RRS for 1,2-Dichloropropane. Please revise accordingly.
- b.) Table 5 - It is unclear why Table 5 lists the nonresidential surface soil RRS for only a subset of all the detected regulated substances at the site. Please provide the full summary of the nonresidential RRS (surface/subsurface) for the substances consistent with Table N in Appendix F. In addition, please provide all of the ProUCL input and output files for trichloroethylene (TCE) for verification of the 95% UCL values.

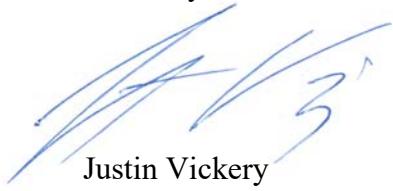

c.) Vapor Intrusion- Please note that EPD's preference is to initially screen the non-cancer endpoint at an HQ of 0.1 to account for potential additive effects. Further refinement of the constituents of interest can then be made using an HQ of 1. In addition, please provide a table comparing the maximum detected concentrations for groundwater and sub-slab soil gas to the media-specific Vapor Intrusion Screening Levels (VISLs) for review.

Response

Risk Reduction Standards have been revised in accordance with a.) and b.) above. The requested tables comparing groundwater and sub-slab concentrations to the media-specific VISLs is provided in Appendix G of the May 2018 Progress Report.

If you have any questions, please call.

Sincerely,

Justin Vickery
Principal

1 INTRODUCTION

1.1 Summary

This Voluntary Remediation Program (VRP) Progress Report is submitted on behalf of Rheem Manufacturing Company (Rheem) for the former Rheem manufacturing facility located at 138 Roberson Mill Road in Milledgeville, Georgia (“the Facility”). The VRP site, or “the Site”, includes the Facility and any other parcel affected by the release. This Progress Report updates the Conceptual Site Model (CSM) and the Risk Analysis, describes the activities conducted during the current reporting period (November 2017 through April 2018), and discusses planned activities for the next reporting period.

1.2 Background

The Facility was formerly used for the manufacturing of domestic air conditioning units and furnaces from 1978 until it ceased operations in 2009. The Facility is comprised of 41.12 acres and is fenced and improved with a vacant manufacturing and office building and an asphalt-paved parking lot. A regional topographic map of the surrounding area is shown on Figure 1. An aerial photograph of the Facility is included as Figure 2A, and an aerial photograph of the Facility and surrounding area is included as Figure 2B.

In September 1988, a release of reclaimed trichloroethene (TCE) was discovered by Rheem and reported to the Georgia Environmental Protection Division (EPD). The release occurred in the tank farm area from underground piping connecting two aboveground TCE storage tanks to a parts washer inside the Facility. A groundwater recovery system was installed in 1989-1990 to remediate TCE in groundwater. Since that time, Rheem has performed ongoing assessment and remedial activities with oversight by the EPD Land Protection Branch.

1.3 Additional Parcel Acquisition

In January 2018, Rheem acquired two Baldwin County tax parcels located west of the Facility which are part of the Site: Parcel 068-008A, an undeveloped lot totaling 44.9 acres and designated as 47 Highway 22, and Parcel 068-009, an 11.3-acre residential lot improved with a house and designated as 123 Meriwether Circle. Parcel 068-008A is divided into three tracts: Tract 1, 10.4 acres located on the east side of Roberson Mill Road; Tract 2, 31.7 acres located on the west side of Roberson Mill Road; and Tract 3, 2.8 acres encompassing a portion of the sewer easement running through Tract 2. Parcel 068-009 is designated as Tract 4. Tracts 1-4 are shown on the attached Figure 3. A survey and legal description for these additional parcels is included in Appendix A.

2 VRP PROJECT MANAGEMENT

2.1 Professional Geologist Oversight

This Progress Report includes a certification by Justin Vickery, P.G., the Professional Geologist specified in the VRP application. Appendix B contains a monthly summary of hours invoiced by the P.G.

2.2 Milestone Schedule

Rheem plans to submit a Compliance Status Report (CSR) for the Site in November 2018. An updated milestone schedule is included in Appendix C.

2.3 Conceptual Site Model (CSM)

An updated CSM is included in Section 3 of this report. Updates include the following:

- a discussion of limited horizontal migration of the TCE in bedrock,
- refinement of the potential receptors and exposure pathways, and
- new Point of Demonstration (POD) and new groundwater and surface water Points of Exposure (POEs).

2.4 Draft Environmental Covenant

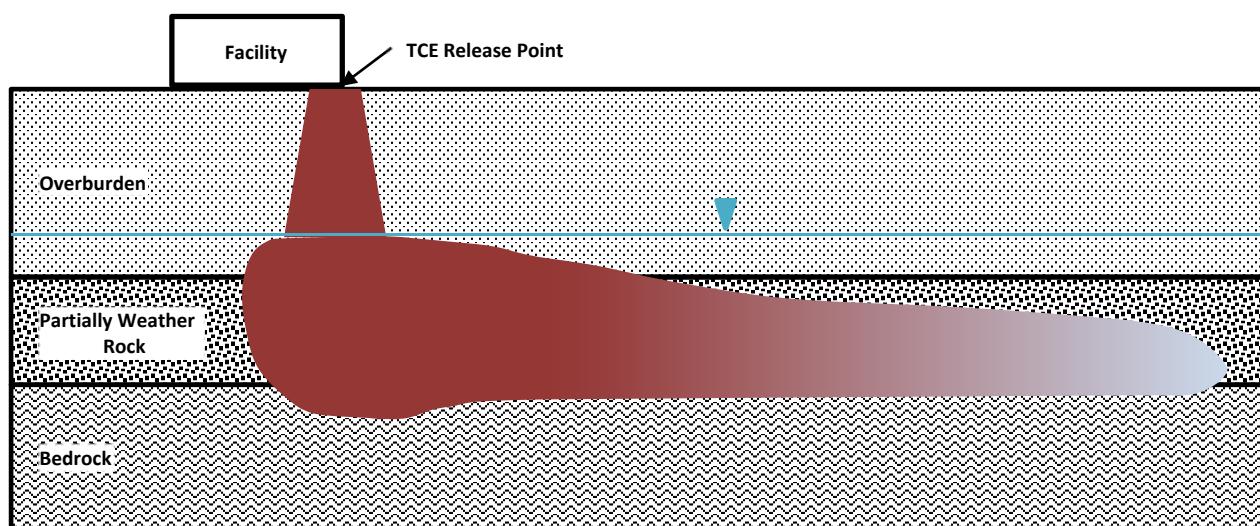

Rheem will establish vapor management protocols and groundwater and residential use restrictions for the Facility using an Environmental Covenant. A draft Environmental Covenant has been included in Appendix D for EPD's review.

3 UPDATED CONCEPTUAL SITE MODEL

3.1 TCE Distribution with Respect to the CSM

3.1.1 TCE Release

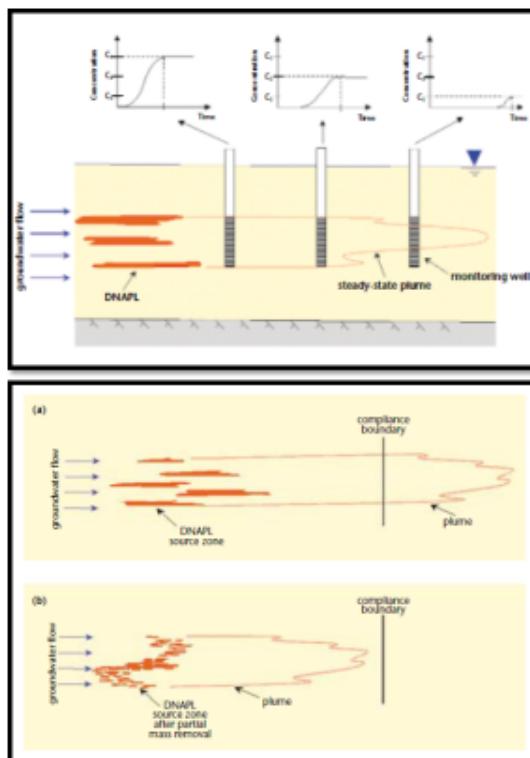

The CSM, as provided in the VRP application and schematically illustrated below, exhibits the characteristic behavior of a dense non-aqueous phase liquid (DNAPL) release, with primarily vertical migration downward from the release point until the DNAPL encounters a low permeability zone (*e.g.*, bedrock), at which point DNAPL may saturate, or pool, in the pore space if a sufficient volume was released. The downward vertical migration of DNAPL leaves in its path residual product globules no longer capable of migrating as a product phase, but acts as a continuing source of DNAPL constituents to groundwater. In the case of a significant release, the residual phase will occur at the soil saturation concentration (“ C_{sat} ”). Potentially the largest volume of DNAPL, as provided in the CSM, occurs at the interface of PWR and bedrock, resulting in an elevated groundwater condition at depth that exceeds the groundwater concentrations in the surficial aquifer, a condition observed at the Rheem Site. These conditions are illustrated below and further described in the bullets following.

- The pattern of TCE distribution in the vadose zone soil and underlying aquifer (groundwater) is consistent with the geologic setting described above and the reported distribution of TCE. TCE is present across the vertical profile of vadose zone soil beneath the area of the product release, indicating DNAPL transport through the soil into the underlying aquifer matrix. As illustrated in Figure 4, which shows the maximum TCE concentrations detected in the Facility monitoring wells over time, lateral spread of the DNAPL (elevated TCE concentrations) is limited to a relatively small area of the Facility.

- TCE is present in groundwater in all three hydrogeologic settings (saprolite, PWR, and bedrock) beneath the area of the TCE release, at levels characteristic of a DNAPL source being present.
- Free-phase DNAPL has never been observed in the Site monitoring wells, even in the release area. This indicates the DNAPL is in the residual saturation state, i.e., present as globules entrained in the aquifer matrix. There is no mobile DNAPL present at the Site.
- The dissolved-phase TCE plume emanating from the source area is mature (release occurred 30 years ago) and likely has been at steady state for a number of years (Kueper et al., 2003). The measured concentration of TCE at a given location/depth is not expected to increase in the future. Moreover, with the bioremediation injection activities being initiated in the release area, the TCE plume extent and magnitude is expected to decrease over time. These points are expressed below.

Plume Behavior in Presence of Residual DNAPL

- Images to left taken from *Illustrated Handbook of DNAPL Transport at Fate in the Subsurface*
- Key Point #1 - all plumes reach steady state regardless of subsurface media (saprolite, rock)
- Key Point #2 - this condition can be realized by the dispersion process without other attenuation processes
- Key Point #3 – proximate wells achieve steady state sooner vs. distant wells (see upper image to left)
- Key Point #4 – plume will persist until source mass is exhausted
- Key Point #5 – partial reduction in DNAPL source zone will result in a new steady-state plume of lesser dimension (see lower image to left)

- Depth-profile sampling of TCE in groundwater, conducted at numerous boring locations across the Site shows that the shallow groundwater (saprolite zone) away from the source area exhibits a lower concentration relative to deeper groundwater (PWR zone). Furthermore, bedrock fracturing at the Site is not interconnected on a Site-wide scale and is not conducive to horizontal migration. Rather, impact to the bedrock fractures, which exhibit low transmissivity, appears to be limited to localized vertical migration of the PWR groundwater plume. This is illustrated in Hydrogeologic Profile A-A' (Figure 5A, with the profile location shown on Figure 5B), showing concentrations in bedrock near the release area (MW-3A and MW-5) historically exceeding 100,000 µg/L with nearby

downgradient bedrock concentrations of less than 100 µg/L. This is consistent with the CSM in that the PWR is the primary flux zone owing to its higher relative permeability.

3.2 Potential Receptors and Exposure Pathways

3.2.1 Facility and Surrounding Area

The Facility includes a single-story former manufacturing facility building (approximately 12 acres under roof) and a parking lot located to the northwest of the building. The former manufacturing facility is currently vacant, but may be occupied by a future owner. There is a security fence surrounding the Facility and periodic inspection/maintenance and landscaping is performed by contractors who maintain the Facility and the grounds on an as needed basis. The Facility is currently being marketed for sale, and its future use is expected to remain commercial/industrial.

The adjoining properties are used for commercial purposes or are currently vacant. The majority of the area near the Facility is zoned for commercial land use with pockets of single family homes to the north and west of Roberson Mill Road, to the east of North Columbia Street, and along Garrett Way to the southeast of the Facility. The nearest residential areas include a single-family housing neighborhood located approximately 300 feet north of the Facility and a townhome neighborhood approximately 500 feet northwest of the Facility.

3.2.2 Well Survey

The results of a water well survey conducted between January and March 2018, were presented to EPD in a letter dated March 30, 2018. No drinking water sources were identified within a ½-mile radius of the Site or within a 3-mile zone downgradient of the Site. EPD is currently reviewing the well survey to evaluate the applicability of the groundwater pathway under the VRP. Pending EPD's evaluation of the Site well survey, the downgradient groundwater pathway was excluded from consideration. In any event, a restriction on the future use of groundwater at the Facility is included in the proposed Environmental Covenant.

3.2.3 Potential Human Receptors

3.2.3.1 Overview and Migration Pathways

The historical release of TCE has impacted soils at the Facility and groundwater both at the Facility and downgradient from the Facility. The potential exposure pathways associated with the Site are discussed below.

3.2.3.2 Potential Facility Receptors

The primary potential Facility receptors include future site workers and construction/utility workers. A non-residential use restriction will be included in the proposed Environmental Covenant, so potential residential receptors are not included in this evaluation. The Facility does not currently have any full-time workers, but inspection/maintenance contractors and

groundskeepers visit the Facility periodically. The risk evaluation will include evaluation of the site worker and construction worker receptors, which would be protective of other categories of non-residential receptors.

Site workers may potentially be exposed to surface soil, which is herein defined as 0 to 2 feet below ground surface (ft-bgs). For the purposes of the risk evaluation it is assumed that construction workers could potentially be exposed to soil from 0 to 10 ft-bgs. Although much of the Facility is covered with pavement, concrete or buildings, the soil data collected under these surfaces were not excluded from the risk evaluation in the event that the surfaces are not maintained in the future.

3.2.3.3 Potential Downgradient Receptors

There are some businesses, including a daycare center, to the southwest of the Facility in the general direction of groundwater flow. Given the concentrations of TCE detected in downgradient groundwater, the depth at which those concentrations have been detected, and the 20 to >40-ft vertical layer of clean groundwater on top of the impacted groundwater, it is unlikely that downgradient site workers could be exposed to vapors migrating from impacted groundwater to the indoor air. However, for purposes of this assessment, downgradient site workers have been included as a potential receptor via this pathway.

There are some single family and multi-family residences within a half-mile of the western boundary of the Facility. The groundwater plume has not migrated onto these residential properties nor any other nearby residential properties. However, for purposes of this assessment, downgradient residents have been included as a potential vapor migration receptor. A residential receptor evaluation is considered representative of a daycare center receptor.

3.2.3.4 Summary of Receptors Evaluated

Below is a summary of the receptors included in the risk evaluation (Section 5).

- Facility Receptors
 - Site Worker: Surface soil and vapor intrusion
 - Construction Worker: Soil 0-10 ft-bgs
- Downgradient Receptors
 - Resident: Vapor intrusion
 - Site Worker: Vapor intrusion

3.2.4 Potential Surface Water Receptors

An unnamed pond, located downgradient of MW-47 and approximately 500 feet downgradient from the toe of the TCE plume, was evaluated as a potential surface water receptor. A surface water sample was collected on September 25, 2012 and analyzed for volatile organic compounds¹ (VOCs). No regulated constituents were detected above method detection limits. Two intermittent

¹ Surface water analyzed for TCL Volatile Organics (SW8260B).

streams converge at the northern tip of the pond, an area of observed perennial water. The groundwater TCE plume in this vicinity is overlain by greater than 40 feet of clean groundwater and is therefore not expected to discharge to the surface water. However, for purposes of this CSM, the surface water will be considered potential pathway.

3.2.5 Points of Demonstration and Exposure

Under the VRP, the POD is a monitoring well located between the source of the Site groundwater impacts and the actual or estimated downgradient POE, which is defined as the nearest of the following: the closest existing downgradient drinking water well, the likely nearest future downgradient drinking water well, or at a hypothetical point of exposure 1,000 feet downgradient of the plume edge. As discussed in Section 3.2.2, no drinking water wells exist within three miles downgradient of the Site. Therefore, at the request of EPD in its January 26, 2018 letter, the POD has been established as monitoring well MW-34 and the groundwater POE has been established as MW-36. The northern tip of the pond is the surface water POE. These are shown on Figure 6.

4 RISK REDUCTION STANDARDS (RRSS) / CLEAN-UP VALUES

4.1 Overview

RRSs were previously developed for the regulated constituents detected in soil and groundwater². In accordance with Comments 13.a. and 13.b. in EPD's January 26, 2018 letter, revisions to the RRS development have been incorporated. The revised RRS calculations are presented in Appendix E, and the RRSs are summarized in the attached Table 1A and Table 1B for soil and groundwater respectively.

Types 1 and 2 RRSs are designed to be protective of residential use, and Types 3 and 4 are designed to be protective of non-residential use. Additionally, Types 1 and 3 are default values and Types 2 and 4 may be based on site-specific conditions. The soil RRSs presented in Appendix E have been updated to reflect more site-specific conditions.

4.2 Site Specific RRSs

According to the VRP Act ("Act"), clean-up standards for soil may be based on:

- a) direct exposure factors for surficial soils within two feet of the land surface,
- b) construction worker exposure factors for subsurface soils to a specified subsurface construction depth, and
- c) leaching concentrations protective of groundwater.

Accordingly, site-specific soil clean-up standards (Type 4 RRSs) have been developed for the two direct exposure scenarios listed above. The RRSs for leaching were not calculated; however, as discussed in Section 5.2.4, current soil concentrations were evaluated to determine the potential impact to groundwater.

The RRSs for direct exposure for site workers to surficial soils and construction worker exposure for soil 0-10 ft bgs were calculated by adjusting the standard RRS calculations. The adjustments included changing the exposure parameters to match the two worker scenarios and by excluding the protection of groundwater aspects of the full RRS calculation matrix. Direct exposure for surficial soils was determined for non-residential receptors (Type 4) using default exposure parameters. Residential direct exposure RRSs (Type 2) for surficial soils was also determined for completeness but is not discussed since, in accordance with the proposed Environmental Covenant, there will be a residential use restriction for the Facility. A Type 4 direct exposure RRS was also developed for the construction worker scenario.

² Type 1-4 RRS were developed in the May 2015 VRP Progress Report #5.

4.3 Delineation and Clean-up Standards

Per the Act, delineation criteria are the Type 1 RRSs, which are shown on Tables 1A and 1B for soil and groundwater, respectively. The clean-up standards for the soil chemicals-of-concern (COCs) are the direct-contact RRSs shown at the bottom of Table 1A. A soil leaching clean-up standard has not been calculated since soil concentrations are not anticipated to impact groundwater above the existing groundwater concentrations (Section 5.2.4). The clean-up standards for groundwater and the surface water at the respective POEs are the Residential RRSs (Table 1B) and the In-Stream Water Quality Standards³ (ISWQs, 30 µg/L for TCE), respectively.

³ State of Georgia Rule 391-3-6-.03 Water Use Classification and Water Quality Standards

5 RISK ANALYSIS

5.1 Overview of the Risk Analysis Process

The risk analysis presented in this section of the report builds upon the identification of potential receptors and exposure pathways presented in Section 3.2, by examining the applicable risk-based criteria for two primary modes of exposure: soil and vapor intrusion. In the context of VRP, soil data are evaluated with respect to RRSs; whereas for vapor intrusion, the data are evaluated with respect to threshold levels.

5.2 Soil Risk Analysis

5.2.1 Dataset Used

The soil dataset used for the risk evaluation did not exclude samples collected under concrete, asphalt or buildings. The soil dataset did exclude old data that has been replaced with newer data. Within the soil vapor extraction (SVE) zone of influence, updated samples collected after completion of SVE system operations were used (refer to Section 6.3.2) to represent current soil conditions.

5.2.2 Screening – Constituent of Concern

The soil data for detected constituents are compared to RRSs in Table 2. As the Facility is zoned commercial/industrial and a non-residential use restriction will be included in the planned environmental covenant, soil COCs are defined as those constituents that have a maximum concentration greater than the Non-Residential RRSs. As shown in Table 2 the only COC is TCE. It is of note that in surface soil, all constituents (except TCE) are also below the residential RRSs; thus, the only residential-based COC would also be TCE.

5.2.3 Evaluation against Site-Specific RRSs

As mentioned previously, site-specific RRSs were developed for TCE based on direct-contact of site workers and construction workers with the soil. Table 3 shows a comparison of the TCE data to the different site-specific RRSs.

Per the Act, compliance may be determined “on the basis of representative concentrations of constituents of concern in soils across each applicable soil exposure domain, and the representative concentrations for groundwater at a point of exposure.” It is conventional in risk assessments to use the 95% Upper Confidence Limit on the mean (“95% UCL”) as the representative concentration. The entire Facility is considered as one exposure domain. The 95% UCL was calculated for each receptor using the EPA’s ProUCL software (version 5.1). ProUCL input and output is presented in Appendix E. As shown in Table 3, the 95% UCLs are below the site-specific

RRSs. The 95% UCL in surface soil is 0.96 mg/kg, well below the site worker RRS (21 mg/kg), and the 95% UCL in surface and subsurface soil combined is 5.9 mg/kg, which is below the construction worker RRS (38 mg/kg). Thus, the soil is in compliance with Type 4 site-specific RRSs (site worker and construction worker).

5.2.4 Protection of Groundwater

For purposes of the VRP, soil compliance requires, in part, that constituents leaching from soils do not impact a groundwater POE above the cleanup standard. The Seasonal Soil Compartment Model (SESOIL) was used to evaluate the magnitude (concentrations) of TCE leaching from the vadose zone (see Appendix F). SESOIL simulates fate and transport of a single chemical in the vertical dimension based on mass balance and equilibrium partitioning of the chemical and uses site-specific soil, chemical, and meteorological data. In the simulation, the current soil TCE condition was expressed as a 4-layer profile covering the entire soil column from the ground surface to the water table (0-2, 2-5, 5-10, and 10-15 ft-bgs) with a representative concentration for each interval calculated as the 95% UCL. Soil characteristics of fine to medium clay, physical-chemical properties of TCE, and climate data for Milledgeville, Georgia were derived from various databases included with the SESOIL software. The SESOIL output indicates a maximum leaching concentration of 2.7 mg/L and adsorption onto soil as the primary process governing the fate and transport of TCE. Therefore, since the current soil concentrations are not anticipated to impact groundwater above the existing groundwater concentrations or the upper range of the groundwater concentrations outside of the groundwater bioremediation zone (*i.e.*, expected post-remediation groundwater concentrations, Section 6.3.1.1.1), soil concentrations comply with the groundwater protection criteria.

5.3 Groundwater Risk Analysis

The Site is not listed on the Hazardous Site Inventory, and as discussed in Section 3.2.2, no drinking water wells were identified within three miles downgradient of the Site. Pending EPD's review of the water well survey, the groundwater pathway was not evaluated for purposes of this discussion.

5.4 Vapor Intrusion Evaluation

Vapor intrusion was evaluated both at the Facility and downgradient from the Facility using groundwater and soil gas data. The assessment is included in Appendix G. The assessment relied on the EPA's vapor intrusion screening level (VISL) online calculator.

Based on this evaluation, no unacceptable risk of vapor intrusion exists for structures located downgradient from the Facility. It is of note that the constituents with elevated soil gas concentrations are mostly chlorinated ethenes at the Facility and petroleum hydrocarbons downgradient from the Facility. The petroleum hydrocarbons detected in soil gas downgradient from the Facility appear to originate from documented petroleum hydrocarbon releases at nearby gas station leaking underground storage tank (LUST) sites, each with several feet of gasoline free

product historically measured. Documentation regarding these LUST sites will be included in the CSR.

Facility soil gas concentrations exceed the Commercial VISL Target Soil Gas Concentrations. Previous vapor intrusion assessments of the Facility have been reported in prior VRP progress reports, and resulted in the installation of a sub-slab depressurization piping network, designed to capture VOCs in soil gas prior to permeation of the slab and entry into the building areas.

6 RECENTLY COMPLETED ACTIVITIES

6.1 Overview

Section 6 discusses activities conducted between November 1, 2017 and April 30, 2018, including:

- assessment and development of potentiometric surface map,
- implementation of full-scale bioremediation injections,
- status of the Accelerated Remediation Technology (ART) system,
- completion of vadose zone remediation and soil confirmation sampling, and
- continued vapor intrusion mitigation.

6.2 Assessment

As requested in Comment 8 of EPD's January 26, 2018 letter, on May 2, 2018, groundwater depths were gauged in Site monitoring wells. Table 4 summarizes the groundwater elevations, and Figure 7 is a potentiometric surface map generated from this data. The groundwater flow direction is to the south-southeast, similar to previous potentiometric surface maps.

6.3 Remediation

6.3.1 Groundwater Remedial Action

6.3.1.1 In-Situ Bioremediation

6.3.1.1.1 Background

Following an *In-Situ* Microcosm Study conducted in 2015 and a bioremediation pilot study initiated in October 2016, bioremediation was selected as the remediation strategy for addressing VOC concentrations in groundwater in the vicinity of the historical release. As shown on Figure 8, the selected bioremediation treatment areas include (i) the “Release Area Zone” (*i.e.*, the core of the TCE-impacted groundwater beneath the TCE release area) and (ii) the “Plume Zone” (*i.e.*, downgradient of the Release Area Zone where TCE generally exceeds 10 milligrams per liter (mg/L)). The treatment involves a combination of biostimulation and bioaugmentation to create suitable conditions for degradation (reductive dechlorination) of TCE and TCE daughter products to benign nontoxic end products. Biostimulation is provided by the application of emulsified vegetable oil (EVO), sold under the trade name SDS-SD® (Terra Systems, Inc.), and bioaugmentation is provided by the application of *Dehalococcoides* culture.

6.3.1.1.2 Injection Well Installation

In October 2016, as part of a bioremediation pilot test, 22 injection wells were installed in five nested well group locations (IW-1 through IW-3 in the Plume Zone and IW-4 and IW-5 in the Release Area Zone (Figure 8)). At each location, between three and five 1-inch wells were constructed with well screens set at varying depths in the saprolite, PWR, and bedrock, ranging from 20 to 118 feet below the ground surface.

In October and November 2017, injection wells IW-6 through IW-63 were installed. Based on the pilot study, which suggested low porosity and low injection rate in the bedrock, in general, the wells were set on top of bedrock and screened in PWR and saprolite. In the Release Area Zone, the top of the screened intervals was set near the water table, while in the Plume Zone, the top of the screen intervals was set at around 50 ft-bgs. Within the transition between the Release Area and the Plume Zones, the tops-of-screen were gradationally set at depths between the water table and 50 ft-bgs. These injection wells were each constructed as single 2-inch PVC wells. Most of the injection wells, with the exception of wells having 40 feet or less of screened interval, were constructed with two screened intervals separated by a 10-ft section of solid well casing. The purpose of the separated screened sections is to create separate vertical injection zones using well packers to better control the spread of the injection media and to minimize preferential pathways.

Injection well (IW-1 through IW-63) construction details are summarized in Table 5, and injection well locations are depicted on Figure 8. Boring logs included in Appendix H.

6.3.1.1.3 Bioremediation Injections

In January 2018, full-scale bioremediation injection was initiated. The injection volume for each screen section was pre-determined using a model developed by Terra Systems, Inc. The EVO is first diluted to the optimum concentration. Municipal water, is run through two 2,000-lb carbon vessels to remove the chlorine. The water is then mixed with sodium ascorbate and sodium bicarbonate and held in a series of 1,500 to 2,500-gallon mix tanks for one to four hours to deoxygenate before mixing with the EVO. The 10% (by volume) EVO solution is then transported to pumping manifolds located at the injection wells either by tote-transport or by direct piping. Once approximately 100 gallons of the EVO solution has been injected into a well, a pre-determined volume of bioaugmentation culture is injected using pressurized nitrogen. The bioaugmentation culture injection is followed by the injection of the remaining pre-determined volume of EVO. Once the full volume of EVO has been injected, deoxygenated flush water, in an amount equal to approximately half of the EVO injection volume, is injected into the wells to facilitate distribution of the injected media into the aquifer.

As of April 30, 2018, a total of approximately 245,000 gallons of 10% EVO and 220 liters of bioaugmentation culture have been injected into 42 injection wells. Table 6 summarizes injection volume, injection rate, injection duration, etc., for each injection well.

6.3.1.2 Status of Property Line ART System

As described in prior submittals, the ART system consists of six remediation wells positioned along a transect (*i.e.* treatment barrier) perpendicular to the TCE plume, intersecting the area of highest TCE concentrations at the Facility's western boundary. The ART well network (including performance wells) is shown on Figure 9. The goal of the ART system is to reduce the mass flux of TCE exiting the Facility, allowing natural attenuation processes along the continued flow path of groundwater to address the lesser VOC flux condition.

The ART system remained operational during this reporting period, but as discussed in Section 7.3.3 below, operation of the system will be terminated based on further evaluation of the groundwater plume and discussions with EPD. As such, ART performance monitoring was not conducted during this reporting period as previously planned. Instead, ART performance wells will be sampled during a comprehensive sampling event in Summer 2018 and the system will ultimately be decommissioned.

6.3.2 Soil (Vadose Zone) Remedial Action

The soil vapor extraction (SVE) system, consisting of a 40 horsepower (HP) vacuum blower connected to 40 hydraulic fracture wells, was previously installed to extract VOCs from the vadose zone soil in the TCE release area. SVE system operations were initiated in April 2015 and continued through the current reporting period, except during system maintenance, exhaust treatment technology replacement, and certain activities associated with the groundwater bioremediation. As of November 2016, an estimated 14,124 pounds of VOCs had been recovered with the SVE system. Additional VOC mass recovered since that time will be determined after the upcoming carbon disposal.

On April 18-19, 2018, 92 soil samples were collected from 19 borings in the vicinity of the SVE system in order 1) to determine the VOC concentrations remaining in the soil within the SVE zone of influence and 2) to determine whether a Type 5 RRS restricted use zone might be required for the purpose of Facility worker protection. Continuous soil cores were collected and screened with a photoionization detector (PID). Sampling depths were determined as follows:

- Samples were collected from each boring at 0.5 feet below the ground surface (ft-bgs) and 1.5 ft-bgs to assess the surface soil condition.
- One sample was collected from each of the following depth intervals: 2-5 ft-bgs, 5-10 ft-bgs, and 10-15 ft-bgs. Specific depths within each interval were determined by the highest PID measurement within each interval.

Historical vadose zone soil sampling, conducted during the operation of the pump and treat system, extended to 20 ft-bgs or more. Since the shutdown of the pump and treat system in January 2017, the water table has risen to approximately 16 ft-bgs, and therefore, the soil sampling intervals were not extended beyond 15 ft-bgs. Recent and historical soil sampling results are included in Table 7, and the recent laboratory analytical report is included in Appendix I. Table 8 provides a statistical comparison of TCE results for the recent samples collected within the SVE zone of influence (post-SVE) and the historical TCE results within this zone (pre-SVE). Figures 10A through 10D show side-by-side comparisons of TCE concentrations pre- and post-SVE system operation for vadose

zone soil samples for the 0-2 ft-bgs, 2-5 ft-bgs, 5-10 ft-bgs, and 10-15 ft-bgs depth intervals, respectively. Historical sampling results for locations outside of the expected SVE zone of influence are shown in each of the figures.

Fifty-five samples were collected from the 11 borings located within the SVE zone of influence. From these samples, the maximum TCE concentration was 3.1 mg/kg at a depth of 8 ft-bgs, and the average TCE concentration was 0.097 mg/kg. These detections are all below the non-residential direct contact clean-up standards (Table 1A) calculated for this Site. TCE concentrations have decreased several orders of magnitude within the zone of SVE influence with previous maximum and average concentrations of 78,000 mg/kg and 2,333 mg/kg, respectively. Samples collected outside of the SVE zone of influence in April 2018 were all below the direct contact clean-up standards as well.

6.3.3 Vapor Intrusion Mitigation

6.3.3.1 SSD System Operation

Previous progress reports described the sub-slab depressurization (SSD) system piping installed at the Facility. Figure 11 shows the SSD system lines (Lines 1-10) and the locations of the fans. Full operation of the system was initiated on November 1, 2016. Each of the lines has remained operational throughout the reporting period, with the exception of temporary shutdown of Lines 6-8 during the bioremediation injection activities in these areas.

As discussed in the June 2017 VRP Progress Report #7, results from samples collected after initiation of SSD system operations indicate that indoor air concentrations are below the EPA screening levels and that sub-slab soil gas sample concentrations have decreased significantly below pre-system operation levels.

7 PLANNED ACTIVITIES FOR NEXT REPORTING PERIOD

7.1 Overview

The planned activities for the next reporting period are being conducted in conjunction with and to facilitate the submittal of a final CSR and proposed Site closure.

7.2 Assessment

7.2.1 Groundwater Assessment

The following monitoring wells will be sampled in Summer 2018 to provide a comprehensive and updated evaluation of current groundwater conditions for incorporation into the VRP CSR. The list includes all of the Site monitoring wells with the exception of wells located within the anticipated zone of influence of the bioremediation injections where concentrations are likely to significantly decrease over time.

MW-2	MW-10	MW-14	MW-20	MW-25	MW-30	MW-35	MW-40A-E	MW-45
MW-3	MW-11	MW-15	MW-21	MW-26	MW-31	MW-36	MW-41A-E	MW-46
MW-6	MW-12	MW-16	MW-22	MW-27	MW-32	MW-37S/D	MW-42A-E	MW-47
MW-7	MW-12A	MW-18	MW-23	MW-28	MW-33	MW-38S/D	MW-43	MW-52A-C
MW-8	MW-13	MW-19	MW-24	MW-29	MW-34	MW-39	MW-44	MW-54

7.2.2 Groundwater Risk Analysis

The groundwater pathway will be further evaluated, as required, in relation to the groundwater and surface water POEs.

7.2.3 Vapor Intrusion Sampling

During the Summer or Fall of 2018, 23 soil gas samples and 12 indoor air samples will be collected to further evaluate the effectiveness of the SSD system. Soil gas and indoor air sample locations are shown on Figures 12 and 13, respectively.

7.3 Remedial Action

7.3.1 Decommissioning of Groundwater Pump-and-Treat System

Pump-and-treat operations have been ongoing since the early 1990s. Concentrations have decreased in several monitoring wells since that time; however, the system has reached the limits of its effectiveness with respect to the remaining TCE impacts in the release area groundwater. With the implementation of bioremediation as a means to decrease the mass of TCE in the release area groundwater, there is no benefit associated with the continued operation of this system. During the next reporting period, the four recovery wells (RW-1 through RW-4) will be sealed and decommissioned. As addressed in Response #2 in the comment response letter, prior to decommissioning of RW-3, bioremediation media will be injected into the well to reduce the elevated TCE in its immediate vicinity.

7.3.2 Groundwater Bioremediation

Bioremediation injections will continue into the next reporting period and are expected to conclude in June 2018. Sampling for VOCs and total organic carbon (TOC) will be conducted monthly following conclusion of injections, and results will be reported in the CSR. Specific recommendations regarding the performance of ongoing performance monitoring will be provided within the CSR.

7.3.3 Termination of Property Line ART System

The ART system was installed as an interim measure to decrease the flux of VOC off of the Facility property and has been effective in this regard (EPS, November 2017). Operation of the ART system will be terminated during Summer 2018 based on the following:

- Literature (Kueper et al., 2003) suggests that all groundwater plumes reach steady-state after some period of time (the Rheem groundwater plume is at least 30 years old).
- Concentration over distance trend charts, using existing groundwater VOC concentrations over various time ranges, suggest that the groundwater VOC plume has reached a steady-state condition.
- Release area bioremediation is expected to significantly decrease the mass of VOCs contributing to the down-gradient plume.

The groundwater plume located downgradient of the Facility is expected to remain steady for the next several years and eventually begin diminishing following the release area groundwater remediation.

7.3.4 Soil SVE System Operation

SVE system operations have been terminated. Carbon used for vapor extraction treatment will be disposed of off-Site, and the SVE wells will be decommissioned. Facility soils are below the direct contact clean-up criteria, and current soil concentrations are not expected to impact groundwater

above the existing to post-bioremediation levels. Therefore, a Type 5 RRS restricted use zone is not required for soils in the source area.

7.3.5 Sub-Slab Depressurization System

The SSD system will continue to operate during the next reporting period, and vapor mitigation requirements will be incorporated into the Environmental Covenant for the Facility.

Notes:

ft-bgs: feet below ground surface

ft-amsl: feet above mean sea level

PWR: partially weathered rock

N/A: Information currently not available

NM: Not Measured

* Depth to bottom of sand pack. Well clusters were installed in single boring.

** The original PZ-2 installation date is unknown. The well was replaced in 1/99 due to destruction by a run-away trailer from Roberson Mill Road.

*** The original RW-1 was installed in 6/21/89. The well was replaced in 1/99 due to collapse of the well.

LIMITED WARRANTY DEED

THIS INDENTURE is made as of the 29 day of January, 2018, between MAXINE GOLDSTEIN OR SUCCESSOR, AS TRUSTEE OF THE MAXINE SHAPIRO GOLDSTEIN FAMILY TRUST DATED JULY 30, 2014 ("Grantor"), and RHEEM MANUFACTURING COMPANY, a Delaware corporation ("Grantee"; the terms "Grantor" and "Grantee" to include their respective heirs, legal representatives, successors and assigns where the context requires or permits).

WITNESSETH:

That Grantor, for and in consideration of the sum of Ten and No/100 Dollars (\$10.00), and other good and valuable consideration, in hand paid at and before the sealing and delivery of these presents, the receipt, adequacy and sufficiency whereof are hereby acknowledged, has granted, bargained, sold, aliened, conveyed and confirmed, and by these presents does hereby grant, bargain, sell, alien, convey and confirm unto Grantee, the following described real property, to wit:

ALL THAT TRACT OR PARCEL of land lying and being in Land Lot 280, 318th GMD, Baldwin County, Georgia, containing 2.99 acres, and being all of Tract Three (3) as shown on a plat by Edwin L. Thompson dated September 28, 1999 recorded in Plat Book 18, Page 5, Office of the Clerk of Superior Court of Baldwin County, Georgia, which plat is by this reference incorporated herein (the "Land"); TOGETHER WITH any and all improvements, appurtenances, rights, privileges and easements benefiting, belonging or pertaining to the Land, and any right, title and interest of Grantor in and to any land lying in the bed of any street, road or highway in front of or adjoining said Land, together with any strips or gores relating to the Land (the Land and the foregoing rights, easements and appurtenances being hereinafter collectively referred to as the "Property").

TO HAVE AND TO HOLD the Property, together with all and singular the rights, members and appurtenances thereof, to the same being, belonging, or in anywise appertaining, to the only proper use, benefit and behoof of Grantee forever in FEE SIMPLE.

AND Grantor will warrant and forever defend the right and title to the Property unto Grantee against the claims of all persons or entities claiming by, through or under Grantor, subject only to the matters set forth on Exhibit "A" attached hereto and made a part hereof by this reference.

(Signature appears on next page)

IN WITNESS WHEREOF, Grantor has signed and sealed this Deed, the day, month and year first above written.

Signed, sealed and delivered
in the presence of:

Doris Lundquist
Witness

Harvey E. Morse
Notary Public

Commission Expiration Date:

1-12-2021

GRANTOR:

Maxine Goldstein (SEAL)
MAXINE GOLDSTEIN, AS TRUSTEE OF THE
MAXINE SHAPIRO GOLDSTEIN FAMILY TRUST
DATED JULY 30, 2014

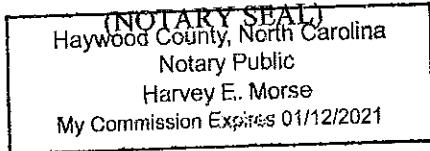

EXHIBIT "A"

PERMITTED EXCEPTIONS

1. All applicable, city, state and county real and personal property taxes for the year 2018 and subsequent years, a lien not yet due and payable.

QUITCLAIM DEED

STATE OF GEORGIA
COUNTY OF BALDWIN

This Quitclaim Deed made and entered into as of this 20 day of January, 2018, by and between MARCIA GOLDSTEIN, as Executrix under the Last Will and Testament of JACOB L. GOLDSTEIN, deceased and under Will dated May 3, 2011, late of the State of Georgia, and County of Baldwin, AS TRUSTEE OF THE MAXINE SHAPIRO GOLDSTEIN MAXINE GOLDSTEIN OR SUCCESSOR, and RHEEM MANUFACTURING FAMILY TRUST DATED JULY 30, 2014 (collectively, "Grantor"), and RHEEM MANUFACTURING COMPANY, a Delaware corporation ("Grantee"). The designation Grantor and Grantee, as used herein, shall include said parties, their heirs, successors, and assigns, and shall include singular, plural, masculine, feminine or neuter, as required by context.

WITNESSETH:

WITNESSETH, Grantor, for and in consideration of the sum of TEN DOLLARS (\$10.00) AND OTHER GOOD AND VALUABLE CONSIDERATION, cash in hand paid, the receipt of which is hereby acknowledged, has bargained, sold and does by these presents bargain, sell, remise, release, convey and forever quitclaim to Grantee all the right, title, interest, claim or demand which Grantor has or may have had, if any, in and to all that tract of land described on Exhibit A, attached hereto and made a part hereof (the "Property").

Together with all the rights, members and appurtenances to the Property in anywise appertaining or belonging.

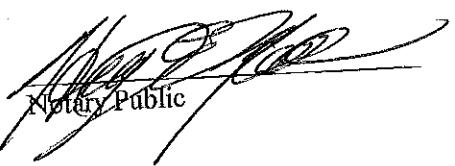

TO HAVE AND TO HOLD the Property unto Grantee, so that neither Grantor nor any other person or persons claiming under Grantor shall at any time, claim or demand any right, title or interest to the Property or its appurtenances.

(Signature appears on next page)

IN WITNESS WHEREOF, the Grantor has caused these presents to be signed.

Signed, sealed and delivered

MAXINE SHAPIRO GOLDSTEIN FAMILY
TRUST DATED JULY 30, 2014

EXHIBIT A

LEGAL DESCRIPTION OF THE PROPERTY

All that tract or parcel of land lying in the 318th G. M. District of Baldwin County, Georgia and more particularly described as follows:

From the POINT OF BEGINNING; which is a concrete monument found on the easterly right-of-way of Meriwether Circle,

Thence, N 33° 43' 28" E for a distance of 115.82 feet to a computed point at the beginning point of a non-tangential curve.

Said curve turning to the left through an angle of 36° 56' 40", having a radius of 381.26 feet, and whose long chord bears N 5° 07' 24" E for a distance of 365.02 feet to a 1/2" iron pin found.

Thence, N 66° 07' 28" E for a distance of 499.64 feet to a 1" iron pipe found.

Thence, N 65° 45' 08" E for a distance of 125.05 feet to a 5/8" iron pin found.

Thence, S 15° 43' 05" E for a distance of 256.06 feet to a 5/8" iron pin found.

Thence, S 01° 02' 06" E for a distance of 181.05 feet to a 5/8" iron pin found.

Thence, S 09° 24' 37" W for a distance of 248.07 feet to a 5/8" iron pin found.

Thence, S 75° 58' 17" W for a distance of 357.67 feet to a 5/8" iron pin found on right-of-way.

Thence, N 44° 40' 53" W for a distance of 171.10 feet to a 5/8" iron pin found.

Thence, N 46° 54' 37" E for a distance of 117.15 feet to a 5/8" iron pin found.

Thence, N 39° 43' 29" E for a distance of 162.20 feet to a 1/2" iron pin found.

Thence, N 37° 41' 56"E for a distance of 131.33 feet to a 1/2" iron pin found.

Thence, N 34° 42' 51" E for a distance of 178.13 feet to a 1/2" iron pin found.

Thence, S 50° 45' 39" E for a distance of 15.00 feet to a 1/2" iron pin found.

Thence, N 35° 46' 17" E for a distance of 300.11 feet to a 1/2" iron pin found.

Thence, S 54° 11' 29" E for a distance of 120.69 feet to a 1/2" iron pin found.

Thence, N 34° 33' 05" E for a distance of 13.96 feet to a 1/2" iron pin found.

Thence, S 57° 06' 11" E for a distance of 189.35 feet to a computed point.

Thence, S 61° 16' 02" E for a distance of 136.62 feet to a 5/8" iron pin found.

Thence, N 25° 15' 32" E for a distance of 188.96 feet to a 5/8" iron pin found.

Thence, N 21° 22' 57" E for a distance of 223.96 feet to a 5/8" iron pin found.

Thence, N 09° 24' 37" E for a distance of 248.07 feet to a 5/8" iron pin found.

Thence, N 01° 02' 06" W for a distance of 181.05 feet to a 5/8" iron pin found.

Thence, N 15° 43' 05" W for a distance of 256.06 feet to a 5/8" iron pin found.

Thence, N 19° 40' 03" W for a distance of 696.21 feet to a computed point.

Thence, N 8° 22' 55" W for a distance of 3.53 feet to a computed point.

Thence, N 7° 16' 11" E for a distance of 63.98 feet to a computed point.

Thence, N 0° 52' 49" E for a distance of 106.65 feet to a computed point.

Thence, N2° 48' 47" E for a distance of 26.22 feet to a computed point.

Thence, N 9° 10' 07" E for a distance of 34.66 feet to a computed point.

Thence, N 2° 47' 29" W for a distanced of 39.39 feet to a computed point.

Thence, N 1° 44' 58" E for a distance of 29.78 feet to a computed point at the beginning of a non-tangential curve and the right-of way of Hillandale Drive.

Said curve turning to the left through an angle of 36° 56' 40", having a radius of 442.53 feet, and whose long chord bears S 78° 59' 55" E for a distance of 280.43 feet to a computed point along said right-of-way.

Thence, N 83° 36' 58" E for a distance of 186.08 feet to a computed point along right-of-way.

Thence, N 83° 28' 10" E for a distance of 199.87 feet to a computed point at the intersection of right-of-way of Hillandale Drive and Roberson Mill Road.

Thence, S 9° 33' 27" W for a distance of 72.81 feet to a computed point on right-of-way of Roberson Mill Road.

Thence, S 3° 36' 12" W for a distance of 174.11 feet to a 1" iron pipe found on right-of-way.

Thence, S 84° 38' 56" W for a distance of 199.69 feet to a 1" iron pipe found.

Thence, S 3° 44' 04" E for a distance of 50.07 feet to a 1" iron pipe found.

Thence, S 8° 54' 10" E for a distance of 149.68 feet to a 5/8" iron pin found.

Thence, S 14° 20' 14" E for a distance of 100.17 feet to a 1" iron pipe found.

Thence, N 84° 48' 20" E for a distance of 165.69 feet to a concrete monument found.

Thence, S 18° 44' 52" E for a distance of 605.74 feet to a 5/8" iron pin found.

Thence, S 69° 57' 10" W for a distance of 15.00 feet to a 5/8" iron found.

Thence, S 20° 46' 41" E for a distance of 40.09 feet to a concrete monument found.

Thence, N 70° 03' 38" E for a distance of 14.62 feet to a concrete monumment found.

Thence, s 25° 57' 36" E for a distance of 124.64 feet to a 1/2" iron pin set.

Thence, S 59° 03' 47" W for a distance of 161.53 feet to a 5/8" iron pin found.

Thence, S 58° 59' 19" W for a distance of 267.62 feet to a 1/2" iron pin found.

Thence, S 18° 34' 41" E for a distance of 85.08 feet to a 1/2" iron pin found.

Thence, S 23° 24' 32" E for a distance of 250.49 feet to a 1" iron pipe found.

Thence, S 44° 55' 16" W for a distance of 551.50 feet to a 5/8" iron pin found.

Thence, S 44° 54' 10" W for a distance of 316.85 feet to a concrete monument found at the right-of way of Georgia State Route #22, which is the Point of Beginning.

Said Tract 2 having an area of 31.704 Acres.

AS-SURVEYED DESCRIPTION (TRACT 3)

All that tract or parcel of land lying in the 318th G. M. District of Baldwin County, Georgia, more particularly described as followed:

From the Point of Beginning which is a 5/8" iron pin found at the south westerly corner of property

Thence N 19° 40' 03" W a distance of 696.21 feet to a computed point in center of creek.

Thence, S 58° 20' 28" E for a distance of 22.33 feet to a 5/8" iron pin found.

Thence, S 53° 37' 17" E for a distance of 86.48 feet to a 5/8" iron pin found.

Thence, S 51° 06' 29" E for a distance of 113.74 feet to a 5/8" iron pin found.

Thence, S 42° 09' 23" E for a distance of 111.85 feet to a 5/8" iron pin found.

Thence, S 46° 20' 35" E for a distance of 101.81 feet to a 5/8" iron pin found.

Thence, S 35° 57' 01" E for a distance of 205.22 feet to a 5/8" iron pin found.

Thence, S 22° 51' 57" E for a distance of 97.60 feet to a 5/8" iron pin found.

Thence, S 65° 52' 56" W for a distance of 273.88 feet to a 5/8" iron pin found

Which is the Point of Beginning.

Said Tract 3 having an area of 2.752 Acres.

Environmental Covenant

This instrument is an Environmental Covenant executed pursuant to the Georgia Uniform Environmental Covenants Act, O.C.G.A. § 44-16-1 *et seq.*, as may be amended from time to time (hereinafter “Act”). This Environmental Covenant is entered into by the entities executing this Environmental Covenant and subjects the property identified below to the activity and/or use limitations and other requirements. This Environmental Covenant further grants such other rights in favor of EPD and Rheem Manufacturing Company as set forth herein.

Fee Simple Owner(s)/Grantor(s):

Rheem Manufacturing Company
1100 Abernathy Road NE, Suite 1700
Atlanta, Georgia 30328

Grantee/Holder with the power to enforce:

Rheem Manufacturing Company

Suite 1456 East Tower
Atlanta, GA 30334

Persons with Interests other than Fee Simple:

[Pending]

Property Subject

The property subject to this Environmental Covenant is a tract of approximately 41.13 acres of real property located at 138 Roberson Mill Road in Milledgeville, Baldwin County, Georgia, which is further identified by the tax parcel ID number below (hereinafter “Property”). The Property was conveyed on December 22, 2010 to Rheem Manufacturing Company; such conveyance is recorded in Deed Book 1044, Pages 396-399, of the Baldwin County, Georgia

deed records. The Property is located in Land Lot 296 and 297 of the 1st Land District, 318th G.M.D. of Baldwin County, Georgia.

The tax parcel of the Property: M52 001 of Baldwin County, Georgia.

A legal description of the Property is attached as Exhibit A and a map of the Property is attached as Exhibit B.

Environmental Covenant Runs with the Land and is Perpetual

Pursuant to the Act, this Environmental Covenant shall run with the land and shall be perpetual unless terminated or amended pursuant to terms herein or in accordance with provisions of the Act. This Environmental Covenant shall be binding upon Rheem Manufacturing Company, and all successors, assigns and transferees of any interest in the Property or any portion thereof.

Administrative Records

This Environmental Covenant imposes activity and/or use limitations and other requirements on the Property that arise under corrective action performed and/or being performed at the Rheem Manufacturing Company facility/site. Records pertaining to this corrective action are available at the following EPD location:

Georgia Environmental Protection Division
Response and Remediation Program
2 MLK Jr. Drive, SE, Suite 1054 East Tower
Atlanta, GA 30334
M-F 8:00 AM to 4:30 PM excluding state holidays

Activity and Use Limitations. The Property is subject to the following activity and/or use limitations:

A. Real Property. The Property shall be used only as non-residential property as defined in Rule 391-3-19-.02(2)(r). Use of the Property as residential property, as defined in Rule 391-3-19-.02(2)(r), is prohibited.

B. Groundwater. The use or extraction of groundwater beneath the Property for drinking water or any other non-remedial purpose is prohibited.

C. Vapor Mitigation. A vapor mitigation system or barrier shall be installed with the future construction of any enclosed structure on the Property, unless and until either: (a) the HSRA regulated substances in groundwater reach HSRA Risk Reduction Standards, or (b) a vapor intrusion exposure pathway evaluation is performed and EPD provides written concurrence that no vapor mitigation system or barrier is required with respect to the structure. A maintenance and monitoring plan, approved by EPD, shall be maintained with respect to any sub-slab depressurization (SSD) system currently present or required to be installed at the Property.

Other Requirements. The Property is subject to the following additional requirements.

A. Notice of Limitations and Requirements in Future Conveyances. Each instrument hereafter conveying any interest in the Property or any portion thereof that may

- affect the activity and use limitations described herein shall include a statement that the Property is subject to this Environmental Covenant (and any amendments thereto), the location (County, Deed Book and Page) in the deed records where this Environmental Covenant (and any amendments thereto) is recorded and a copy of this Environmental Covenant (and any amendments thereto).
- B. Notice to EPD of Future Conveyances. Within thirty (30) days after each conveyance of a fee simple interest in the Property or any portion thereof, a notice shall be sent to EPD and Rheem Manufacturing Company. The notice shall include the new owner's name, address, telephone number and other pertinent contact information, the date of the conveyance and the location (County, Deed Book and Page) where the conveyance is recorded, and, if the conveyance is a portion of the Property, a survey map showing the boundaries of the real property conveyed.
 - C. Notice of Change of Use. If such activity will materially affect any required monitoring or maintenance of any institutional or engineering controls described herein, the owner of the Property must provide to EPD thirty (30) days' advance written notice of the owner's intent to change the use of the Property, to apply for a building permit for construction at the Property, or to perform any site work.

Environmental Covenant Does Not Authorize Use Otherwise Prohibited

Pursuant to the Act, this Environmental Covenant shall not be construed to authorize a use of the Property that is otherwise prohibited by zoning, ordinance, local law or general law or by a recorded instrument that has priority over this Environmental Covenant.

Rights of Access and Enforcement

Authorized representatives of EPD and Rheem Manufacturing Company shall have the right to enter the Property at reasonable times in connection with implementation, compliance, or enforcement of this Environmental Covenant, including but not limited to the right to conduct inspections, examine related records, or to take samples.

This Environmental Covenant shall be enforceable by EPD, Rheem Manufacturing Company and other parties as provided in the Act. Such rights of access and enforcement herein shall not limit EPD's authority under other applicable law.

No Interest in Real Property in EPD

EPD's rights under this Environmental Covenant and the Act shall not be considered an interest in real property.

Recording of Environmental Covenant and Service on Other Persons

Within thirty (30) days after execution of this Environmental Covenant by the Director of EPD, Rheem Manufacturing Company shall record the Environmental Covenant in every county in which any portion of the Property is located in accordance with the law governing the recording

and priority of interests in real property. Upon recording of the Environmental Covenant, Rheem Manufacturing Company shall provide in a manner deemed acceptable by EPD a copy of the executed, recorded Environmental Covenant to each of the persons or entities identified in O.C.G.A. § 44-16-7.

Representations and Warranties by Grantor(s). Rheem Manufacturing Company represents and warrants that all of the following are true and correct:

- A. Rheem Manufacturing Company holds fee simple title to the Property.
- B. Rheem Manufacturing Company has the authority to enter into this Environmental Covenant, has the authority to grant any rights granted by it within, has the ability to carry out the obligations described within and, based upon information and belief after reasonable inquiry, does not know of any anticipated material change in the practices, ownership, or authority of Rheem Manufacturing Company that will alter this representation and warranty.
- C. The execution and delivery of this Environmental Covenant and carrying out the obligations described within will not conflict with any of the provisions of the organizational documents, operating agreement of Rheem Manufacturing Company nor will it violate, contravene and/or constitute a breach or default under any agreement, contract, order or instrument to which Rheem Manufacturing is a party or by which Rheem Manufacturing Company may be bound.
- D. There are no persons with existing interests other than fee simple in the Property.
- E. This Environmental Covenant does not authorize a use of the Property that is otherwise prohibited by zoning, ordinance, local law or general law or by a recorded instrument that has priority over this Environmental Covenant.
- F. At least thirty (30) days prior to presenting this Environmental Covenant to EPD for execution, Rheem Manufacturing Company served a copy of the proposed final text of this Environmental Covenant on all persons or entities required to be noticed in accordance with O.C.G.A. § 44-16-7.

Submission of Required Documents and Communications

Documents and communications required by this Environmental Covenant shall be submitted to:

Georgia Environmental Protection Division
Branch Chief
Land Protection Branch
2 Martin Luther King Jr. Drive SE
Suite 1054 East Tower
Atlanta, GA 30334

With a copy to:

Rheem Manufacturing Company
c/o Mr. Gregory Henry
1100 Abernathy Road NE, Suite 1700

Atlanta, Georgia 30328

EPD's Environmental Covenants Registry

This Environmental Covenant and any amendment thereto or termination thereof may be included in EPD's registry for environmental covenants.

Severability

Should any provision of this Environmental Covenant be found by a court of competent jurisdiction to be invalid and/or unenforceable in any respect, the remaining provisions shall continue in full force and effect.

Effective Date

This Environmental Covenant shall be effective on the date the fully executed Environmental Covenant is recorded in accordance with O.C.G.A. § 44-16-8(a).

Exhibit A
Legal Description of Property

All of Tract 1, as depicted on Survey of Property for Rheem Manufacturing Company, a plat of which is of record in Plat Book 37, Pages 50-51, recorded with the Clerk of Superior Court of Baldwin County, Georgia, Tract 1 being more particularly described as follows:

All that tract or parcel of land lying and being in Land Lots 296 and 297, First Land District, 3181 G.M.D. in Baldwin County, Georgia and being more particularly described as follows: Beginning at the P.O.B. of Tract 1; thence S 45°49'00" E a distance of 250.00' to a 1/2" rebar found; thence N 44°09'58" E a distance of 710.01' to a computed point; thence S 46°15'34" E a distance of 226.81' to a 1/2" rebar found; thence S 45°59'15" E a distance of 486.62" to a 1/2" rebar found; thence S 38°01'04" E a distance of 608.66' to a 1/2" rebar found; thence S 53°24'40" W a distance of 145.78' to a 5/8" rebar found; thence S 45°09'21" W a distance of 94.54' to a 1/2" rebar set; thence N 45°41'09" W a distance of 121.59' to a nail set in washer; thence N 45°36'40" W a distance of 88.99' to a fence post; thence N 45°43'11" W a distance of 196.06' to a fence post; thence S 44°11'14" W a distance of 613.36' to a fence post; thence S 45°21'01" E a distance of 266.17' to a fence post; thence S 45°17'46" E a distance of 17.46' to a chiseled "X"; thence S 44°18'53" W a distance of 254.37' to a computed point; thence S 44°19'29" W a distance of 192.10' to a computed point; thence S 44°19'09" W a distance of 296.00' to a 1/2" rebar set; thence N 32°45'36" W a distance of 460.26' to a 1" iron pipe; thence N 32°45'36" W a distance of 894.28' to a 1/2" rebar set; thence N 31°35'12" E a distance of 125.98' to a computed point; thence with a curve turning to the right with an arc length of 542.43', with a radius of 1869.86', with a chord bearing of N 36°48'05" E, with a chord length of 540.53' to a 1/2" rebar found, which is the point of beginning, having an area of 41.13 acres.

KM Standard Error of Mean (logged)	N/A		

DL/2 Statistics

Mean in Original Scale	0.219	SD in Original Scale	0.569
95% t UCL (Assumes normality)	0.345		

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

99% KM (Chebyshev) UCL	0.971
------------------------	-------

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

APPENDIX G
Vapor Intrusion Evaluation

G1 VAPOR INTRUSION EVALUATION

G1.1 Overview

Vapor intrusion involves the migration of vapors from the subsurface (soil or groundwater), through the soil and into an overlying building. EPA's guidance¹ regarding vapor intrusion recommends collecting and weighing multiple lines of evidence when evaluating the potential risk due to vapor intrusion. EPA endorses the use of the Vapor Intrusion Screening Level (VISL) calculator for vapor intrusion evaluation. VISL is an online tool that provides generally recommended screening-level concentrations for groundwater, soil gas (exterior to buildings and sub-slab) and indoor air for specified target risk levels and exposure scenarios. The VISL online tool will also calculate excess lifetime cancer risk (ELCR) and hazard quotient (HQ) values due to concentrations observed in groundwater, soil gas, or indoor air. According to the EPA, the allowable risk range (ELCR) is 10^{-6} to 10^{-4} , and the allowable range for hazard is 0.1 - 3. This risk evaluation ultimately uses an allowable risk of 10^{-5} and a hazard quotient of 1 in accordance with EPD practices.

Elevated concentrations of VOCs are present in groundwater at the Site, which leads to the potential for vapor intrusion. Once vapors leave the groundwater, they migrate through the vadose zone. In this zone the soil gas can be sampled to determine if vapors are present. The vapors may then migrate through building foundations into a building. Indoor air samples can be taken to determine if vapors are present at potentially unsafe levels. Groundwater and soil gas samples have been collected at both the Facility and downgradient from the Facility. The downgradient area can be divided into the East area (east of Roberson Mill Road) and the West area (west of Roberson Mill Road), since impacted groundwater in the area west of Roberson Mill Road is beneath a substantial (> 40 ft) lens of clean water; thus, vapor intrusion is an incomplete pathway in this area.

The vapor intrusion screening process below compares maximum groundwater and soil gas concentrations to applicable VISL screening levels to determine chemicals-of-concern (COC). For each COC, the 95% upper confidence limit on the mean (95% UCL)² of the constituent concentration within a given area, is used as the representative soil gas concentration for final VISL comparison.

¹ USEPA. 2015. OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air. June.

² Determined using EPA's ProUCL software

G1.1.1 Groundwater

Maximum groundwater concentrations in the three areas of the Site were compared to VISL Target Groundwater Concentrations (TGCs) based on an ELCR of 10^{-5} and an HQ of 1 (Table G-1, attached). Constituents exceeding the TGCs are considered COC_{GW}. Based on this screening, the following constituents are COC_{GW}:

Facility: 1,1,2-trichloroethane, 1,1-dichloroethene, benzene, chlorobenzene, Freon-12, trichloroethene (TCE), and vinyl chloride
Downgradient East: TCE, vinyl chloride
Downgradient West: TCE

G1.1.2 Soil Gas

Maximum soil gas concentrations in the three areas of the Site were compared to VISL Target Exterior Soil Gas Concentrations (TESGCs) based on an ELCR of 10^{-5} and an HQ of 1 (Table G-2). Constituents exceeding the TESGCs are considered COC_{SG}. Based on this screening, the following constituents are COC_{SG}:

Facility: 1,1-dichloroethene, chloroform, PCE, and TCE
Downgradient East: benzene
Downgradient West: none

G1.2 Risk Evaluation

G1.2.1 Facility

Groundwater and soil gas concentrations exceed the VISL screening values for several constituents at the Facility. Since soil gas data is more indicative of a potential risk as it is closer to the potential area of exposure than groundwater, the risk evaluation was conducted using the soil gas data only. The VISL online calculator was used to determine the ELCR and HQ for each COC_{SG}. The 95% UCL was used as the representative soil gas concentration. The UCL output is presented in Attachment G-1, and a summary of the results is shown in Table G3. The 95% UCLs for TCE and chloroform exceed the 10^{-5} ELCR, and the 95% UCLs for TCE and 1,1-dichloroethene exceed the HQ of 1. Subsequently, the sums of the ELCRs and HQs for the Facility COC_{SG} also exceeded 10^{-5} and 1, respectively. The ELCR and HQ at the Facility exceed the EPA's allowable risk range; however, based on indoor air sampling (EPS May 2016), the sub-slab depressurization system appears to be mitigating the vapor intrusion risk.

G1.2.2 Downgradient East and West

Groundwater concentrations exceed the VISL screening values for TCE and vinyl chloride in the downgradient East area and for TCE in the downgradient West area. However, these groundwater impacts are beneath 20 to >40 feet of clean groundwater.

Since soil gas data is more indicative of a potential risk as it is closer to the ground surface where vapor intrusion would hypothetically occur, the risk evaluation was conducted using the soil gas data only. Benzene to the East, was the only COC_{SG} in either downgradient area. The VISL online calculator was used to determine the ELCR and HQ for benzene using the 95% UCL as its representative concentration. The benzene 95% UCL does not exceed a 10^{-5} ELCR or an HQ of 1. For the downgradient West area, no constituents exceeded the VISLs, and therefore, there does not appear to be a vapor intrusion risk.

G1.3 Summary

Facility soil gas concentrations exceed EPD's established ELCR and HQ. However, based on indoor air sampling (EPS May 2016), the sub-slab depressurization system appears to be mitigating the vapor intrusion risk. Furthermore, release area soil concentrations have decreased significantly since the soil gas samples have been collected and ongoing groundwater remediation is expected to significantly decrease groundwater concentrations moving forward, both of which will reduce the potential for further vapor intrusion.

Vapor intrusion risk downgradient from the Facility does not exceed EPD's established ELCR or HQ, and therefore, there does not appear to be a vapor intrusion risk. It is of note that the constituents with elevated soil gas concentrations at the Facility are mostly chlorinated ethenes and those with elevated soil concentrations downgradient from the Facility are mostly petroleum hydrocarbons. The presence of these petroleum hydrocarbons is unrelated to the Site and appears to instead be related to petroleum hydrocarbon releases at two nearby leaking underground storage tank (LUST) sites.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL	44446
----------------	-------

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Warning: Data set has only 2 Detected Values.

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

APPENDIX I
Laboratory Analytical Report

ANALYTICAL ENVIRONMENTAL SERVICES, INC.

April 30, 2018

Justin Vickery
Environmental Planning Specialists, Inc.
400 Northridge Rd
Sandy Springs GA 30350

RE: Rheem

Dear Justin Vickery: Order No: 1804H65

Analytical Environmental Services, Inc. received 94 samples on April 18, 2018 4:30 pm for the analyses presented in following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES's accreditations are as follows:

-NELAP/State of Florida Laboratory ID E87582 for analysis of Non-Potable Water, Solid & Chemical Materials, Air & Emissions Volatile Organics, and Drinking Water Microbiology & Metals, effective 07/01/17-06/30/18.

State of Georgia, Department of Natural Resources ID #800 for analysis of Drinking Water Metals, effective 07/01/17-06/30/18 and Total Coliforms/ E. coli, effective 04/25/17-04/24/20.

-NELAP/Louisiana Agency Interest No. 100818 for or analysis of Non-Potable Water and Solid & Chemical Materials, effective 07/01/17-06/30/18.

-AIHA-LAP, LLC Laboratory ID: 100671 for Industrial Hygiene samples (Organics, Metals, PCM Asbestos, Gravimetric), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) Direct Examination, effective until 11/01/19.

These results relate only to the items tested. This report may only be reproduced in full.

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Chris Pafford
Project Manager

Case Narrative

Volatile Organic Compounds Analysis by Method 8260B:

Due to sample matrix, sample 1804H65-078A required dilution during preparation and/or analysis resulting in elevated reporting limits. Sample was ran twice and poorly purged both times.

cis-1,2-Dichloroethene value for sample 1804H65-079A is "E" qualified indicating an estimated value over linear calibration range. Sample was diluted and reanalyzed using the supplied methanol preserved sample at the minimum dilution allowed resulting in analytes being below reporting limits.

Trichloroethene value for sample 1804H65-080A is "E" qualified indicating an estimated value over linear calibration range. Sample was diluted and reanalyzed using the supplied methanol preserved sample at the minimum dilution allowed resulting in analytes being below reporting limits.

SAMPLE/COOLER RECEIPT CHECKLIST

1. Client Name: **Environmental Planning Specialists, Inc.**

AES Work Order Number: **1804H65**

2. Carrier: FedEx UPS USPS Client Courier Other _____

	Yes	No	N/A	Details	Comments
3. Shipping container/cooler received in good condition?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	damaged <input type="checkbox"/> leaking <input type="checkbox"/> other <input type="checkbox"/>	
4. Custody seals present on shipping container?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
5. Custody seals intact on shipping container?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
6. Temperature blanks present?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
7. Cooler temperature(s) within limits of 0-6°C? [See item 13 and 14 for temperature recordings.]	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	Cooling initiated for recently collected samples / ice present <input type="checkbox"/>	
8. Chain of Custody (COC) present?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
9. Chain of Custody signed, dated, and timed when relinquished and received?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
10. Sampler name and/or signature on COC?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
11. Were all samples received within holding time?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
12. TAT marked on the COC?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	If no TAT indicated, proceed with standard TAT per Terms & Conditions. <input type="checkbox"/>	

13. Cooler 1 Temperature 2.3 °C Cooler 2 Temperature 2.5 °C Cooler 3 Temperature 2.1 °C Cooler 4 Temperature 2.0 °C

14. Cooler 5 Temperature 1.8 °C Cooler 6 Temperature _____ °C Cooler 7 Temperature _____ °C Cooler 8 Temperature _____ °C

15. Comments: _____

I certify that I have completed sections 1-15 (dated initials).

MJ 4/18/18

	Yes	No	N/A	Details	Comments
16. Were sample containers intact upon receipt?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
17. Custody seals present on sample containers?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
18. Custody seals intact on sample containers?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
19. Do sample container labels match the COC?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	incomplete info <input type="checkbox"/> illegible <input type="checkbox"/> no label <input type="checkbox"/> other <input type="checkbox"/>	
20. Are analyses requested indicated on the COC?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
21. Were all of the samples listed on the COC received?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	samples received but not listed on COC <input type="checkbox"/> samples listed on COC not received <input type="checkbox"/>	
22. Was the sample collection date/time noted?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
23. Did we receive sufficient sample volume for indicated analyses?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
24. Were samples received in appropriate containers?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
25. Were VOA samples received without headspace (< 1/4" bubble)?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>		
26. Were trip blanks submitted?	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	listed on COC <input checked="" type="checkbox"/> not listed on COC <input type="checkbox"/>	

27. Comments: _____

This section only applies to samples where pH can be checked at Sample Receipt.

I certify that I have completed sections 16-27 (dated initials).

AJJ 4/18/18

	Yes	No	N/A	Details	Comments
28. Have containers needing chemical preservation been checked? *	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>		
29. Containers meet preservation guidelines?	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>		
30. Was pH adjusted at Sample Receipt?	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>		

* Note: Certain analyses require chemical preservation but must be checked in the laboratory and not upon Sample Receipt such as Coliforms, VOCs and Oil & Grease/TPH.

I certify that I have completed sections 28-30 (dated initials).
