Technical Memorandum

Date: January 28, 2021

To: Tim Hassett; Hercules LLC

From: Ali Ciblak, P.E., Ph.D., Rich Murray, P.E., Shanna Thompson, P.E., Geosyntec Consultants, Inc.

Subject: Shallow Groundwater Pilot Test Results
Hercules/Pinova, Glynn County, Brunswick, GA

Geosyntec Consultants, Inc. (Geosyntec) performed field studies on behalf of Hercules, LLC between December 2019 and November 2020 to evaluate the feasibility of remedial technologies and to support selection of an interim corrective measure (ICM) to address volatile organic compounds (VOCs) or/and possible non-aqueous phase liquid (NAPL) in shallow groundwater near the location of temporary shallow groundwater (SGW) sample location, SGW-23, and monitoring wells MW-21, MW-22, MW-23, and MW-24 (i.e. the SGW-23 Area, also known as the Stillhouse Control Room area) at the Hercules/Pinova facility in Brunswick, Georgia (Site) as shown in **Figure 1**. A desktop study evaluated the feasibility of remedial technologies including excavation, air sparging/soil vapor extraction (AS/SVE), in-situ stabilization (ISS), multi-phase extraction (MPE), in-situ chemical oxidation (ISCO), Ozone/SVE, in-situ thermal treatment, and enhanced in-situ bioremediation (EISB). Based on the desktop study, EISB, ISCO and MPE were selected for further evaluation with field and laboratory studies. The following studies were performed to evaluate the feasibility of selected technologies:

- A pilot test to evaluate the feasibility of MPE; and,
- An injection test to evaluate the injection rate and pressure that could be achieved if implementing an EISB or ISCO remedy.

This technical memorandum summarizes the methodology, results and conclusions of the MPE pilot test and the injection rate test.

BACKGROUND

The SGW-23 Area is located north of the Stillhouse Control Room within the greater Southern Production Area, which is an identified source area at the site according to the *Refined Conceptual Site Model Hercules/Pinova Brunswick Facility, Brunswick, Georgia* (Integral, 2019). The dominant direction of groundwater flow in this area is vertical with a dominant downward hydraulic gradient, and a less significant horizontal gradient which simultaneously transports groundwater eastward (Integral, 2019). Elevated concentrations of VOCs, specifically benzene, p-isopropyltoluene (paracymene), and toluene, have been detected in the monitoring wells which define the area: MW-21, MW-22, MW-23, and MW-24 as shown on **Figure 2**. The recent benzene, paracymene, and toluene results for each of the four monitoring wells are shown in the table below.

Monitoring Well	Sampling Date	Results (µg/L)		
		Benzene	Paracymene	Toluene
MW-21	12/13/2019	33,000	8,300	5,600
MW-22	6/14/2018	36,000	9,600	9,300
MW-23	12/13/2019	5,600	8,800	910
MW-24	12/15/2016	9,400	770	140

MPE PILOT TEST

This section explains the pilot test well layout, methods and results of the MPE pilot test.

Multi-Phase Extraction (MPE) Technology

MPE is a remedial technology that extracts both subsurface liquids and soil vapors from extraction well(s) by applying varying levels of vacuum to extraction wells. For a typical MPE application, a drop tube, also known as a "stinger", is installed in the extraction well (s) to control the volume of liquid extracted. Vacuum is applied directly to the stinger, making it possible to extract free product (if available) or water directly from or just below the groundwater table. The depth of the drop tube can be adjusted to varying depths, depending on testing conditions, to depress the liquid levels in the extraction well. Vacuum is also applied to the well head assembly, causing VOCs laden coil vapor to be recovered through well head riser pipe. The combined air and liquid stream extracted from the MPE well is conveyed through a flexible vacuum hose to the MPE system where the VOCs in the extracted vapors are treated using a thermal oxidizer or vapor-phase granular activated carbon unit (s) before vapor discharge to the atmosphere, through a stack. The extracted LNAPL/water stream can be collected and disposed of offsite or a can be treated before discharge to a permitted discharge location.

Pilot Test Well Layout

A test well network consisting of one MPE test well, two observation wells, and three soil vapor probes was installed to implement the MPE pilot test and injection rate test. A private utility locator was contracted to mark locations of underground utilities in the pilot test area prior to drilling, and all locations were hand cleared to a minimum of 5 feet below ground consistent with site underground utility clearance protocols. Betts Environmental Recovery from Adel, Georgia was contracted to install the MPE test well (MPE-01), observation well (MPE-OW-01 and MPE-OW-02), and vapor probes (VP-01, VP-02, and VP-03). The MPE well and observation well were installed using hollow-stem auger drilling techniques, and the vapor points were installed via hand auger. As shown in **Figure 2**, the location of MPE-01 and the observation wells were selected so that existing well MW-24 was utilized as a third observation well. MPE-01 was placed 20-feet from MW-24, and observation wells MPE-OW-01 and MPE-OW-02 were installed approximately 5-feet and 10-feet, respectively, from MPE-01. Existing well MW-23 was also utilized as an observation well to a lesser extent. It is approximately 44-feet from MPE-01. Soil vapor probes, VP-01, VP-02, and VP-03, were installed approximately 10 feet, 12 feet and 15 feet away from MPE-01, respectively. The vapor probes were used to monitor vacuum influence during the MPE test. Boring logs for newly installed wells are provided in **Attachment A**.

The table below provides survey and well construction information for the wells utilized during the MPE pilot and injection rate tests:

Well ID	Northing[1]	Easting[1]	Top of Casing (ft. NAVD88)	Screen Interval (ft. bgs.)
MPE-01	424368.64	870457.13	9.56	2 - 10
MPE-OW-01	424368.92	870461.58	9.51	2 - 17
MPE-OW-02	424359.36	870460.70	9.50	2 - 15
VP-01	424364.22	870465.05	9.42	2 - 5
VP-02	424356.24	870456.94	9.66	2 - 5
VP-03	424380.89	870465.77	9.67	2 - 5
MW-23	424375.02	870503.65	9.91	4 - 14
MW-24	424374.63	870437.85	10.04	4.8 - 14.8

ft. bgs. - feet below ground surface

ft. NAVD88 - feet North American Vertical Datum 1988

MPE Test Methods and Results

The MPE test equipment includes well head assembly, a scrubber/knockout tank assembly, a blower, and a thermal oxidizer to treat vapor phase VOCs. The details of the test equipment are included in **Attachment B**. A 20,000 gallon frac tank was used for collection and temporary storage of water extracted during the MPE test.

Geosyntec and Fruits mobilized to the Site on April 27th, 2020 and the test was completed in two days. On April 27th, 2020 (Day 1), a plastic sheeting/tarp was installed on the ground surface in test area to minimize the potential for short circuiting of air during the MPE testing. Baseline data including depth to water (DTW), depth to product (DTP), VOC screening using a photo-ionization detector (PID), and baseline vacuum was collected at the MPE test well (MPE-01) and the observation locations including MPE-OW-01, MPE-OW2, MW-24, VP-01, VP-02 and VP-03. The baseline readings are summarized in **Attachment C**. Based on the baseline measurements on Day 1, headspace PID readings ranged between 11 parts per million (ppm) and 57.9 ppm, with the highest reading in MPE-01. There was no measurable LNAPL in the test wells. The DTW was generally around 1.5 to 1.8 ft bgs.

Operational parameters: After completion of the baseline measurements, a well head assembly was placed in MPE-01 at a depth of 7 ft bgs. The test was performed for a period of 6.5 hours on April 27th. The applied vacuum was increased slowly from 1 inch of mercury (in Hg) up to 10.5 in Hg during the test duration. The monitoring data is included in **Attachment B** and **Attachment C**. The following observations were noted during the test on April 26th:

- Maximum air flow rate from the subsurface was 38 actual cubic feet per minute (ACFM) observed at a well head vacuum of 11.5 in. Hg.
- Maximum extracted liquid flow rate was around 2.2 gallons per minute (gpm) within the range of applied vacuum.
- A vacuum influence of 0.13 inches of water was noted in VP-03, which was approximately 15 feet from the test well. No significant vacuum influence was observed in VP-01 and VP-02, which were approximately 10 and 12 feet away from the test well. It is possible that the applied vacuum was surfacing through a preferential pathway prior to reaching to VP-01 and VP-02.
- No LNAPL was observed in the extracted water and in the observation wells, and maximum FID from hydrocarbons (not including methane) was 640 ppm.

- Maximum water table drawdown in observation wells MPE-OW-01, MPE-0W-02 and MW-24 were 2.27 ft, 1.60 ft and 0.76 ft, respectively.

The test was continued on April 28th (Day 2) after collection of another round of baseline water levels. Applied wellhead vacuum ranged from 10 to 17 in. Hg. The stinger depth was slowly lowered in the well to 9.8 ft bgs on Day 2. Pressure transducers were installed in MPE-OW-01, MPE-OW-02 and MW-24. The pressure transducers collected DTW readings once per minute. Four groundwater and four vapor samples were collected on Day 2 to estimate aqueous phase and vapor phase mass removal rates and evaluate treatment options. The following observations were noted from Day 2 activities:

- Maximum air flow rate from the subsurface was approximately 120 ACFM observed at a well head vacuum of 17 in. Hg.

- Extracted flow rate ranged between 2 gpm and 3.5 gpm within the range of applied vacuum (10 to 17" Hg).

- A vacuum influence of 0.3 inches of water was noted in VP-03, which was approximately 15 feet from the test well with an applied vacuum of 15 in. Hg.

- No LNAPL was observed in the extracted water, and maximum VOCs in the vapor phase from hydrocarbons (not including methane) was 580 ppm.

- **Figure 3** shows DTW changes in the observation wells. Maximum drawdown in MPE-OW-01, MPE-OW-02 and MW-24 were 9.54 ft, 2.1 ft and 1.29 ft, respectively.

Analytical results: On Day 2, four groundwater samples were collected. Two duplicate groundwater samples (i.e., MPE-GW-042820-1, MPE-GW-042820-2) and third sample (i.e., MPE-GW-042820-3) were collected from the extracted liquid at different times of the test. A fourth groundwater sample (i.e., MPE-GW-042820-4) was collected as a grab sample directly from MPE-01 at the end of the testing. In addition, two duplicate vapor samples were collected the extracted.

Groundwater samples were sent to Test America in Savannah, Georgia (GA) for the analysis of site-specific VOCs, total iron and manganese, hardness, alkalinity, and total suspended solid (TSS). Vapor samples were sent to Test America in Knoxville, Tennessee (TN) for VOC analysis using TO-15 method. The laboratory reports are included in **Attachment D.**

A summary of the laboratory analytical data is presented in **Tables 1 and 2**. The results are summarized and discussed below.

Volatile Organic Compounds (VOCs):

- The detected VOCs in the aqueous phase include 4-Methyl-2-Pentanone (MIBK), benzene, ethylbenzene, paracymene, methyl ethyl ketone (MEK), toluene and xylenes.

- The concentration of total VOCs in the aqueous grab sample collected directly from MPE-01 was around 17,805 micrograms per liter (µg/L). Assuming an extraction rate of 3.5 gpm and continuous operation, the mass removal rate in the aqueous phase would be 0.75 lbs. per day per well.

- The concentrations of total VOCs in the aqueous samples collected after MPE equipment ranged between 1,246 µg/L and 1,561 µg/L.

- The concentration of total VOCs in the vapor phase was approximately 64,100 µg/m^3 . Assuming a vapor extraction rate of 120 ACFM per well and continuous operation, the mass removal rate in the vapor phase would be 0.69 lbs. per day per well. The following VOCs were detected in vapor samples, as shown in order from highest to lowest average concentration:

    - benzene with an average concentration of 42,750 micrograms per cubic meter (µg/m^3);
    - paracymene with an average concentration of 13,334 µg/m^3;
    - toluene with an average concentration of 6,800 µg/m^3;
    - MEK with an average concentration of 1,295 J µg/m^3;
    - xylenes (Total) with an average concentration of 645 µg/m^3.
    - m,p-xylene with an average concentration of 435 µg/m^3;
    - o-xylene with an average concentration of 210 µg/m^3; and
    - ethylbenzene with an average concentration of 153 J µg/m^3.

Metals:

The groundwater samples exhibited iron concentrations ranging between 1,100 µg/L and 4,700 µg/L and manganese concentrations ranging between 67 µg/L and 230 µg/L.

Hardness, Alkalinity, and Solids

The groundwater samples had an average hardness of 175 milligrams per liter (mg/L) as calcium carbonate ($CaCO_3$), mostly attributable to calcium and magnesium hardness. Groundwater samples had an average alkalinity of 112 mg/L as $CaCO_3$ and an average total suspended solids (TSS) concentration of 221 mg/L. Typically, waters with hardness above 150 mg/L as $CaCO_3$ are classified as very "hard" waters.

Conclusions Related to MPE Feasibility and Design Parameters

Based on the pilot test results, MPE technology would be feasible, especially addressing treatment zones with residual or mobile LNAPL. However, if the extracted water is not hauled offsite to a waste water treatment facility, then the MPE system requires a system capable of addressing water with high hardness and relatively high iron/manganese concentrations prior to a permitted discharge location. Even though LNAPL was not detected in the pilot test area, the key design parameters for fluid recovery were obtained during the test. It is observed that an air flow rate of 38 ACFM was possible at an applied vacuum of up to 11.5 in Hg, when the stinger was placed approximately 5 feet below water level (5 feet of exposed screen for vapor recovery). A remedial design basis of 2,000 to 4,000 pore volume exchange per year is recommended for the treatment of soil vapor in a reasonable timeframe. Assuming an effective porosity of 20%, an exposed screen length of 5 feet, and a design air flow rate of 38 ACFM and a radius of influence (ROI) of 20 feet would result in approximately 16,000 pore volume exchange per year and provide an effective treatment. The following design parameters are recommended for the full scale design.

- Radius of influence: 20 feet;
- Design air flow rate: 38 ACFM per well (the treatment area may require capping to prevent short circuiting of vacuum propagation);
- Well spacing: 40 feet on center;
- Design well head vacuum: up to 12 in Hg; and
- Water extraction rate: up to 3.5 gpm per well.

LIQUID INJECTION FEASABILITY TEST

The injection rate tests were conducted with the purpose of informing a potential EISB or ISCO remedy. However, data gained from the tests can inform the design of any potential liquid injection systems.

Injection Preparation

The injection rate tests for MPE-OW-01 and MPE-OW-02 were conducted on April 29th and April 30th, 2020, respectively. The injection equipment consisted of an injection trailer with a 1,100-gallon polyethene tank, generator, and electrical centrifugal injection pump. Injectate consisted of potable water from a fire hydrant onsite, and, in the case of MPE-OW-01, a tracer solution consisting of concentrated sodium bromide was added to the batch to create an injected concentration of 210 mg/L sodium bromide. A pilot injection notification was provided to the Underground Injection Control department at the Georgia Environmental Protection Division. Injectate was fed through a totalizing flowmeter and into an injection wellhead affixed with a pressure gauge to monitor injection pressure.

Baseline samples for bromide analysis were collected from MPE-OW-02, MPE-01, MW-23, and MW-24 on March 27th, 2020. Background bromide concentrations are generally low, the highest observed concentration was 0.93 mg/L at MPE-OW-02, followed by 0.80 mg/L at MPE-01 and MW-23, and a non-detect result from MW-24. Background samples were also collected for fluorescein dye which were non-detect at all locations. Fluorescein was retained as a potential back-up tracer in the event background bromide levels were too high. Bromide was used over fluorescein because it is a conservative tracer, readily available, and inexpensive. A concentrated 250 g/L sodium bromide solution was prepared by SiREM lab in Knoxville, TN and shipped to the site.

Approximately 1-liter of 250 g/L sodium bromide solution was added to the 500-gal batch for MPE-OW-01, and a sample collected from the batch tank showed a concentration of 210 mg/L in the tank. The injection rate for both wells followed generally the same procedure with three primary goals:

- evaluate sustainable injection rates at pressures which do not result in surfacing of injectate (daylighting);
- evaluate the effect of screen length on observed injection rate; and
- evaluate radius of influence (ROI) for potential full scale design.

Injection Activity

At MPE-OW-01, injection initially commenced under gravity flow conditions. Totalizer readings were recorded on 10 to 20-minute intervals and water level measurements were collected from surrounding monitoring wells on 30 minute intervals. When the water level in the injection area stabilized from gravity flow (about 6 hours), the injection pump was utilized to increase injection pressure to 0.5 psi, 1.0 psi, and finally 2.0 psi. Water levels continued to be monitored in surrounding wells during this time and injection ceased when daylighting was observed while injecting at 2 psi. The totalizer indicated a total of 497.4 gallons was injected into MPE-OW-01.

At MPE-OW-02, injection briefly commenced under gravity flow conditions, then injection pressure was increased to 0.5 psi for two hours, and then increased again to 1.0 psi for one-and-a-half hours until daylighting was observed. At that point the injection pump was shut down, and the remainder of the batch was injected via gravity flow. **Table 3** provides water level measurements collected throughout the event, and **Table 4** provides the wellhead pressure and totalizer measurements.

Injection Monitoring

Field parameters (pH, conductivity, ORP, DO, and temperature) were recorded from the five wells in the pilot test area at the start and end of each injection day. Field parameter readings are tabulated in **Table 5**. Samples for bromide analysis were collected from MPE-01, MPE-OW-02, MW-23, and MW-24 immediately after wrapping up injection on April 29, 2020 and again in the morning of April 30, 2020, before starting the injection test that day. Bromide results at surrounding wells following the injection rate test into MPE-OW-01 are presented in the table below:

Location	Approximate Distance from Injection Well	Background (mg/L)	4/29 End-of-day Concentration (mg/L)	4/30 Beginning-of-Day Concentration (mg/L)
MPE-01	5	0.8	< 0.50	0.97
MPE-OW-02	12	0.93	2.6	< 0.50
MW-24	22	< 0.50	0.52	1.2
MW-23	40	0.8	1.1	< 0.50

Bromide observations at wells placed at varied distances from the injection point were used to estimate the injection radius of influence. Bromide results from the 29th indicate transport from MPE-OW-01 to MPE-OW-02, 12 ft away, and potentially MW-24, 22 ft away. The concentration of bromide at MPE-OW-01 increased from 0.93 mg/L to 2.6 mg/L, and at MW-24 bromide

increased from non-detect to 0.52 mg/L. A rainstorm was recorded in the Brunswick, GA area in the early morning of April 30, 2020, resulting in 0.26 in of rain on the pilot test area prior to collecting the bromide samples on the 30th (www.weatherunderground.com). Infiltration from precipitation likely influenced the transport and dilution of bromide in the subsurface due to the shallow water table and well-draining sands present. Overnight transport of bromide was not able to be determined from the data due to this precipitation event. A good indicator of rainwater dilution are the results from MPE-OW-02 where bromide was 2.6 mg/L on the afternoon of the 29th, but non-detect the following morning. Similar dilution is exhibited at MW-23, from 1.1 mg/L on the 29th to non-detect on the 30th. Bromide results from the 29th indicate transport from MPE-OW-01 radially outward to MPE-OW-02, 12 ft away, and potentially MW-24, 22 ft away. The concentration of bromide at MPE-OW-01 increased from 0.93 mg/L to 2.6 mg/L, and at MW-24 bromide increased from non-detect to 0.52 mg/L.

Water level changes in response to the injection were used to evaluate the degree to which the injectate would mound in the area around the injection well versus spreading out into the aquifer. Baseline groundwater elevations within the pilot test area were less than 2-ft bgs. at the start of the injection test into MPE-OW-01. Water level monitoring during gravity flow conditions show an increase of 0.37 to 0.62-ft throughout the plot. The table below shows observed mounding under gravity flow conditions for each observation well and its distance from MPE-OW-01.

Observation Well	MPE-01	MPE-OW-02	MW-24	MW-23
Distance from Injection Well (ft)	5	10	22	40
Maximum Observed Change in Groundwater Elevation (ft)	0.62	0.37	0.5	0.33

The following day, injection commenced at MPE-OW-02 under 0.5 psi which was increased to 1-psi after two hours and held at 1-psi for two hours.

The table below displays the average observed flow rates at each injection pressure for both MPE-OW-01 and MPE-OW-02:

Injection Well	Date of Injection Test	Injection Pressure		
		0 psi	0.5 psi	1 - 2 psi
MPE-OW-01	4/29/2020	0.87 gpm	1.47 gpm	4.75* gpm
MPE-OW-02	4/30/2020	0.63 gpm	1.50 gpm	1.95** gpm

* daylighting observed and injection ceased after approximately 20-minutes at 2-psi.
** daylighting observed and injection ceased after approximately 1.5 hours at 1-psi.

Observed flow rates under gravity flow and pressure and generally similar between the two locations. The 4.75-gpm observed at ME-OW-01 under 1-psi was the result of injection fluid surfacing and is not considered a sustainable injection pressure. The addition of an additional 2-ft of injection well screen at MPE-OW-02 did not impart a noticeable increase in the specific capacity of the injection well. Furthermore, gravity flow conditions at MPE-OW-02 were tested after approximately 400-gallons of injectate, unlike the injection test in MPE-OW-01, so the decreased gravity flow rate at MPE-OW-02 compared to MPE-OW-01 may be due to the pressurized injection that occurred immediately prior. Gravity flow at MPE-OW-02 had to overcome dissipating mounding pressure in addition to natural pore water entry pressure.

Conclusions Related to Liquid Injection Feasibility and Design Parameters

Based on the pilot test results, liquid injection of amendments would be feasible under gravity feed conditions or very low pressure (e.g. 0.5 psi) conditions. Injection under gravity flow conditions resulted in relatively low groundwater mounding (0.33 – 0.67 ft) throughout the pilot, and no daylighting was observed. Under pressurized injection conditions, daylighting of injectate was observed when pressures were increased to 1 psi in one of the test wells and 2 psi in the other test well. In addition to monitoring injection pressure and mounding, ROI was evaluated by injecting bromide as a conservative tracer. The following design parameters are recommended for the full scale design.

- Observed ROI was up to 22 ft.; however, closer well spacing to provide overlapping ROIs can be used to mitigate the potential for daylighting if the design volume per well requires long-term injection.

- Design injection pressure: Gravity feed (0 psi) up to 0.5 psi. Up to 1 psi may be possible based on observations at one of the two wells used during this pilot injection.

- Design injection flowrate: gravity feed at 0.75 gpm (average of MPE-OW-01 and MPE-OW-02 flowrates) or low pressure (0.5 - 1 psi) at 1.5 gpm. These are initial injection flow rates, and injection flow rates can slow down over the course of an injection event.

- Injection well screens: injection well screens from 2 – 12 feet below ground surface were used successfully in this injection test. Future remedial designs could also provide varied well screen depths and presume deeper placement of the top of the well screen would result in the ability to apply some degree of additional injection pressure.

Groundwater level should be monitored closely during full scale injection because the superposition of multiple wells receiving injectate at once could result in unacceptable mounding or surfacing of groundwater. Injections must cease if surfacing is observed to allow the treatment area to recover to pre-injection groundwater levels. Sequencing the distribution of injectate so that adjacent injection wells are not receiving fluid at the same time will reduce mounding potential. Injection wells MPE-OW-01 and MPE-OW-02 were installed via hollow-stem auger and performed well during the test; however, the drilling team reported some difficulty during installation due to the loose, sandy conditions. The low clay and high sand content of the formation may allow for alternative, less intrusive drilling methods – such as direct push technology (DPT) - to be utilized.

Vinyl Chloride	µg/L	0.50 U	0.50 U	0.50 U	25 U
Xylenes (Total)	µg/L	27	150	210	55
Total VOCs	µg/L	1560.6	1246	1318	17805
Alkalinity					
Alkalinity	mg/L	110	110	130	97
Bicarbonate Alkalinity as $CaCO_3$	mg/L	110	110	130	97
Bicarbonate ion as HCO_3	mg/L	140	140	160	120
Carbon Dioxide, Free	mg/L	7.9	7.1	5.0 U	120
Carbonate Alkalinity as $CaCO_3$	mg/L	5.0 U	5.0 U	5.0 U	5.0 U
Hydroxide Alkalinity	mg/L	5.0 U	5.0 U	5.0 U	5.0 U
Phenolphthalein Alkalinity	mg/L	5.0 U	5.0 U	5.0 U	5.0 U
Total Metals					
Iron	µg/L	3,600	4,700	2,100	1,100
Manganese	µg/L	200	230	140	67
Solids, Total Suspended (TSS)					
Total Suspended Solids	mg/L	390	410	57	28
Total Hardness (as $CaCO_3$) by Calculation					
Hardness as $CaCO_3$	mg/L	190	190	160	160
Calcium Hardness as $CaCO_3$	mg/L	95	90	75	65
Magnesium Hardness as $CaCO_3$	mg/L	91	99	86	99

Notes:
µg/L - micrograms per liter; mg/L - milligrams per liter; CaCO3 - calcium carbonate; HCO_3 - bicarbonate
J - Result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value.
U - Indicates the analyte was analyzed for but not detected.

Table 2

Geosyntec Consultants

Summary of Soil Vapor Analytical Results

Hercules LLC/Pinova Inc. Facility, Brunswick, GA

Well ID	Units	MPE-01			
Sample Date		04/28/20			
Lab ID		140-19001-1	140-19001-2	140-19001-3	140-19001-4
Sample Name		MPE_VP01_042820	MPE_VP02_042820	MPE_VP03_042820	MPE_VP04_042820
Volatile Organic Compounds					
1,2,3-Trichloropropane	µg/m^3	320 U	240 U	350 U	250 U
Acetone	µg/m^3	2,400 U	1,800 U	2,600 U	1,900 U
Benzene	µg/m^3	37,000	40,000	43,000	51,000
Chlorobenzene	µg/m^3	52 U	39 U	58 U	41 U
Chloroform	µg/m^3	55 U	41 U	61 U	43 U
Ethylbenzene	µg/m^3	100 U	150 J	160 J	200 J
Methyl Isobutyl Ketone (MEK)	µg/m^3	880 J	1,300	1,500 J	1,500
Naphthalene	µg/m^3	700 U	520 U	780 U	550 U
p-Cymene	µg/m^3	7,400	12,000	14,000	14,000
Toluene	µg/m^3	5,500	6,300	7,200	8,200
Vinyl Chloride	µg/m^3	120 U	88 U	130 U	93 U
m,p-Xylene	µg/m^3	320 J	370 J	460 J	590 J
o-Xylene	µg/m^3	160 J	180 J	240 J	260 J
Xylene (Total)	µg/m^3	480 J	550 J	700 J	850 J

Notes:

µg/m^3 - micrograms per cubic meter

J - Result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value.

U - Indicates the analyte was analyzed for but not detected.

Subject:
Two Day High-Vacuum Remediation Pilot Study
Hercules Pinova Facility
2801 Cook Street
Brunswick, Georgia
Fruits Project: GA20-9074

Dear Mr. Ciblak:

Fruits & Associates, Inc. is pleased to provide this summary of the High-Vacuum Remediation event that was conducted on April 27th, 2020 at the above referenced facility. Below is a summary of both the technology as well as the results of the actual event.

Technology:

High-Vacuum Remediation (HVR) involves the extraction of subsurface vapors and liquids via a monitoring well or recovery well. This is accomplished by applying high levels of vacuum pressure to the extraction point. To eliminate mounding of the water table, a drop tube (commonly known as a stinger) is inserted in the well to the static water level depth. The applied vacuum and airflow extracted from the well is pulled through this drop tube. As the water table attempts to mound due to the application of vacuum, the liquids are “slurped” through this drop tube. This slurping effectively maintains the static conditions of the water table while the elevated vacuum is applied to the well during the event. In order to minimize any change to the current smear zone associated with the site, seasonal water level data is analyzed. Once the extraction process is underway, the inlet of the stinger assembly is slowly lowered to the maximum historical water level observed for each extraction well. This draw down (one to ten feet below the static water level) depresses the water table and creates a cone of influence, which maximizes the efficiency of the high vacuum process.

Occasionally, fresh air (5 to 25 CFM) is introduced at the well surface to increase the airflow and enhance the liquid removal rate. In order to accurately record the actual removal rate from the well, an airflow gauge is mounted on the well head to measure the amount of fresh air that is introduced. This extra fresh air is subtracted from the total flow calculated for each extraction well. Additionally, two vacuum gauges are installed; one on the stinger assembly (well head vacuum), and one on the well casing (influence vacuum). If fresh air is introduced at the well head, the influence vacuum reading will be artificially lower than the actual applied vacuum because the inlet for fresh air is adjacent to this vacuum gauge port. The setup and piping configurations are shown in Figure #1.

During the extraction process, the combined air and liquids are transferred to the mobile treatment system where the liquids are separated with a liquid scrubber / knockout system and discharged into a storage tank for future disposal. The hydrocarbon vapors are transferred to the off-gas treatment system and are incinerated in a forced air Thermal Oxidation (ThOx) unit at 1500 degrees Fahrenheit. After thorough destruction of the contaminants in the air stream, the clean air is discharged into the atmosphere. A complete flow diagram of this process is shown in Figure #2.

Calculations:

During the HVR event, two measurements are taken, of both the influent and effluent flow rates, the concentrations of the vapors removed (before off-gas treatment), and the off-gas treatment system concentrations. These measurements are used to calculate the removal rates and the off-gas emission rates. The flow rates were measured using a Dwyer DS-300 Pitot tube attached to a differential pressure gauge. These flow rate measurements are reported in Actual Cubic Feet per Minute (ACFM). Before each event, these flow assemblies are calibrated to insure an accurate flow measurement. A separate flow rate is calculated for each influent well (if more than one well is connected), as well as for any additional fresh air that is introduced into the influent stream. The individual flow rates are combined to achieve the total flow and velocity derived from the extraction points. Because of the extremely high concentrations involved with a High Vacuum event, additional quench air (0 to 2,000 SCFM) is added to the vapor stream, just before entering the ThOx unit. An additional Pitot tube assembly is installed at the inlet of the ThOx unit and is used to measure the total flow. Combined with the off-gas concentration readings, this total flow rate is used to calculate the destruction efficiency of the system.

The concentration measurements are taken using a TVA-1000A FID instrument calibrated to methane. For comparison purposes, the removal rates are calculated in total carbon, as well as total hydrocarbons. This FID instrument has a dynamic range of 0-50,000 PPM as methane, 0-100,000 PPM as hydrocarbon. Our concentration samples are collected before any additional bleed or quench air is added to the extracted flow rate. These undiluted concentration measurements exceed the dynamic range of any FID instrument. In order to accurately record the high concentrations observed during a HVR event, a calibrated 10:1 dilution valve is used to cut the sample. This dilution valve, along with the FID instrument, is calibrated before the start of each event.

In order to eliminate the naturally occurring methane that is present during a typical HVR event, each concentration sample is measured twice. The first sample is collected directly from the system, and recorded as the total VOC concentration. The second sample is collected using an in-line activated carbon filter, which adsorbs the hydrocarbon compounds leaving only methane present in the sample to be measured. This methane only result is then subtracted from the total VOC concentration measurement (first sample), resulting in a Non Methane Organic Compound (NMOC) concentration. This NMOC concentration is used in the mass removal calculations. However, as with any FID instrument, the NMOC results are recorded as parts per million by volume (PPM_v) as if the concentrations were methane. A conversion from methane to a hydrocarbon and from a volume to a weight is necessary to calculate an accurate mass removal rate. Using the NMOC concentration results and the TVA-1000's factory certified response ratio for hydrocarbons, the NMOC results are converted to equivalent hydrocarbon mg/Ls. A TVA-1000 FID has an average response ratio of 600 PPM_v per mg/L of unleaded gasoline and 200 PPM_v per mg/L of diesel. Summaries of these calculations are shown in Figure #3.

Results:

Phase Separated Hydrocarbon (PSH) was not detected in any monitoring wells prior to performing the event (well locations are shown in Figure #4). Once static water levels were established, during the course of the event the system was connected to MPE-1. At each of the extraction points a stinger was located at the static fluid levels, and once the ThOx unit's normal operating temperature was reached, the inlet flow valve was opened for this well. Once the PSH was removed from the extraction well (if any), the stinger assembly was lowered into the static fluid level approximately 0 to 6 feet, creating a cone of influence.

During the first HVR event, the average ACFM was calculated at 24.49 for MPE-1, with an additional 5.00 ACFM recorded at the fresh air breather port. The fresh air breather port is used during an event to enhance the volatilization and fluid recovery rates from the monitoring wells. A summary of the recovered flow rates are shown in Figure # 5. The combined total airflow from the extraction well and breather port averaged 28.81 ACFM.

During the second HVR event, the average ACFM was calculated at 88.92 for MPE-1, with an additional 5.00 ACFM recorded at the fresh air breather port. The fresh air breather port is used during an event to enhance the volatilization and fluid recovery rates from the monitoring wells. A summary of the recovered flow rates are shown in Figure # 5. The combined total airflow from the extraction well and breather port averaged 93.92 ACFM.

Throughout the event, air concentration measurements were recorded periodically from both the influent and effluent sample ports. The concentration results were entered into the HVR field monitoring log (Attachment A) and during the event, 0.65 pounds of carbon was removed (2.19 pounds of hydrocarbon, 0.35 equivalent gallons of gasoline). Additionally, 3.87 pounds of methane was removed and incinerated during the event. A summary of the total equivalent hydrocarbon recovery rate is shown in Figure #6. The total off-gas discharge (to the atmosphere) was 0.01948 pounds of carbon (0.06501 pounds of hydrocarbon), thus yielding a 92.34% destruction rate for the ThOx unit. Induced vacuum readings (in inches of water column) were recorded in this event (See Attachment A for results).

Once the HVR event was complete, a second round of water level measurements was recorded in which the results are shown in Attachment A. After the event, there were no levels of PSH recorded in any of the associated monitoring wells. During the event, 1,413 gallons of petroleum contacted water (PCW) was removed and collected in a holding tank onsite.

Sincerely,

Fruits & Associates, Inc.

John M. Fruits

Calculation of Hydrocarbon Loading Rate

Formula:

$$\dot{m} = Q \times C \times CF$$

Where:

$\dot{m}$ = Contaminant Loading Rate (lbs/hr)

Q = Air Flow Rate (CFM)

C = Contaminant Concentration (mg/m³)

CF = Conversion Factor = $0.000003743 = \frac{1\ m^3}{35.31\ ft^3} \times \frac{1\ lb}{454 \times 10^3\ mg} \times \frac{60\ min}{1\ hr}$

Since all field measurements are in PPM_V, the following formula is used to convert to mg/m³.

$$C = \frac{PPM_V}{R} \times \frac{1{,}000\ L}{1 m^3}$$

Where:

R = TVA Response Ratio*

*According to the manufacture's documentation, *The Foxboro Monitor, Volume 3, Issue 1A, Page 5, Response Ratio of Fuel Samples,* the Foxboro TVA-1000 has a response ratio of approximately $\frac{600\ PPM_V}{1\ mg/L}$ for Gasoline, $\frac{200\ PPM_V}{1\ mg/L}$ for Diesel Fuel.

Example:

Q = Air Flow Rate = 200 CFM

C = TVA-1000 Reading = 20,400 PPM_V

R = Response Ratio for Gasoline = 600

Results:

$$25.45\ lbs/hr = 200 \times \left(\frac{20{,}400}{600} \times 1{,}000\right) \times 0.000003743$$

($\dot{m}$ = 25.45 lbs/hr; Q = 200; C = 20,400; R = 600; CF = 0.000003743)

Note:

To convert *lbs* to equivalent gallons, the following formula is used:
Specific Gravity (Gasoline =0.74, Diesel = 0.84) x Conversion Factor (8.333) = *lbs/gal.*
(Gasoline = 6.16 *lbs/gal.* Diesel = 6.99 *lbs/gal.)*

Monitoring Well Gauging Data

Well Number	Before DTP	Before DTW	Before Prod.(ft)	Vacuum Readings at: 3:10 PM			DTP	DTW	Prod.(ft)	After DTP	After DTW	After Prod.(ft)	Drawdown Results (ft)
MPE-1	1.58	1.58		7" Hg						5.80	5.80		-4.22

Comments:

notes
Dan & Ali taking all DTW, Vac and PID readings at the monitoring wells
Per Ali we do not have to log these.
Influent readings and water production is all we have to take. Due to flowmeter malfunctions no hourly readings on Monday.
Per Ali remove flowmeter and measure frat tank hourly on Tuesday.

Calibration Information

Calibration Gas	Methane
Calibration Gas Concentration (PPMv)	10,000
Response Factor (TVA-1000)	600
Number of Carbons	1
Influent Pipe Dia.	2
Effluent Stack Dia.	8

This Event's Totals

Total Lbs of Carbon	0.08
Total Lbs of Methane	0.25
Total Lbs of Hydrocarbon	0.27
Equiv. Gal. of Hydrocarbons	0.043
Total Gallons of Liquid (Groundwater)	180.00
Total Operating Time (Hours)	6.5

Cumulative (To Date) Totals

Total Lbs of Carbon	0.08
Total Lbs of Methane	0.25
Total Lbs of Hydrocarbon	0.27
Equiv. Gal. of Hydrocarbons	0.043
Total Gallons of Liquid	180.00

Table of Contents

Definitions/Glossary

Client: Geosyntec Consultants, Inc.
Project/Site: MPE Pilot Test/Brunswick, GA

Job ID: 140-19001-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 140-19001-1

Laboratory: Eurofins TestAmerica, Knoxville

Narrative

CASE NARRATIVE

Client: Geosyntec Consultants, Inc.

Project: MPE Pilot Test/Brunswick, GA

Report Number: 140-19001-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Receipt
The samples were received on 5/4/2020 2:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice.

VOLATILE ORGANIC COMPOUNDS IN AMBIENT AIR
Samples MPE_VP01_042820 (140-19001-1), MPE_VP02_042820 (140-19001-2), MPE_VP03_042820 (140-19001-3) and MPE_VP04_042820 (140-19001-4) were analyzed for Volatile Organic Compounds in Ambient Air in accordance with EPA Method TO-15. The samples were analyzed on 05/06/2020.

TO-15: EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-39410 exhibited % difference of > 30% for the following analyte(s) Acetone, Chloromethane and Isopropyl alcohol ; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Samples MPE_VP01_042820 (140-19001-1)[38.79X], MPE_VP02_042820 (140-19001-2)[39.22X], MPE_VP03_042820 (140-19001-3) [39.05X] and MPE_VP04_042820 (140-19001-4)[41.35X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

EUROFINS/TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?	/			☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	/			☐ **Sample Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)		/		☑ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, notify lab to adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg
Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig
Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)
14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

Narrative

CASE NARRATIVE

Client: Geosyntec Consultants, Inc.

Project: Hercules/Pinova Brunswick Facility

Report Number: 680-183249-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

RECEIPT
The samples were received on 04/30/2020; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.8 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples MPE-GW-042820-1 (680-183249-1), MPE-GW-042820-2 (680-183249-2), MPE-GW-042820-3 (680-183249-3) and MPE-GW-042820-4 (680-183249-4) were analyzed for Volatile Organic Compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/03/2020, 05/04/2020 and 05/05/2020.

Surrogate recovery for the following sample was outside control limits: MPE-GW-042820-1 (680-183249-1). Evidence of matrix interference due to high target analytes is present; therefore, re-extraction and/or re-analysis was not performed

Surrogate recovery for the following sample was outside control limits: MPE-GW-042820-2 (680-183249-2). Evidence of matrix interference due to high target analytes is present; therefore, re-extraction and/or re-analysis was not performed

1,2-Dichlorobenzene and 1,4-Dichlorobenzene were detected in method blank MB 680-617331/8 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Methylene Chloride was detected in method blank MB 680-617375/10 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The method blank for analytical batch 680-617527 contained Methylene chloride above the method detection limit (MDL). Associated samples were not re-analyzed because results were less than the reporting limit (RL

Samples MPE-GW-042820-1 (680-183249-1)[5X], MPE-GW-042820-2 (680-183249-2)[2X], MPE-GW-042820-3 (680-183249-3)[5X] and MPE-GW-042820-4 (680-183249-4)[50X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batches 680-617331,680-617337, 680-617375, and 680-617527.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

METALS (ICPMS)
Samples MPE-GW-042820-1 (680-183249-1), MPE-GW-042820-2 (680-183249-2), MPE-GW-042820-3 (680-183249-3) and MPE-GW-042820-4 (680-183249-4) were analyzed for metals (ICPMS) in accordance with EPA SW-846 Method 6020A. The samples were

Job ID: 680-183249-1 (Continued)

Laboratory: Eurofins TestAmerica, Savannah (Continued)

prepared on 05/04/2020 and analyzed on 05/05/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ALKALINITY
Samples MPE-GW-042820-1 (680-183249-1), MPE-GW-042820-2 (680-183249-2), MPE-GW-042820-3 (680-183249-3) and MPE-GW-042820-4 (680-183249-4) were analyzed for alkalinity in accordance with SM 2320B. The samples were analyzed on 05/04/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL SUSPENDED SOLIDS
Samples MPE-GW-042820-1 (680-183249-1), MPE-GW-042820-2 (680-183249-2), MPE-GW-042820-3 (680-183249-3) and MPE-GW-042820-4 (680-183249-4) were analyzed for total suspended solids in accordance with SM 2540D. The samples were analyzed on 05/01/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PH
Samples MPE-GW-042820-1 (680-183249-1), MPE-GW-042820-2 (680-183249-2), MPE-GW-042820-3 (680-183249-3) and MPE-GW-042820-4 (680-183249-4) were analyzed for pH in accordance with EPA SW-846 Method 9040C. The samples were analyzed on 05/01/2020.

This analysis is considered a field test and is to be performed within 15 minutes of collection. This sample(s) was performed in the laboratory outside the 15 minute timeframe.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL HARDNESS (AS CACO3) BY CALCULATION
Samples MPE-GW-042820-1 (680-183249-1), MPE-GW-042820-2 (680-183249-2), MPE-GW-042820-3 (680-183249-3) and MPE-GW-042820-4 (680-183249-4) were analyzed for total hardness (as CaCO3) by calculation in accordance with SM 2340B. The samples were analyzed on 05/06/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Sample Summary

Client: Geosyntec Consultants, Inc.
Job ID: 680-183249-1
Project/Site: Hercules/Pinova Brunswick Facility

Lab Sample ID	Client Sample ID	Matrix	Collected	Received	Asset ID
680-183249-1	MPE-GW-042820-1	Water	04/28/20 15:45	04/30/20 09:30	
680-183249-2	MPE-GW-042820-2	Water	04/28/20 15:45	04/30/20 09:30	
680-183249-3	MPE-GW-042820-3	Water	04/28/20 17:30	04/30/20 09:30	
680-183249-4	MPE-GW-042820-4	Water	04/28/20 18:20	04/30/20 09:30	

Method Summary

Client: Geosyntec Consultants, Inc.
Project/Site: Hercules/Pinova Brunswick Facility

Job ID: 680-183249-1

Method	Method Description	Protocol	Laboratory
8260B	Volatile Organic Compounds (GC/MS)	SW846	TAL SAV
6020A	Metals (ICP/MS)	SW846	TAL SAV
SM 2340B	Total Hardness (as CaCO3) by calculation	SM	TAL SAV
2320B-2011	Alkalinity, Total	SM	TAL SAV
2540 D-2011	Total Suspended Solids (Dried at 103-105°C)	SM	TAL SAV
9040C	pH	SW846	TAL SAV
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	TAL SAV
5030B	Purge and Trap	SW846	TAL SAV

Protocol References:

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate recovery exceeds control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

CASE NARRATIVE

Client: Geosyntec Consultants, Inc.

Project: Ashland - Brunswick Plant Waters

Report Number: 680-183351-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

RECEIPT
The samples were received on 05/01/2020; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.1 C.

TCLP VOLATILE ORGANIC COMPOUNDS (GC-MS)
Sample MPE_WC_043020 (680-183351-10) was analyzed for TCLP volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8260B. The samples were leached on 05/06/2020 and analyzed on 05/06/2020.

Sample MPE_WC_043020 (680-183351-10)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PESTICIDES (TCLP)
Sample MPE_WC_043020 (680-183351-10) was analyzed for Pesticides (TCLP) in accordance with EPA SW-846 Method 1311/8081B_8082A. The samples were leached on 05/06/2020, prepared on 05/07/2020 and analyzed on 05/11/2020.

This method incorporates 2nd column confirmation. Corrective action is not taken for surrogate/spike compounds unless results from both columns are unacceptable. Results outside criteria are qualified.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 680-617699 and 680-617920 and analytical batch 680-618275 recovered outside control limits for the following analyte: Methoxychlor. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data has been reported

Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Methoxychlor failed the recovery criteria high for LCS 680-617920/11-A. Methoxychlor failed the recovery criteria high for LCSD 680-617920/12-A. Refer to the QC report for details.

IGNITABILITY
Sample MPE_WC_043020 (680-183351-10) was analyzed for ignitability in accordance with EPA SW846 Method 1010A. The samples were analyzed on 05/18/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Job ID: 680-183351-1 (Continued)

Laboratory: Eurofins TestAmerica, Savannah (Continued)

ANIONS BY ION CHROMATOGRAPHY (28 DAY)

Samples INJ_BT_042920 (680-183351-1), INJ_MW24_042920 (680-183351-2), INJ_MPE01_042920 (680-183351-3), INJ_OW02_042920 (680-183351-4), INJ_MW23_042920 (680-183351-5), INJ_MW24_043020 (680-183351-6), INJ_MPE01_043020 (680-183351-7), INJ_OW02_043020 (680-183351-8) and INJ_MW23_043020 (680-183351-9) were analyzed for Anions by Ion Chromatography (28 Day) in accordance with EPA Method 300.0. The samples were analyzed on 05/05/2020, 05/06/2020 and 05/08/2020.

Method 300_ORGFM_28D: The following samples was diluted due to color and appearance: INJ_MPE01_042920 (680-183351-3), INJ_OW02_042920 (680-183351-4), INJ_OW02_043020 (680-183351-8), INJ_MW23_043020 (680-183351-9). Elevated reporting limits (RL) are provide

Samples INJ_BT_042920 (680-183351-1)[10X], INJ_MPE01_042920 (680-183351-3)[5X], INJ_OW02_042920 (680-183351-4)[5X], INJ_OW02_043020 (680-183351-8)[10X] and INJ_MW23_043020 (680-183351-9)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Method Summary

Client: Geosyntec Consultants, Inc.
Project/Site: Ashland - Brunswick Plant Waters

Job ID: 680-183351-1

Method	Method Description	Protocol	Laboratory
8260B	Volatile Organic Compounds (GC/MS)	SW846	TAL SAV
8081B/8082A	Organochlorine Pesticides and Polychlorinated Biphenyls by Gas Chromatography	SW846	TAL SAV
300.0-1993 R2.1	Anions, Ion Chromatography	MCAWW	TAL SAV
1010A	Ignitability, Pensky-Martens Closed-Cup Method	SW846	TAL CAN
1311	TCLP Extraction	SW846	TAL SAV
3520C	Liquid-Liquid Extraction (Continuous)	SW846	TAL SAV
5030B	Purge and Trap	SW846	TAL SAV

Protocol References:

Definitions/Glossary

Client: Geosyntec Consultants, Inc. Job ID: 680-183351-1
Project/Site: Ashland - Brunswick Plant Waters

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD recovery exceeds control limits.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
U	Indicates the analyte was analyzed for but not detected.

HPLC/IC

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Detection Summary

Client: Geosyntec Consultants, Inc.
Project/Site: Ashland - Brunswick Plant Waters

Job ID: 680-183351-1

Client Sample ID: INJ_BT_042920 — Lab Sample ID: 680-183351-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True	

Accreditation/Certification Summary

Client: Geosyntec Consultants, Inc. Job ID: 680-183351-1
Project/Site: Ashland - Brunswick Plant Waters

Laboratory: Eurofins TestAmerica, Savannah

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Florida	NELAP	E87052	06-30-20

Laboratory: Eurofins TestAmerica, Canton

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	Identification Number	Expiration Date
California	State	2927	02-23-21
Connecticut	State	PH-0590	12-31-21
Florida	NELAP	E87225	06-30-20
Georgia	State	4062	02-23-21
