

# What does Groundwater Monitoring look like?

Now that you have allowed access to your property, what happens next? Put your mind at ease by knowing what the groundwater (GW) monitoring wells look like.

- ✓ Your property's groundwater will be evaluated for contamination. In order to collect samples of this water source, multiple wells may need to be installed at several locations. The contractors/consultants doing the work are professionals contracted by the State of Georgia. Your property will only be used to properly identify contamination boundaries and/or provide clean water.

Below are pictures of what the wells on your property may look like and the equipment used to install them. Your property will be returned to its original condition once the wells are decommissioned.
