Voluntary Remediation Program
Rayloc Facility
600 Rayloc Drive, SW
Atlanta, Fulton County, Georgia 30336
HSI #10547
Clearwater Project No. 1502-1-3

Dear Mr. Nix:

Clearwater Environmental Resources, LLC (Clearwater), under contract to Genuine Parts Company (GPC), respectfully submits this 5th Semi-Annual Progress Report for the Rayloc facility. This report describes the actions taken at the site since the 4th Semi-Annual Progress Report submitted on November 12, 2015.

Clearwater appreciates the opportunity to provide this Progress Report. Please feel free to contact me at (678) 491-4601 or jack.wintle@clearwaterenv.net or Mr. Bob Lewis with Genuine Parts Company at (404) 858-2564 if you have any questions regarding our report.

Sincerely,
Clearwater Environmental Resources, LLC

Jack A. Wintle, P.G.
Senior Environmental Geologist

LIST OF APPENDICES

1.0 INTRODUCTION

A Voluntary Remediation Plan (VRP) for the Rayloc facility located at 600 Rayloc Drive in Atlanta, Fulton County, Georgia, was received by the Georgia Environmental Protection Division Response and Remediation Program (GAEPD) on January 15, 2013 and conditionally approved by the GAEPD on October 11, 2013. In order to evaluate the progress of the voluntary clean-up efforts, semi-annual progress reports are required. Please refer to Figure 1 for a Site Aerial Map for the location of the site.

The remedial activities include the continued treatment of contaminated groundwater in and downgradient of the former waste pit area using gas-infusion technology with the objective of achieving Type 3 Risk Reduction Standards (RRS). Clearwater has also operated an Air Sparge/Soil Vapor Extraction system using the gas-infusion technology to the only area of impact identified within the former Rayloc building to effect the same result. Further, Clearwater has recently completed excavation of impacted soils identified outside of the Rayloc building during the PPCAP investigation.

1.1 Groundwater Sampling Protocol

Groundwater sampling activities at the Rayloc Facility are completed in a manner consistent with the current EPA Region 4 SESD Operating Procedure SESDPROC-301-R3, dated March 4, 2013. Unless otherwise noted, each monitoring well is sampled via bailers or the "Low Flow" method using a bladder pump. These methodologies were selected based on the target depth of the samples and the objective of minimizing investigation-derived waste (IDW). Sampling commences when parameters in the purged groundwater reach a pH variance of no more than 0.1 SU, a specific conductance variance of no more than 5% of the observed value, and a turbidity variance of less than 5 NTU or a total reading of less than 10 NTU, when possible. Sampling commences after the removal of three measured well volumes if stabilization has not been noted in the purging parameters.

Purging of each shallow monitoring well (less than 33 feet) is completed in a controlled, quiescent manner with single-use, disposable polyethylene bailers. Stabilization criteria of the purged groundwater are evaluated with an YSI 556 multi-parameter instrument and a nephelometric turbidimeter. The YSI 556 and turbidimeter are calibrated by a third-party equipment supplier and verified on-site per Operating Procedures SESDPROC-100, SESDPROC-101, and SESDPROC-103.

Sampling of the deeper (greater than 33 feet) monitoring wells is completed via a bladder pump constructed with stainless steel housing and Teflon bladders in conjunction with a QED MicroPurge controller. The bladder pump intake is placed at the target screen interval of the monitoring well, and the samples are collected through single-use, down-well polyethylene tubing and bladder. At the start and end of the sampling event, and after each monitoring well sampled, the stainless steel housing of the bladder pump is decontaminated in a pre-rinse, a Liquinox bath, and subsequently rinsed with deionized water. IDW including purged groundwater, polyethylene bailers, bailer twine,

polyethylene tubing, and Teflon bladders are stockpiled in one or more sealed 55-gallon drums during each sampling event, and transported off-site at periodic intervals. Following collection in laboratory-supplied containers, groundwater samples are stored on site with wet ice as a preservative and delivered to the designated lab under chain-of-custody protocols.

2.0 MILESTONES COMPLETED SINCE NOVEMBER 12, 2015

Since November 12, 2015, Clearwater has completed the excavation of impacted soil identified outside of the Rayloc building during the PPCAP investigation. The following paragraph discusses the excavation work. Due to the recent completion of this work, tables and figures will be provided in the 6th Semi-Annual Progress Report.

2.1 Excavation of Impacted Areas Identified During the PPCAP Investigation

Between October 2015 and March 2016 Clearwater excavated a total of 193.11 tons of impacted soil from the areas of minor impacts (AST-2, OT-3 and OT-5) identified outside of the Rayloc building during the PPCAP investigation. These soil impacts have recently been remediated to below the RRS Type 3. The excavations were then backfilled and resurfaced. Please refer to Figure 2 for a map showing the soil excavation locations. Tables and figures are being prepared and will be provided in the 6th Semi-Annual VRP Report.

3.0 MILESTONES IN-PROGRESS OR TO BE COMPLETED

The milestones that are either in-progress or to be completed at the Rayloc property are outlined in the following sections.

3.1 Source Area Remediation

GPC and Clearwater are in the process of proposing an alternative remedial option for this area.

3.2 Former Parts Disassembly and Cleaning Area AS/SVE Remedial System

Clearwater has operated an Air Sparge/Soil Vapor Extraction (AS/SVE) system in the former PDA area since April 2015 which utilizes gas-infusion technology.

Environmental X_2 Contracting, Inc. (X2) is a remedial contractor at Rayloc and has active remedial systems in both the site groundwater and the PDA area.

Due to analytical results indicating that the PCE impact extended west beyond our initial system, Clearwater subsequently installed three (3) additional extraction wells and one (1) additional injection well on the west side of the known impact area.

In March 2016, a pilot study was initiated using a gravity fed in-situ chemical oxidation (ISCO) using persulfate to attempt to accelerate the remedial process. Early results, although minor, appear positive. Based on Clearwater's remedial contractor (X_2), the conclusion is that the persulfate pilot study is showing positive results in air monitoring of the study monitoring wells in the form of spikes in sulfides and carbon monoxide. Effluent from the activated carbon exhaust has been non-detect for VOCs since October 2015.

Clearwater will continue to collect verification soil samples from the same locations within the PDA area every two months to compare results. This will allow X_2 to adjust injection or extraction flows and/or gas concentrations to provide more effective remediation of the impact. Please refer to Table 1 for a summary of historical PDA sampling results and Figure 3 for a figure showing the PDA sampling locations and results. December 2015 and March 2016 PDA laboratory data are located in Appendix A. The X_2 Soil Remediation Status Report is located in Appendix D.

3.3 Groundwater Remedial System

In early October 2015, Clearwater collected groundwater samples from the twenty (20) compliance wells at the Rayloc facility.

As stated in the November 2015 5th Semi-Annual Progress Report, some wells have maintained their concentrations of VOCs while others have shown excellent reduction in tetrachloroethene (PCE). MW-15 saw a reduction from 156 ppb in November 2012 to

5.23 ppb in October 2015 and MW-19 from 97 ppb in November 2012 to 8.12 ppb in October 2015. These wells are located near the drainage feature east of Wendell Drive and are located near injection wells.

Results of PCE levels in RAD-4, a deep source area well, have gone down from 20,000 ppb in January 2010 to less than 5 ppb in October 2015 and results of PCE levels from RAD-5, a deep well adjacent to the source area, have gone down from 13,500 ppb in November 2012 to 841 in October 2015. These reductions in contaminant concentrations may be due to the typical rebounding of dechlorinating microbes when the temperature drops after an Electro-Thermal Dynamic Stripping Process or ET-DSP™ system is deactivated. The ET-DSP™ system was shut down in 2008.

Please refer to Table 2 for a summary of monitoring well and groundwater elevations, Table 3 for a summary of historical Compliance Well sampling results, Figure 4 for a figure showing the groundwater sampling locations and October 2015 results, Figure 6 for a figure showing the October 2015 Potentiometric-Surface Map and Figure 7 for a figure showing the October 2015 PCE Isoconcentration Map.

X2 has provided a technical summary of the groundwater remedial operations as follows:

There was a significant reduction in PCE concentrations throughout the source area, an increase in the downgradient zone Area 2 (Railroad Area), and modest change in the offsite Area 3 (Creek Area). However, there was substantial generation of CIS-1,2 - Dichloroethene daughter product in Area 2, indicating that a high level of reduction is occurring as greater mass of PCE migrates into the area. The 27 percent improvement in ORP during this period supports the conclusion that reductive dechlorination is increasing in most of the treatment zone. The areas that are deficient in organic acids and buffering capacity continue to experience excess methane generation due to methanogenic competition for hydrogen, thus inhibiting reductive dechlorination.

Please refer to Table 4 for a summary of the Historical X2 Remedial System Sampling Results, Figure 5 for a figure showing the February 2016 X2 Remedial System Sampling Results, February 2016 laboratory data is located in Appendix B, Sampling Logs are located in Appendix C and the X2 Groundwater Remediation Status Report is located in Appendix D

3.4 Installation of Additional POD Wells

Clearwater is in the process of negotiating with the offsite owners for access to install two new monitoring wells to be used as Point of Demonstration (POD) wells: one between the abandoned MW-14 and MW-10; and one along the drainage feature between MW-10 and MW-15. Based on the negotiation, Clearwater anticipates these wells will be installed this summer and will be included in the 6th Semi-Annual VRP Report.

3.5 Complete Horizontal and Vertical Delineation

Although much of the impacted groundwater has been delineated, Clearwater is in the process of further delineating the groundwater impact at the Rayloc property. The soil impact within the Rayloc building (PDA Area) is being addressed as previously discussed.

3.6 Vapor-Intrusion Investigation (Rayloc Building)

Soil-vapor samples will be collected from locations within the Rayloc building to determine whether chlorinated solvents in the site groundwater may have migrated to the building area. These samples will be collected upon completion of the remediation of the impact in the Parts Disassembly & Cleaning Area. This Area is located in an unused area of the Rayloc building, away from any currently used areas. The only area currently being consistently used is the high-ceilinged warehouse where the trucks are loaded and unloaded through bay doors using forklifts.

4.0 CERTIFICATIONS

4.1 Professional Geologist Certification

"I certify under penalty of law that this report and all attachments were prepared by me or under my direct supervision in accordance with the Voluntary Remediation Program Act (O.C.G.A. Section 12-8-101, et seq.). I am a professional geologist who is registered with the Georgia State Board of Registration for Professional Geologists and I have the necessary experience and am in charge of the investigation and remediation of this release of regulated substances.

Furthermore, to document my direct oversight of the Voluntary Remediation Plan development, implementation of corrective action, and long term monitoring, I have attached a monthly summary of hours invoiced and description of services provided by me to the Voluntary Remediation Program participant since the previous submittal to the Georgia Environmental Protection Division.

The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment for knowing violations."

Please refer to Table 5 for a Summary of Professional Oversight Hours.

APPENDIX A
DECEMBER 2015 AND MARCH 2016
PDA LABORATORY REPORTS

ANALYTICAL RESULTS

PERFORMED BY

GCAL, LLC
7979 Innovation Park Dr.
Baton Rouge, LA 70820

Report Date 12/28/2015

GCAL Report 215121648

Project Rayloc PDA Confirmation Sampli

Deliver To	***Additional Recipients***
Jack Wintle Clearwater Env. Resources Peachtree Industrial blvd Duluth, GA 30096 678-491-4601	Jack Wintle, Clearwater Env. Resources

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with the NELAC Institute standard and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: Clearwater Environmental Resources **Report:** 215121648

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

VOLATILES MASS SPECTROMETRY

In the EPA 8260B analysis, samples 21512164801 (PD-2 @ 10'), 21512164802 (WD-2 @ 10'), 21512164803 (WD-4 @ 10'), 21512164804 (WD-8 @ 5'), 21512164805 (WD-11 @ 10'), 21512164806 (ADD-1 @ 6'), 21512164807 (ADD-1 @ 10'), 21512164808 (ADD-2 @ 5'), and 21512164809 (ADD-2 @ 10') had to be diluted to bracket the concentration of target analytes within the calibration range of the instrument. The dilutions are reflected in elevated detection limits.

In the EPA 8260B analysis for analytical batch 575413, the LCS and/or LCSD recoveries are outside control limits for Carbon disulfide and Trichlortrifluoroethane. All other recoveries are acceptable.

MISCELLANEOUS

All samples were received outside of the prescribed temperature range. Please refer to the preservative checklist for details on the temperature upon receipt. The client was contacted and authorized the laboratory to proceed with the analyses.

GCAL Report 216031403

Project Rayloc PDA

Deliver To	***Additional Recipients***
Jack Wintle Clearwater Env. Resources Peachtree Industrial blvd Duluth, GA 30096 678-491-4601	NONE

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
CF	HPLC or GC Confirmation
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%
P	RPD between primary and confirmation result is greater than 40

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: Clearwater Environmental Resources **Report:** 216031403

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

VOLATILES MASS SPECTROMETRY

In the EPA 8260B analysis, all samples had to be diluted due to the presence of non-target background and/or to bracket the concentration of target compounds within the calibration range of the instrument. The dilution is reflected in elevated detection limits.

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%
P	**RPD between primary and confirmation result is greater than 40**

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: Clearwater Environmental Resources **Report:** 216021623

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

VOLATILES MASS SPECTROMETRY

In the EPA 8260B analysis, samples 21602162302 (MW-12 @ 60), 21602162304 (MW-17 @ 30), 21602162306 (MW-20 @ 60), 21602162307 (MW-21 @ 60), 21602162308 (MW-22 @ 60), 21602162309 (MW-23 @ 60), 21602162310 (MW-24 @ 30) and 21602162311 (PT-3 @ 60) had to be diluted due to the presence of non-target background and/or to bracket the concentration of target compounds within the calibration range of the instrument. The dilution is reflected in elevated detection limits.

VRP Groundwater Remediation Progress Report

Project: Former Rayloc Facility

600 Rayloc Drive

Atlanta, GA 30336

For: **Mr. Jack Wintle, P.G.**

Clearwater Environmental Resources, LLC

3870 Peachtree Ind. Blvd.

Suite 340139

Duluth, GA 30096

April 4, 2016

OVERVIEW

This report provides a technical summary of remedial operations during the period October 2015 through March 2016. There was a significant reduction in PCE concentrations throughout the source area, an increase in the downgradient zone Area 2, and modest change in the offsite Area 3. However, there was substantial generation of CIS-1,2 -Dichloroethene daughter product in Area 2, indicating that a high level of reduction is occurring as greater mass of PCE migrates into the area. The 27 percent improvement in ORP during this period supports the conclusion that reductive dechlorination is increasing in most of the treatment zone. The areas that are deficient in organic acids and buffering capacity continue to experience excess methane generation due to *methanogenic* competition for hydrogen, thus inhibiting reductive dechlorination.

During this reporting period, several maintenance and enhancement projects were undertaken. The primary groundwater injection system treating Area 1 and 2 was replaced with a state-of-the-art mixing system that allows for automated adjustment of the % hydrogen injected. Anticipating the application of methanogen inhibitor during the next quarter, the new system will allow for increased levels of hydrogen, which will support higher rates of reductive dechlorination. In addition, the injection system treating Area 3 was damaged by vandalism and has been replaced by a new system to improve performance via the 4 injection points in Area 3.

SOURCE AREA

The perimeter of the primary source area (Area 1) is monitored by 3 deep wells MW-21,22,23. There are presently 12 groundwater injection wells that deliver gas phase reagents to this zone. The percent change in key parameters is presented in Figure 1 below; note that positive numbers indicate a decrease from the prior period, while a negative value reflects an increase. There was substantial reduction of PCE mass in the source area during this period. MW-22 revealed a large increase of CIS-1,2 daughter product, indicating a higher level of reductive dechlorination; MW-22 is most influenced by the supplemental injection wells that were installed in December 2014. The long term trends in key parameters listed in Figure 1 and illustrated graphically in Exhibits 1-5; trends in key parameters for MW-21,22,23 are illustrated graphically in Exhibits 6-8.

Figure 1. Percent Change in Key Parameters

AreaLocation	PCE	CIS	TCE	DO	ORP
1-MW-21	56	0	69	20	30
1-MW-22	66	-74	-5	-84	20
1-MW-23	38	55	44	20	-19
2-MW-12	-30	-48	100	14	3
2-MW-20	-62	-705	-192	29	-4
2-PT-3	13	-436	-9	67	-10
2-MW-24	-24	-28	-11	-29	10
3-MW-15	0	0	0	0	0
3-MW-17	-3	-5	13	-80	58
3-MW-19	0	100	0	5	179
Average	5	-114	1	-4	27

AREA 2 – DOWN GRADIENT

The treatment zone immediately down gradient of the source area (Area 2) is an abandoned railroad right of way. Prior pilot studies with various technologies were conducted in Area 2. This zone has seen fluctuations in mass migration and reaction rates due to geochemical conditions that in some cases inhibit reductive dechlorination. Process control sampling was implemented in January 2015 to include the following parameters:

- pH, EC, Temp, ORP, DO, Alkalinity
- Organic Carbon: DOC/TOC,
- CAHs,
- chloride,
- nitrate, nitrite
- sulphate,
- Iron: (II) and (III)
- ethane/ethene/methane.

Evaluation of the process control information facilitates decisions on supplemental reagents such as methanogen inhibitor, organic acids, and hydrogen percentage. Although 3 of the 4 monitoring wells in Area 2 experienced an influx of PCE mass during this period, the concurrent increase in CIS-1,2 daughter product indicates that reductive dechlorination is progressing, but at a rate that is less than the rate of influx from the source area. Recent maintenance improvements to injection system components in Area 2, coupled with the recent system capacity upgrade should improve the rates during the present quarter. The key parameter trends for the monitoring wells in Area 2 (MW-12, 20, PT-3, MW-24) are illustrated graphically in Exhibits 9-12.

OFF SITE AREA 3

This area is located adjacent to a Chattahoochee River tributary creek south of Wendell Drive, and down gradient from the source area. It is monitored by MW-15,17,19. There are 4 groundwater injections wells in a linear array between MW-17 and MW-19. This area is influenced by the creek hydraulics, and has experienced some down time due to vandalism during the reporting period. A new system was fabricated and installed within a steel shipping container to avoid further vandalism delays. There was little change in conditions in Area 3 during this period; the results for key parameters are illustrated graphically in Exhibits 13-15.

Soil Remediation Status Report

Parts Disassembly Area

Project: Former Rayloc Facility

600 Rayloc Drive

Atlanta, GA 30336

For: **Mr. Jack Wintle, P.G.**

Clearwater Environmental Resources, LLC

3870 Peachtree Ind. Blvd.

Suite 340139

Duluth, GA 30096

April 4, 2016

OVERVIEW

Since start up in April of 2015, confirmation soil sampling has been performed on a bi-monthly schedule to monitor progress. The results through December 2015 are summarized in Table 1 below; note that the percent reduction calculations are based on the 5 confirmation sampling points. The baseline sampling stations that have not been sampled were assumed to be the same as baseline in an attempt to be conservative, however we know from field vapor VOC readings that these stations have been reduced significantly. Although the 79 % reduction is substantial, the soil PCE concentrations are still well above the Type 3 HSRA Risk Reduction Standard of 0.5 mg/kg. The ISCO pilot work was commenced for that reason, and has shown encouraging impacts during the first month of operation. The SVE system has continued to operate efficiently. A moisture condensation issue was discovered in early December that was causing elevated water content in the activated carbon filter, resulting in diminished efficiency. That has been resolved and the carbon is now removing over 99% of the VOC influent.

BACKGROUND

The former Rayloc Facility Parts Disassembly Area (PDA) is presently undergoing remediation of PCE contaminated soil under the concrete floor. The treatment zone is approximately 1400 square feet in surface area; the baseline condition was approximately 520 pounds (236 kg) of perchloroethene (PCE) in 1 million kg of soil. A soil vapor extraction (SVE) system was installed in April 2015 as the primary remedial technology. The SVE process involves inducing flow in the subsurface with an applied vacuum, thus enhancing in situ volatilization of contaminants. The original system included 11 vacuum extraction wells and 8 gas injection wells. The extraction vapor is processed through an air-water separator, an air cooled heat exchanger, followed by fixed bed activated carbon vessel.

Analysis of operating results to date in September 2015 led to the conclusion that there may be substantial PCE mass in the area west of the existing system. As a result of exploratory soil sampling performed in October 2015 at locations ADD-1 and ADD-2 shown on Exhibit 1, it was determined that 3 additional extraction wells (IW-12, 13, 14) and 1 injection well (I-9) should be installed on the west side of the existing treatment zone. In November 2015, the supplemental wells were installed to a depth of 15 feet with a 1-inch PVC riser and screened between 5 feet and 15 feet, while the upper 5 feet was grouted.

In March 2016 a pilot study was initiated using in situ chemical oxidation (ISCO) to evaluate the effectiveness in accelerating the degradation of PCE in the areas of higher concentration in the western area of the treatment zone. The initial chemical injections were performed with persulfate and results to date have been encouraging. Referring to Exhibit 1, injection wells PDS-I-6, PDS-I-8, and PDS-I-9 were included in the first phase of the ISCO pilot. Each injection point received between 80 and 120 gallons in the first phase. A second phase was recently performed with the volume being adjusted based on observed results. The extraction wells adjacent to each injection point have been monitored, and the results to date are summarized in later sections.

PDA ISCO PILOT

A targeted program of injection in areas of highest PCE concentration commenced in early March 2016 to demonstrate the effectiveness of the technology in the PDA environment, and determine full scale requirements. The conventional method of ISCO injection in soil is to use direct push drilling on a triangular grid pattern, with screening set at the required depths to reach the contaminated zones. However, since there are pre-existing injection wells throughout the PDA grid, 3 injection wells were used for the initial injections; referring to Exhibit 1, injection wells PDS-I-6, PDS-I-8, and PDS-I-9 were included in the first phase of the ISCO pilot.

Each injection point received between 80 and 120 gallons in the first phase. Understanding that the underlying soil is very dense, low permeability material, a gravity feed system was developed to maintain injection pressure near 5 psi. The extraction wells adjacent to each injection point were monitored using a hand held PID, prior to and during the injection program. The results of the monitoring are presented graphically in Exhibits 2 through 5.

The lower portion of Table 1 provides a comparison of the December 2015 soil analytic levels with the post-ISCO application numbers. As of March 10th, the first application had been completed. The second phase was initiated the following week. Although the PCE levels in the sampling stations do not show significant, clear impacts from the first phase of the ISCO injection, the extraction well PID data reveals that the oxidation process has had a significant impact on the PDA soil environment.

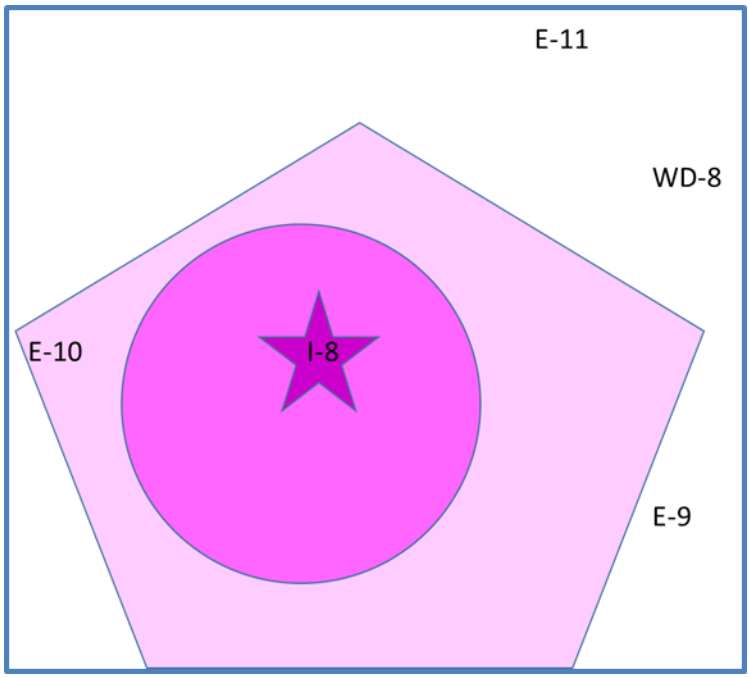

Figure 1. Zone of Influence Schematic

Referring to Figure 1, the 3 color zones represent the dark injection well area, the mid-color oxidation zone, and the lighter fringe reduced zone. The field PID monitoring data indicates that the persulfate oxidation reactions are depleting the oxygen and creating reducing conditions outside the reaction zone.

An increase in carbon monoxide and hydrogen sulfide are clear markers of this process. Carbon dioxide is produced by the oxidation of VOC, and sulfate is released as well. As the oxygen is depleted, the carbon dioxide is reduced to monoxide, and the sulfate is reduced to sulfides. The extraction wells associated with the SCVE system have been monitored on a routine basis since start up. Sulfides have never been detected in any of the wells. However, within 24 hours of the initial persulfate injections, sulfide was detected in several adjacent wells, as well as elevated levels of carbon monoxide.

The schematic of Figure 1 uses I-8 as an example because it had a high rate of throughput with the liquid injection. Monitoring point E-10 had clear spikes in sulfides and carbon monoxide during the injection process. After the injection was completed, the levels subsided as the oxygen levels recovered.

The conclusion is that persulfate is being completely consumed within the medium color zone by both native organic materials in the soil and PCE and related VOC compounds. As the second phase of injection progresses, it is anticipated that the reactive zone will spread outward to the soil sampling wells and clear evidence will be obtained of successful oxidation.
